**VIA E-MAIL**

State of North Dakota  
Office of Attorney General  
Attn: Mr. David Garner  
500 North Ninth Street  
Bismarck, ND 58501-4509

**RE: NDIC Case Nos. 30869–30880**

Dear Mr. Garner:

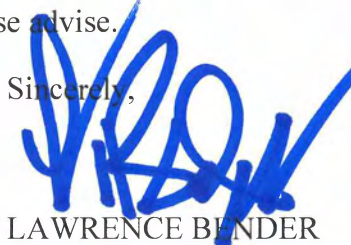

This letter concerns Mr. Braaten's e-mail dated May 9, 2024, numerous petitions to intervene filed by Mr. Braaten's clients, and a motion to expedite discovery filed on May 16, 2024 by the Swenson Living Trust, all related to proceedings on the applications filed by Summit Carbon Storage #1, LLC, Summit Carbon Storage #2, LLC, and Summit Carbon Storage #3, LLC (collectively, "Summit") in NDIC Case Nos. 30869–30880.

Mr. Braaten's May 9, 2024 e-mail and May 16, 2024 motion to expedite discovery all concern efforts by at least one of his clients to obtain discovery from Summit in NDIC Case Nos. 30869–30880. As of the date of this letter, however, Mr. Braaten does not represent anyone entitled to conduct discovery in these cases. *See* N.D.A.C. § 98-02-02-06(1). None of the petitions to intervene have been granted. The petitions to intervene should be denied for, among other reasons, the reasons stated in Summit's Response to the Swenson's Living Trust's Motion to Continue Hearing and Request for Scheduling Conference, and neither the Swenson Living Trust nor the other petitioners should be considered parties in NDIC Case Nos. 30869–30880.

Notwithstanding the foregoing, Summit intends to respond to the motion to expedite discovery filed by the Swenson Living Trust on or before May 28, 2024. *See* N.D.A.C. § 98-02-02-08, *see also* N.D.A.C. § 968-02-02-04. Summit will file a separate, consolidated response to the petitions to intervene filed by all of Mr. Braaten's clients within the same timeframe.

Should you have any questions, please advise.

Sincerely,

LAWRENCE BENDER

In re motion to consider establishing the field and pool limits for lands located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, subject to the application of Summit Carbon Storage #1, LLC for the geologic storage of carbon dioxide in the Broom Creek Formation.

---

## PETITION TO INTERVENE

---

Pursuant to N.D.C.C. § 28-32-28, Gary A. Smith and Cassie Smith (“Landowners”) hereby petition to intervene in the above-captioned proceedings. In support of this petition, Landowners state and allege as follows:

[¶1] On February 6, 2024, Summit Carbon Storage #1, LLC (“SCS”) filed an Application for a Permit (“Application”) asking the North Dakota Industrial Commission (“NDIC”) to grant its application. *See* Case Nos. 30869, 30870, 30871, and 30872.

[¶2] Landowners have property located within the area encompassed by SCS’ Applications and it owns real property that will be impacted by SCS’s proposed sequestration as referenced in Case Nos. 30869, 30870, 30871, and 30872. Specifically, Landowners own property that is within the proposed storage facilities, and also own property directly between the storage facilities where pore space will be impacted and used by the proposed storage facilities despite those lands not being listed as part of the storage facilities.

[¶3] Landowners are an owner and owner of fractional interest as a tenant in common in the property legally described as follows:

- a. Township 142 North, Range 87 West: Section 23: W1/2, Oliver County, North Dakota.
- b. Township 142 North, Range 87 West: Section 20: NE1/4, Oliver County, North Dakota.
- c. LOT A, within the SE¼ of Section 22, Township 142 North, Range 87 West, Oliver County, North Dakota described as follows: COMMENCING at the East Quarter Corner of Section 22; THENCE S 00°00'00" W, along the east line of Section 22, a distance of 120.00', to the true point of beginning; THENCE S 00°00'00" W, along said line, a distance of 660.00'; THENCE S 90°00'00" W,

a distance of 660.00'; THENCE N 00°00'00" E, a distance of 660.00'; THENCE N 90°00'00" E, a distance of 660.00', back to the point of beginning. This parcel contains 10.0 acres, more or less.

- d. Township 142 North, Range 87 West: Section 22: SE1/4, Oliver County, North Dakota.
- e. Township 142 North, Range 87 West: Section 15: NE1/4 and NW1/4, Oliver County, North Dakota.

[¶4] The legal rights, privileges, and other legal interests of Landowners will be substantially affected by the NDIC's findings and conclusions in this proceeding as they relate to the Applications and other findings that will alter and take away property and other legal rights of Landowners. Landowners file this petition for the purpose of responding in opposition to the Applications.

[¶5] For these reasons Landowners petition for leave to intervene in this proceeding for the purpose of responding to SCS' Applications and participating in any oral argument or hearings on the application and the right to be heard before the final determination as it relates to Landowners and the legality of the relief requested and which may be provided in these proceedings.

Dated this 16<sup>th</sup> day of May, 2024.

**In re application of Summit Carbon Storage # 1, LLC for an order of the Commission**

determining the amount of financial responsibility for the geologic storage of carbon dioxide from the Midwest Carbon Express Pipeline in the storage facility located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, in the Broom Creek Formation.

In re motion to consider establishing the field and pool limits for lands located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, subject to the application of Summit Carbon Storage #1, LLC for the geologic storage of carbon dioxide in the Broom Creek Formation.

---

## PETITION TO INTERVENE

---

Pursuant to N.D.C.C. § 28-32-28, Michael Bauman (“Landowner”) hereby petitions to intervene in the above-captioned proceedings. In support of this petition, Landowner states and alleges as follows:

[¶1] On February 6, 2024, Summit Carbon Storage #1, LLC (“SCS”) filed an Application for a Permit (“Application”) asking the North Dakota Industrial Commission (“NDIC”) to grant its application. *See* Case Nos. 30869, 30870, 30871, and 30872.

[¶2] Landowner has property located within the area encompassed by SCS’ Applications and it owns real property that will be impacted by SCS’s proposed sequestration as referenced in Case Nos. 30869, 30870, 30871, and 30872. Specifically, Landowner owns property that is within one of the proposed storage facilities and impacted by all of them.

[¶3] Landowner owns interests in property legally described as follows:

a. Township 142 North, Range 88 West  
Section 24: SW¼ less a 20 acre parcel described as follows:  
Commencing at the NE corner of SW¼, thence West along the North boundary of the SW¼ a distance of 950 feet; thence South in a line parallel to the East boundary of the SW 1/4 a distance of 915 feet; thence East in a line parallel to the North boundary of the SW¼ a distance of 950 feet to the East boundary of the SW¼; thence North along the East boundary of the SW¼ to the point of beginning, Mercer County, North Dakota.

[¶4] The legal rights, privileges, and other legal interests of Landowner will be substantially affected by the NDIC’s findings and conclusions in this proceeding as they relate to the Applications and other findings that will alter and take away property and other legal rights

of Landowner. Landowner files this petition for the purpose of responding in opposition to the Applications.

[¶5] For these reasons Landowner petitions for leave to intervene in this proceeding for the purpose of responding to SCS' Applications and participating in any oral argument or hearings on the application and the right to be heard before the final determination as it relates to Landowner and the legality of the relief requested and which may be provided in these proceedings.

Dated this 16<sup>th</sup> day of May, 2024.

---

PETITION TO INTERVENE

---

Pursuant to N.D.C.C. § 28-32-28, JoLene M. Rust (“Landowner”) hereby petitions to intervene in the above-captioned proceedings. In support of this petition, Landowner states and alleges as follows:

[¶1] On February 6, 2024, Summit Carbon Storage #1, LLC (“SCS”) filed an Application for a Permit (“Application”) asking the North Dakota Industrial Commission (“NDIC”) to grant its application. *See* Case Nos. 30869, 30870, 30871, and 30872.

[¶2] Landowner has property located within the area encompassed by SCS’ Applications and it owns real property that will be impacted by SCS’s proposed sequestration as referenced in Case Nos. 30869, 30870, 30871, and 30872. Specifically, Landowner owns property that is within one of the proposed storage facilities and impacted by all of them.

[¶3] Landowner owns interests in property legally described as follows:

- a. Township 142 North, Range 88 West, Mercer County, North Dakota  
Section 13: SW¼

[¶4] The legal rights, privileges, and other legal interests of Landowner will be substantially affected by the NDIC’s findings and conclusions in this proceeding as they relate to the Applications and other findings that will alter and take away property and other legal rights of Landowner. Landowner files this petition for the purpose of responding in opposition to the Applications.

[¶5] For these reasons Landowner petitions for leave to intervene in this proceeding for the purpose of responding to SCS’ Applications and participating in any oral argument or hearings on the application and the right to be heard before the final determination as it relates to Landowner and the legality of the relief requested and which may be provided in these proceedings.

Dated this 16<sup>th</sup> day of May, 2024.

### **OIL AND GAS DIVISION**

**In re application of Summit Carbon Storage #1, LLC requesting consideration for the geologic storage of carbon dioxide in the Broom Creek Formation from the Midwest Carbon Express Pipeline in the storage facility located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND**

**Case Nos. 30869  
30870  
30871  
30872**

**In re application of Summit Carbon Storage # 1, LLC to consider the amalgamation of the storage reservoir pore space, in which the Commission may require that the pore space owned by nonconsenting owners be included in the geologic storage, as required to operate the Summit Carbon Storage #1, LLC storage facility located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, in the Broom Creek Formation.**

**In re application of Summit Carbon Storage # 1, LLC for an order of the Commission**

determining the amount of financial responsibility for the geologic storage of carbon dioxide from the Midwest Carbon Express Pipeline in the storage facility located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, in the Broom Creek Formation.

In re motion to consider establishing the field and pool limits for lands located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, subject to the application of Summit Carbon Storage #1, LLC for the geologic storage of carbon dioxide in the Broom Creek Formation.

---

## PETITION TO INTERVENE

---

Pursuant to N.D.C.C. § 28-32-28, Glenn and Lisa Gerving (“Landowners”) hereby petition to intervene in the above-captioned proceedings. In support of this petition, Landowners state and allege as follows:

[¶1] On February 6, 2024, Summit Carbon Storage #1, LLC (“SCS”) filed an Application for a Permit (“Application”) asking the North Dakota Industrial Commission (“NDIC”) to grant its application. *See* Case Nos. 30869, 30870, 30871, and 30872.

[¶2] Landowners have property located within the area encompassed by SCS’ Applications and it owns real property that will be impacted by SCS’s proposed sequestration as referenced in Case Nos. 30869, 30870, 30871, and 30872. Specifically, Landowners own property that is within the proposed storage facilities, and also own property directly between the storage facilities where pore space will be impacted and used by the proposed storage facilities despite those lands not being listed as part of the storage facilities.

[¶3] Landowners own interests in property legally described as follows:

- a. The South fifty-three (53) acres of the South Half of the South Half (S1/2 S1/2) of Section Thirteen (13), in Township One Hundred Forty-One (141) North, Range Eighty-Eight (88) West of the Fifth Principal Meridian, LESS a tract of land deeded to the State of North Dakota for the use of the State Highway Department described as follows:  
All that portion of the South fifty-four (54) acres of the South Half of the South Half (S 1/2 S 1/2) of Section Thirteen (13), Township One Hundred Forty-One (141) North, Range Eighty-Eight (88) West, lying within a strip of land 100.00 feet wide, located on the Easterly side of and measured at right angles to the following described highway center line, as surveyed and staked: Beginning at

a point 154.58 feet East of the Southwest corner of said Section Thirteen (13), thence from a tangent bearing North 0.09' West running along a 0.30' curve to the left 446.7 feet, more or less, until said strip crosses the North Line of said South 54 acres, also including all that portion lying Westerly of the above described strip except all that portion lying within 33 feet of the section line, tract contains 1.92 acres, more or less, Mercer County, North Dakota.

- b. S1/2 SW1/4 of Sec. 24, Township. 141N, Range 88W, Mercer County, North Dakota.
- c. S1/2 SW1/4 NW1/4 of Sec. 24, Township 141N, Range. 88W, Mercer County, North Dakota.
- d. The E1/2 SE1/4 of Section 34 in Township 142N, Range 87W, Oliver County, North Dakota.
- e. The S1/2 SW1/4 of Section 35 in Township 142N, Range 87W, Oliver County, North Dakota.

[¶4] The legal rights, privileges, and other legal interests of Landowners will be substantially affected by the NDIC's findings and conclusions in this proceeding as they relate to the Applications and other findings that will alter and take away property and other legal rights of Landowners. Landowners file this petition for the purpose of responding in opposition to the Applications.

[¶5] For these reasons Landowners petition for leave to intervene in this proceeding for the purpose of responding to SCS' Applications and participating in any oral argument or hearings on the application and the right to be heard before the final determination as it

relates to Landowners and the legality of the relief requested and which may be provided in these proceedings.

Dated this 16<sup>th</sup> day of May, 2024.

**In re application of Summit Carbon Storage # 1, LLC for an order of the Commission**

determining the amount of financial responsibility for the geologic storage of carbon dioxide from the Midwest Carbon Express Pipeline in the storage facility located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, in the Broom Creek Formation.

In re motion to consider establishing the field and pool limits for lands located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, subject to the application of Summit Carbon Storage #1, LLC for the geologic storage of carbon dioxide in the Broom Creek Formation.

---

## PETITION TO INTERVENE

---

Pursuant to N.D.C.C. § 28-32-28, Kirk and Linda Maize and Allen Maize (“Landowners”) hereby petition to intervene in the above-captioned proceedings. In support of this petition, Landowners state and allege as follows:

[¶1] On February 6, 2024, Summit Carbon Storage #1, LLC (“SCS”) filed an Application for a Permit (“Application”) asking the North Dakota Industrial Commission (“NDIC”) to grant its application. *See* Case Nos. 30869, 30870, 30871, and 30872.

[¶2] Landowners have property located within the area encompassed by SCS’ Applications and it owns real property that will be impacted by SCS’s proposed sequestration as referenced in Case Nos. 30869, 30870, 30871, and 30872. Specifically, Landowner owns property that is within one of the proposed storage facilities and impacted by all of them.

[¶3] Landowners own interests in property legally described as follows:

- a. South Half (S/2) of the Southeast Quarter (SE/4) of Section 20, Township 141 North, Range 87 West of the Fifth Principal Meridian, in Oliver County, ND.

[¶4] The legal rights, privileges, and other legal interests of Landowners will be substantially affected by the NDIC’s findings and conclusions in this proceeding as they relate to the Applications and other findings that will alter and take away property and other legal rights of Landowners. Landowners file this petition for the purpose of responding in opposition to the Applications.

[¶5] For these reasons Landowners petition for leave to intervene in this proceeding for the purpose of responding to SCS’ Applications and participating in any oral argument or hearings on the application and the right to be heard before the final determination as it relates to Landowners and the legality of the relief requested and which may be provided in these proceedings.

Dated this 16<sup>th</sup> day of May, 2024.

**In re application of Summit Carbon Storage #3, LLC to consider the amalgamation of the storage reservoir space, in which the Commission may require that the pore space owned by nonconsenting owners be included in the geologic storage, as required to operate the Summit Carbon Storage #3, LLC storage facility located in Section 36, Township 143 North, Range 87 West, Sections 19, 20, 21, 28, 29, 30, 31, 32, 33, 34, 35, and 36, Township 143 North, Range 86 West, Sections 1, 2, 11, 12, 13, 14, and 24, Township 142 North, Range 87 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, and 35, Township 142 North, Range 86 West, and Sections 6, 7, 17, 18, 19, and 20, Township 142 North, Range 85 West, Oliver County, ND, in the Broom Creek Formation.**

**In re application of Summit Carbon Storage #3, LLC for an order of the Commission determining the amount of financial responsibility for the geologic storage of carbon dioxide from the Midwest Carbon Express Pipeline in the storage facility located in Section 36, Township 143 North, Range 87 West, Sections 19, 20, 21, 28, 29, 30, 31 , 32, 33, 34, 35, and 36, Township 143 North, Range 86 West, Sections 1, 2, 11, 12, 13, 14, and 24, Township 142 North, Range 87 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, and 35, Township 142 North, Range 86 West, and Sections 6, 7, 17, 18, 19, and 20, Township 142 North, Range 85 West, Oliver County, ND, in the Broom Creek Formation.**

**In re motion of the Commission to consider establishing the field and pool limits for lands located in Section 36, Township 143 North, Range 87 West, Sections 19, 20, 21, 28, 29, 30, 31 , 32, 33, 34, 35, and 36, Township 143 North, Range 86 West, Sections 1, 2, 11, 12, 13, 14, and 24, Township 142 North, Range 87 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, and 35, Township 142 North, Range 86 West, and Sections 6, 7, 17, 18, 19, and 20, Township 142 North, Range 85 West, Oliver county, ND, subject to the application of Summit Carbon Storage #3, LLC for the geologic storage of carbon dioxide in the Broom Creek Formation, and enact such special field rules as may be necessary.**

---

**MOTION TO EXPEDITE DISCOVERY**

---

Landowner, The Swenson Living Trust, by and through its undersigned counsel, hereby moves to expedite discovery in the above-captioned matter and to hold a discovery and prehearing conference. This Motion is supported by the Brief in Support and Declarations filed herewith.

DATED this 16<sup>th</sup> day of May, 2024.

## BRIEF IN SUPPORT OF MOTION TO EXPEDITE DISCOVERY

---

Landowner The Swenson Living Trust (“Swenson Trust”), by and through its undersigned counsel, submits the following Brief in Support of its Motion to Expedite Discovery.

Swenson Trust is a North Dakota landowner that owns 359.4 acres in or within one-half mile of a proposed carbon storage facility that is the subject of the June 11-12, 2024 hearing. Applicants do not dispute that Swenson Trust’s legal rights may be “substantially affected” by these proceedings. *See* Applicant’s Resp. to Swenson Trust’s Mot. to Cont. Hearing and Req. for Sched. Conf., at 10-11.

Swenson Trust received notice of the hearing on April 16, 2024—less than two months before the hearing is to take place. *See* Braaten Decl. ¶ 3. Underground carbon sequestration permitting is complex. Analyzing a facility to understand its potential impact requires detailed information and electronic data, specialized expertise, and sufficient time to analyze the information and data. Due to this complexity, the current schedule does not allow for Swenson Trust to obtain and analyze the information necessary to adequately represent its interests at the hearing. *See* Button Decl., ¶ 6. Therefore, Swenson Trust filed a motion to continue the hearing which is pending before the Commission.

In the event Swenson Trust’s motion to continue the hearing is not granted, the Commission should order Applicants to respond to Swenson Trust’s discovery requests on an expedited basis. Specifically, Swenson Trust’s experts need the information by May 23, 2024 for the first set of discovery attached as Exhibit A and by May 29, 2024 for the second and third sets of discovery attached as Exhibits B and F to have time to analyze it before the June 11-12, 2024 hearing. *See*

Button Decl., ¶ 6. Anything less than continuing the hearing or requiring expedited discovery responses would irreparably injure Swenson Trust and be a violation of procedural due process.

### **BACKGROUND**

Swenson Trust received notice of the hearing on April 16, 2024 with the hearing scheduled for June 11-12, 2024. *See* Declaration of Derrick Braaten, ¶3. Swenson Trust filed its Petition to Intervene on April 18, 2024. *Id.*, ¶4. Swenson Trust filed its Motion to Continue Hearing and Request for Scheduling Conference on April 25, 2024. *Id.*, ¶5. Summit Carbon Solutions (“SCS”) filed its Response to Motion to Continue Hearing and Request for Scheduling Conference on April 30, 2024. *Id.*, ¶6. The petition to intervene and motion to continue are still pending. *Id.*, ¶7.

Swenson Trust served Summit with Landowners Interrogatories and Request for Production of Documents to Applications (Set 1) on May 2, 2024. *See* Exhibit A, attached to the Decl. of Derrick Braaten, ¶8. On May 6, 2024, Swenson Trust served Summit with Landowners Interrogatories and Request for Production of Documents to Applications (Set 2). *See* Exhibit B, attached to the Decl. of Derrick Braaten, ¶9. Correspondence was sent to Lawrence Bender, attorney for Summit on May 7, 2024 to address clerical errors in the discovery served on May 2, 2024. *See* Exhibit C, attached to the Decl. of Derrick Braaten, ¶10. Landowners Notice of 30(b)(6) Deposition of Summit Carbon Solutions was served upon Summit on May 9, 2024 noticing Summit Carbon Solutions 30(b)(6) deposition for June 6, 2024. *See* Exhibit D, attached to the Decl. of Derrick Braaten, ¶11. On May 9, 2024, the undersigned sent an email to Hearing Officer Dave Garner, asking for a response to the petition to intervene and motion to continue. *See* Exhibit E, attached to the Decl. of Derrick Braaten, ¶12. On May 10, 2024, Swenson Trust served Summit with Landowners Interrogatories and Request for Production of Documents to Applications (Set 3). *See* Exhibit F, attached to the Decl. of Derrick Braaten, ¶13. On May 15, 2024, an open records

request was sent to the North Dakota Industrial Commission, Oil and Gas Division. *See* Exhibit G, attached to the Decl. of Derrick Braaten, ¶14.

### **STANDARD**

Hearing officers have broad discretion in scheduling, granting continuances, and controlling discovery in adjudicative proceedings. *Berger v. North Dakota Dept. Of Transp.*, 2011 ND 55, ¶ 7, 795 N.W.2d 707, ¶ 7 (rejecting plaintiff's claim that he was entitled to have his hearing held at its originally scheduled time). Section 28-32-33, N.D.C.C., provides that discovery may be obtained in an adjudicative proceeding in accordance with the North Dakota Rules of Civil Procedure. This section also grants authority to the hearing officer to issue discovery orders. Rule 34 of the North Dakota Rules of Civil Procedure governs how a party may request and obtain documents from another party. The default rule is that a party to whom a request for production is directed has 30 days in which to respond after being served. But as is relevant here, a shorter time may be ordered by the court (or here, the hearing examiner). Rule 34(b)(2)(A). In other words, under § 28-32-33, N.D.C.C., the hearing officer/examiner is authorized to expedite responses to discovery requests.

The Administrative Agencies Practice Act expressly directs that, in all adjudicative proceedings, "[t]he administrative agency shall designate the time and place for the hearing." N.D.C.C. § 28-32-21(1)(c). Furthermore, **the hearing officer has broad discretion to regulate the course of the administrative proceeding**. N.D.C.C. § 28-32-35; *Medical Arts Clinic, P.C. v. Franciscan Initiatives, Inc.*, 531 N.W.2d 289, 300 (N.D. 1995); *Knudson v. Director, North Dakota Dep't of Transp.*, 530 N.W.2d 313, 316 (N.D. 1995). [\*\*\*6] A hearing officer in an adjudicative administrative proceeding functions in a quasi-judicial capacity, and shares the broad discretion accorded to judicial officers. *See Medical Arts Clinic*, at 297, 300; *Loran v. Iszler*, 373 N.W.2d 870, 876 (N.D. 1985). Thus, it has been recognized that hearing officers have discretion to control procedural matters such as discovery and admission of evidence. *See, e.g., State ex rel. Workforce Safety & Ins. v. Altru Health Sys.*, 2007 ND 38, ¶ 11, 729 N.W.2d 113; *May v. Sprynczynatyk*, 2005 ND 76, ¶ 24, 695 N.W.2d 196. Trial courts have broad discretion over the progress and conduct of a trial or hearing, including scheduling and the determination whether to continue a trial or hearing. *See Hartleib v. Simes*,

2009 ND 205, ¶ 15, 776 N.W.2d 217; State v. Ripley, 2009 ND 105, ¶ 12, 766 N.W.2d 465; State v. Schmidkunz, 2006 ND 192, ¶ 22, 721 N.W.2d 387; Peterson v. Zerr, 443 N.W.2d 293, 297 n.3 (N.D. 1989). A hearing officer conducting an adjudicative administrative proceeding has the same scope of discretion in conducting the hearing, including scheduling and continuances. See Medical Arts Clinic, at 297, 300.

*Berger v. N.D. DOT*, 2011 ND 55, ¶ 7, 795 N.W.2d 707, 710 (emphasis added).

The hearing officer should apply a “good cause” standard of review in granting Swenson Trust’s motion. This standard is appropriate here because N.D.R.Civ.P. 34 is modeled after the corresponding federal rule, “good cause” is the standard applied by federal courts in interpreting the rule, *see Mullane v. Almon*, 339 F.R.D 659, 662-664 (N.D. Fla. 2021), and North Dakota courts look to federal court interpretations of corresponding federal rules in construing the North Dakota Rules of Civil Procedure. *PHI Financial Services v. Johnston Law Office, P.C.*, 2016 ND 114, ¶ 11, 881 N.W.2d 216, ¶ 11 (using federal case law applying Fed.R.Civ.P. 37(a)(i) to construe N.D.R.Civ.P. 37(a)(i)).

Further support for applying a “good cause” standard is the fact that North Dakota courts and agencies apply it in other contexts that involve the exercise of discretion. *See Burleigh County Social Service Board v. Rath*, 2023 ND 12, ¶ 6, 985 N.W.2d 725, ¶ 6 (reviewing the district court’s granting of an extension under the good cause standard in the context of Rule 6(b)(i)); *see* Order on Sinclair Oil & Gas Co. and Missouri River Royalty Corp.’s Motion to Compel and Reopen Discovery, Case No. 28637 (considering whether good cause existed to reopen discovery after discovery had closed). Thus, if Swenson Trust demonstrates good cause for requesting expedited discovery responses, then the motion should be granted. *See Mullane v. Almon*, 339 F.R.D. 659, 662-664.

Procedural fairness is required at an administrative hearing. *Schlittenhart v. North Dakota Dept. of Transp.*, 2015 ND 179, ¶ 27, 865 N.W.2d 825, ¶ 27 (noting that the Court reviews

administrative proceedings to “ensure procedural fairness”). “Procedural due process requires fundamental fairness, which, at a minimum, necessitates notice and a meaningful opportunity for a hearing appropriate to the nature of the case.” *Id.* (quoting *In re G.R.H.*, 2006 ND 56, ¶ N.W.2d 587).

An agency overseeing an adjudicative proceeding that involves an opportunity to comment and a hearing must present “the data underlying its proposed action *before* the close of the comment and hearing period.” *National Wildlife Federation v. Marsh*, 568 F.Supp. 985, 994 (D.C. 1983) (emphasis in original). This is because the right to comment or be heard cannot be meaningful “when one is not apprised of the issues and positions to which the argument is relevant.” *Id.* at 993 (quoting *U.S. Lines v. Federal Maritime Commission*, 584 F.2d 519, 540 (D.C.Cir. 1978)). In other words, an exchange of views and dialogue is only possible if the public is adequately informed, and “without such dialogue any notion of real public participation is necessarily an illusion.” *Id.*; *see also Chemical Mfrs. Ass’n v. U.S. E.P.A.*, 870 F.2d 177, 200 (“[F]airness requires that the agency afford interested parties an opportunity to challenge the underlying factual data relied on by the agency.”).

Section 28-32-29, N.D.C.C., authorizes an agency to conduct a prehearing conference. The only conditions for doing so are giving reasonable notice to all parties and interested persons and conducting the conference in a way that does not substantially prejudice or infringe on the rights of any party. § 28-32-29, N.D.C.C.

### **ANALYSIS**

It is the express policy of North Dakota to conduct procedures relating to the geologic storage of carbon dioxide “in a manner fair to all interests.” § 38-22-01, N.D.C.C. Fairness requires, at a minimum, that interested parties be afforded access to all information and data

necessary to adequately represent their interests with sufficient time to fully analyze it. The engineering complexities of carbon sequestration facilities combined with the expeditious nature of administrative hearings require that Swenson Trust receive expedited responses to its discovery requests.

**I. Good cause exists to order expedited responses to Swenson Trust’s discovery requests.**

North Dakota courts are guided by federal precedent in interpreting the North Dakota Rules of Civil Procedure. Federal courts apply a “good cause” standard when reviewing motions to expedite discovery. The commission should grant Swenson Trust’s motion because the factors comprising the good cause analysis weigh in its favor: Specifically, (A) the hearing is occurring on an expedited basis in comparison to the timeframe contemplated by the North Dakota Rules of Civil Procedure; (B) the requested discovery is narrowly tailored to the purpose for seeking expedition; (C) the request is being made to be able to adequately prepare for the hearing; (D) the burden on the Applicants is minimal because all of the information is readily available to it and part of the applications; (E) the information cannot be obtained more efficiently from some other source; (F) the discovery process will only minimally be expedited; and (G) there is no possibility the case will be disposed of prior to the hearing.

**A. The hearing is occurring on an expedited basis in comparison to the timeframe contemplated by the North Dakota Rules of Civil Procedure.**

The hearing is scheduled to occur within two months of Swenson Trust receiving notice of it. The fact that the hearing is occurring more expeditiously than a typical case in a district court cuts in favor of granting Swenson Trust’s motion. A hearing on a preliminary injunction is analogous to an administrative proceeding because like a hearing on a preliminary injunction, an administrative hearing occurs well in advance of when a typical trial would occur. “Because of the

expedited nature of injunctive proceedings, expedited discovery is more likely to be appropriate....” *Mullane*, 339 F.R.D. at 665.

In both contexts, the North Dakota Rules of Civil Procedure apply, but the rules themselves contemplate a lengthier discovery process. In other words, they are an imperfect fit, and an expedited process is more likely to be required. This is especially so here, where the facts require expert analysis that takes several days to perform. *See* Button Declar., ¶ 6.

**B. The requested discovery is narrowly tailored to the purpose of seeking expedition.**

Swenson Trust has served three sets of discovery requests and noticed a deposition of the Applicants. The information requested in the discovery is critical to its ability to present evidence at the hearing and requires time to analyze. The fact that Swenson Trust “seeks only limited discovery narrowly tailored to serve [its] purpose for seeking expedition” weighs in favor of granting the motion. *Mullane*, 339 F.R.D at 664 (citation omitted). In contrast to the plaintiff in *Mullane*, Swenson Trust has “narrowly tailored” its requests to information which is needed on an expedited basis, and therefore this factor supports the showing of good cause.

**C. Swenson Trust requires expedited discovery to sufficiently prepare for the hearing.**

The reasons for seeking expedited discovery should also be considered. *Mullane*, 339 F.R.D. at 664. Swenson Trust requires the expedited discovery to participate and present evidence at the hearing. Under § 28-32-35, N.D.C.C., the person presiding over the hearing is required to afford parties and others allowed to participate an opportunity to present evidence and argument. The right to present evidence implies a right to obtain the information required to present the evidence before the hearing. The reason for seeking expedited discovery is simply to be able to fully participate at the hearing. This supports Swenson Trust’s motion.

**D. The burden on the Applicants is minimal because all of the information is readily available and is part of the applications.**

The information sought is readily available to the Applicants and is narrowly tailored to what is needed and is literally part of the applications itself. The diagrams and calculations provided in the applications were not created out of thin air, and were created using these models as the applications itself indicates. *See* Section 3.1 of the applications. Thus, this minimal burden supports the showing of good cause. *See Mullane*, 339 F.R.D at 667. Indeed, everything necessary for Swenson Trust to evaluate the carbon storage facility would have already been provided to the Commission as part of the application process. Therefore, it should already be organized and compiled in a format conducive to transferring. As shown in the attached requests, Swenson Trust is only seeking expedited responses to fifteen interrogatories and twenty-eight requests for production, responses to which are necessary to participate in the hearing. *See* Exhs. A, B, and F.. As the Commission can see, the requests are narrowly tailored and only encompass information that the Applicants would have submitted in the application process. Therefore, producing the material on an expedited basis would not result in an “unnecessary burden.” *See Mullane*, 339 F.R.D at 667. Indeed, any minimal burden on the Applicants from transferring this information is greatly outweighed by Swenson Trust’s need for the material.

**E. The discovery process will only minimally be expedited.**

Swenson Trust served its first set of discovery on May 2, 2024. *See* Braaten Decl. ¶ 8. Typically, the Applicants would have thirty days within which to respond. Rule 34, N.D.R.Civ.P. Under the timeline requested by Swenson Trust, the Applicants will have twenty-one days, or three weeks in which to do so for the first set of discovery. Applicants will have twenty-three days to respond to the second set of discovery and nineteen days to respond to the third set of discovery. Accordingly, the Applicants will still have the benefit of the majority of typical timeframe in which

to respond. Because this timeline does not substantially deviate from the normal progression of discovery, this factor supports Swenson Trusts motion. *See Mullane*, 339 F.R.D at 667-68.

**F. The information cannot be obtained more efficiently from some other source.**

Courts also consider whether the information can be obtained more efficiently from some other source. *Mullane*, 339 F.R.D. at 663. This simply is not possible here. Therefore, this factor also supports a showing of good cause.

**G. There is no possibility the case will be disposed of prior to the hearing.**

Finally, courts consider whether producing the discovery on an expedited basis would be a waste—specifically, whether there is a motion to dismiss pending that could dispose of the proceedings. *Mullane*, 339 F.R.D. at 668. But here, there is no such possibility that the case will be dismissed before the hearing, so there is no risk the production would be a waste. Therefore, this factor too supports Swenson Trust’s showing of good cause.

**II. The commission should exercise its authority under 28-32-29, N.D.C.C. to hold a prehearing conference to discuss a discovery plan.**

The commission has the authority to hold a prehearing conference under § 28-32-29, N.D.C.C. Swenson Trust requests that the commission exercise such authority so the Commission and the parties can discuss a discovery plan in this matter.

**CONCLUSION**

The complexities of carbon storage in conjunction with the timeline for the hearing require that the hearing be continued. If the hearing is not continued, then there is good cause for ordering the Applicants to respond to Swenson Trust’s discovery requests by May 23, 2024 for the first set of discovery (Exh. A) and by May 29, 2024 for the second and third sets of discovery (Exhs. B and F). Swenson Trust will be prejudiced in making its case before the commission if the information

is received on a date any later than that. Therefore, the Commission should either continue the hearing or grant the instant motion.

DATED this 16<sup>th</sup> day of May, 2024.

**DECLARATION OF DERRICK BRAATEN IN SUPPORT OF MOTION TO EXPEDITE  
DISCOVERY**

---

1. I am an attorney for The Swenson Living Trust (“Swenson Trust”), in the above-captioned matter.
2. I represent the Swenson Trust in matters involving the applications submitted by Summit Carbon Solutions #1, LLC, Summit Carbon Solutions #2, and Summit Carbon Solutions #3, LLC (“SCS”).
3. Swenson Trust received notice on April 16, 2024 with the hearing scheduled for June 11-12, 2024.
4. Swenson Trust filed its Petition to Intervene on April 18, 2024.
5. Swenson Trust filed its Motion to Continue Hearing and Request for Scheduling Conference on April 25, 2024.
6. Summit Carbon Solutions (“SCS”) filed its Response to Motion to Continue Hearing and Request for Scheduling Conference on April 30, 2024.
7. The petition to intervene and motion to continue are still pending.
8. Attached hereto as Exhibit A is a true and correct copy of Landowners Interrogatories and Request for Production of Documents to Applications (Set 1) served on May 2, 2024.
9. Attached hereto as Exhibit B is a true and correct copy of Landowners Interrogatories and Request for Production of Documents to Applications (Set 2) served on May 6, 2024.

10. Attached hereto as Exhibit C is a true and correct copy of correspondence sent to Lawrence Bender, attorney for Summit on May 7, 2024 to address clerical errors in the discovery served on May 2, 2024.
11. Attached hereto as Exhibit D is a true and correct copy of Landowners Notice of 30(b)(6) Deposition of Summit Carbon Solutions which was served upon Summit on May 9, 2024 noticing Summit Carbon Solutions 30(b)(6) deposition for June 6, 2024.
12. Attached hereto as Exhibit E is a true and correct copy of an email sent to Hearing Officer Dave Garner on May 9, 2024.
13. Attached hereto as Exhibit F is a true and correct copy of Landowners Interrogatories and Request for Production of Documents to Applications (Set 3) served on May 10, 2024.
14. Attached hereto as Exhibit G is a true and correct copy of a request for open records sent to the North Dakota Industrial Commission, Oil and Gas Division, on May 15, 2024.
15. In order for Swenson Trust's experts to provide reports and/or expert testimony, the experts need the documentation by May 23, 2024 and May 29, 2024.

**I declare under penalty of perjury under the law of North Dakota, that the foregoing is true and correct.**

**In re application of Summit Carbon Storage # 1, LLC to consider the amalgamation of the storage reservoir pore space, in which the Commission may require that the pore space owned by nonconsenting owners be included in the geologic storage, as required to operate the Summit Carbon Storage #1, LLC storage facility located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, in the Broom Creek Formation.**

**In re application of Summit Carbon Storage # 1, LLC for an order of the Commission determining the amount of financial responsibility for the geologic storage of carbon dioxide from the Midwest Carbon Express Pipeline in the storage facility located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, in the Broom Creek Formation.**

**In re motion to consider establishing the field and pool limits for lands located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, subject to the application of Summit Carbon Storage #1, LLC for the geologic storage of carbon dioxide in the Broom Creek Formation.**

**In re application of Summit Carbon Storage #2, LLC requesting consideration for the geologic storage of carbon dioxide in the Broom Creek Formation from the Midwest Carbon Express Pipeline in the storage facility located in Sections 27, 28, 29, 32, 33, 34, and 35, Township 143 North, Range 88 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, 35, and 36, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, and 31, Township 142 North, Range 87 West, and Sections 1, 2, and 3, Township 141 North, Range 88 West, Mercer and Oliver Counties, ND.**

**In re application of Summit Carbon Storage # 2, LLC to consider the amalgamation of the storage reservoir pore space, in which the Commission may require that the pore space owned by nonconsenting owners be included in the geologic storage, as required to operate the Summit Carbon Storage #2, LLC storage facility located in Sections 27, 28, 29, 32, 33, 34, and 35, Township 143 North, Range 88 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, 35, and 36, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, and 31, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, 31, Township 142 North, Range 87 West, and Sections 1, 2, and 3, Township 141 North, Range 88 West, Mercer and Oliver Counties, ND in the Broom Creek Formation.**

**In re application of Summit Carbon Storage # 2, LLC to consider the application of Summit Carbon Storage #2, LLC for an order of the Commission determining the amount of financial responsibility for the geologic storage of carbon dioxide from the Midwest Carbon Express Pipeline in the storage facility located in Sections 27, 28, 29, 32, 33, 34, and 35, Township 143 North, Range 88 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, 35, and 36, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, and 31, Township 142 North, Range 87 West, and Sections 1, 2, and 3, Township 141 North, Range 88 West, Mercer and Oliver Counties, ND, in the Broom Creek Formation.**

**In re motion of the Commission to consider establishing the field and pool limits for lands located in Sections 27, 28, 29, 32, 33, 34, and 35, Township 143 North, Range 88 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, 35, and 36, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, and 31, Township 142 North, Range 87 West, and Sections 1, 2, and 3, Township 141 North, Range 88 West, Mercer and Oliver Counties, ND, subject to the application of Summit Carbon Storage #2, LLC for the geologic storage of carbon dioxide in the Broom Creek Formation, and enact such special field rules as may be necessary.**

**In re application of Summit Carbon Storage #3, LLC requesting consideration for the geologic storage of carbon dioxide in the Broom Creek Formation from the Midwest Carbon Express Pipeline in the storage facility located in Section 36, Township 143 North, Range 87 West, Sections 19, 20, 21, 28, 29, 30, 31, 32, 33, 34, 35, and 36, Township 143 North, Range 87 West, Sections 19, 20, 21, 28, 29, 30, 31, 32, 33, 34, 35, and 36, Township 143 North, Range 86 West, Sections 1, 2, 11, 12, 13 14, and 24, Township 142 North, Range 87 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, and 24, Township 142 North, Range 87 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 26, 27, 28, 29, 30, 32, 33, 34, and 35, Township 142 North, Range 86 West, and Sections 6, 7, 17, 18, 19, and 20, Township 142 North, Range 85 West, Oliver County, ND.**

**In re application of Summit Carbon Storage #3, LLC to consider the amalgamation of the storage reservoir space, in which the Commission may require that the pore space owned by nonconsenting owners be included in the geologic storage, as required to operate the Summit Carbon Storage #3, LLC storage facility located in Section 36, Township 143 North, Range 87 West, Sections 19, 20, 21, 28, 29, 30, 31, 32, 33, 34, 35, and 36, Township 143 North, Range 86 West, Sections 1, 2, 11, 12, 13, 14, and 24, Township 142 North, Range 87 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, and 35, Township 142 North, Range 86 West, and Sections 6, 7, 17, 18, 19, and 20, Township 142 North, Range 85 West, Oliver County, ND, in the Broom Creek Formation.**

**In re application of Summit Carbon Storage #3, LLC for an order of the Commission determining the amount of financial responsibility for the geologic storage of carbon dioxide from the Midwest Carbon Express Pipeline in the storage facility located in Section 36, Township 143 North, Range 87 West, Sections 19, 20, 21, 28, 29, 30, 31 , 32, 33, 34, 35, and 36, Township 143 North, Range 86 West, Sections 1, 2, 11, 12, 13, 14, and 24, Township 142 North, Range 87 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, and 35, Township 142 North, Range 86 West, and Sections 6, 7, 17, 18, 19, and 20, Township 142 North, Range 85 West, Oliver County, ND, in the Broom Creek Formation.**

**In re motion of the Commission to consider establishing the field and pool limits for lands located in Section 36, Township 143 North, Range 87 West, Sections 19, 20, 21, 28, 29, 30, 31 , 32, 33, 34, 35, and 36, Township 143 North, Range 86 West, Sections 1, 2, 11, 12, 13, 14, and 24, Township 142 North, Range 87 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, and 35, Township 142 North, Range 86 West, and Sections 6, 7, 17, 18, 19, and 20, Township 142 North, Range 85 West, Oliver county, ND, subject to the application of Summit Carbon Storage #3, LLC for the geologic storage of carbon dioxide in the Broom Creek Formation, and enact such special field rules as may be necessary.**

**LANDOWNERS INTERROGATORIES AND REQUEST FOR PRODUCTION OF  
DOCUMENTS TO APPLICANTS (SET 1)**

---

PLEASE TAKE NOTICE, that The Swenson Living Trust, (“Landowners”), hereby require Applicants, Summit Carbon Storage #1, LLC, Summit Carbon Storage #2 , and Summit Carbon Storage #3, LLC (“SCS” or “Summit”), to answer the following interrogatories, signed and under oath, and produce and permit Landowners to inspect and copy documents responsive to the document requests contained herein in accordance with Rules 33 and 34 of the North Dakota Rules of Civil Procedure. Your answers must be in writing and signed by someone authorized to sign on behalf of, and whose signature binds, Summit. Documents should be made available at the office of Braaten Law Firm, 109 N. 4<sup>th</sup> St., Suite 100, Bismarck, North Dakota, or copies of said documents may be forwarded to Landowners attorneys (in native, electronic format). A copy of the answers and responses, together with your objections, if any, must be served within thirty (30) days from the date of service, or within such other time as the court may allow, or parties agree.

**INSTRUCTIONS**

1. These interrogatories and requests for production are deemed to be continuing in nature and should you, your counsel, or anyone representing your interest become aware of or acquire any additional knowledge or documents which affect the accuracy or completeness of any answers herein, or which relate to the matters into which these requests for production inquire, it is hereby demanded that such knowledge and documents be immediately transferred to the undersigned attorney by way of supplemental answers and responses to the full extent required by Rule 26(e), N.D.R.Civ.P.

2. In answering these interrogatories and requests for production, you are required to furnish all information and responsive documents in the possession of you, your attorney, accountants, advisors, or other persons directly employed by you.

3. Your attention is directed to Rule 34 of the North Dakota Rules of Civil Procedure, which provides that any party who produces documents for inspection “must produce documents as they are kept in the usual course of business or must organize and label them to correspond to the categories in the request.” If the requested documents are stored only on software or otherwise are “computer based information,” regardless of whether you produce as kept in the usual course of business or by category, you are directed to produce the raw data along with codes and programs necessary for translating it into usable form, or produce the information in a finished, usable form. In either case, all necessary glossaries, keys, indices, metadata, and software necessary for interpretation of the material should be produced unless software is proprietary in nature, in which case native format should be produced with an indication of the software types required to view and process the data.

4. **Produce electronic records in their native format.** Without limiting the generality of the foregoing, Word documents should be produced in .docx or .doc format, emails should be produced in Outlook or .eml format, ArcGIS shapefiles should be produced in .shp, .shx and .dbf formats (and when available .prj, .xml, .sbn, and .sbx), and Excel spreadsheets should be produced in .xlsx, .xls, or .csv format. To the maximum extent feasible, file structures should be maintained, especially when a data or document database is linked to an ArcGIS map, website, or other such file.

5. In responding to the requests for production, for each document or any portion thereof which you have withheld based on privilege, describe the factual basis for your claim of

privilege in sufficient detail to permit adjudication of the validity of that claim, including the following:

- a. A brief description of the type of document or communication;
- b. The date of the document or communication;
- c. The name, title and job description of the transmitter of the document or communication;
- d. The name, title, and job description of the person to whom the document or communication was addressed;
- e. The name, title, and job description of each person who has received or had access to the document or communication;
- f. A brief description of the subject matter of the document or communication; and
- g. The nature of the privilege claim.

6. In responding to the Requests for Production, for each document or any portion thereof which has been lost, discarded or destroyed, identify such document as completely as possible, providing as much of the following information as possible:

- a. The type of document;
- b. Its date;
- c. The date or approximate date it was lost, discarded, or destroyed;
- d. The reason(s) for disposing of the document (if discarded or destroyed);
- e. The identity of all person(s) authorizing or having knowledge of the circumstances surrounding the disposal of the document;
- f. The identity of the person(s) who lost, discarded or destroyed the document; and
- g. The identity of all persons having knowledge of the contents thereof.

7. Each interrogatory and request for production (as well as these instructions) may contain one or more terms that are defined below. You should construe each defined term

according to the meaning of that word as set forth below. All other words should be construed consistent with customary usage given the context in which the words appear such that, in each instance, you should construe any word to bring that word within the scope of the discovery request in which it appears. Consistent with the above, the singular usage of a word shall be considered to include within its meaning the plural, and vice versa; the conjunctive shall be considered to include within its meaning the disjunctive, and vice versa; and the feminine shall be considered to include within its meaning the masculine, and vice versa.

### **DEFINITIONS**

As used in these Interrogatories and Request for Production of Documents, the following terms shall have the meanings and definitions as indicated:

1. “SCS” or “Summit” means the applicants in NDIC Case Nos. 30870, 30871, 30872 (for “Summit Carbon Storage #1, LLC,”); 30873, 30874, 30875, 30876 (for “Summit Carbon Storage #2,”) and 30877, 30878, 30879, 30880 (for “Summit Carbon Storage #3, LLC,”) and each of those entities’ authorized agents.

2. “Landowner” means The Swenson Living Trust.

3. “Storage Reservoir” means the reservoir and formation into which Summit intends to inject CO<sub>2</sub> within the Areas of Review as well as the confining layers, as defined and depicted by Summit’s applications herein (*see e.g.* Figure 1-1, NDIC Case No. 30869) including but not limited to the Storage Reservoir as defined by Section 1.15 of the Storage Agreement included with Summit’s applications in NDIC Case No. 30869, and includes the confining layers/zones, to wit:

the Pore Space and confining subsurface strata underlying the Facility Area described as the Opeche/Spearfish (Upper Confining Zone), Broom Creek (Injection Zone), and Amsden (Lower Confining Zone) Formation(s) and which are defined as identified by the well logging suite performed at one stratigraphic well,

the Milton Flemmer 1 well (NDIC File No. 38594) located in the NW¼ of the NE¼, Section 35, Township 141 North, Range 88 West, Mercer County, North Dakota. The Storage Reservoir is defined as the stratigraphic interval from below the top of the Opeche/Spearfish Formation found at a depth of 5,587 feet below the Kelly Bushing, to above the base of the Amsden Formation, found at a depth of 6,421 feet below the Kelly Bushing, as identified by the Array Induction Gamma log run in the Milton Flemmer 1 well. The logging suite included triple combo (gamma ray [GR], density porosity, and resistivity), caliper, spectral GR, combinable magnetic resonance (CMR), elemental capture spectroscopy (ESC), dipole sonic including four-arm caliper and inclinometer, and an image log. Further, the acquired logs were used to pick formation top depths and interpret lithology, petrophysical properties, and time-to-depth shifting of seismic data obtained from three 3D seismic surveys and one 5-mile long 2D seismic line covering an area totaling 208 miles in and around the Milton Flemmer 1 stratigraphic well. Formation top depths were picked from the top of the Pierre Formation to the base of the Amsden Formation. The average depth of the top of the Opeche/Spearfish Formation (Upper Confining Zone) across the storage facility area is 5,464 total vertical depth (TVD). The average depth of the base of the Amsden Formation (Lower Confining Summit Carbon Storage #1, LLC – Broom Creek 5 Zone) across the storage facility area is 6,270 feet TVD. The average thickness of the Storage Reservoir across the storage facility area is 806 feet.

4. “Communication” means any oral or written utterance, notation, or statement of any nature, by and to whomever, including, but not limited to, correspondence, text messages, chat messages, emails, letters, and any other oral or written conversations, dialogues, discussions, interviews, or consultations, between or among two or more persons.

5. “Document” means all documents or electronically stored information discoverable under N.D.R.Civ.P. 34 - including writings, drawings, graphs, charts, photographs, sound recordings, images, and other data or data compilations - stored in any medium from which information can be obtained either directly or, if necessary, after translation by you into a reasonably usable form. Documents and electronically stored information encompasses and includes all file formats in which electronically stored information is or can be stored or saved, and always includes the native file format if one exists.

6. “ESI” or “electronically stored information” means all electronically stored information discoverable under N.D.R.Civ.P. 34 - including writings, databases, shapefiles, electronic or computer files, graphs, charts, photographs, sound recordings, images, and other data or data compilations - stored in any medium from which information can be obtained either directly or, if necessary, after translation by you into a reasonably usable form. ESI encompasses and includes all file formats in which electronically stored information is or can be stored or saved, and always includes the native file format if one exists.

7. “Identification,” “identify,” or “identity,” when used in reference to (a) a natural person, requires you to state his or her full name and residential and business addresses; (b) a corporation, requires you to state its full corporate name and any names under which it does business, its state of incorporation, the address of its principal place of business, and the addresses of all of its offices in the State of North Dakota; (c) a business, requires you to state the full name or style under which the business is conducted, its business address or addresses, the types of businesses in which it is engaged, the geographic area in which it conducts those businesses, and the identity of the person or persons who own, operate, and control the business; (d) a document, requires you to state the number of pages and the nature of the document (e.g., letter or memorandum), and if not apparent on the face of the document or ESI, its title, its date, the name or names of its authors and recipients, and its present location and custodian; (e) a communication, requires you, if any part of the communication was written, to identify the document or documents which refer to or evidence the communication, and, to the extent that the communication was non-written, to identify the persons participating in the communication and to state the date, manner, place, and substance of the communication.

8. “Person” means any individual acting in any capacity as well as any entity or organization, including divisions, departments, and other units of the organization, and shall include such organizations as public or private corporations, partnerships, joint ventures, voluntary or unincorporated associations, sole proprietorships, trusts, estates, governmental agencies, commissions, bureaus, or departments.

9. “Representative” means any agent, employee, servant, officer, director, attorney, or other person acting or purporting to act on behalf of the person in question.

10. “You,” “your,” or “yourself” refer to “SCS” or “Summit”, each of its agents, representatives, and attorneys, and each person acting or purporting to act on its behalf.

### **INTERROGATORIES**

**INTERROGATORY NO. 1:** Identify the petroleum engineers or reservoir engineers who made any material contribution to Summit’s applications or the materials provided in support of Summit’s applications in NDIC Case Nos. 30869-30880.

**INTERROGATORY NO. 2:** Identify the geologists who made any material contribution to Summit’s applications or the materials provided in support of Summit’s applications in NDIC Case Nos. 30869-30880.

**INTERROGATORY NO. 3:** List any other individuals not listed in Interrogatories 1 and 2 who made any material contribution to Summit’s applications or the materials provided in support of Summit’s applications in NDIC Case Nos. 30869-30880. Identify each and every person whom you expect to call or may call as a witness at trial.

**INTERROGATORY NO. 4:** Identify all witnesses Summit plans to testify in support of Summit’s applications in NDIC Case Nos. 30869-30880.

**INTERROGATORY NO. 5:** Identify all exhibits Summit plans to offer in support of Summit's applications in NDIC Case Nos. 30869-30880.

### **REQUESTS FOR PRODUCTION**

**REQUEST NO. 1:** Please produce the underlying data and electronic files necessary to run the model used to create the images of the pressure differentials contained in Figures 3-14(a-d) in Summit's application in NDIC Case No. 30869.

**REQUEST NO. 2:** Please produce all the input files, field and analytical data , and the model geochemical database used to evaluate the CO2 effects on the upper and lower confining layers, including but not limited to all inputs and data files used to run the United States Geological Survey's USGS's Phreeqc geochemical model.

**REQUEST NO. 3:** Please produce all the input files, field and analytical data , and the model geochemical database used to run Computer Modelling Group Ltd.'s GEM model and software or any similar model or software used for the same purposes.

**REQUEST NO. 4:** Please produce all the input files, field and analytical data , and the model geochemical database used to run any modelling or analysis of critical threshold pressures or areal extent of review or impact and pressure buildup, or which was used to do any kind of analysis related to EPA Method 1 or EPA Method 2 or Analytical Solution for Leakage in Multilayered Aquifers – ASLMA, or any risk-based area-of-review analysis.

**REQUEST NO. 5:** Please produce the following data and files as referenced by Summit in its application in NDIC Case No. 30873: Geophysical Logs that penetrate injection and confining zones, Seismic survey data and core sample measurements, Acoustic impedance, total porosity, effective porosity, permeability, facies, and SLB's Petrel was used to interpolate structural surfaces for zones.

**REQUEST NO. 6:** Please produce all the input files, field and analytical data, and the model geochemical database used to evaluate the CO2 effects on the upper and lower confining layers, including but not limited to all inputs and data files used to run Computer Modelling Group Ltd.'s GEM model and software or any similar model or software used for the same purposes.

**REQUEST NO. 7:** Please produce all data from any parameter referenced or described in Table 2-1: Model Parameters for Multiphase Fluid Modeling of Geologic Sequestration as that table appears in EPA Guidance - AOR Evaluation and Corrective Action Guidance (Guidance page 11) as found here: AOR Evaluation and Corrective Action Guidance - <https://www.epa.gov/sites/default/files/2015-07/documents/epa816r13005.pdf>.

**REQUEST NO. 8:** Please produce all electronic files and data provided to the North Dakota Industrial Commission or its Department of Mineral Resources or Oil and Gas Division in association with or related to the applications in NDIC Case Nos. 30869-30880. Please produce the general ledger detail (or account activity report) for the account for Drain #11 starting January 1, 2011 through present, on an annual basis (i.e. January 1, 2011 to December 31, 2011, and January 1, 2012 to December 31, 2012, etc.).

**REQUEST NO. 9:** Please produce all 3D numerical reservoir simulation model data decks, output files and graphing files of the Storage Reservoir in original electronic format. Without limiting the foregoing, such files may commonly be stored in Slumberger Eclipse format, CMG (Canadian Modeling Group) Imex format, or other similar format. The purpose of this request is to obtain the simulation model of the proposed storage facilities and associated reservoir, along with input and output files in Summit's possession for this simulation model.

**REQUEST NO. 10:** Please produce structure maps of the injection zone top, structure maps for major sub zones, and/or structure maps of confining zones for the Storage Reservoir and the confining zones as defined therein. Such maps include those created based upon formation tops

from well logs, 3D seismic reflectors, and interpretation of geologic deposition environment to give a representation of the elevation change across the target reservoir.

**REQUEST NO. 11:** Please produce all gross and net thickness isopach maps for the Storage Reservoir.

**REQUEST NO. 12:** Please produce pore volume (PV) maps and hydrocarbon pore volume (HCPV) maps of the Storage Reservoir, regardless of when compiled and regardless of whether created by Summit.

**REQUEST NO. 13:** Please produce all well logs (raw data plus processed and interpreted copies) from anywhere in or near the Storage Reservoir. Specially please produce the well logs in .las or other digital format, including any and all well logs utilized by Summit in developing its applications herein.

**REQUEST NO. 14:** Please produce any databases, spreadsheets, or other documents containing porosity, permeability, saturation, and other rock properties such as (minerology, geomechanical properties etc) for the Storage Reservoir in original electronic format and, if available, in Excel spreadsheet format.

**REQUEST NO. 15:** Please produce water chemistry and any other liquid or solid sampling data for water or other substances in the Storage Reservoir. Please include any gas solubility testing that was performed on the water samples for CO<sub>2</sub> or injected gas stream.

**REQUEST NO. 16:** Please produce all spreadsheets, databases, and other documents or compilations containing reservoir pressure data for the Storage Reservoir, including but not limited to all bottom hole pressure data, surface pressure data, and fluid level measurements. If a spreadsheet is not available, then please produce all Documents containing this information.

**REQUEST NO. 17:** Please produce all relative permeability data for the Storage Reservoir, including core test information. If multiple cores have been tested, please produce all test data.

**REQUEST NO. 18:** Please produce all capillary pressure data for all cores tested in the Storage Reservoir.

**REQUEST NO. 19:** Please produce all routine core analysis data for the Storage Reservoir.

**REQUEST NO. 20:** Please produce all spreadsheets of reservoir temperature data in the Storage Reservoir, including spreadsheets indexing reservoir temperature data to well name and API number. If this information is not available in spreadsheet format, then please produce all Documents containing this information.

**REQUEST NO. 21:** Please produce all written interpretations of micro-seismic data obtained from the Storage Reservoir.

Dated this 2<sup>nd</sup> day of May, 2024.

**In re application of Summit Carbon Storage # 1, LLC to consider the amalgamation of the storage reservoir pore space, in which the Commission may require that the pore space owned by nonconsenting owners be included in the geologic storage, as required to operate the Summit Carbon Storage #1, LLC storage facility located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, in the Broom Creek Formation.**

**In re application of Summit Carbon Storage # 1, LLC for an order of the Commission determining the amount of financial responsibility for the geologic storage of carbon dioxide from the Midwest Carbon Express Pipeline in the storage facility located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, in the Broom Creek Formation.**

**In re motion to consider establishing the field and pool limits for lands located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, subject to the application of Summit Carbon Storage #1, LLC for the geologic storage of carbon dioxide in the Broom Creek Formation.**

**In re application of Summit Carbon Storage #2, LLC requesting consideration for the geologic storage of carbon dioxide in the Broom Creek Formation from the Midwest Carbon Express Pipeline in the storage facility located in Sections 27, 28, 29, 32, 33, 34, and 35, Township 143 North, Range 88 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, 35, and 36, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, and 31, Township 142 North, Range 87 West, and Sections 1, 2, and 3, Township 141 North, Range 88 West, Mercer and Oliver Counties, ND.**

**In re application of Summit Carbon Storage # 2, LLC to consider the amalgamation of the storage reservoir pore space, in which the Commission may require that the pore space owned by nonconsenting owners be included in the geologic storage, as required to operate the Summit Carbon Storage #2, LLC storage facility located in Sections 27, 28, 29, 32, 33, 34, and 35, Township 143 North, Range 88 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, 35, and 36, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, and 31, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, 31, Township 142 North, Range 87 West, and Sections 1, 2, and 3, Township 141 North, Range 88 West, Mercer and Oliver Counties, ND in the Broom Creek Formation.**

**In re application of Summit Carbon Storage # 2, LLC to consider the application of Summit Carbon Storage #2, LLC for an order of the Commission determining the amount of financial responsibility for the geologic storage of carbon dioxide from the Midwest Carbon Express Pipeline in the storage facility located in Sections 27, 28, 29, 32, 33, 34, and 35, Township 143 North, Range 88 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, 35, and 36, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, and 31, Township 142 North, Range 87 West, and Sections 1, 2, and 3, Township 141 North, Range 88 West, Mercer and Oliver Counties, ND, in the Broom Creek Formation.**

**In re motion of the Commission to consider establishing the field and pool limits for lands located in Sections 27, 28, 29, 32, 33, 34, and 35, Township 143 North, Range 88 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, 35, and 36, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, and 31, Township 142 North, Range 87 West, and Sections 1, 2, and 3, Township 141 North, Range 88 West, Mercer and Oliver Counties, ND, subject to the application of Summit Carbon Storage #2, LLC for the geologic storage of carbon dioxide in the Broom Creek Formation, and enact such special field rules as may be necessary.**

**In re application of Summit Carbon Storage #3, LLC requesting consideration for the geologic storage of carbon dioxide in the Broom Creek Formation from the Midwest Carbon Express Pipeline in the storage facility located in Section 36, Township 143 North, Range 87 West, Sections 19, 20, 21, 28, 29, 30, 31, 32, 33, 34, 35, and 36, Township 143 North, Range 87 West, Sections 19, 20, 21, 28, 29, 30, 31, 32, 33, 34, 35, and 36, Township 143 North, Range 86 West, Sections 1, 2, 11, 12, 13 14, and 24, Township 142 North, Range 87 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, and 24, Township 142 North, Range 87 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 26, 27, 28, 29, 30, 32, 33, 34, and 35, Township 142 North, Range 86 West, and Sections 6, 7, 17, 18, 19, and 20, Township 142 North, Range 85 West, Oliver County, ND.**

**In re application of Summit Carbon Storage #3, LLC to consider the amalgamation of the storage reservoir space, in which the Commission may require that the pore space owned by nonconsenting owners be included in the geologic storage, as required to operate the Summit Carbon Storage #3, LLC storage facility located in Section 36, Township 143 North, Range 87 West, Sections 19, 20, 21, 28, 29, 30, 31, 32, 33, 34, 35, and 36, Township 143 North, Range 86 West, Sections 1, 2, 11, 12, 13, 14, and 24, Township 142 North, Range 87 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, and 35, Township 142 North, Range 86 West, and Sections 6, 7, 17, 18, 19, and 20, Township 142 North, Range 85 West, Oliver County, ND, in the Broom Creek Formation.**

**In re application of Summit Carbon Storage #3, LLC for an order of the Commission determining the amount of financial responsibility for the geologic storage of carbon dioxide from the Midwest Carbon Express Pipeline in the storage facility located in Section 36, Township 143 North, Range 87 West, Sections 19, 20, 21, 28, 29, 30, 31 , 32, 33, 34, 35, and 36, Township 143 North, Range 86 West, Sections 1, 2, 11, 12, 13, 14, and 24, Township 142 North, Range 87 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, and 35, Township 142 North, Range 86 West, and Sections 6, 7, 17, 18, 19, and 20, Township 142 North, Range 85 West, Oliver County, ND, in the Broom Creek Formation.**

**In re motion of the Commission to consider establishing the field and pool limits for lands located in Section 36, Township 143 North, Range 87 West, Sections 19, 20, 21, 28, 29, 30, 31 , 32, 33, 34, 35, and 36, Township 143 North, Range 86 West, Sections 1, 2, 11, 12, 13, 14, and 24, Township 142 North, Range 87 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, and 35, Township 142 North, Range 86 West, and Sections 6, 7, 17, 18, 19, and 20, Township 142 North, Range 85 West, Oliver county, ND, subject to the application of Summit Carbon Storage #3, LLC for the geologic storage of carbon dioxide in the Broom Creek Formation, and enact such special field rules as may be necessary.**

**LANDOWNERS INTERROGATORIES AND REQUEST FOR PRODUCTION OF  
DOCUMENTS TO APPLICANTS (SET 2)**

---

PLEASE TAKE NOTICE, that The Swenson Living Trust, (“Landowners”), hereby require Applicants, Summit Carbon Storage #1, LLC, Summit Carbon Storage #2 , and Summit Carbon Storage #3, LLC (“SCS” or “Summit”), to answer the following interrogatories, signed and under oath, and produce and permit Landowners to inspect and copy documents responsive to the document requests contained herein in accordance with Rules 33 and 34 of the North Dakota Rules of Civil Procedure. Your answers must be in writing and signed by someone authorized to sign on behalf of, and whose signature binds, Summit. Documents should be made available at the office of Braaten Law Firm, 109 N. 4<sup>th</sup> St., Suite 100, Bismarck, North Dakota, or copies of said documents may be forwarded to Landowners attorneys (in native, electronic format). A copy of the answers and responses, together with your objections, if any, must be served within thirty (30) days from the date of service, or within such other time as the Commission may allow, or parties agree.

**INSTRUCTIONS**

1. These interrogatories and requests for production are deemed to be continuing in nature and should you, your counsel, or anyone representing your interest become aware of or acquire any additional knowledge or documents which affect the accuracy or completeness of any answers herein, or which relate to the matters into which these requests for production inquire, it is hereby demanded that such knowledge and documents be immediately transferred to the undersigned attorney by way of supplemental answers and responses to the full extent required by Rule 26(e), N.D.R.Civ.P.

2. In answering these interrogatories and requests for production, you are required to furnish all information and responsive documents in the possession of you, your attorney, accountants, advisors, or other persons directly employed by you.

3. Your attention is directed to Rule 34 of the North Dakota Rules of Civil Procedure, which provides that any party who produces documents for inspection “must produce documents as they are kept in the usual course of business or must organize and label them to correspond to the categories in the request.” If the requested documents are stored only on software or otherwise are “computer based information,” regardless of whether you produce as kept in the usual course of business or by category, you are directed to produce the raw data along with codes and programs necessary for translating it into usable form, or produce the information in a finished, usable form. In either case, all necessary glossaries, keys, indices, metadata, and software necessary for interpretation of the material should be produced unless software is proprietary in nature, in which case native format should be produced with an indication of the software types required to view and process the data.

4. **Produce electronic records in their native format.** Without limiting the generality of the foregoing, Word documents should be produced in .docx or .doc format, emails should be produced in .msg (Outlook) or .eml format, ArcGIS shapefiles should be produced in .shp, .shx and .dbf formats (and when available .prj, .xml, .sbn, and .sbx), and Excel spreadsheets should be produced in .xlsx, .xls, or .csv format. To the maximum extent feasible, file structures should be maintained, especially when a data or document database is linked to an ArcGIS map, website, or other such file.

5. In responding to the requests for production, for each document or any portion thereof which you have withheld based on privilege, describe the factual basis for your claim of

privilege in sufficient detail to permit adjudication of the validity of that claim, including the following:

- a. A brief description of the type of document or communication;
- b. The date of the document or communication;
- c. The name, title and job description of the transmitter of the document or communication;
- d. The name, title, and job description of the person to whom the document or communication was addressed;
- e. The name, title, and job description of each person who has received or had access to the document or communication;
- f. A brief description of the subject matter of the document or communication; and
- g. The nature of the privilege claim.

6. In responding to the Requests for Production, for each document or any portion thereof which has been lost, discarded or destroyed, identify such document as completely as possible, providing as much of the following information as possible:

- a. The type of document;
- b. Its date;
- c. The date or approximate date it was lost, discarded, or destroyed;
- d. The reason(s) for disposing of the document (if discarded or destroyed);
- e. The identity of all person(s) authorizing or having knowledge of the circumstances surrounding the disposal of the document;
- f. The identity of the person(s) who lost, discarded or destroyed the document; and
- g. The identity of all persons having knowledge of the contents thereof.

7. Each interrogatory and request for production (as well as these instructions) may contain one or more terms that are defined below. You should construe each defined term

according to the meaning of that word as set forth below. All other words should be construed consistent with customary usage given the context in which the words appear such that, in each instance, you should construe any word to bring that word within the scope of the discovery request in which it appears. Consistent with the above, the singular usage of a word shall be considered to include within its meaning the plural, and vice versa; the conjunctive shall be considered to include within its meaning the disjunctive, and vice versa; and the feminine shall be considered to include within its meaning the masculine, and vice versa.

### **DEFINITIONS**

As used in these Interrogatories and Request for Production of Documents, the following terms shall have the meanings and definitions as indicated:

1. “SCS” or “Summit” means the applicants in NDIC Case Nos. 30869, 30870, 30871, 30872 (for “Summit Carbon Storage #1, LLC,”); 30873, 30874, 30875, 30876 (for “Summit Carbon Storage #2,”) and 30877, 30878, 30879, 30880 (for “Summit Carbon Storage #3, LLC,”) and each of those entities’ authorized agents.

2. “Landowner” means The Swenson Living Trust.

3. “Storage Reservoir” means the reservoir and formation into which Summit intends to inject CO<sub>2</sub> and the confining zones within the Areas of Review as defined and depicted by Summit’s applications herein (*see e.g.* Figure 1-1, NDIC Case No. 30869) including but not limited to the Storage Reservoir as defined by Section 1.15 of the Storage Agreement included with Summit’s applications in NDIC Case No. 30869, to wit:

the Pore Space and confining subsurface strata underlying the Facility Area described as the Opeche/Spearfish (Upper Confining Zone), Broom Creek (Injection Zone), and Amsden (Lower Confining Zone) Formation(s) and which are defined as identified by the well logging suite performed at one stratigraphic well, the Milton Flemmer 1 well (NDIC File No. 38594) located in the NW¼ of the NE¼, Section 35, Township 141 North, Range 88 West, Mercer County, North Dakota.

The Storage Reservoir is defined as the stratigraphic interval from below the top of the Opeche/Spearfish Formation found at a depth of 5,587 feet below the Kelly Bushing, to above the base of the Amsden Formation, found at a depth of 6,421 feet below the Kelly Bushing, as identified by the Array Induction Gamma log run in the Milton Flemmer 1 well. The logging suite included triple combo (gamma ray [GR], density porosity, and resistivity), caliper, spectral GR, combinable magnetic resonance (CMR), elemental capture spectroscopy (ESC), dipole sonic including four-arm caliper and inclinometer, and an image log. Further, the acquired logs were used to pick formation top depths and interpret lithology, petrophysical properties, and time-to-depth shifting of seismic data obtained from three 3D seismic surveys and one 5-mile long 2D seismic line covering an area totaling 208 miles in and around the Milton Flemmer 1 stratigraphic well. Formation top depths were picked from the top of the Pierre Formation to the base of the Amsden Formation. The average depth of the top of the Opeche/Spearfish Formation (Upper Confining Zone) across the storage facility area is 5,464 total vertical depth (TVD). The average depth of the base of the Amsden Formation (Lower Confining Summit Carbon Storage #1, LLC – Broom Creek 5 Zone) across the storage facility area is 6,270 feet TVD. The average thickness of the Storage Reservoir across the storage facility area is 806 feet.

4. “Communication” means any oral or written utterance, notation, or statement of any nature, by and to whomever, including, but not limited to, correspondence, text messages, chat messages, emails, letters, and any other oral or written conversations, dialogues, discussions, interviews, or consultations, between or among two or more persons.

5. “Document” means all documents or electronically stored information discoverable under N.D.R.Civ.P. 34 - including writings, drawings, graphs, charts, photographs, sound recordings, images, and other data or data compilations - stored in any medium from which information can be obtained either directly or, if necessary, after translation by you into a reasonably usable form. Documents and electronically stored information encompasses and includes all file formats in which electronically stored information is or can be stored or saved, and always includes the native file format if one exists.

6. “ESI” or “electronically stored information” means all electronically stored information discoverable under N.D.R.Civ.P. 34 - including writings, databases, shapefiles,

electronic or computer files, graphs, charts, photographs, sound recordings, images, and other data or data compilations - stored in any medium from which information can be obtained either directly or, if necessary, after translation by you into a reasonably usable form. ESI encompasses and includes all file formats in which electronically stored information is or can be stored or saved, and always includes the native file format if one exists.

7. “Identification,” “identify,” or “identity,” when used in reference to (a) a natural person, requires you to state his or her full name and residential and business addresses; (b) a corporation, requires you to state its full corporate name and any names under which it does business, its state of incorporation, the address of its principal place of business, and the addresses of all of its offices in the State of North Dakota; (c) a business, requires you to state the full name or style under which the business is conducted, its business address or addresses, the types of businesses in which it is engaged, the geographic area in which it conducts those businesses, and the identity of the person or persons who own, operate, and control the business; (d) a document, requires you to state the number of pages and the nature of the document (e.g., letter or memorandum), and if not apparent on the face of the document or ESI, its title, its date, the name or names of its authors and recipients, and its present location and custodian; (e) a communication, requires you, if any part of the communication was written, to identify the document or documents which refer to or evidence the communication, and, to the extent that the communication was non-written, to identify the persons participating in the communication and to state the date, manner, place, and substance of the communication.

8. “Person” means any individual acting in any capacity as well as any entity or organization, including divisions, departments, and other units of the organization, and shall include such organizations as public or private corporations, partnerships, joint ventures, voluntary

or unincorporated associations, sole proprietorships, trusts, estates, governmental agencies, commissions, bureaus, or departments.

9. “Representative” means any agent, employee, servant, officer, director, attorney, or other person acting or purporting to act on behalf of the person in question.

10. “Summit’s applications” means all of Summit’s applications and documents and other materials in support in NDIC Case Nos. 30869, 30870, 30871, 30872; 30873, 30874, 30875, 30876; 30877, 30878, 30879, 30880.

11. “You,” “your,” or “yourself” refer to “SCS” or “Summit”, and its authorized agents.

### **INTERROGATORIES**

**INTERROGATORY NO. 1:** Identify all software programs necessary to open or run or execute any electronic files that are themselves responsive to or which contain data and information responsive to any of Landowners written interrogatories or requests for production of documents. Please exclude from your answer any software programs needed to open files with the following extensions: .doc, .docx, .pdf, .xlsx, .csv, .eml, .msg, as well as common audio-visual file types that can be opened with freely-available software such as .jpg/.jpeg, .tiff, and .mp4 files.

**INTERROGATORY NO. 2:** State whether Summit possesses documents related to any exchange of valuable consideration (including but not limited to monetary compensation even if nominal) for the right to use or damage the pore space of a property.

**INTERROGATORY NO. 3:** Describe how Summit determined the amounts it paid to property owners for use of or damage to their pore space for its activities related to Summit’s applications.

**INTERROGATORY NO. 4:** State the amounts that Summit has paid to property owners for use of or damage to pore space for injections of CO<sub>2</sub>.

**INTERROGATORY NO. 5:** State how Summit determines if a property owner has been “equitably compensated” as that phrase is used in N.D.C.C. § 38-22-08(14), and what criteria it uses to make this determination.

**INTERROGATORY NO. 6:** Identify the factual basis in Summit’s applications or the materials submitted in support of Summit’s applications that might support or that Summit will use to support a finding that property owners have been “equitably compensated” as that phrase is used in N.D.C.C. § 38-22-08(14).

**INTERROGATORY NO. 7:** Identify the factual basis in any documents or information sources other than Summit’s applications that might support or that Summit will use to support a finding that property owners have been “equitably compensated” as that phrase is used in N.D.C.C. § 38-22-08(14).

**INTERROGATORY NO. 8:** Identify the sections of Summit’s applications that support a finding that “[t]hat the proposed storage facility will not adversely affect surface waters or formations containing fresh water” as is stated at N.D.C.C. § 38-22-08(7). If Summit claims that any documents or information outside of Summit’s applications support such a finding, identify those documents and information.

**INTERROGATORY NO. 9:** Identify the source of any carbon dioxide that will be injected pursuant to Summit’s applications that is created or produced or originates in North Dakota.

### **REQUESTS FOR PRODUCTION**

**REQUEST NO. 1:** Please produce all agreements for use of or damage to the pore space of any property that are in your possession.

**REQUEST NO. 2:** Without limiting the generality of Request No. 1, please produce all agreements that might support or that Summit will use to support a finding “[t]hat the storage operator has obtained the consent of persons who own at least sixty percent of the storage reservoir's pore space” as required by N.D.C.C. § 38-22-08(5).

**REQUEST NO. 3:** Without limiting the generality of Request No. 1, produce all agreements that might support or that Summit will use to support a finding that “all nonconsenting pore space owners are or will be equitably compensated” as stated in N.D.C.C. § 38-22-08(14).

**REQUEST NO. 4:** Please produce all documents containing data or information indicating or indicative of market values for any rights associated with the use of or damage to a property’s pore space.

**REQUEST NO. 5:** Without limiting the generality of the foregoing requests, please produce all agreements for use of or damage to any surface estate necessary for Summit to complete construction of the facilities described in Summit’s applications, including but not limited to its injections wells (but for clarification not those agreements necessary for the interstate transmission line subject to siting proceedings before the ND Public Service Commission).

**REQUEST NO. 6:** Please produce all correspondence related to Summit’s applications between Summit and the North Dakota Industrial Commission and its Department of Mineral Resources and its Oil and Gas Division (collectively “NDIC”) and any authorized agents of the NDIC, and all correspondence between your authorized agents and the NDIC (including any individuals copied on or submitting Summit’s applications) related to Summit’s applications.

**Re: Summit Carbon Solutions – NDIC Case Nos. 30869-30880**

Lawrence:

I am writing to address clerical errors in the discovery served on May 2, 2024.

Case number 30869 was inadvertently left out of the definitions in paragraph 1. The definition should read as follows:

1. “SCS” or “Summit” means the applicants in NDIC Case Nos. 30869, 30870, 30871, 30872 (for “Summit Carbon Storage #1, LLC,”); 30873, 30874, 30875, 30876 (for “Summit Carbon Storage #2,”) and 30877, 30878, 30879, 30880 (for “Summit Carbon Storage #3, LLC,”) and each of those entities’ authorized agents.

There was also a clerical error in Request No. 8. It should read as follows:

**REQUEST NO. 8:** Please produce all electronic files and data provided to the North Dakota Industrial Commission or its Department of Mineral Resources or Oil and Gas Division in association with or related to the applications in NDIC Case Nos. 30869-30880.

Please let me know if you have any questions or need any further clarification.

**LANDOWNERS NOTICE OF 30(b)(6) DEPOSITION OF  
SUMMIT CARBON SOLUTIONS**

---

**TO:** Summit Carbon Solutions, by and through its attorney, Lawrence Bender, Fredrickson & Byron, P.A., 1133 College Drive, Suite 1000, Bismarck, North Dakota, 58501:

[¶1] PLEASE TAKE NOTICE that, pursuant to N.D.C.C. § 28-32-33 and Rule 30(b)(6) of the North Dakota Rules of Civil Procedure, Intervenor The Swenson Living Trust (“Landowners” or “Swenson Trust”) will take the deposition upon oral examination of Summit Carbon Solutions (“SCS” or “CO<sub>2</sub> injector”) through one or more of its officers, directors, managing agents, or other representatives who shall be designated to testify on the CO<sub>2</sub> injector’s behalf regarding all information known or reasonably available to the CO<sub>2</sub> injector with respect to the subject matters identified in Exhibit A.

[¶2] The deposition shall commence on June 6, 2024 at 9:00 a.m. (Central Time), and continue thereafter until complete, at the offices of Braaten Law Firm, 100 N. 4<sup>th</sup> St., Ste. 100, Bismarck, North Dakota 58501. The deposition shall be conducted before a court reporter, or other officer authorized by law to administer oaths, and shall be recorded by stenographic means and supplementally recorded by video. The deposition will be taken for the purposes of discovery, for use at hearings, or for other purposes as permitted under the North Dakota Rules of Civil Procedure and N.D.C.C. ch. 28-32.

Dated this 9<sup>th</sup> day of May, 2024.

## EXHIBIT A TO NOTICE OF DEPOSITION OF SUMMIT CARBON SOLUTIONS

### DEFINITIONS

As used in this Notice, the following terms shall have the meanings and definitions as indicated:

1. “SCS” or “Summit” means the applicants in NDIC Case Nos. 30869, 30870, 30871, 30872 (for “Summit Carbon Storage #1, LLC,”); 30873, 30874, 30875, 30876 (for “Summit Carbon Storage #2,”) and 30877, 30878, 30879, 30880 (for “Summit Carbon Storage #3, LLC,”). and each of those entities’ authorized agents.

2. “Landowner” means The Swenson Living Trust.

3. “Storage Reservoir” means the reservoir and formation into which Summit intends to inject CO<sub>2</sub> and the confining zones within the Areas of Review, as defined and depicted by Summit’s applications herein (*see e.g.* Figure 1-1, NDIC Case No. 30869) including but not limited to the Storage Reservoir as defined by Section 1.15 of the Storage Agreement included with Summit’s applications in NDIC Case No. 30869, and includes the confining layers/zones, to wit:

the Pore Space and confining subsurface strata underlying the Facility Area described as the Opeche/Spearfish (Upper Confining Zone), Broom Creek (Injection Zone), and Amsden (Lower Confining Zone) Formation(s) and which are defined as identified by the well logging suite performed at one stratigraphic well, the Milton Flemmer 1 well (NDIC File No. 38594) located in the NW<sup>1</sup>/<sub>4</sub> of the NE<sup>1</sup>/<sub>4</sub>, Section 35, Township 141 North, Range 88 West, Mercer County, North Dakota. The Storage Reservoir is defined as the stratigraphic interval from below the top of the Opeche/Spearfish Formation found at a depth of 5,587 feet below the Kelly Bushing, to above the base of the Amsden Formation, found at a depth of 6,421 feet below the Kelly Bushing, as identified by the Array Induction Gamma log run in the Milton Flemmer 1 well. The logging suite included triple combo (gamma ray [GR], density porosity, and resistivity), caliper, spectral GR, combinable magnetic resonance (CMR), elemental capture spectroscopy (ESC), dipole sonic including four-arm caliper and inclinometer, and an image log. Further, the acquired logs were used to pick formation top depths and interpret lithology, petrophysical properties, and time-to-depth shifting of seismic data obtained from three 3D seismic surveys and one 5-mile long 2D seismic line covering an area totaling 208 miles in and around the Milton Flemmer 1 stratigraphic well. Formation top depths

were picked from the top of the Pierre Formation to the base of the Amsden Formation. The average depth of the top of the Opeche/Spearfish Formation (Upper Confining Zone) across the storage facility area is 5,464 total vertical depth (TVD). The average depth of the base of the Amsden Formation (Lower Confining Summit Carbon Storage #1, LLC – Broom Creek 5 Zone) across the storage facility area is 6,270 feet TVD. The average thickness of the Storage Reservoir across the storage facility area is 806 feet.

4. “Communication” means any oral or written utterance, notation, or statement of any nature, by and to whomever, including, but not limited to, correspondence, text messages, chat messages, emails, letters, and any other oral or written conversations, dialogues, discussions, interviews, or consultations, between or among two or more persons.

5. “Document” means all documents or electronically stored information discoverable under N.D.R.Civ.P. 34 - including writings, drawings, graphs, charts, photographs, sound recordings, images, and other data or data compilations - stored in any medium from which information can be obtained either directly or, if necessary, after translation by you into a reasonably usable form. Documents and electronically stored information encompasses and includes all file formats in which electronically stored information is or can be stored or saved, and always includes the native file format if one exists.

6. “ESI” or “electronically stored information” means all electronically stored information discoverable under N.D.R.Civ.P. 34 - including writings, databases, shapefiles, electronic or computer files, graphs, charts, photographs, sound recordings, images, and other data or data compilations - stored in any medium from which information can be obtained either directly or, if necessary, after translation by you into a reasonably usable form. ESI encompasses and includes all file formats in which electronically stored information is or can be stored or saved, and always includes the native file format if one exists.

7. “Identification,” “identify,” or “identity,” when used in reference to (a) a natural person, requires you to state his or her full name and residential and business addresses; (b) a corporation, requires you to state its full corporate name and any names under which it does business, its state of incorporation, the address of its principal place of business, and the addresses of all of its offices in the State of North Dakota; (c) a business, requires you to state the full name or style under which the business is conducted, its business address or addresses, the types of businesses in which it is engaged, the geographic area in which it conducts those businesses, and the identity of the person or persons who own, operate, and control the business; (d) a document, requires you to state the number of pages and the nature of the document (e.g., letter or memorandum), and if not apparent on the face of the document or ESI, its title, its date, the name or names of its authors and recipients, and its present location and custodian; (e) a communication, requires you, if any part of the communication was written, to identify the document or documents which refer to or evidence the communication, and, to the extent that the communication was non-written, to identify the persons participating in the communication and to state the date, manner, place, and substance of the communication.

8. “Person” means any individual acting in any capacity as well as any entity or organization, including divisions, departments, and other units of the organization, and shall include such organizations as public or private corporations, partnerships, joint ventures, voluntary or unincorporated associations, sole proprietorships, trusts, estates, governmental agencies, commissions, bureaus, or departments.

9. “Representative” means any agent, employee, servant, officer, director, attorney, or other person acting or purporting to act on behalf of the person in question.

10. “You,” “your,” or “yourself” refer to “SCS” or “Summit”, and each of its authorized agents.

### **TOPICS FOR EXAMINATION**

In accordance with N.D.R.Civ.P. 30(b)(6), The Swenson Living Trust designates the following topics and matters for examination.

- I. Summit’s applications and the information contained in and created or submitted in support of the applications and conclusions drawn therefrom in NDIC Case Nos. 30869, 30870, 30871, 30872 (for “Summit Carbon Storage #1, LLC,”); 30873, 30874, 30875, 30876 (for “Summit Carbon Storage #2,”) and 30877, 30878, 30879, 30880 (for “Summit Carbon Storage #3, LLC,”) (all applications hereafter referred to collectively as “Summit’s applications”).
  - a. Summit’s applications include all documents submitted to the North Dakota Industrial Commission including its Department of Mineral Resources and its Oil and Gas Division (collectively “NDIC”) as part of or in support of or in relation to Summit’s applications, and all correspondence between Summit and NDIC whether in writing and whether electronic or physical, and whether written or oral. This topic and the scope of Summit’s applications as used herein includes all data files, spreadsheets, databases, and models (including loading files necessary to make data files useable with any model) and all of the information, data, documents, calculations, and non-attorney work product that was created in support of Summit’s applications or which was necessary to create or is materially supportive of Summit’s applications.
    - i. Without limiting the generality of the foregoing, this topic includes the following models and associated data:
      1. The data and interpretations and inputs for the geologic model created with SLB’s Petrel software (Schlumberger, 2020).
      2. The data and inputs and model referred to in Section 3.1 of the applications as follows:
        - a. “The geologic model and properties served as inputs for numerical simulations of CO<sub>2</sub> injection using Computer Modelling Group Ltd.’s (CMG’s) GEM software (Computer Modelling Group Ltd., 2021). Numerical simulations of CO<sub>2</sub> injection were conducted to assess potential CO<sub>2</sub> injection rate, disposition of injected CO<sub>2</sub>, wellhead pressure (WHP), bottomhole pressure (BHP), and pressure changes in the storage reservoir throughout the expected injection time frame and postinjection period. Results of the numerical simulations were then used to determine the

project's area of review (AOR) pursuant to North Dakota's geologic CO2 storage regulations.”

3. United States Geological Survey's PHREEQC geochemical model and both the data files and data inputs used to run this model and bases for using the chosen inputs.
  4. The data and load files and data decks for the SLB Petrel model that was run for Summit's applications.
  5. Computer Modelling Group Ltd.'s GEM model and both the data files and data inputs used to run this model and bases for using the chosen inputs.
  6. 3D numerical reservoir simulation model data decks, output files and graphing files of the Storage Reservoir in original electronic format. Without limiting the foregoing, such files may commonly be stored in Schlumberger SEclipse format, CMG (Canadian Modeling Group) Imex format, or other similar format.
  7. Input files, field and analytical data, and the model geochemical database (and the sources of the foregoing) used to run any modelling or analysis of critical threshold pressures or areal extent of review or impact and pressure buildup, or which was used to do any kind of analysis related to EPA Method 1 or EPA Method 2 or Analytical Solution for Leakage in Multilayered Aquifers – ASLMA, or any risk-based area-of-review analysis.
- ii. These models also include the conclusions drawn from the models and the data inputs used, particularly as those conclusions were used to support Summit's applications as referenced in these topics.
  - iii. The identity of the person most familiar with the workflows described in Section 3.2.3 of Summit's application in NDIC Case No. 30869 and how it was performed for purposes of Summit's applications and the identity of the person who wrote this passage.
  - iv. The meaning and context and details of how the various processes and functions described in Section 3.2.3 of Summit's applications and how they were actually performed and the models and calculations used to support them.
- b. The factual documentation and information that might support or that Summit will use to support a finding “[t]hat the storage operator has obtained the consent of persons who own at least sixty percent of the storage reservoir's pore space” as required by N.D.C.C. § 38-22-08(5).
  - c. The factual documentation and information that might support or that Summit will use to support any finding in this proceeding “[t]hat the proposed storage facility will not adversely affect surface waters or formations containing fresh water” as is stated at N.D.C.C. § 38-22-08(7).
  - d. The factual documentation and information that might support or that Summit will use to support any finding in this proceeding that “[t]hat the storage facility will not

endanger human health nor unduly endanger the environment” as is stated at N.D.C.C. § 38-22-08(10).

- e. The factual documentation and information that might support or that Summit will use to support any finding in this proceeding “[t]hat the horizontal and vertical boundaries of the storage reservoir are defined [and] include buffer areas to ensure that the storage facility is operated safely and as contemplated” as is stated at N.D.C.C. § 38-22-08(12).
- f. The factual documentation and information related to or that might support or that Summit will use to support any finding in this proceeding that “all nonconsenting pore space owners are or will be equitably compensated” as that phrase is used in N.D.C.C. § 38-22-08(14) and any documentation, information, data sets, comparable sales, comparable transactions, appraisals, market reports, financial reports, or other documents related to or referencing compensation paid to nonconsenting pore space owners.
  - i. This subtopic I.b. includes all amounts paid by Summit to any individual or entity for use of or damages to pore space or property rights associated with or related to its storage facility that is the subject of Summit’s application and the Storage Reservoir, and all agreements for such use or damages or payments.
  - ii. This subtopic I.b. includes all reports and agreements in Summit’s possession indicating any amount of compensation paid for any kind of use of or damage to pore space or property for CO<sub>2</sub> sequestration. If Summit has in its possession any agreement with any property owner for use of property or damage to property arising from use of pore space or property for storage or sequestration of CO<sub>2</sub> it is included in this topic.

---

Mr. Garner:

I represent the Swenson Living Trust, a proposed intervenor in NDIC Case Nos. 30869-30880. I also represent several other landowners who intend to intervene and we will be filing those petitions in the near future. I called and left a voicemail last Friday asking to speak with you and Mr. Bender regarding the extremely abbreviated schedule in this matter. The hearing has been scheduled for June 11-12, and we have submitted a motion requesting additional time to allow us to respond and prepare for a hearing. We are going to do our best to prepare if that motion is not granted, but I am very concerned that it will require a very abbreviated discovery schedule. I have scheduled a deposition for June 6, but I need to obtain the data decks, load files, and other data that was used to run the models developed for the application, and I need to do that with sufficient time to allow my team of experts to both run the models (which can take days depending on the data and how it is set up) and then analyze the results. We need to do all of this before the deposition. I have scheduled that for June 6 and this means I will likely not be able to get a transcript back before our hearing, but I wanted to give us as much time as possible to facilitate the exchange of information. If I can get some of the data decks from the NDIC, I would like to explore that as well.

I would also like to discuss logistics if we could. I have a number of landowners and it would be my preference to stipulate in advance to some of the information regarding their land ownership, deeds, etc. to avoid having to call them to walk through that at the hearing. I can make them available for examination if Mr. Bender wishes, but I'd rather not spend several hours of our time walking through deeds, etc. I also will need some very quick turnaround on the data to get this done in time, so will be asking to expedite the discovery process. I am also concerned that if the NDIC intends to grant out petitions to intervene, we are being significantly prejudiced right now because they have not been granted, and that takes more time away from us as we are trying to prepare. I have served discovery and a deposition notice, but without having our intervention granted I suspect Mr. Bender is free to ignore those. I do apologize for my directness here in addressing the tribunal, but I would ask that the intervention be granted retroactively such that our discovery requests and deposition notice do not need to be re-served, which would reset the time to respond.

I am also planning to get a motion filed tomorrow or Monday formally asking for this relief in the form of expedited discovery and an immediate discovery conference to set deadlines. I have served two rounds of discovery and in the first I focused solely on the data my experts requested in order to conduct their analysis. If there is any way to expedite that data above others I would appreciate that, and also point out that the data I am seeking for my experts is literally a part of the applications here, and I think due process requires that I obtain that in a timely manner for this to be a fair hearing. If there is anything I can do to facilitate this please let me know, and as I said, I am working as fast as I can on a motion to expedite and will have it filed tomorrow or Monday. I have attached a copy of the discovery we served and a letter clarifying some errors we made – this is the data we are

seeking that is part of the application and which our experts require in order to assess the application. If the NDIC is able to assist with sharing any of this data itself I would ask that you please consider that and I will facilitate any way I can.

I look forward to hearing from you and would appreciate if we can get a conference call set up to discuss all of this as soon as possible.

Sincerely,

**Derrick Braaten**

**LANDOWNERS INTERROGATORIES AND REQUEST FOR PRODUCTION OF  
DOCUMENTS TO APPLICANTS (SET 3)**

---

PLEASE TAKE NOTICE, that The Swenson Living Trust, (“Landowners”), hereby require Applicants, Summit Carbon Storage #1, LLC, Summit Carbon Storage #2 , and Summit Carbon Storage #3, LLC (“SCS” or “Summit”), to answer the following interrogatories, signed and under oath, and produce and permit Landowners to inspect and copy documents responsive to the document requests contained herein in accordance with Rules 33 and 34 of the North Dakota Rules of Civil Procedure. Your answers must be in writing and signed by someone authorized to sign on behalf of, and whose signature binds, Summit. Documents should be made available at the office of Braaten Law Firm, 109 N. 4<sup>th</sup> St., Suite 100, Bismarck, North Dakota, or copies of said documents may be forwarded to Landowners attorneys (in native, electronic format). A copy of the answers and responses, together with your objections, if any, must be served within thirty (30) days from the date of service, or within such other time as the Commission may allow, or parties agree.

**INSTRUCTIONS**

1. These interrogatories and requests for production are deemed to be continuing in nature and should you, your counsel, or anyone representing your interest become aware of or acquire any additional knowledge or documents which affect the accuracy or completeness of any answers herein, or which relate to the matters into which these requests for production inquire, it is hereby demanded that such knowledge and documents be immediately transferred to the undersigned attorney by way of supplemental answers and responses to the full extent required by Rule 26(e), N.D.R.Civ.P.

2. In answering these interrogatories and requests for production, you are required to furnish all information and responsive documents in the possession of you, your attorney, accountants, advisors, or other persons directly employed by you.

3. Your attention is directed to Rule 34 of the North Dakota Rules of Civil Procedure, which provides that any party who produces documents for inspection “must produce documents as they are kept in the usual course of business or must organize and label them to correspond to the categories in the request.” If the requested documents are stored only on software or otherwise are “computer based information,” regardless of whether you produce as kept in the usual course of business or by category, you are directed to produce the raw data along with codes and programs necessary for translating it into usable form, or produce the information in a finished, usable form. In either case, all necessary glossaries, keys, indices, metadata, and software necessary for interpretation of the material should be produced unless software is proprietary in nature, in which case native format should be produced with an indication of the software types required to view and process the data.

4. **Produce electronic records in their native format.** Without limiting the generality of the foregoing, Word documents should be produced in .docx or .doc format, emails should be produced in .msg (Outlook) or .eml format, ArcGIS shapefiles should be produced in .shp, .shx and .dbf formats (and when available .prj, .xml, .sbn, and .sbx), and Excel spreadsheets should be produced in .xlsx, .xls, or .csv format. To the maximum extent feasible, file structures should be maintained, especially when a data or document database is linked to an ArcGIS map, website, or other such file.

5. In responding to the requests for production, for each document or any portion thereof which you have withheld based on privilege, describe the factual basis for your claim of

privilege in sufficient detail to permit adjudication of the validity of that claim, including the following:

- a. A brief description of the type of document or communication;
- b. The date of the document or communication;
- c. The name, title and job description of the transmitter of the document or communication;
- d. The name, title, and job description of the person to whom the document or communication was addressed;
- e. The name, title, and job description of each person who has received or had access to the document or communication;
- f. A brief description of the subject matter of the document or communication; and
- g. The nature of the privilege claim.

6. In responding to the Requests for Production, for each document or any portion thereof which has been lost, discarded or destroyed, identify such document as completely as possible, providing as much of the following information as possible:

- a. The type of document;
- b. Its date;
- c. The date or approximate date it was lost, discarded, or destroyed;
- d. The reason(s) for disposing of the document (if discarded or destroyed);
- e. The identity of all person(s) authorizing or having knowledge of the circumstances surrounding the disposal of the document;
- f. The identity of the person(s) who lost, discarded or destroyed the document; and
- g. The identity of all persons having knowledge of the contents thereof.

7. Each interrogatory and request for production (as well as these instructions) may contain one or more terms that are defined below. You should construe each defined term

according to the meaning of that word as set forth below. All other words should be construed consistent with customary usage given the context in which the words appear such that, in each instance, you should construe any word to bring that word within the scope of the discovery request in which it appears. Consistent with the above, the singular usage of a word shall be considered to include within its meaning the plural, and vice versa; the conjunctive shall be considered to include within its meaning the disjunctive, and vice versa; and the feminine shall be considered to include within its meaning the masculine, and vice versa.

### **DEFINITIONS**

As used in these Interrogatories and Request for Production of Documents, the following terms shall have the meanings and definitions as indicated:

1. “SCS” or “Summit” means the applicants in NDIC Case Nos. 30869, 30870, 30871, 30872 (for “Summit Carbon Storage #1, LLC,”); 30873, 30874, 30875, 30876 (for “Summit Carbon Storage #2,”) and 30877, 30878, 30879, 30880 (for “Summit Carbon Storage #3, LLC,”) and each of those entities’ authorized agents.

2. “Landowner” means The Swenson Living Trust.

3. “Storage Reservoir” means the reservoir and formation into which Summit intends to inject CO<sub>2</sub> and the confining zones within the Areas of Review as defined and depicted by Summit’s applications herein (*see e.g.* Figure 1-1, NDIC Case No. 30869) including but not limited to the Storage Reservoir as defined by Section 1.15 of the Storage Agreement included with Summit’s applications in NDIC Case No. 30869, to wit:

the Pore Space and confining subsurface strata underlying the Facility Area described as the Opeche/Spearfish (Upper Confining Zone), Broom Creek (Injection Zone), and Amsden (Lower Confining Zone) Formation(s) and which are defined as identified by the well logging suite performed at one stratigraphic well, the Milton Flemmer 1 well (NDIC File No. 38594) located in the NW¼ of the NE¼, Section 35, Township 141 North, Range 88 West, Mercer County, North Dakota.

The Storage Reservoir is defined as the stratigraphic interval from below the top of the Opeche/Spearfish Formation found at a depth of 5,587 feet below the Kelly Bushing, to above the base of the Amsden Formation, found at a depth of 6,421 feet below the Kelly Bushing, as identified by the Array Induction Gamma log run in the Milton Flemmer 1 well. The logging suite included triple combo (gamma ray [GR], density porosity, and resistivity), caliper, spectral GR, combinable magnetic resonance (CMR), elemental capture spectroscopy (ESC), dipole sonic including four-arm caliper and inclinometer, and an image log. Further, the acquired logs were used to pick formation top depths and interpret lithology, petrophysical properties, and time-to-depth shifting of seismic data obtained from three 3D seismic surveys and one 5-mile long 2D seismic line covering an area totaling 208 miles in and around the Milton Flemmer 1 stratigraphic well. Formation top depths were picked from the top of the Pierre Formation to the base of the Amsden Formation. The average depth of the top of the Opeche/Spearfish Formation (Upper Confining Zone) across the storage facility area is 5,464 total vertical depth (TVD). The average depth of the base of the Amsden Formation (Lower Confining Summit Carbon Storage #1, LLC – Broom Creek 5 Zone) across the storage facility area is 6,270 feet TVD. The average thickness of the Storage Reservoir across the storage facility area is 806 feet.

4. “Communication” means any oral or written utterance, notation, or statement of any nature, by and to whomever, including, but not limited to, correspondence, text messages, chat messages, emails, letters, and any other oral or written conversations, dialogues, discussions, interviews, or consultations, between or among two or more persons.

5. “Document” means all documents or electronically stored information discoverable under N.D.R.Civ.P. 34 - including writings, drawings, graphs, charts, photographs, sound recordings, images, and other data or data compilations - stored in any medium from which information can be obtained either directly or, if necessary, after translation by you into a reasonably usable form. Documents and electronically stored information encompasses and includes all file formats in which electronically stored information is or can be stored or saved, and always includes the native file format if one exists.

6. “ESI” or “electronically stored information” means all electronically stored information discoverable under N.D.R.Civ.P. 34 - including writings, databases, shapefiles,

electronic or computer files, graphs, charts, photographs, sound recordings, images, and other data or data compilations - stored in any medium from which information can be obtained either directly or, if necessary, after translation by you into a reasonably usable form. ESI encompasses and includes all file formats in which electronically stored information is or can be stored or saved, and always includes the native file format if one exists.

7. “Identification,” “identify,” or “identity,” when used in reference to (a) a natural person, requires you to state his or her full name and residential and business addresses; (b) a corporation, requires you to state its full corporate name and any names under which it does business, its state of incorporation, the address of its principal place of business, and the addresses of all of its offices in the State of North Dakota; (c) a business, requires you to state the full name or style under which the business is conducted, its business address or addresses, the types of businesses in which it is engaged, the geographic area in which it conducts those businesses, and the identity of the person or persons who own, operate, and control the business; (d) a document, requires you to state the number of pages and the nature of the document (e.g., letter or memorandum), and if not apparent on the face of the document or ESI, its title, its date, the name or names of its authors and recipients, and its present location and custodian; (e) a communication, requires you, if any part of the communication was written, to identify the document or documents which refer to or evidence the communication, and, to the extent that the communication was non-written, to identify the persons participating in the communication and to state the date, manner, place, and substance of the communication.

8. “Person” means any individual acting in any capacity as well as any entity or organization, including divisions, departments, and other units of the organization, and shall include such organizations as public or private corporations, partnerships, joint ventures, voluntary

or unincorporated associations, sole proprietorships, trusts, estates, governmental agencies, commissions, bureaus, or departments.

9. “Representative” means any agent, employee, servant, officer, director, attorney, or other person acting or purporting to act on behalf of the person in question.

10. “Summit’s applications” means all of Summit’s applications and documents and other materials in support in NDIC Case Nos. 30869, 30870, 30871, 30872; 30873, 30874, 30875, 30876; 30877, 30878, 30879, 30880.

11. “You,” “your,” or “yourself” refer to “SCS” or “Summit”, and its authorized agents.

### **INTERROGATORIES**

**INTERROGATORY NO. 1:** For any installed CO2 pressure relief devices or CO2 vent systems or other mechanical devices designed for relieving pressure from a pipe, at any of the surface facilities constructed for purposes of Summit’s applications, please provide the following:

- a. Rated capacity of each device or system;
- b. Quantity of each device or system;
- c. Discharge pipe size(s);
- d. Discharge pipe outlet(s) direction (vertical or horizontal); and
- e. If horizontal, state direction of discharge.

### **REQUESTS FOR PRODUCTION**

**REQUEST FOR PRODUCTION NO. 1:** Please produce any above-ground vapor dispersion modeling results such as from any engineered pressure relief systems, including all data and input files and load files. Without limiting the generality of the forgoing, specifically provide

all data inputs for the following: weather conditions modeled, topography assumptions modeled, flow rate of CO2 over time, total quantity of CO2 released and total time of release modeled, and predicted CO2 concentrations at any public receptors such as roads, buildings, and dwellings.

**Re: Records Request**

I am writing to request a copy of records from your office, pursuant to N.D.C.C. § 44-04-18. Please provide the following data electronic files and/or load files submitted to the Oil and Gas Division by applicants Summit Carbon Storage #1, LLC, Summit Carbon Storage #2, LLC, and Summit Carbon Storage #3, LLC:

- All the input files, field and analytical data, and the model geochemical database used to evaluate the CO<sub>2</sub> effects on the upper and lower confining layers, including but not limited to all inputs and data files used to run the United States Geological Survey's USGS's PHREEQC model.
- All the input files, field and analytical data, and the model geochemical database used to run Computer Modelling Group Ltd.'s GEM model and software or any similar model or software used for the same purposes.
- Geophysical Logs that penetrate injection and confining zones, seismic survey data and core sample measurements, all measurements and data for acoustic impedance, total porosity, effective porosity, permeability, and facies.
- All the input files, field and analytical data, and the model, including but not limited to all inputs and data files used to run SLB's Petrel model in any manner related to Summit's applications.
- All 3D numerical reservoir simulation model data decks, output files and graphing files of the Storage Reservoir in original electronic format. Without limiting the foregoing, such files may commonly be stored in Slumberger Eclipse or Petrel format, CMG (Canadian Modeling Group) Imex format, or other similar format.

To the maximum extent possible, I request that you provide all records to me in electronic format by emailing them to my paralegal Desirae Zaste at [desirae@braatenlawfirm.com](mailto:desirae@braatenlawfirm.com). If it is necessary to mail responsive records, they may be sent to me at the address below.

**In re application of Summit Carbon Storage # 2, LLC to consider the application of Summit Carbon Storage #2, LLC for an order of the Commission determining the amount of financial responsibility for the geologic storage of carbon dioxide from the Midwest Carbon Express Pipeline in the storage facility located in Sections 27, 28, 29, 32, 33, 34, and 35, Township 143 North, Range 88 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, 35, and 36, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, and 31, Township 142 North, Range 87 West, and Sections 1, 2, and 3, Township 141 North, Range 88 West, Mercer and Oliver Counties, ND, in the Broom Creek Formation.**

**In re motion of the Commission to consider establishing the field and pool limits for lands located in Sections 27, 28, 29, 32, 33, 34, and 35, Township 143 North, Range 88 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, 35, and 36, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, and 31, Township 142 North, Range 87 West, and Sections 1, 2, and 3, Township 141 North, Range 88 West, Mercer and Oliver Counties, ND, subject to the application of Summit Carbon Storage #2, LLC for the geologic storage of carbon dioxide in the Broom Creek Formation, and enact such special field rules as may be necessary.**

**In re application of Summit Carbon Storage #3, LLC requesting consideration for the geologic storage of carbon dioxide in the Broom Creek Formation from the Midwest Carbon Express Pipeline in the storage facility located in Section 36, Township 143 North, Range 87 West, Sections 19, 20, 21, 28, 29, 30, 31, 32, 33, 34, 35, and 36, Township 143 North, Range 87 West, Sections 19, 20, 21, 28, 29, 30, 31, 32, 33, 34, 35, and 36, Township 143 North, Range 86 West, Sections 1, 2, 11, 12, 13 14, and 24, Township 142 North, Range 87 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, and 24, Township 142 North, Range 87 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 26, 27, 28, 29, 30, 32, 33, 34, and 35, Township 142 North, Range 86 West, and Sections 6, 7, 17, 18, 19, and 20, Township 142 North, Range 85 West, Oliver County, ND.**

**In re application of Summit Carbon Storage #3, LLC to consider the amalgamation of the storage reservoir space, in which the Commission may require that the pore space owned by nonconsenting owners be included in the geologic storage, as required to operate the Summit Carbon Storage #3, LLC storage facility located in Section 36, Township 143 North, Range 87 West, Sections 19, 20, 21, 28, 29, 30, 31, 32, 33, 34, 35, and 36, Township 143 North, Range 86 West, Sections 1, 2, 11, 12, 13, 14, and 24, Township 142 North, Range 87 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, and 35, Township 142 North, Range 86 West, and Sections 6, 7, 17, 18, 19, and 20, Township 142 North, Range 85 West, Oliver County, ND, in the Broom Creek Formation.**

**In re application of Summit Carbon Storage #3, LLC for an order of the Commission determining the amount of financial responsibility for the geologic storage of carbon dioxide from the Midwest Carbon Express Pipeline in the storage facility located in Section 36, Township 143 North, Range 87 West, Sections 19, 20, 21, 28, 29, 30, 31 , 32, 33, 34, 35, and 36, Township 143 North, Range 86 West, Sections 1, 2, 11, 12, 13, 14, and 24, Township 142 North, Range 87 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, and 35, Township 142 North, Range 86 West, and Sections 6, 7, 17, 18, 19, and 20, Township 142 North, Range 85 West, Oliver County, ND, in the Broom Creek Formation.**

**In re motion of the Commission to consider establishing the field and pool limits for lands located in Section 36, Township 143 North, Range 87 West, Sections 19, 20, 21, 28, 29, 30, 31 , 32, 33, 34, 35, and 36, Township 143 North, Range 86 West, Sections 1, 2, 11, 12, 13, 14, and 24, Township 142 North, Range 87 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, and 35, Township 142 North, Range 86 West, and Sections 6, 7, 17, 18, 19, and 20, Township 142 North, Range 85 West, Oliver county, ND, subject to the application of Summit Carbon Storage #3, LLC for the geologic storage of carbon dioxide in the Broom Creek Formation, and enact such special field rules as may be necessary.**

---

**DECLARATION OF PAUL BUTTON IN SUPPORT OF MOTION TO EXPEDITE  
DISCOVERY**

---

1. I am a Petroleum Engineer with experience modeling and operating oil and gas reservoirs, and I currently reside in Butte, Montana.
2. Attached hereto as Exhibit H is a true and correct copy of my Curriculum Vitae.
3. I have worked with CMG the owner of the GEM software many times in the past and typically you can get a copy within a week of requesting a quote.
4. For GEM, the data decks are easily exportable if you have the .dat file and any included files that are called on it can be rerun pretty easily.
5. Runtime is not only based on the model size (number of cells) but also how quickly the solutions converge for each time step. In my experience, a model that is having convergence problems can take days to run. Introducing a new fluid, CO<sub>2</sub>, into the reservoir is most likely going to create convergence problems but it is hard to determine what the run time is until we get ahold of the model and either run it or look at the existing output files to see what the run time is and the computer processing power that was used to run the model.
6. I am familiar with Schlumberger's software.
7. In order to allow adequate time, I estimate that the geologist and I and the expert reviewing the PHREEQC model would need to receive the electronic data for the GEM, SLB Petrel, PHREEQC, and other computer models by May 23, 2024 in order to run and analyze the models and prepare for the hearing on June 11-12.

**I declare under penalty of perjury under the law of North Dakota, that the foregoing is true and correct.**

Executed this 16<sup>th</sup> day of May, 2024 in Butte, Montana.

---

### **SUMMARY OF QUALIFICATIONS**

**Petroleum Engineer** with diversified experience in reservoir and production engineering. Responsibilities include reservoir modeling, geologic engineering, rate transient analysis, property valuation, well completion optimization, detailed reservoir characterization, waterflood management, and EOR management.

### **EMPLOYMENT HISTORY**

#### **TerraStor Energy Corporation**

**2021-Present**

#### **Chief Technology Officer**

**Butte, MT**

Perform geologic search for Compressed Air Energy Storage (CAES) sites. Determine electricity grid connectivity around geologic sites to determine if interconnection is possible. Liaison with consulting engineers and OEM providers on compression, turbo expansion, heat exchange and cavern design.

#### **Poplar Resources**

**2019-Present**

#### **Sr Vice President Resource Development**

**Billings, MT**

Supervise technical and operational staff on the implementation and monitoring of gas oil gravity drainage project at Poplar Dome.

Develop EOR development plan, schedule implementation operations, budget and monitoring of results.

#### **Button Petroleum Management**

**2016-2022**

#### **Consulting Reservoir Engineer**

**Billings, MT**

Consulting Reservoir Engineer that has performed field valuations and recovery forecasts on conventional and un-conventional fields at client's request.

- Constructed development plan for multiple water flood fields including economic model. Work with geology and land to determine unitization area and criteria.
- Conducted optimal spacing study for unconventional Bakken & Three Forks development. Reviewed multiple spacing tests and well performance to determine most economic development scenario for each reservoir in the client's subject land position.
- EOR review and valuation of field for acquisition. Included full reserve review and CO2 requirement review.
- Reservoir Simulation and EOR recovery project design and planning.
- Expert Witness and Advise on cases for Braaten Law Firm

#### **SM Energy**

**2005 - 2016**

#### **Senior Reservoir Engineer**

**Billings, MT**

Multi-disciplined team leader for Wyoming asset team, developing conventional, unconventional, and EOR reserves. Responsibilities include development planning, exploration evaluation, EOR project screening, and A&D evaluation.

- Multi discipline team lead responsible for the acquisition of 160,000 acres of stacked pay un-conventional resources in the Powder River Basin. Primary reservoir evaluator for over \$300 MM in acquisitions and

over \$200 MM in appraisal drilling in the Frontier and Niobrara. Responsible for identifying key play drivers, developing optimal depletion plan, and maximizing net asset value. Key evaluation engineer on basin wide exploration effort focus on Muddy and Mowry.

- Lead reservoir engineer on team that developed the Niobrara and Codell resource plays in Laramie Co, Wyoming. Worked intricately with asset team to design innovative completion design to maximize recovery from Niobrara. Team drilled first long lateral (+9,000' lateral) which was key to economic exploitation of the Codell and Niobrara.
- Lead role in EOR evaluation of Wind River and Bighorn Basin Tensleep fields. Developed screening criteria and determined recovery potential on several legacy assets. Determined technical feasibility of miscible CO<sub>2</sub> but determined resource size was economically unfeasible.
- Primary reservoir engineer Nance Petroleum's early development of Elm Coulee Field Richland Co, MT. Instrumental in asset team's effort to improve recovery through spacing optimization, wellbore design and completion design.

## **Kinder Morgan**

**2003 - 2005**

### ***Reservoir Engineer***

***Midland, TX***

Multi-disciplined team member in Yates field, a highly fractured carbonate reservoir with 400 million barrels remaining reserves. Responsibilities include improving reservoir understanding, optimizing contact movement to improve reserve development, and providing analysis on EOR projects.

- Selected 40 horizontal well locations for drilling in early 2004. Prepared economic justification for each well, selected target interval within reservoir, developed detailed well plan, and provided production and reserve forecast for the program.
- Prepared detailed review of Surfactant and Thermal EOR projects that included review of production response, economic performance, and Texas EOR Severance Tax filings.

## **MARATHON OIL COMPANY**

**1998 - 2003**

### ***Reservoir Engineer***

***Midland, TX***

Multi-disciplined team member in Yates field, a highly fractured carbonate reservoir with 400 million barrels remaining reserves. Responsibilities include improving reservoir understanding, optimizing contact movement to improve reserve development from double displacement gas injection, and providing analysis on EOR projects.

- Improve reservoir understanding for diversified team by providing simulation support that led to the optimization of the Double Displacement Process. Built and ran a variety of simulation models that led to increased understanding of oil drainage and mobilization. Recommendations resulted in improved oil rate and increased asset value.
- Recommended termination of 60 MMCFD of nitrogen injection to control reservoir pressure growth and moderate contact movement to maximize oil mobilization. Project included simulation, material balance, and economic analysis as well as contract negotiation. Resulted in a \$25 million improvement in asset net present value.
- Performed reserve evaluation of an immiscible CO<sub>2</sub> project. Determined that a potential 25 million barrels of reserves are probable. Analysis involved compositional modeling, equation of state tuning, coordinating PVT lab work, and economic analysis.

- Coordinated \$80 million dollar capital and expense budget for three years. Responsible for presenting to senior management, tracking expenditures, and making recommendations on projects for local management's approval.
- Project engineer responsible for testing and developing innovative, low cost completion methods in Yates field. Successfully modeled completion performance of both vertical and horizontal completions and recommended changes in our completion practices that improved the well production efficiency. Published an SPE paper on the modeling work and presented it at a convention in Villahermosa, Mexico.

#### EDUCATION

***Bachelor of Science in Petroleum Engineering (B.S.P.E.) December 1997***

Montana Tech of the University of Montana, Butte, Montana

#### SPECIAL SKILLS

Reservoir Simulation... Rate Transient Analysis... Aries... PHDWin...Spotfire... Excel... Word... Power Point...

### **OIL AND GAS DIVISION**

**In re application of Summit Carbon Storage #1, LLC requesting consideration for the geologic storage of carbon dioxide in the Broom Creek Formation from the Midwest Carbon Express Pipeline in the storage facility located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND**

**Case Nos. 30869  
30870  
30871  
30872**

**In re application of Summit Carbon Storage # 1, LLC to consider the amalgamation of the storage reservoir pore space, in which the Commission may require that the pore space owned by nonconsenting owners be included in the geologic storage, as required to operate the Summit Carbon Storage #1, LLC storage facility located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, in the Broom Creek Formation.**

**In re application of Summit Carbon Storage # 1, LLC for an order of the Commission**

determining the amount of financial responsibility for the geologic storage of carbon dioxide from the Midwest Carbon Express Pipeline in the storage facility located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, in the Broom Creek Formation.

In re motion to consider establishing the field and pool limits for lands located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, subject to the application of Summit Carbon Storage #1, LLC for the geologic storage of carbon dioxide in the Broom Creek Formation.

---

PETITION TO INTERVENE

---

Pursuant to N.D.C.C. § 28-32-28, John Jochim (“Landowner”) hereby petitions to intervene in the above-captioned proceedings. In support of this petition, Landowner states and alleges as follows:

[¶1] On February 6, 2024, Summit Carbon Storage #1, LLC (“SCS”) filed an Application for a Permit (“Application”) asking the North Dakota Industrial Commission (“NDIC”) to grant its application. *See* Case Nos. 30869, 30870, 30871, and 30872.

[¶2] Landowner has property located within the area encompassed by SCS’ Applications and it owns real property that will be impacted by SCS’s proposed sequestration as referenced in Case Nos. 30869, 30870, 30871, and 30872. Specifically, Landowner owns property that is within the proposed storage facilities.

[¶3] Landowner owns interests in property legally described as follows:

- a. Township 142 North, Range 88 West, Mercer County, North Dakota  
Section 24: NW¼

[¶4] The legal rights, privileges, and other legal interests of Landowner will be substantially affected by the NDIC’s findings and conclusions in this proceeding as they relate to the Applications and other findings that will alter and take away property and other legal rights of Landowner. Landowner files this petition for the purpose of responding in opposition to the Applications.

[¶5] For these reasons Landowner petitions for leave to intervene in this proceeding for the purpose of responding to SCS’ Applications and participating in any oral argument or hearings on the application and the right to be heard before the final determination as it relates to Landowner and the legality of the relief requested and which may be provided in these proceedings.

Dated this 15<sup>th</sup> day of May, 2024.

**In re application of Summit Carbon Storage # 1, LLC to consider the amalgamation of the storage reservoir pore space, in which the Commission may require that the pore space owned by nonconsenting owners be included in the geologic storage, as required to operate the Summit Carbon Storage #1, LLC storage facility located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, in the Broom Creek Formation.**

**In re application of Summit Carbon Storage # 1, LLC for an order of the Commission**

determining the amount of financial responsibility for the geologic storage of carbon dioxide from the Midwest Carbon Express Pipeline in the storage facility located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, in the Broom Creek Formation.

In re motion to consider establishing the field and pool limits for lands located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, subject to the application of Summit Carbon Storage #1, LLC for the geologic storage of carbon dioxide in the Broom Creek Formation.

---

## PETITION TO INTERVENE

---

Pursuant to N.D.C.C. § 28-32-28, Paul and Christy Metz (“Landowners”) hereby petition to intervene in the above-captioned proceedings. In support of this petition, Landowners state and allege as follows:

[¶1] On February 6, 2024, Summit Carbon Storage #1, LLC (“SCS”) filed an Application for a Permit (“Application”) asking the North Dakota Industrial Commission (“NDIC”) to grant its application. *See* Case Nos. 30869, 30870, 30871, and 30872.

[¶2] Landowners have property located within the area encompassed by SCS’ Applications and it owns real property that will be impacted by SCS’s proposed sequestration as referenced in Case Nos. 30869, 30870, 30871, and 30872. Specifically, Landowners own property that is within the proposed storage facilities.

[¶3] Landowners own interests in property legally described as follows:

a. Auditor's Lot 1, a parcel of land in the N½ of the SE¼ of Section 4 Township 141 North Range 87 West of the Fifth Principal Meridian, Oliver County, North Dakota, more particularly described as follows:

Commencing at the East ¼ Corner said Section 4; thence S.00°03'34"E., 774.60', along the East Line of Said Section 4, to the Point of Beginning; thence continuing along the said East line S.00°03'34"E., 58.66'; thence N.63°25'13"W., 803.38'; thence S.01°13'58"E., 416.27'; thence S.74°08'23"W., 204.26'; thence N.61°33'16"W., 577.21'; thence N.60°45'05"W., 404.12'; thence N.01°56'26"W., 407.78'; thence N.89°47'04"E., 1045.86'; thence S.01°48'11"E., 412.49'; thence S.63°30'12"E., 805.92', to the Point of Beginning and containing 18.88 acres more or less.

[¶4] The legal rights, privileges, and other legal interests of Landowners will be substantially affected by the NDIC's findings and conclusions in this proceeding as they relate to the Applications and other findings that will alter and take away property and other legal rights of Landowners. Landowners file this petition for the purpose of responding in opposition to the Applications.

[¶5] For these reasons Landowners petition for leave to intervene in this proceeding for the purpose of responding to SCS' Applications and participating in any oral argument or hearings on the application and the right to be heard before the final determination as it relates to Landowners and the legality of the relief requested and which may be provided in these proceedings.

Dated this 15<sup>th</sup> day of May, 2024.

## PETITION TO INTERVENE

---

Pursuant to N.D.C.C. § 28-32-28, Michael and Bonnie Haupt (“Landowners”) hereby petition to intervene in the above-captioned proceedings. In support of this petition, Landowners state and allege as follows:

[¶1] On February 6, 2024, Summit Carbon Storage #1, LLC (“SCS”) filed an Application for a Permit (“Application”) asking the North Dakota Industrial Commission (“NDIC”) to grant its application. *See* Case Nos. 30869, 30870, 30871, and 30872.

[¶2] Landowners have property located within the area encompassed by SCS’ Applications and it owns real property that will be impacted by SCS’s proposed sequestration as referenced in Case Nos. 30869, 30870, 30871, and 30872. Specifically, Landowners own property directly between the storage facilities where pore space will be impacted and used by the proposed storage facilities despite those lands not being listed as part of the storage facilities.

[¶3] Landowners own interests in property legally described as follows:

- a. The Southeast Quarter (SE 1/4) of Section Thirty-Five (35), Township One Hundred Forty-One (141) North, Range Eighty-Eight (88) West of the Fifth Principal Meridian, Mercer County, North Dakota.
- b. The Southwest Quarter (SW 1/4) of Section Twenty-Seven (27), Township One Hundred Forty-One (141) North, Range Eighty-Eight (88) West of the Fifth Principal Meridian, Mercer County, North Dakota.

[¶4] The legal rights, privileges, and other legal interests of Landowners will be substantially affected by the NDIC’s findings and conclusions in this proceeding as they relate to the Applications and other findings that will alter and take away property and other legal rights

of Landowners. Landowners file this petition for the purpose of responding in opposition to the Applications.

[¶5] For these reasons Landowners petition for leave to intervene in this proceeding for the purpose of responding to SCS' Applications and participating in any oral argument or hearings on the application and the right to be heard before the final determination as it relates to Landowners and the legality of the relief requested and which may be provided in these proceedings.

Dated this 15<sup>th</sup> day of May, 2024.

Good afternoon Sarah,

We do have comments regarding these cases and I have attached a letter for each of Summit Carbon Solutions #1-3.

Respectfully,

Lorna Meidinger  
Lead Historic Preservationist  
State Historical Society of North Dakota  
612 E Boulevard Ave  
Bismarck, ND 58505

**SHSND Ref.: 24-9060 Summit Carbon Solutions #1 in portions of 43 Sections in Mercer, Morton, and Oliver Counties, North Dakota**

Dear Director Helms,

We reviewed SHSND Ref.: 24-9060 for Case Numbers 30869, 30870, 30871, 30872 and have a few comments. Seismic testing can adversely affect certain types of sensitive cultural sites and our office should be contacted regarding areas to avoid prior to any of this type of testing.

While we know a Class III (pedestrian survey) of cultural resources is underway for the pipeline, we are not able to verify at this time if that survey includes all of the injection wells, monitoring wells, and any of new ground disturbance for associated access to these wells. We recommend each of those sites be surveyed and the survey must follow “North Dakota SHPO Guidelines Manual for Cultural Resource Inventory Projects,” which is available at <https://www.history.nd.gov/hp/hpforms.html>.

Thank you for the opportunity to review this project to date. We look forward to review of the Class III survey for archaeological resources. If you have any questions please contact Lorna Meidinger, Lead Historic Preservation Specialist at (701) 328-2089 or [lbmeidinger@nd.gov](mailto:lbmeidinger@nd.gov).

Sincerely,

for William D. Peterson, PhD

To the Commission:

I am responding to a Notice of Hearing from Summit Carbon Storage.

I am very **STRONGLY OPPOSED** to this proposed carbon dioxide storage facility. I feel that this could negatively affect the land and environment and minerals.

Summit Carbon Storage has a bad reputation as far as respect to land owners such as going onto property without owner's consent doing tests and surveys. This to me is indicative of future abuse and disregard for owners.

North Dakota does not need to be a storage facility for garbage from other states.

Respectfully submitted.

**BEFORE THE INDUSTRIAL COMMISSION  
OF THE STATE OF NORTH DAKOTA**

**CASE NOS. 30869-30880**

**In re application of Summit Carbon Storage #1, LLC requesting consideration for the geologic storage of carbon dioxide in the Broom Creek Formation from the Midwest Carbon Express Pipeline in the storage facility located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND**

**In re application of Summit Carbon Storage # 1, LLC to consider the amalgamation of the storage reservoir pore space, in which the Commission may require that the pore space owned by nonconsenting owners be included in the geologic storage, as required to operate the Summit Carbon Storage #1, LLC storage facility located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, in the Broom Creek Formation.**

**In re application of Summit Carbon Storage # 1, LLC for an order of the Commission determining the amount of financial responsibility for the geologic storage of carbon dioxide from the Midwest Carbon Express Pipeline in the storage facility located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1,**

11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, in the Broom Creek Formation.

In re motion to consider establishing the field and pool limits for lands located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, subject to the application of Summit Carbon Storage #1, LLC for the geologic storage of carbon dioxide in the Broom Creek Formation.

In re application of Summit Carbon Storage #2, LLC requesting consideration for the geologic storage of carbon dioxide in the Broom Creek Formation from the Midwest Carbon Express Pipeline in the storage facility located in Sections 27, 28, 29, 32, 33, 34, and 35, Township 143 North, Range 88 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, 35, and 36, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, and 31, Township 142 North, Range 87 West, and Sections 1, 2, and 3, Township 141 North, Range 88 West, Mercer and Oliver Counties, ND

In re application of Summit Carbon Storage # 2, LLC to consider the amalgamation of the storage reservoir pore space, in which the Commission may require that the pore space owned by

**nonconsenting owners be included in the geologic storage, as required to operate the Summit Carbon Storage #2, LLC storage facility located in Sections 27, 28, 29, 32, 33, 34, and 35, Township 143 North, Range 88 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, 35, and 36, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, and 31, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, 31, Township 142 North, Range 87 West, and Sections 1, 2, and 3, Township 141 North, Range 88 West, Mercer and Oliver Counties, ND in the Broom Creek Formation.**

**In re application of Summit Carbon Storage # 2, LLC to consider the application of Summit Carbon Storage #2, LLC for an order of the Commission determining the amount of financial responsibility for the geologic storage of carbon dioxide from the Midwest Carbon Express Pipeline in the storage facility located in Sections 27, 28, 29, 32, 33, 34, and 35, Township 143 North, Range 88 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, 35, and 36, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, and 31, Township 142 North, Range 87 West, and Sections 1, 2, and 3, Township 141 North, Range 88 West, Mercer and Oliver Counties, ND, in the Broom Creek Formation.**

**In re motion of the Commission to consider establishing the field and pool limits for lands located in Sections 27, 28, 29, 32, 33, 34, and 35, Township 143 North, Range 88 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, 35, and 36, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, and 31, Township 142 North, Range 87 West, and Sections 1, 2, and 3, Township 141 North, Range 88 West, Mercer and Oliver Counties, ND, subject to the application of Summit Carbon Storage #2, LLC for the geologic storage of**

**carbon dioxide in the Broom Creek Formation, and enact such special field rules as may be necessary.**

**In re application of Summit Carbon Storage #3, LLC requesting consideration for the geologic storage of carbon dioxide in the Broom Creek Formation from the Midwest Carbon Express Pipeline in the storage facility located in Section 36, Township 143 North, Range 87 West, Sections 19, 20, 21, 28, 29, 30, 31, 32, 33, 34, 35, and 36, Township 143 North, Range 87 West, Sections 19, 20, 21, 28, 29, 30, 31, 32, 33, 34, 35, and 36, Township 143 North, Range 86 West, Sections 1, 2, 11, 12, 13 14, and 24, Township 142 North, Range 87 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, and 24, Township 142 North, Range 87 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 26, 27, 28, 29, 30, 32, 33, 34, and 35, Township 142 North, Range 86 West, and Sections 6, 7, 17, 18, 19, and 20, Township 142 North, Range 85 West, Oliver County, ND.**

**In re application of Summit Carbon Storage #3, LLC to consider the amalgamation of the storage reservoir space, in which the Commission may require that the pore space owned by nonconsenting owners be included in the geologic storage, as required to operate the Summit Carbon Storage #3, LLC storage facility located in Section 36, Township 143 North, Range 87 West, Sections 19, 20, 21, 28, 29, 30, 31, 32, 33, 34, 35, and 36, Township 143 North, Range 86 West, Sections 1, 2, 11, 12, 13, 14, and 24, Township 142 North, Range 87 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, and 35, Township 142 North, Range 86 West, and Sections 6, 7, 17, 18, 19, and 20, Township 142 North, Range 85 West, Oliver County, ND, in the Broom Creek Formation.**

**In re application of Summit Carbon Storage #3, LLC for an order of the Commission determining the amount of financial responsibility for the**

**geologic storage of carbon dioxide from the Midwest Carbon Express Pipeline in the storage facility located in Section 36, Township 143 North, Range 87 West, Sections 19, 20, 21, 28, 29, 30, 31, 32, 33, 34, 35, and 36, Township 143 North, Range 86 West, Sections 1, 2, 11, 12, 13, 14, and 24, Township 142 North, Range 87 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, and 35, Township 142 North, Range 86 West, and Sections 6, 7, 17, 18, 19, and 20, Township 142 North, Range 85 West, Oliver County, ND, in the Broom Creek Formation.**

**In re motion of the Commission to consider establishing the field and pool limits for lands located in Section 36, Township 143 North, Range 87 West, Sections 19, 20, 21, 28, 29, 30, 31, 32, 33, 34, 35, and 36, Township 143 North, Range 86 West, Sections 1, 2, 11, 12, 13, 14, and 24, Township 142 North, Range 87 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, and 35, Township 142 North, Range 86 West, and Sections 6, 7, 17, 18, 19, and 20, Township 142 North, Range 85 West, Oliver county, ND, subject to the application of Summit Carbon Storage #3, LLC for the geologic storage of carbon dioxide in the Broom Creek Formation, and enact such special field rules as may be necessary.**

**RESPONSE TO MOTION TO CONTINUE HEARING  
AND REQUEST FOR SCHEDULING CONFERENCE**

[¶ 1] Applicants Summit Carbon Storage #1, LLC, Summit Carbon Storage #2, LLC, and Summit Carbon Storage #3, LLC (collectively, “Summit”), by and through their counsel, Lawrence Bender, Fredrikson & Byron, P.A., 304 East Front Avenue, Suite 400, Bismarck, ND 58504-5639, hereby submit this brief in response to the motion to continue filed with the North Dakota Industrial Commission (“Commission”) by the Swenson Living Trust (the “Trust”) on April 25th, 2024. For the reasons set forth herein, the Commission should deny the Trust’s motion

and proceed with the hearing currently scheduled for the above-captioned cases on June 11th and 12th, 2024 (the “Hearing”).

### **RELEVANT FACTUAL BACKGROUND**

[¶ 2] The Petitions to Intervene filed by the Trust in the above-captioned cases indicate the Trust owns approximately 676.43 acres in the vicinity of the proposed carbon dioxide storage facility locations referenced in the caption above, but only 359.4 acres are located within the horizontal boundaries of the storage facility proposed by Summit Carbon Storage #2, LLC and/or the one-half mile notice area surrounding the storage facility proposed by Summit Carbon Storage #2, LLC. Declaration of Jeff Skarre in Support of Summit’s Response to Motion for Continuance (“Skaarre Decl.”), ¶ 2. The Trust does not own any interests within the horizontal boundaries of the storage facilities proposed by Summit Carbon Storage #1, LLC or Summit Carbon Storage #3, LLC. *Id.* ¶ 3.

[¶ 3] On June 9, 2023, Summit submitted initial draft applications to the Commission seeking permits related to the three proposed carbon dioxide storage facilities described in the caption, above. *Id.* ¶ 4. On February 8, 2024, the Commission notified Summit that each of the applications were complete and had been sent to the North Dakota Department of Environmental Quality for review. *Id.* ¶ 5.

[¶ 4] Summit Carbon Solutions, LLC has been in contact with Kurt Swenson, Trustee of the Trust, since August of 2021 and has had multiple meetings with Mr. Swenson since that time regarding the storage facility proposed by Summit Carbon Solutions #2, LLC. *Id.* ¶ 6. Summit Carbon Solutions, LLC sent Formal Option and Lease offers to the Trust via certified mail on July 7, 2023, and again on March 25, 2024. *Id.* Summit Carbon Solutions, LLC also sent a meeting invitation to all surface owners within the proposed storage facility boundaries and within

the one-half mile hearing notice area for an open house meeting at the Beulah Civic Center on April 3, 2024. *Id.* ¶ 7. Kurt and Faye Swenson were both in attendance at this open house. *Id.*

[¶ 5] On April 16, 2024, Summit deposited notice of the Hearing with the U.S. Postal Service via certified mail, addressed to each of the persons required to receive notice under N.D.C.C. § 38-22-06(3)–(8) and N.D.A.C. § 43-05-01-08(1). *Id.* ¶ 8. The Trust acknowledged receipt of the hearing notice on April 18, 2024. *Id.* ¶ 9.

[¶ 6] Service of notice of the Hearing required in 2,615 certified mailings, at \$9.68 per mailing, for a total cost to Summit of \$25,313.20, with additional processing costs charged by Summit’s third-party document handler in the amount of \$575.30. *Id.* ¶ 10. The foregoing does not include the additional expense incurred by Summit for mailing supplies, for printing, or for labor by Summit’s own administrative staff. *Id.*

[¶ 7] Summit is not aware of any discovery requests, deposition notices, or expert disclosures served by the Trust in connection with the above-captioned cases. Declaration of Lawrence Bender in Support of Summit’s Response to Motion for Continuance (“Bender Decl.”) ¶ 2. Summit is not aware of any attempt by the Trust to contact Summit regarding the requested continuance prior to filing the present motion. *Id.* ¶ 3.

### **LEGAL STANDARD**

[¶ 8] The Trust’s motion does not specify the authority under which it seeks a continuance. Neither N.D.C.C. ch. 38-22 nor the Commission’s regulations thereunder in N.D.A.C. ch. 43-05-01 provide any authority for continuing a hearing on Summit’s applications. N.D.C.C. ch. 28-32 likewise does not address continuances. To Summit’s knowledge, the only relevant provision specifying a basis and procedure for requesting and granting continuances of administrative hearings is set forth in the Office of Administrative Hearings Uniform Rule of

Administrative Procedure for Adjudicative Proceedings. Specifically, N.D.A.C. § 98-02-03-07 provides as follows:

A party seeking a continuance shall first contact the other parties for the purpose of obtaining a stipulated agreement. If the party seeking the continuance is unable to secure a stipulated agreement then that party shall submit a written request for continuance to the hearing officer, with copies served upon the parties of record. These requirements may be waived by the hearing officer if circumstances arise to make compliance unreasonable. The hearing officer may not approve a continuance except for good cause shown. The hearing officer may order a continuance upon the hearing officer's own motion.

The Commission should not approve a continuance of the hearing unless it finds the Trust has met the foregoing criteria.

### **ARGUMENT**

[¶ 9] The Trust's motion for a continuance should be denied for several reasons. First, the motion should be denied because it is procedurally defective. Such motions can only be made by "parties," and the Trust is not a "party" as that term is defined by the Administrative Agencies Practice Act. Such motions can also only be made after the moving party has conferred with the non-moving party(s) in an attempt to obtain a stipulated continuance, which the Trust has not done in this case.

[¶ 10] Second, the motion should be denied because the Trust has not shown good cause for a continuance. The Hearing is imminent and postponing the Hearing at this time would be prejudicial to Summit. The Trust claims that it needs to conduct discovery, and that it will be unable to do so in the time remaining until the Hearing but offers no support for this claim beyond conclusory assertions. As a result, the Trust has failed to show good cause and, under N.D.A.C. § 98-02-03-07 the Commission may not approve the requested continuance.

**I. The Trust's motion for continuance is procedurally defective.**

[¶ 11] The Commission should deny the Trust's motion for continuance because, notwithstanding the merits of the request, which are discussed below, the Trust has not complied with the requirements for making such a request. First, the Trust has not shown that it is a "party" entitled to make such a request. Second, the Trust did not first contact Summit for the purpose of obtaining a stipulated agreement to continue the Hearing before requesting a continuance from the Commission.

**A. The Trust is not a "party" entitled to seek a continuance of the Hearing.**

[¶ 12] N.D.A.C. § 98-02-03-07 allows a "party" to seek a continuance of a hearing in an adjudicative proceeding. N.D.C.C. § 28-32-01(9) defines a "party" as "each person named or admitted as a party or properly seeking and entitled as of right to be admitted as a party." Thus, to be qualified to request a continuance of the Hearing, the Trust must be either a "person named or admitted as a party" or a person "properly seeking and entitled as of right to be admitted as a party."

[¶ 13] The Trust is not a "person," as that term is defined by the Administrative Agencies Practice Act. N.D.C.C. § 28-32-01(10) defines a person as "an individual, association, partnership, corporation, limited liability company, the [North Dakota ethics commission], a state governmental agency or governmental subdivision, or an agency of such governmental subdivision." Trusts are not considered persons for purposes of agency proceedings, just as they are not considered persons for purposes of judicial proceedings. "A trust generally is not a separate legal entity, and cannot sue or be sued in its own name." *Western Life Trust v. State*, 536 N.W.2d 709, 712 (N.D. 1995) (concluding that appeal by the Western Life Trust must be dismissed because the trust was "not a proper party and lacks capacity to sue").

[¶ 14] The Trust was also not “named” as a party in any of the above-captioned cases; only Summit, the applicant, is named as a party. In recognition of this fact, the Trust filed Petitions to Intervene in the above-captioned cases on April 18, 2024. To Summit’s knowledge, those petitions have not yet been granted by the Commission. Thus, the Trust has not been “admitted” as a party in any of the above-captioned cases.

[¶ 15] The Trust is not “properly seeking” and “entitled as of right” to be admitted as a party in the above-captioned cases. Intervention in adjudicative proceedings is governed by N.D.C.C. § 28-32-28, which reads as follows:

An administrative agency may grant intervention in an adjudicative proceeding to promote the interests of justice if intervention will not impair the orderly and prompt conduct of the proceeding and if the petitioning intervenor demonstrates that the petitioner's legal rights, duties, privileges, immunities, or other legal interests may be substantially affected by the proceeding or that the petitioner qualifies as an intervenor under any provision of statute or rule. The agency may impose conditions and limitations upon intervention. The agency shall give reasonable notice of the intervention to all parties. An administrative agency may adopt rules relating to intervention in an adjudicative proceeding.

A nonparty “properly” seeking to be admitted as a party to an adjudicative proceeding must comply with the foregoing. As a result, not only must the would-be intervenor demonstrate that its “legal rights, duties, privileges, immunities, or other legal interests may be substantially affected by the proceeding,” but the proposed intervention must also not “impair the orderly and prompt conduct of the proceeding.”

[¶ 16] In its Petitions to Intervene the Trust asserts that it owns property in the lands comprising Summit’s proposed storage facilities and, as a result, “[t]he legal rights, privileges, and other interests of the Trust will be substantially affected by the [Commission’s] findings and conclusions in [the above-captioned cases].” Summit does not dispute these assertions as to NDIC Case Nos. 30873 through 30876, and as such Summit does not dispute the Trust has demonstrated that its legal rights, duties, privileges, immunities, or other legal interests may be substantially

affected by proceedings in those cases. *See* Skaare Decl., ¶ 2. But the Trust does not own any property in the lands comprising the storage facilities proposed in the other eight cases captioned above, and as such the Trust cannot demonstrate that its legal rights, duties, privileges, immunities, or other legal interests may be substantially affected by proceedings in those cases. *See id.* ¶ 3.

[¶ 17] The Petitions to Intervene do not address whether the Trust’s intervention would “impair the orderly and prompt conduct of the proceeding[s].” The reason for this omission is apparent now that the Trust has filed its motion for continuance, by which the Trust seeks to postpone the Hearing to an indefinite date in the future. Though not disclosed in the Petitions to Intervene, the Trust’s intervention in the above-captioned cases would plainly impair the orderly and prompt conduct thereof.

[¶ 18] Based on the foregoing, the Trust is not a “person” “named,” “admitted,” or “properly seeking and entitled as of right to be admitted” in the above-captioned cases. As such, the Trust is not a “party,” to the above-captioned cases and cannot properly request a continuance of the Hearing. Also based on the foregoing, the Trust’s Petitions to Intervene should be denied or, at most, be granted on the condition that the Hearing will not be postponed.<sup>1</sup>

**B. The Trust did not contact Summit for the purpose of obtaining a stipulated agreement before seeking a continuance.**

[¶ 19] A party seeking a continuance “shall first contact the other parties for the purpose of obtaining a stipulated agreement.” N.D.A.C. § 98-02-03-07. Only after the party is unsuccessful at obtaining a stipulated agreement may the party then submit a written request for

---

<sup>1</sup> Summit notes that, per the Petition to Intervene, the Trust sought intervention “for the purpose of responding to [Summit’s] Applications and participating in any oral argument or hearings.” The Petitions made no mention of the need for discovery, depositions, or analyses by undisclosed experts. Accordingly, granting the Petitions on the condition that the Hearing will not be postponed would be entirely consistent therewith. Doing so would presumably moot the present motion to continue.

continuance. *Id.* The motion for continuance gives no indication that the Trust attempted to contact Summit about a continuance prior to making its motion, nor is Summit aware of any such attempt. Bender Decl., ¶ 3. Because the Trust failed to contact Summit for the purpose of obtaining a stipulated agreement, the Trust is not yet entitled to request a continuance under N.D.A.C. § 98-02-03-07. As a result, its motion must be denied.

**II. The Trust has failed to show good cause for the requested continuance.**

[¶ 20] In addition to the procedural defects discussed above, the Commission should deny the Trust's motion for continuance because it fails on the merits. N.D.A.C. § 98-02-03-07 provides that the Commission "may not approve a continuance except for good cause shown." The Trust has not shown good cause for a continuance. It offers only conclusory assertions about the need for discovery that preclude any meaningful assessment by Summit and the Commission, and it neglects to account for the prejudice that Summit would suffer if the Hearing were continued.

[¶ 21] In a prior case the Commission considered whether good cause existed to reopen fact discovery after the deadline to complete fact discovery had closed. *See* Order on Sinclair Oil & Gas Co. and Missouri River Royalty Corp.'s Motion to Compel and Reopen Discovery, Case No. 28637. The Commission noted that good cause for extending discovery deadlines can generally be shown if the party seeking relief can show that the deadlines cannot reasonably be met despite the party's diligence. *Id.* at 3. The Commission considered six factors in that case to determine whether good cause existed: (1) whether the hearing was imminent; (2) whether the request is opposed; (3) whether the non-moving party would be prejudiced; (4) whether the moving party was diligent in obtaining discovery within the guidelines established by the Commission; (5) the foreseeability of the need for additional discovery in light of the time allotted by the Commission; and (6) the likelihood that the discovery will lead to relevant evidence. *Id.* at 3–4. Though the Trust's motion is not one to reopen discovery that has closed, a consideration of the

“good cause” factors relied on by the Commission in Case No. 28637 demonstrates why good cause is lacking from the present motion.

**A. The Hearing is imminent.**

[¶ 22] The Hearing is approximately six weeks away and was just under seven weeks away when the Trust filed its motion to continue. Notice of the Hearing has been properly made by Summit. *See* Skaare Decl., ¶¶ 8–10. The Commission has opened the public notice and comment period, which will conclude on June 10th, 2024, one day before the Hearing. As such, the Hearing is imminent, and the first factor weighs against a continuance. *See* Order on Sinclair Oil & Gas Co. and Missouri River Royalty Corp.’s Motion to Compel and Reopen Discovery, Case No. 28637, p. 4 (characterizing a hearing scheduled to take place approximately four weeks after the subject motion as “imminent”).

**B. Summit opposes and would be prejudiced by a continuance.**

[¶ 23] Summit opposes the Trust’s request for a continuance. Summit has already paid over \$25,000 to provide the required notice of the Hearing. *See* Skaare Decl., ¶ 10. Postponing the Hearing would force Summit to once again incur significant, unrecoverable costs to provide notice of a new hearing date. Also, Summit personnel, including witnesses, corporate representatives, and in-house legal counsel, have already made travel and other plans to be available for the Hearing as scheduled. *Id.* ¶ 11. Postponing the hearing would negate these scheduling efforts. As such, the second and third factors weigh against a continuance.

**C. The Trust has not demonstrated that it was diligent, that the need for discovery was previously unforeseeable, or that discovery would lead to relevant evidence.**

[¶ 24] The fourth, fifth, and sixth “good cause” factors require, as an initial matter, detailed information about the discovery sought by the moving party. The Trust’s counsel asserts that “[w]ith the hearing less than 60 days away, this does not allow adequate time to conduct

discovery, depositions, or to allow time for expert reports or resolve any discovery disputes in this matter.” Declaration of Derrick Braaten in Support of Motion to Continue Hearing and Request for Scheduling Conference (“Braaten Decl.”), ¶ 5. Conclusory statements like these, when unsupported by specific factual detail, are ordinarily not considered competent evidence. *Cf., e.g., Spratt v. MDU Res. Grp., Inc.*, 2011 ND 94, ¶ 7, 797 N.W.2d 328 (explaining that a party resisting summary judgment must “set forth specific facts by presenting competent, admissible evidence” and “may not simply rely upon . . . unsupported, conclusory allegations”). Summit is not aware of any discovery requests served by the Trust in the above-captioned cases. Bender Decl., ¶ 2. Without knowing what discovery the Trust wishes to conduct, neither Summit nor the Commission can determine whether such discovery would lead to relevant evidence, whether the Trust has been diligent, whether the continuance requested is commensurate with the Trust’s anticipated discovery, etc. As a result, the fourth, fifth, and sixth factors weigh neither for nor against a continuance.

**D. The “good cause” factors do not support a continuance.**

[¶ 25] Based on the foregoing, none of the “good cause” factors weigh in favor of the continuance the Trust seeks. Three factors weigh against a continuance, and the other three factors should not be given any weight because they cannot be meaningfully assessed. Accordingly, because the Trust has not shown good cause, the Commission must deny the motion for continuance.

**CONCLUSION**

[¶ 26] For the foregoing reasons, Summit respectfully requests the Commission deny the Trust’s motion for continuance. While Summit does not oppose the scheduling conference requested by the Trust, Summit believes such a conference is unnecessary, and Summit presumes that denial of the motion for continuance will moot the Trust’s request for a scheduling conference.

Dated this 30th day of April, 2024.

**CASE NOS. 30869–30880**

**In re application of Summit Carbon Storage #1, LLC requesting consideration for the geologic storage of carbon dioxide in the Broom Creek Formation from the Midwest Carbon Express Pipeline in the storage facility located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND**

**In re application of Summit Carbon Storage # 1, LLC to consider the amalgamation of the storage reservoir pore space, in which the Commission may require that the pore space owned by nonconsenting owners be included in the geologic storage, as required to operate the Summit Carbon Storage #1, LLC storage facility located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, in the Broom Creek Formation.**

**In re application of Summit Carbon Storage # 1, LLC for an order of the Commission determining the amount of financial responsibility for the geologic storage of carbon dioxide from the Midwest Carbon Express Pipeline in the storage facility located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1,**

11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, in the Broom Creek Formation.

In re motion to consider establishing the field and pool limits for lands located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, subject to the application of Summit Carbon Storage #1, LLC for the geologic storage of carbon dioxide in the Broom Creek Formation.

In re application of Summit Carbon Storage #2, LLC requesting consideration for the geologic storage of carbon dioxide in the Broom Creek Formation from the Midwest Carbon Express Pipeline in the storage facility located in Sections 27, 28, 29, 32, 33, 34, and 35, Township 143 North, Range 88 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, 35, and 36, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, and 31, Township 142 North, Range 87 West, and Sections 1, 2, and 3, Township 141 North, Range 88 West, Mercer and Oliver Counties, ND

In re application of Summit Carbon Storage # 2, LLC to consider the amalgamation of the storage reservoir pore space, in which the Commission may require that the pore space owned by

**nonconsenting owners be included in the geologic storage, as required to operate the Summit Carbon Storage #2, LLC storage facility located in Sections 27, 28, 29, 32, 33, 34, and 35, Township 143 North, Range 88 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, 35, and 36, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, and 31, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, 31, Township 142 North, Range 87 West, and Sections 1, 2, and 3, Township 141 North, Range 88 West, Mercer and Oliver Counties, ND in the Broom Creek Formation.**

**In re application of Summit Carbon Storage # 2, LLC to consider the application of Summit Carbon Storage #2, LLC for an order of the Commission determining the amount of financial responsibility for the geologic storage of carbon dioxide from the Midwest Carbon Express Pipeline in the storage facility located in Sections 27, 28, 29, 32, 33, 34, and 35, Township 143 North, Range 88 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, 35, and 36, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, and 31, Township 142 North, Range 87 West, and Sections 1, 2, and 3, Township 141 North, Range 88 West, Mercer and Oliver Counties, ND, in the Broom Creek Formation.**

**In re motion of the Commission to consider establishing the field and pool limits for lands located in Sections 27, 28, 29, 32, 33, 34, and 35, Township 143 North, Range 88 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, 35, and 36, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, and 31, Township 142 North, Range 87 West, and Sections 1, 2, and 3, Township 141 North, Range 88 West, Mercer and Oliver Counties, ND, subject to the application of Summit Carbon Storage #2, LLC for the geologic storage of**

**carbon dioxide in the Broom Creek Formation, and enact such special field rules as may be necessary.**

**In re application of Summit Carbon Storage #3, LLC requesting consideration for the geologic storage of carbon dioxide in the Broom Creek Formation from the Midwest Carbon Express Pipeline in the storage facility located in Section 36, Township 143 North, Range 87 West, Sections 19, 20, 21, 28, 29, 30, 31, 32, 33, 34, 35, and 36, Township 143 North, Range 87 West, Sections 19, 20, 21, 28, 29, 30, 31, 32, 33, 34, 35, and 36, Township 143 North, Range 86 West, Sections 1, 2, 11, 12, 13, 14, and 24, Township 142 North, Range 87 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, and 24, Township 142 North, Range 87 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 26, 27, 28, 29, 30, 32, 33, 34, and 35, Township 142 North, Range 86 West, and Sections 6, 7, 17, 18, 19, and 20, Township 142 North, Range 85 West, Oliver County, ND.**

**In re application of Summit Carbon Storage #3, LLC to consider the amalgamation of the storage reservoir space, in which the Commission may require that the pore space owned by nonconsenting owners be included in the geologic storage, as required to operate the Summit Carbon Storage #3, LLC storage facility located in Section 36, Township 143 North, Range 87 West, Sections 19, 20, 21, 28, 29, 30, 31, 32, 33, 34, 35, and 36, Township 143 North, Range 86 West, Sections 1, 2, 11, 12, 13, 14, and 24, Township 142 North, Range 87 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, and 35, Township 142 North, Range 86 West, and Sections 6, 7, 17, 18, 19, and 20, Township 142 North, Range 85 West, Oliver County, ND, in the Broom Creek Formation.**

**In re application of Summit Carbon Storage #3, LLC for an order of the Commission determining the amount of financial responsibility for the**

geologic storage of carbon dioxide from the Midwest Carbon Express Pipeline in the storage facility located in Section 36, Township 143 North, Range 87 West, Sections 19, 20, 21, 28, 29, 30, 31, 32, 33, 34, 35, and 36, Township 143 North, Range 86 West, Sections 1, 2, 11, 12, 13, 14, and 24, Township 142 North, Range 87 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, and 35, Township 142 North, Range 86 West, and Sections 6, 7, 17, 18, 19, and 20, Township 142 North, Range 85 West, Oliver County, ND, in the Broom Creek Formation.

In re motion of the Commission to consider establishing the field and pool limits for lands located in Section 36, Township 143 North, Range 87 West, Sections 19, 20, 21, 28, 29, 30, 31, 32, 33, 34, 35, and 36, Township 143 North, Range 86 West, Sections 1, 2, 11, 12, 13, 14, and 24, Township 142 North, Range 87 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, and 35, Township 142 North, Range 86 West, and Sections 6, 7, 17, 18, 19, and 20, Township 142 North, Range 85 West, Oliver county, ND, subject to the application of Summit Carbon Storage #3, LLC for the geologic storage of carbon dioxide in the Broom Creek Formation, and enact such special field rules as may be necessary.

**DECLARATION OF JEFF SKAARE IN SUPPORT OF  
SUMMIT'S RESPONSE TO MOTION FOR CONTINUANCE**

STATE OF NORTH DAKOTA        )  
  ) ss:  
COUNTY OF BURLEIGH        )

Jeff Skaare, being first duly sworn upon oath, states and alleges as follows:

[¶ 1] I am Director of Land, Legal and Regulatory Affairs at Summit Carbon Solutions, LLC. The above-named applicants Summit Carbon Storage #1, LLC, Summit Carbon Storage #2, LLC, and Summit Carbon Storage #3, LLC (collectively, "Applicants") are wholly-owned

subsidiaries of Summit Carbon Solutions LLC. In my capacity as Director of Land, Legal and Regulatory Affairs at Summit Carbon Solutions, LLC I am familiar with and have personal knowledge of the facts set forth below.

[¶ 2] According to the lands listed in the Petition to Intervene filed by the Swenson Living Trust (“Trust”), the Trust owns approximately 676.43 acres in the vicinity of the proposed storage facility locations, but only 359.4 acres are located within the horizontal boundaries of the Summit Carbon Storage #2 storage facility or within the one-half (½) mile notice area of the Summit Carbon Storage #2 storage facility.

[¶ 3] The Trust does not own any interests within the horizontal boundaries of the Summit Carbon Storage #1 or Summit Carbon Storage #3 storage facilities, nor within the one-half (½) mile hearing notice areas of such facilities.

[¶ 4] On June 9, 2023, the Applicants submitted initial draft applications to the North Dakota Industrial Commission (“Commission”) seeking permits related to the three proposed carbon dioxide storage facilities described in the above-captioned matters.

[¶ 5] On February 8, 2024, the Commission notified the Applicants that each of their respective applications were complete and had been sent to the North Dakota Department of Environmental Quality for review.

[¶ 6] Summit Carbon Solutions, LLC has been in contact with Kurt Swenson, Trustee of the Trust since August of 2021 and has held multiple meetings with him. Formal Option and Lease offers were sent to the Trust via certified mail on July 7, 2023; and were sent again via certified mail on March 25, 2024.

[¶ 7] Summit Carbon Solutions, LLC sent a meeting invitation to all surface owners within the proposed storage facility boundaries and within the one-half (½) mile hearing notice

area for an open house meeting at the Beulah Civic Center on April 3, 2024. Trustees, Kurt and Faye Swenson were both in attendance at this open house.

[¶ 8] On April 16, 2024, Summit Carbon Solutions, LLC and Applicants deposited notice of the hearing date set by the Commission for the above-captioned cases with the U.S. Postal Service via certified mail, addressed to each of the persons required to receive notice under N.D.C.C. § 38-22-06(3)–(8) and N.D.A.C. § 43-05-01-08(1).

[¶ 9] The Trust acknowledged receipt of the hearing notice on April 18, 2024, signed for by F. Swenson.

[¶ 10] Service of notice required in 2,615 certified mailings, at \$9.68 per mailing, for a total cost to Summit of \$25,313.20. Summit hired Presort Plus to support its mailing efforts and incurred processing costs in the amount of \$575.30. Summit also incurred printing costs, costs to obtain mailing supplies, and labor costs for Summit's administrative staff who assisted in preparing the above-referenced mailings.

[¶ 11] I have overseen and confirmed arrangements for Summit personnel, including witnesses, corporate representatives, and in-house legal counsel, to be available for the June 11-12, 2024, hearing in the above-captioned cases.

I declare, under penalty of perjury under the law of North Dakota, that the foregoing is true and correct.

Signed on the 30th day of April, 2024, at Bismarck, North Dakota, USA.

By:   
Jeff Skaare

**BEFORE THE INDUSTRIAL COMMISSION  
OF THE STATE OF NORTH DAKOTA**

**CASE NOS. 30869–30880**

**In re application of Summit Carbon Storage #1, LLC requesting consideration for the geologic storage of carbon dioxide in the Broom Creek Formation from the Midwest Carbon Express Pipeline in the storage facility located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND**

**In re application of Summit Carbon Storage # 1, LLC to consider the amalgamation of the storage reservoir pore space, in which the Commission may require that the pore space owned by nonconsenting owners be included in the geologic storage, as required to operate the Summit Carbon Storage #1, LLC storage facility located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, in the Broom Creek Formation.**

**In re application of Summit Carbon Storage # 1, LLC for an order of the Commission determining the amount of financial responsibility for the geologic storage of carbon dioxide from the Midwest Carbon Express Pipeline in the storage facility located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1,**

11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, in the Broom Creek Formation.

In re motion to consider establishing the field and pool limits for lands located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, subject to the application of Summit Carbon Storage #1, LLC for the geologic storage of carbon dioxide in the Broom Creek Formation.

In re application of Summit Carbon Storage #2, LLC requesting consideration for the geologic storage of carbon dioxide in the Broom Creek Formation from the Midwest Carbon Express Pipeline in the storage facility located in Sections 27, 28, 29, 32, 33, 34, and 35, Township 143 North, Range 88 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, 35, and 36, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, and 31, Township 142 North, Range 87 West, and Sections 1, 2, and 3, Township 141 North, Range 88 West, Mercer and Oliver Counties, ND

In re application of Summit Carbon Storage # 2, LLC to consider the amalgamation of the storage reservoir pore space, in which the Commission may require that the pore space owned by

**nonconsenting owners be included in the geologic storage, as required to operate the Summit Carbon Storage #2, LLC storage facility located in Sections 27, 28, 29, 32, 33, 34, and 35, Township 143 North, Range 88 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, 35, and 36, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, and 31, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, 31, Township 142 North, Range 87 West, and Sections 1, 2, and 3, Township 141 North, Range 88 West, Mercer and Oliver Counties, ND in the Broom Creek Formation.**

**In re application of Summit Carbon Storage # 2, LLC to consider the application of Summit Carbon Storage #2, LLC for an order of the Commission determining the amount of financial responsibility for the geologic storage of carbon dioxide from the Midwest Carbon Express Pipeline in the storage facility located in Sections 27, 28, 29, 32, 33, 34, and 35, Township 143 North, Range 88 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, 35, and 36, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, and 31, Township 142 North, Range 87 West, and Sections 1, 2, and 3, Township 141 North, Range 88 West, Mercer and Oliver Counties, ND, in the Broom Creek Formation.**

**In re motion of the Commission to consider establishing the field and pool limits for lands located in Sections 27, 28, 29, 32, 33, 34, and 35, Township 143 North, Range 88 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, 35, and 36, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, and 31, Township 142 North, Range 87 West, and Sections 1, 2, and 3, Township 141 North, Range 88 West, Mercer and Oliver Counties, ND, subject to the application of Summit Carbon Storage #2, LLC for the geologic storage of**

**carbon dioxide in the Broom Creek Formation, and enact such special field rules as may be necessary.**

---

**BRIEF IN SUPPORT OF MOTION TO CONTINUE HEARING AND  
REQUEST FOR SCHEDULING CONFERENCE**

---

Intervenor The Swenson Living Trust (“Swenson Trust”), by and through its undersigned counsel, submits the following Brief in Support of its Motion to Continue Hearing and Request for Scheduling Conference.

Swenson Trust is requesting this matter be rescheduled from June 11-12, 2024 to a date on or after September 12, 2024 to allow time to conduct discovery, depositions, and to allow time for experts to review materials and analyze the evidence presented in this matter. Swenson Trust will need time to properly conduct discovery and obtain documents, electronic shapefiles, and other data from the applicant. Swenson Trust also requests that a scheduling conference be scheduled in this matter within the next fourteen days to discuss an appropriate schedule.

Swenson Trust received notice on April 16, 2024 with the hearing scheduled for June 11-12, 2024. This is less than 60 days from the date of the hearing. This does not allow adequate time to conduct discovery or resolve discovery disputes in the event it is necessary to resolve the disputes.

Under North Dakota law, Swenson Trust must be afforded a fair hearing. *See* N.D.C.C. § 28-32-46(4). To deny Swenson Trust a continuance based upon the rules and procedure of the administrative agency and require a hearing in less than 60 days will deny Swenson Trust its right to a fair hearing and to procedural and substantive due process. Applicants in these types of adjudicative proceedings have as much time as necessary to prepare applications and witnesses prior to hearings, and indeed this applicant has had the benefit of months of pre-review from the Commission staff. While Swenson Trust has responded quickly and has attempted to serve discovery and hire consultants to review, analyze, and assess the impacts it would have on Swenson Trust’s property, it is not possible to have time to adequately conduct discovery and allow experts time to analyze the data and develop their opinions and assessments.

Swenson Trust requests a scheduling conference be scheduled within the next fourteen days to discuss an appropriate schedule and that a continuance be granted and the hearing be rescheduled for a time after September 12, 2024.

DATED this 25<sup>th</sup> day of April, 2024.

**DECLARATION OF DERRICK BRAATEN IN SUPPORT OF MOTION TO  
CONTINUE HEARING AND REQUEST FOR SCHEDULING CONFERENCE**

---

1. I am an attorney for The Swenson Living Trust ("Swenson Trust"), in the above-captioned matter.
2. I represent the Swenson Trust in matters involving the application submitted by Summit Carbon Solutions #1, LLC ("SCS").
3. This matter involves a decision of granting SCS' applications regarding carbon dioxide.
4. The hearing on SCS' applications has been scheduled for June 11-12, 2024. Swenson Trust received notice on April 16, 2024.
5. With the hearing less than 60 days away, this does not allow adequate time to conduct discovery, depositions, or to allow time for expert reports or resolve any discovery disputes in this matter.
6. Swenson Trust requests that a scheduling conference be scheduled within the next fourteen days to discuss an appropriate schedule and that a continuance of the June 11-12, 2024 hearing be granted.

**I declare under penalty of perjury under the law of North Dakota, that the foregoing is true and correct.**

Executed this 25<sup>th</sup> day of April, 2024 in Bismarck, North Dakota.

**In re application of Summit Carbon Storage # 1, LLC for an order of the Commission**

determining the amount of financial responsibility for the geologic storage of carbon dioxide from the Midwest Carbon Express Pipeline in the storage facility located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, in the Broom Creek Formation.

In re motion to consider establishing the field and pool limits for lands located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, subject to the application of Summit Carbon Storage #1, LLC for the geologic storage of carbon dioxide in the Broom Creek Formation.

---

## PETITION TO INTERVENE

---

Pursuant to N.D.C.C. § 28-32-28, The Swenson Living Trust (the “Trust”) hereby petitions to intervene in the above-captioned proceedings. In support of this petition, the Trust states and alleges as follows:

[¶1] On February 6, 2024, Summit Carbon Storage #1, LLC (“SCS”) filed an Application for a Permit (“Application”) asking the North Dakota Industrial Commission (“NDIC”) to grant its application. *See* Case Nos. 30869, 30870, 30871, and 30872.

[¶2] The Trust has property located within the area encompassed by SCS’ Applications and it owns real property that will be impacted by SCS’s proposed sequestration as referenced in Case Nos. 30869, 30870, 30871, and 30872. Specifically, the Trust owns property that is within the proposed storage facilities, and also owns property directly between the storage facilities where pore space will be impacted and used by the proposed storage facilities despite those lands not being listed as part of the storage facilities.

[¶3] The Trust owns interests in property legally described as follows:

- a. W1/2 NE1/4 of Section 14, Township 142 North, Range 88 West, Mercer County, ND;
- b. SE1/4 of Section 27, Township 143 North, Range 88 West, Mercer County, ND;
- c. Outlot B, E1/2 of NW ¼ of Section 7, Township 142 North, Range 87 West, Oliver County, ND;
- d. NW1/4 of Section 22, Township 142 North, Range 87 West, Oliver County, ND;
- e. SE1/4 of Section 15, Township 142 North, Range 87 West, Oliver County, ND;
- f. Section 21, Township 142 North, Range 87 West, Oliver County, ND;

g. SW1/4 of Section 9, Township 142 North, Range 87 West, Oliver County, ND.

[¶4] The legal rights, privileges, and other legal interests of the Trust will be substantially affected by the NDIC's findings and conclusions in this proceeding as they relate to the Applications and other findings that will alter and take away property and other legal rights of the Trust. The Trust files this petition for the purpose of responding in opposition to the Applications.

[¶5] For these reasons the Trust petitions for leave to intervene in this proceeding for the purpose of responding to SCS' Applications and participating in any oral argument or hearings on the application and the right to be heard before the final determination as it relates to the Trust and the legality of the relief requested and which may be provided in these proceedings.

Dated this 18<sup>th</sup> day of April, 2024.

# DRAFT STORAGE FACILITY PERMIT

## STORAGE FACILITY FOR CARBON SEQUESTRATION UNDER THE NORTH DAKOTA UNDERGROUND INJECTION CONTROL PROGRAM

In compliance with North Dakota Century Code (NDCC) Chapter 38-22 (Carbon Dioxide Underground Storage) and North Dakota Administrative Code (NDAC) Chapter 43-05-01 (Geologic Storage of Carbon Dioxide), Summit Carbon Storage #1, LLC has applied for a carbon dioxide storage facility permit. A draft permit does not grant the authorization to inject. This is a document prepared under NDAC Section 43-05-01-07.2 indicating the Commission's tentative decision to issue a storage facility permit. Before preparing the draft permit, the Commission through the Department of Mineral Resources Oil and Gas Division, consulted with the Department of Environmental Quality, and has determined the storage facility permit application to be complete. The draft permit contains permit conditions required under NDAC Sections 43-05-01-07.3 and 43-05-01-07.4. A fact sheet is included and contains the following information:

1. A brief description of the type of facility or activity which is the subject of the draft permit.
2. The quantity and quality of the carbon dioxide which is proposed to be injected and stored.
3. A brief summary of the basis for the draft permit conditions, including references to applicable statutory or regulatory provisions.
4. The reasons why any requested variances or alternatives to required standards do or do not appear justified.
5. A description of the procedures for reaching a final decision of the draft permit, including:
  - a. The beginning and ending dates of the comment period.
  - b. The address where comments will be received.
  - c. The date, time, and location of the storage facility permit hearing.
  - d. Any other procedures by which the public may participate in the final decision.
6. The name and telephone number of a person to contact for additional information.

This draft permit has been established on April 15, 2024, and shall remain in effect until a storage facility permit is granted under NDAC Section 43-05-01-05, unless amended or terminated by the Department of Mineral Resources Oil and Gas Division (Commission).

Tamara Madche, Geologist  
Department of Mineral Resources  
Oil and Gas Division  
Date: April 15, 2024

## **I. APPLICANT**

Summit Carbon Storage #1, LLC  
2321 North Loop Drive, Suite #221  
Ames, IA 50010

## **II. PERMIT CONDITIONS (NDAC Section 43-05-01-07.3)**

1. The storage operator shall comply with all conditions of the permit. Any noncompliance with the permit constitutes a violation and is grounds for enforcement action, including permit termination, revocation, or modification pursuant to section 43-05-01-12.
2. In an administrative action, it shall not be a defense that it would have been necessary for the storage operator to halt or reduce the permitted activity in order to maintain compliance with the conditions of the permit.
3. The storage operator shall take all reasonable steps to minimize or correct any adverse impact on the environment resulting from noncompliance with the storage facility permit.
4. The storage operator shall develop and implement an emergency and remedial response plan pursuant to section 43-05-01-13.
5. The storage operator shall at all times properly operate and maintain all storage facilities which are installed or used by the storage operator to achieve compliance with the conditions of the storage facility permit. Proper operation and maintenance includes effective performance, adequate funding, adequate operator staffing and training, and adequate laboratory and process controls, including appropriate quality assurance procedures. This provision requires the operation of backup or auxiliary facilities or similar systems only when necessary to achieve compliance with the conditions of the storage facility permit.
6. The permit may be modified, revoked and reissued, or terminated pursuant to section 43-05-01-12. The filing of a request by the storage operator for a permit modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance, does not stay any permit condition.
7. The injection well permit or the permit to operate an injection well does not convey any property rights of any sort or any exclusive privilege.
8. The storage operator shall furnish to the Commission, within a time specified by the Commission, any information which the Commission may request to determine whether cause exists for modifying, revoking and reissuing, or terminating the permit, or to determine compliance with the permit. The storage operator shall also

furnish to the Commission, upon request, copies of records required to be kept by the storage facility permit.

9. The storage operator shall allow the Commission, or an authorized representative, upon the presentation of credentials and other documents as may be required by law, to:
  - a. Enter upon the storage facility premises where records must be kept under the conditions of the permit;
  - b. At reasonable times, have access to and copy any records that must be kept under the conditions of the permit;
  - c. At reasonable times, inspect any facilities, equipment, including monitoring and control equipment, practices, or operations regulated or required under the permit; and
  - d. At reasonable times, sample or monitor for the purposes of assuring permit compliance, any substances, or parameters at any location.
10. The storage operator shall prepare, maintain, and comply with a testing and monitoring plan pursuant to section 43-05-01-11.4.
11. The storage operator shall comply with the reporting requirements provided in section 43-05-01-18.
12. The storage operator must obtain an injection well permit under section 43-05-01-10 and injection wells must meet the construction and completion requirements in section 43-05-01-11.
13. The storage operator shall prepare, maintain, and comply with a plugging plan pursuant to section 43-05-01-11.5.
14. The storage operator shall establish mechanical integrity prior to commencing injection and maintain mechanical integrity pursuant to section 43-05-01-11.1.
15. The storage operator shall implement the worker safety plan pursuant to section 43-05-01-13.
16. The storage operator shall comply with leak detection and reporting requirements pursuant to section 43-05-01-14.
17. The storage operator shall conduct a corrosion monitoring and prevention program pursuant to section 43-05-01-15.
18. The storage operator shall prepare, maintain, and comply with the area of review and corrective action plan pursuant to section 43-05-01-05.1.
19. The storage operator shall maintain financial responsibility pursuant to section 43-

05-01-09.1.

20. The storage operator shall maintain and comply with post-injection site care and facility closure plan pursuant to section 43-05-01-19.

### **III. CASE SPECIFIC PERMIT CONDITIONS**

1. NDAC Section 43-05-01-11.4, subsection 1, subdivision b; The operator shall notify the Commission within 24 hours of failure or malfunction of any surface or bottom hole gauges in the TB Leingang 1 (File No. 40158 – SENE 18-141N-87W) and TB Leingang 2 (File No. 40178 – SENE 18-141N-87W) injectors and the Milton Flemmer 1 (File No. 38594 – NWN 35-141N-88W) monitor well.
2. NDAC Section 43-05-01-11, subsection 14 and NDAC Section 43-05-01-11.4, subsection 1, subdivision c; The operator shall run an ultrasonic or other log capable of evaluating internal and external pipe condition to establish a baseline for corrosion monitoring for the TB Leingang 1, TB Leingang 2 and Milton Flemmer 1 wells. The operator shall run logs with the same capabilities for the TB Leingang 1 and TB Leingang 2 wells on a 5 year schedule, unless analysis of corrosion coupons or subsequent logging necessitates a more frequent schedule.
3. NDAC Section 43-05-01-11.4, subsection 1, subdivision d and NDAC Section 43-05-01-13, subsection 2; The storage operator shall notify the Commission within 24 hours of any release of carbon dioxide from the storage facility, flow lines, or of carbon dioxide detected above the upper confining zone. Where the Commission or the storage operator obtains evidence that the injected carbon dioxide stream and associated pressure front may endanger an underground source of drinking water, the storage operator shall cease injection immediately, implement the emergency and remedial plan approved by the Commission, and take all steps reasonably necessary to identify and characterize any release.
4. NDAC 43-05-01-11.1 subsections 3 and 5 and NDAC 43-05-01-11.4, subsection 1, subdivision e; External mechanical integrity shall be continuously monitored with the proposed fiber optic lines for the TB Leingang 1, TB Leingang 2 and Milton Flemmer 1 wells. The Commission must be notified within 24 hours should a fiber optic line fail. The Commission must be notified prior to severing the line above the confining zone if such an action becomes necessary for remedial work or monitoring activities.
5. NDAC 43-05-01-11.4, subsection 1, subdivision h, paragraph 1; Surface air and soil gas monitoring is required to be implemented as planned by the operator in Section 5.2 (Surface Facilities Leak Detection Plan) and Section 5.7.1 (Soil Gas Monitoring) of its permit.
6. NDAC 43-05-01-10, subsection 9, subdivision c, NDAC 43-05-01-11, subsection

15, and NDAC 43-05-01-11.1, subsection 2; The operator shall notify the Commission at least 48 hours in advance to witness a mechanical integrity test of the tubing-casing annulus for the injection and monitoring wells. The packer must be set within 100' of the upper most perforation and in the 25CR-80 casing for the TB Leingang 1 and TB Leingang 2 injectors and 13CR-80 casing for the Milton Flemmer 1 monitor. Dependent on evaluation, the operator shall run the same test on a 5 year schedule for the TB Leingang 1, TB Leingang 2 and Milton Flemmer 1 wells.

7. NDAC 43-05-01-11, subsections 3 and 5; The operator shall continuously monitor the surface casing-long string casing annulus with proposed fiber optic lines, and a gauge not to exceed 300 psi. The Commission must be notified of any pressure that needs to be bled off.
8. NDAC 43-05-01-05, subsection 1; Any other information that the Commission requires the storage facility permit to include. The operator shall implement a data sharing plan that provides for real-time sharing of data between Summit Carbon Storage #1, LLC, Summit Carbon Storage #2, LLC, Summit Carbon Storage #3, LLC and SCS Carbon Transport LLC operations. If a discrepancy in the shared data is observed, the party observing the data discrepancy shall notify all other parties, take action to determine the cause, and record the instance. Copies of such records must be filed with the Commission upon request.
9. NDAC 43-05-01-17, subsection 1; The storage operator must pay fees based upon the carbon dioxide source and the amount of carbon dioxide injected for storage. The Commission must make a determination on the contribution to the energy and agriculture production economy of North Dakota of each additional carbon dioxide source, before it is approved to be stored. If the Commission deems a carbon dioxide source does not contribute to the energy and agricultural production economy of North Dakota, the fees will be determined by hearing.
10. NDAC 43-05-01-11.3, subsection 3; The operator shall fill the annulus between the tubing and the long string casing with a noncorrosive fluid approved by the Commission. The storage operator shall maintain on the annulus a pressure that exceeds the operating injection pressure, unless the Commission determines that such a requirement might harm the integrity of the well or endanger the underground sources of drinking water. Section 5.4 (Wellbore Mechanical Integrity Testing) proposes a nitrogen cushion of 300 psi minimum to maintain constant positive pressure on the well annulus in each injector. Section 11.0 (Injection Well and Storage Operations) proposes a maximum operating injection pressure of 2100 psi.

# Fact Sheet

## **1. Description of Facility**

Summit Carbon Storage #1, LLC (SCS #1) is a wholly owned subsidiary of SCS Permanent Carbon Storage LLC (SCS PCS) which is a wholly owned subsidiary of Summit Carbon Solutions, LLC (SCS). SCS, under the wholly owned subsidiary SCS Carbon Transport LLC, intends to construct, own, and operate a carbon dioxide transmission pipeline, the Midwest Carbon Express (MCE) pipeline. The MCE pipeline will receive carbon dioxide from over 30 anthropogenic sources, including biofuels from ethanol facilities and other industries across the Midwest, including Iowa, Minnesota, Nebraska, South Dakota, and North Dakota. The MCE pipeline will be capable of transporting up to 18 million metric tons per year, to North Dakota to be stored in three storage facilities located in Mercer, Morton, and Oliver Counties, near the city of Beulah, North Dakota, owned by SCS #1, Summit Carbon Storage #2, LLC (SCS #2) and Summit Carbon Storage #3, LLC (SCS #3). SCS #2 and SCS #3 are wholly owned subsidiaries of SCS PCS. All three storage facilities are intended to operate in tandem with each other.

## **2. Quantity and Quality of Carbon Dioxide Stream**

The storage facility was modeled to receive a maximum of 124.4 million metric tons over a 20-year injection period, equating to approximately 6.22 million metric tons annually. The combined maximum modeled storage volume across all three storage facilities is 352 million metric tons over 20 years.

The commingled carbon dioxide stream being transported by the MCE pipeline at the time of this application is anticipated to average at least 98.25% carbon dioxide, <1.44% nitrogen, with trace quantities of oxygen, water, hydrocarbons, hydrogen sulfide, sulfur, and glycol, equaling less than 0.31% combined.

The MCE pipeline and storage facility have been conservatively designed to accommodate a carbon dioxide stream that is 95% carbon dioxide, 2% oxygen, and 3% nitrogen. SCS #1 is proposing that the carbon dioxide stream must be between 95% and 99.9% carbon dioxide to be accepted into the MCE pipeline to allow flexibility to receive carbon dioxide from a variety of industrial sources.

## **3. Summary of Basis of Draft Permit Conditions**

The case specific permit conditions are unique to this storage facility, and not indicative of conditions for other storage facility permits. The conditions take into consideration the equipment proposed for this storage facility. Regulatory provisions for these conditions are all cited from NDAC Chapter 43-05-01 (Geologic Storage of Carbon Dioxide).

#### **4. Reasons for Variances or Alternatives**

Draft Permit Section III. Case Specific Conditions are referenced below by number from aforementioned section.

4. NDAC 43-05-01-11.4, subsection 1, subdivision e, requires a demonstration of external mechanical integrity at least once per year until the injection well is plugged. NDAC 43-05-01-11.1, subsection 3 requires the storage operator to, at least annually, determine the absence of significant fluid movement outside the casing by running an approved tracer survey or temperature log or noise log. The proposed fiber optic lines shall provide continuous temperature logs for the length of the injection wellbores.

10. NDAC 43-05-01-11.3, subsection 3; The operator shall fill the annulus between the tubing and the long string casing with a noncorrosive fluid approved by the Commission. The storage operator shall maintain on the annulus a pressure that exceeds the operating injection pressure, unless the Commission determines that such a requirement might harm the integrity of the well or endanger the underground sources of drinking water. The proposed nitrogen cushion of 300 psi minimum to maintain constant positive pressure on the well annulus in each injector will provide corrosion protection without risking the creation of a micro annulus by debonding of the long string casing-cement sheath during the operational life of the well. The Commission finds a micro annulus would harm external mechanical integrity and provide a potential pathway for endangerment of USDWs.

#### **5. Procedures Required for Final Decision**

**The beginning and ending dates of the comment period:**

April 15, 2024 to 5:00 P.M. CDT June 10, 2024

**The address where comments will be received:**

Oil and Gas Division, 1016 East Calgary Avenue, Bismarck, North Dakota 58503-5512  
or [slforsberg@nd.gov](mailto:slforsberg@nd.gov)

**Date, time, and location of the storage facility permit hearing:**

June 11-12, 2024 9:00 A.M. CDT at 1000 East Calgary Avenue, Bismarck, North Dakota 58503

**Any other procedures by which the public may participate in the final decision:**

At the hearing, the Commission will receive testimony and exhibits of interested parties.

#### **6. Contact for Additional Information**

**RE: SUMMIT CARBON STORAGE #1, LLC SFP AND CLASS VI APPLICATION**

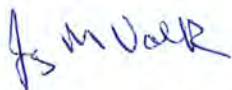

Dear Mrs. Madche,

Summit Carbon Storage #1, LLC (SCS1) respectfully submits for the review and consideration of the Department of Mineral Resources – Oil & Gas Division, one application for carbon dioxide storage facility permits for the injection site called the TB Leingang; which is located in Oliver County, North Dakota. This application was prepared pursuant to and in accordance with Chapter 38-22 of the North Dakota Century Code and Chapter 43-05-01 of the North Dakota Administrative Code.

The storage facility permit application, associated simulation data and the Permit Application Certification – Broom Creek, has been sent electronically.

Please contact me with any questions.

Sincerely,

Jay M. Volk, PhD  
Sequestrations – Director of Health, Safety & Environmental

Enclosure

## Permit Application Certification -Broom Creek-

BEFORE ME, the undersigned authority, personally appeared Wade Boeshans, Executive Vice President of Summit Carbon Solutions, LLC the ultimate parent company of the wholly owned subsidiary, **Summit Carbon Storage #1, LLC**, a Delaware Limited Liability Company whose office is located at 2321 North Loop Drive, Suite #221, Ames, IA, 50010 who being duly sworn, upon oath stated and certified that:

1. I, Wade Boeshans, am over eighteen years of age. I have personal knowledge of the information and facts stated by me in the Certification and that they are true and correct. I have never been convicted of any felony or of any crime involving moral turpitude and am fully competent to make these representations.
2. I hold the position of Executive Vice President for Summit Carbon Solutions, LLC. As required in accordance with North Dakota Administrative Code § 43-05-01-07.1 and by virtue of my position with Summit Carbon Solutions, LLC, I am authorized to make these representations on behalf of **Summit Carbon Storage #1, LLC**.
3. Attached hereto is the storage facility permit application requesting permits under Chapter 38-22 of the North Dakota Century Code, and in accordance with Article 43-05 of the North Dakota Administrative Code, for the establishment of carbon dioxide storage facilities located in Oliver, Mercer and Morton County's, North Dakota. Further, enclosed is the accompanying Class VI drilling permit information for two (2) carbon dioxide injection wells and one (1) monitoring well.
4. Based upon information and reports provided by individuals immediately responsible for compiling and preparing the enclosed permit applications and supporting information, I have personal knowledge and am familiar with the information being submitted in the enclosed documents and attachments to the permit applications. Based upon information and belief, the information contained herein is true, accurate and complete.
5. I affirm under penalty of perjury that the representation contained in the affidavit are true, to the best of my knowledge, information, and belief. I understand that there are significant penalties for submitting false information, including the possibility of a fine and imprisonment.
6. By my signature below, I hereby submit the enclosed applications and supporting documents and information on behalf of **Summit Carbon Storage #1, LLC**.

Executed this 6 day of February, 2024

  
Wade Boeshans

**SUMMIT CARBON STORAGE #1, LLC  
CARBON DIOXIDE GEOLOGIC STORAGE FACILITY PERMIT APPLICATION**

**PROJECT SUMMARY**

**General Applicant and Project Information.** Summit Carbon Storage #1, LLC (SCS1), a wholly owned subsidiary of SCS Permanent Carbon Storage LLC (SCS PCS) which is a wholly owned subsidiary of Summit Carbon Solutions, LLC (SCS), as shown in Figure PS-1, is requesting consideration of this storage facility permit (SFP) application for the geologic storage of anthropogenic carbon dioxide (CO<sub>2</sub>) within Mercer, Morton, and Oliver Counties, North Dakota.

The current mailing address for SCS1, as the storage facility operator of TB Leingang, is as follows:

Summit Carbon Storage #1, LLC  
c/o Summit Carbon Solutions, LLC  
Attn: Wade Boeshans  
2321 North Loop Drive, Suite 221  
Ames, IA 50010-8218

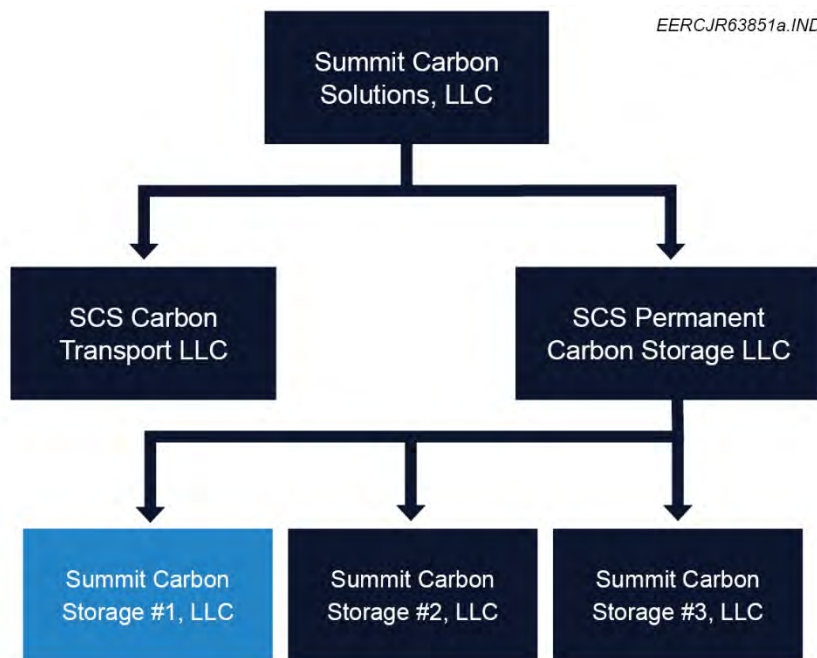

Figure PS-1. SCS1 business structure.

SCS proposes to construct, own, and operate the Midwest Carbon Express (MCE) Project (Figure PS-2), which will capture or receive CO<sub>2</sub> from over 30 anthropogenic sources (biofuel and

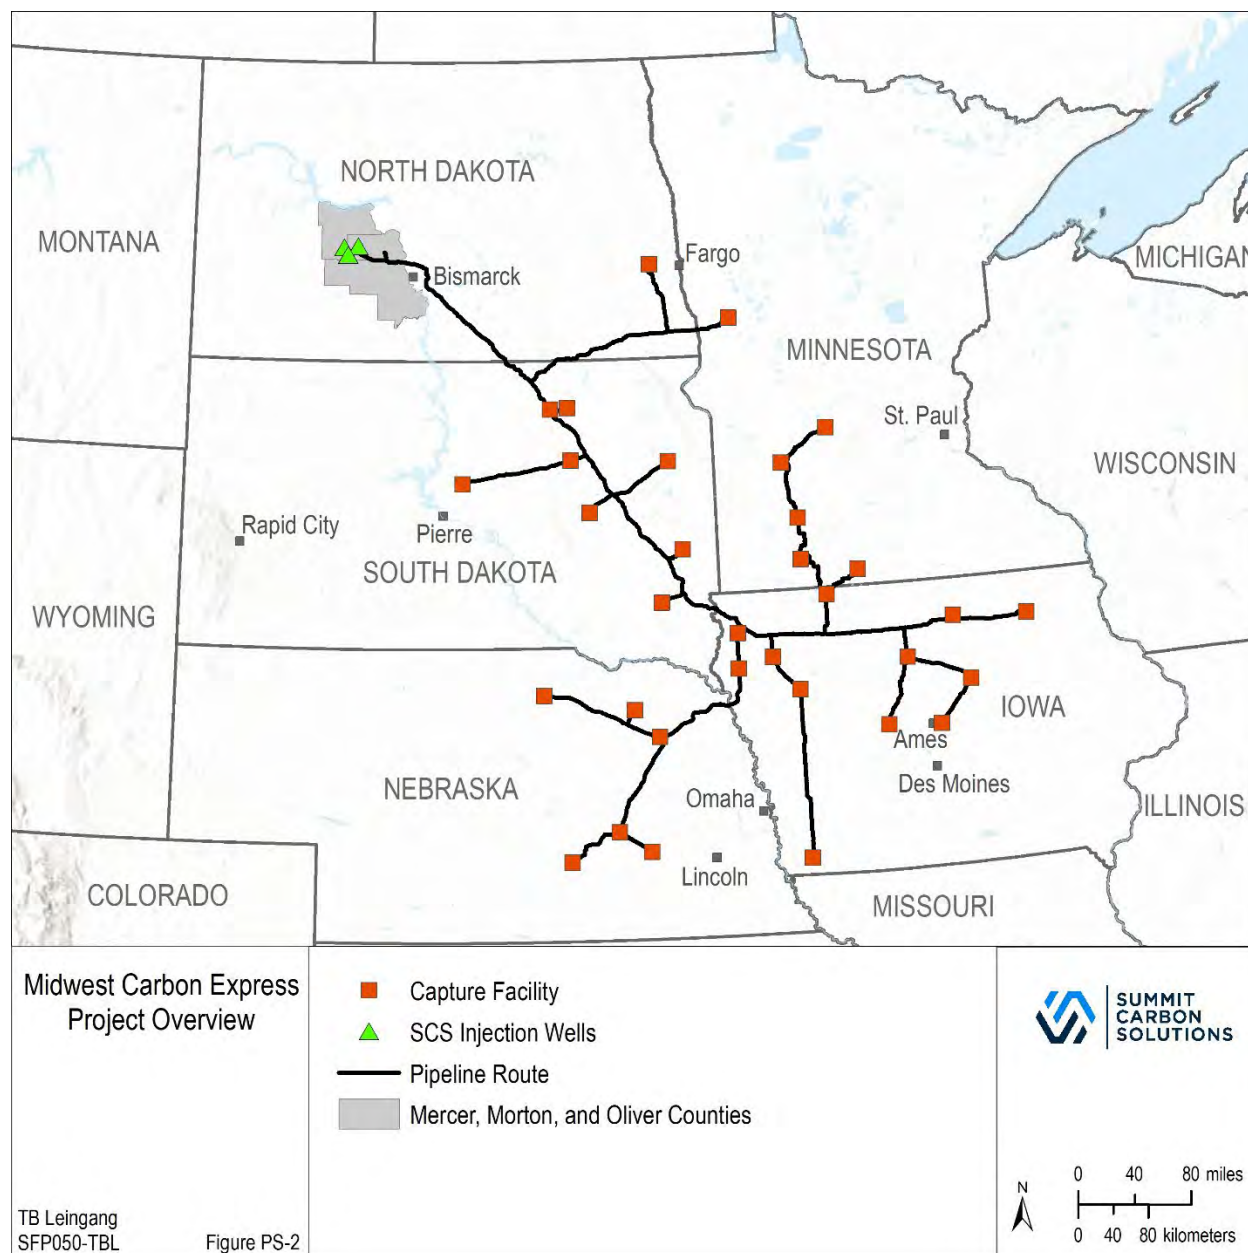

Figure PS-2. MCE Project overview map.

other industrial facilities) across the Midwest and transport the CO<sub>2</sub> via pipeline to North Dakota to be permanently stored within deep underground formations. The commingled stream composition in the MCE pipeline from all sources is anticipated to average  $\geq 98.25\%$  CO<sub>2</sub>, with less than 1.75% trace quantities of other constituents (Table PS-1). The MCE Project is conservatively designed with a 95% CO<sub>2</sub>, 2% O<sub>2</sub>, and 3% N<sub>2</sub> specification; therefore, SCS1 is requesting a commercial permit for the operation of the storage facility for injection of a CO<sub>2</sub> stream that will range from 95% CO<sub>2</sub> to  $\leq 99.9\%$  CO<sub>2</sub>. This commercial permit will provide flexibility to receive CO<sub>2</sub> from a variety of industrial sources.

**Table PS-1. Anticipated Average CO<sub>2</sub> Stream Composition**

<b>Chemical Content</b>	<b>System Specification</b>
Carbon Dioxide, CO <sub>2</sub>	≥98.25%
Inert, N <sub>2</sub>	≤1.44%
Oxygen, O <sub>2</sub>	≤0.31%
Water, H <sub>2</sub> O*	≤20 lb/MMscf
Total Hydrocarbons*	≤1800 ppm by volume
Hydrogen Sulfide, H <sub>2</sub> S*	≤10 ppm by volume
Total Sulfur, S*	≤10 ppm by volume
Glycol	≤0.3 gallons/MMscf

\* Denotes trace constituents that do not make up notable percentages of stream composition.

The MCE Project will generate approximately 11,400 construction and 1100 operational jobs across the project. The MCE Project contributes to the North Dakota economy by employing workers, paying salaries and benefits, purchasing goods and services from local businesses, contributing to other household consumption, and paying taxes. Capital expenditures in North Dakota from SCS and its contractors during the construction phase will support 1934 annual jobs on average consisting of direct, indirect, and through induced contributions. Likewise, during operations, SCS will support 150 jobs in North Dakota through direct, indirect, and induced contributions (Ernst and Young, LLP, 2022).

The MCE Project aims to reduce the carbon intensity (CI) of biofuels produced from ethanol facilities and work toward achieving climate goals while creating jobs and other economic benefits across the project. The MCE Project is being designed to transport up to 18 million metric tonnes per annum (MMtpa) of CO<sub>2</sub> via a 2000-mile greenfield pipeline system (permitted through relevant state regulatory agencies and associated processes) to North Dakota for permanent storage approximately 1 mile underground in secure geologic formations across three CO<sub>2</sub> storage facilities owned and operated by SCS1; Summit Carbon Storage #2, LLC (SCS2); and Summit Carbon Storage #3, LLC (SCS3). Within this application, SCS1 was modeled at 124.4 million metric tonnes (MMt) over 20 years while all three storage facilities were modeled over 352 MMt. (124.4 TB Leingang + 98.3 BK Fischer + 129.7 KJ Hintz). TB Leingang 1 and TB Leingang 2 were modeled at 3.15 and 3.08 MMtpa, respectfully. The captured CO<sub>2</sub> will be injected into the Broom Creek Formation, a sandstone reservoir and saline aquifer underlying the project area (Figure PS-3) and surrounding region. SCS1's proposed CO<sub>2</sub> storage facility location in North Dakota provides not only favorable and plentiful geologic storage capacity supportive of the MCE Project but also CO<sub>2</sub> storage critical to both the agriculture and energy industries in North Dakota and surrounding regions.

By efficiently utilizing North Dakota's vast pore-space resource, estimated at approximately 250 billion metric tons of potential (U.S. Department of Energy, 2015), SCS seeks to lower greenhouse gas (GHG) emissions by storing up to 18 MMtpa of CO<sub>2</sub> through the MCE Project across three CO<sub>2</sub> storage facilities owned and operated by SCS1, SCS2, and SCS3, equivalent to removing the annual CO<sub>2</sub> emissions from approximately 3.9 million vehicles. This initiative directly supports U.S. and international climate change policies, goals, and efforts. When placed into service, the MCE Project will provide the largest and single most meaningful technology-

based reduction of carbon emissions in the world. To date, more than 30 ethanol plants across the MCE Project's footprint have entered long-term CO<sub>2</sub> offtake agreements with SCS, opening new economic opportunities to sell their products in markets that pay more for lower-carbon fuels. This improved market accessibility ensures Midwestern ethanol plants' environmental and economic sustainability by significantly reducing their CO<sub>2</sub> emissions' footprint and lowering the CI of ethanol-based fuels. Specifically, by participating in the MCE Project and reducing the CI of their product, ethanol producers can compete in low-carbon fuel standard (LCFS) markets for an increased margin. If ethanol facilities are unable to reduce their CI, their access to the LCFS markets will decline, thus limiting their ability to compete in these markets and risking the jobs and communities they help sustain.

The importance of CO<sub>2</sub> pipelines for the ethanol industry and the agriculture industry that relies on them, as well as other anthropogenic industrial CO<sub>2</sub> sources, is further supported by the fact that other proposed carbon capture, pipeline transportation, and geologic storage projects in the Midwest have entered similar agreements with other ethanol plants. The primary challenge for Midwestern ethanol plants and other industrial sources of CO<sub>2</sub> is the lack of suitable and economic geologic formations for stored in proximity to their sites, as well as other economic and practicable solutions for use of the CO<sub>2</sub>. The MCE Project offers a solution for this proximity challenge and a service for biofuel and industrial facilities across the Midwest by connecting these facilities via a greenfield pipeline system directly to the project area (Figure PS-2) located within North Dakota.

The project area (Figure PS-3) will consist of three separate CO<sub>2</sub> SFP locations: TB Leingang, BK Fischer, and KJ Hintz (Figure PS-3). Each SFP location will be owned and operated by individual operators: SCS1, SCS2, and SCS3. Each proposed SFP's surface use area covers approximately 30,000 acres and will include up to two Broom Creek Formation injection wells, a dedicated Broom Creek Formation stratigraphic and reservoir-monitoring well, and a dedicated monitoring well(s) for the lowest underground source of drinking water (USDW). Each site will also have associated surface facility infrastructure that will accept CO<sub>2</sub> transported via a CO<sub>2</sub> flowline. SCS1 will own and operate the CO<sub>2</sub> flowline (NDL-327) beginning at the terminus point in Oliver County (Figure PS-3) of the MCE (North Dakota Public Service Commission Case No. PU 22-391; NDM-106) and consists of approximately 8.6 miles of 24/20-inch flowline delivering CO<sub>2</sub> downstream to the TB Leingang 1 and 2 injection wells, also located in Oliver County. Operating agreements between SCS1, SCS2, SCS3, SCS PCS, and Summit Carbon Transport, LLC will include, but are not limited to, defining financial responsibilities, measurement and custody transfers, data access and data sharing, and general operations including leak detection and reporting, emergency response, monitoring, and maintenance of the NDL-327 as Summit Carbon Transport, LLC will be operating the MCE line and respective SCS1, SCS2, and SCS3 flowlines as one system. Likewise, operating agreements will include, but are not limited to, allowing the sharing of geologic models, monitoring equipment and associated data, as well as operational data, leak detection and monitoring, and emergency response actions.

The underlying target storage reservoir for this application, the Broom Creek Formation and, more specifically, its CO<sub>2</sub> storage potential, has been the subject of numerous studies conducted by the North Dakota Geological Survey, the U.S. Geological Survey (USGS), and the Energy & Environmental Research Center (EERC). The Broom Creek Formation is an ideal storage

## TB LEINGANG/MILTON FLEMMER 1

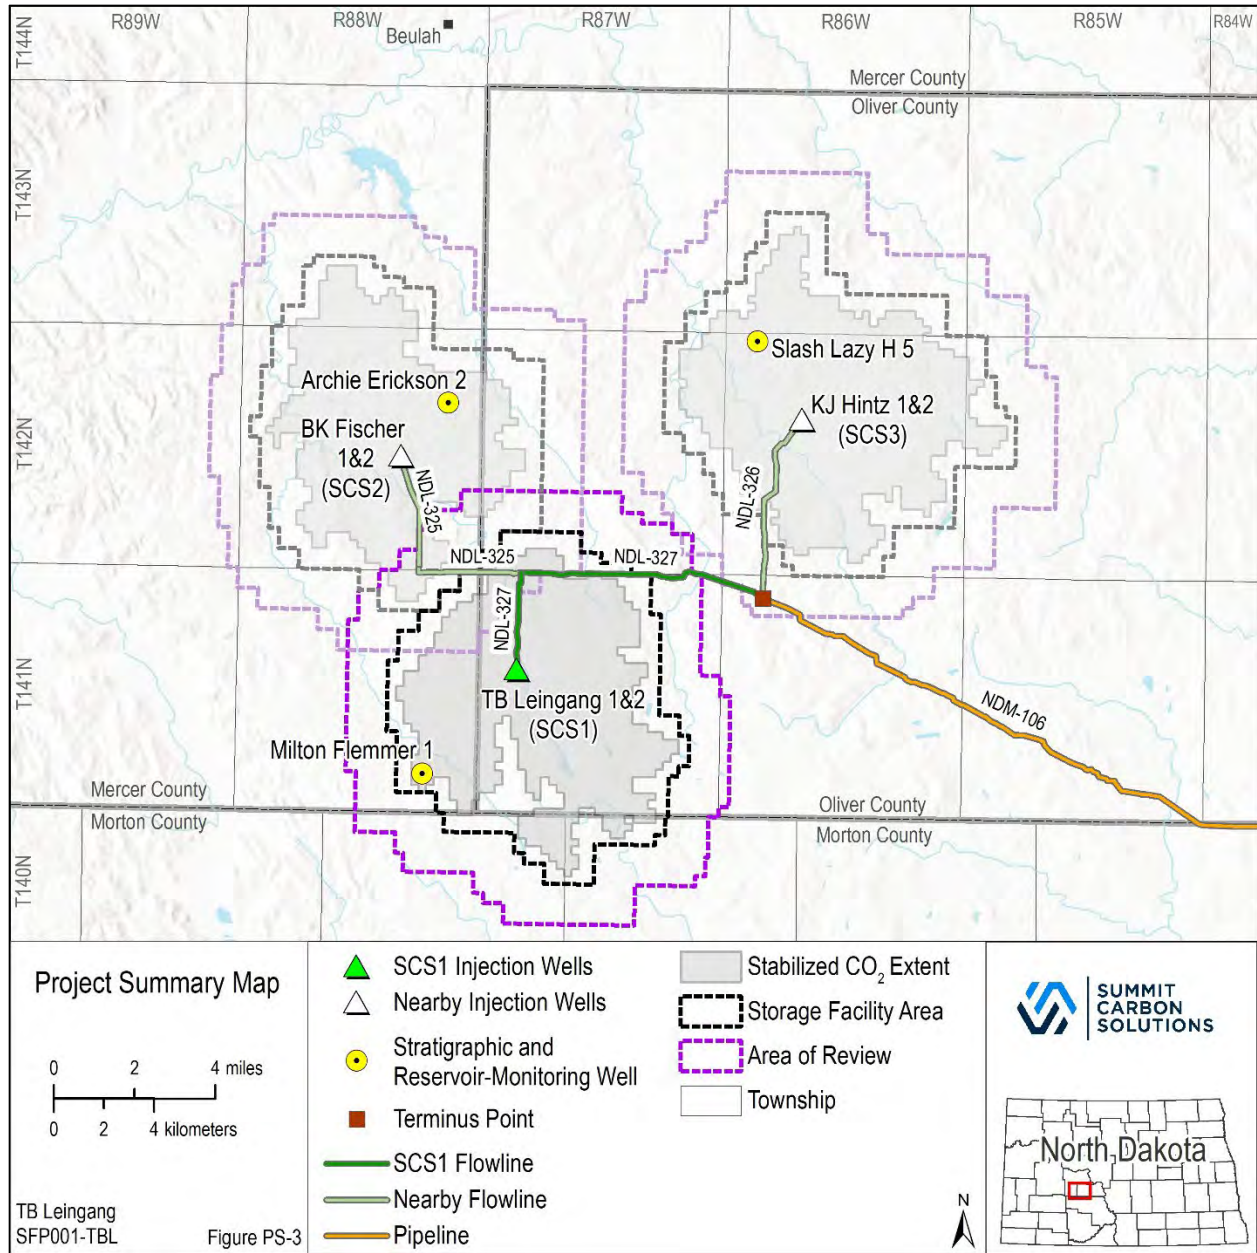

Figure PS-3. Project summary map.

candidate because of its superior reservoir quality, depth, impermeable upper and lower confining zones, and expansive areal extent. The suitability of these formations has been further verified by the extensive data sets collected by SCS to illustrate the long-term, safe storage of CO<sub>2</sub> within the proposed project area.

SCS collected data and completed a detailed characterization of the injection and confining zones to ensure that the injected CO<sub>2</sub> will remain permanently stored in the subsurface. Data acquisition began by first obtaining seismic consent from >95% of landowners via surface access

agreements, allowing SCS to collect seismic data. Seismic data collection commenced in October 2021 and spanned approximately six townships over 200 square miles. Thereafter, three stratigraphic wells were drilled and completed; drilling operations started in January 2022 and ended in May 2022. The Milton Flemmer 1 (North Dakota Industrial Commission [NDIC] File No. 38594, American Petroleum Institute (API) No. 33-057-00041, Mercer County) well was drilled, cored, and logged into the Deadwood Formation at approximately 12,000 ft, while Archie Erickson 2 (NDIC File No. 38622, API No. 33-057-00042, Mercer County) and Slash Lazy H 5 (NDIC File No. 38701, API No. 33-065-00021, Oliver County) were both drilled, cored, and logged through the Broom Creek Formation, at approximately 6400 and 6100 ft, respectively.

In the following SFP application, SCS1 presents a detailed evaluation of site geology and characterizations that provide the data required to conduct an in-depth evaluation of the proposed SFP. Thus confirming the proposed SCS1 storage facility is suitable to receive and permanently store CO<sub>2</sub>. This SFP application has been presented in conjunction with two other SFP applications within the project area (Figure PS-3): BK Fischer (SCS2) and KJ Hintz (SCS3).

## **SECTION 1.0**

### **PORE SPACE ACCESS**

## 1.0 PORE SPACE ACCESS

North Dakota law explicitly grants title to pore space in all strata underlying the surface of lands and waters to the owner of the overlying surface estate; i.e., the surface owner owns the pore space (North Dakota Century Code [N.D.C.C.] § 47-31-03). Prior to issuance of the storage facility permit (SFP), North Dakota law mandates the storage operator obtain the consent of landowners who own at least 60% of the pore space of the storage reservoir for geologic storage of CO<sub>2</sub> (N.D.C.C. § 38-22-08[5]). The statute also mandates that a good faith effort be made to obtain consent from all pore space owners and that all nonconsenting pore space owners are, or will be, equitably compensated (N.D.C.C. §§ 38-22-08[4], [14]). North Dakota law grants the North Dakota Industrial Commission (NDIC) the authority to require pore space owned by nonconsenting owners to be included in a storage facility and subject to geologic storage through pore space amalgamation (N.D.C.C. § 38-22-10). Amalgamation of pore space will be considered at an administrative hearing as part of the regulatory process required for consideration of the SFP application. Surface access for any potential aboveground activities is not included in pore space amalgamation.

Summit Carbon Storage #1, LLC (SCS1) has identified the owners (surface and mineral) (N.D.C.C. §§ 38-22-06[3], [4]; North Dakota Administrative Code [N.D.A.C.] § 43-05-01-08[1]). No mineral lessees or operators of mineral extraction activities are within the facility area or within 0.5 miles of its outside boundary. SCS1 will notify all owners of a pore space amalgamation hearing at least 45 days prior to the scheduled hearing and will provide information about the proposed CO<sub>2</sub> storage project and the details of the scheduled hearing. An affidavit of mailing will be provided to NDIC to certify that these notifications were made (N.D.C.C. §§ 38-22-06[3], [4]; N.D.A.C. §§ 43-05-01-08[1], [2]).

All owners, lessees, and operators that require notification have been identified in accordance with North Dakota law, which vests the title to the pore space in all strata underlying the surface of lands and water to the owner of the overlying surface estate (N.D.C.C. § 47-31-03). The review of pertinent county recorder records identified no severance of pore space from the surface estate or leasing of pore space to a third party prior to April 9, 2009. All surface owners and pore space owners and lessees are the same owner of record.

The map in Figure 1-1 shows the extent of the pore space that will be occupied by CO<sub>2</sub> at the cessation of injection (20 years) and over the life of the project (the stabilized CO<sub>2</sub> extent) as well as the storage facility area boundary and 0.5 miles outside of the storage facility area boundary (the hearing notification area).

# **TB LEINGANG/MILTON FLEMMER 1**

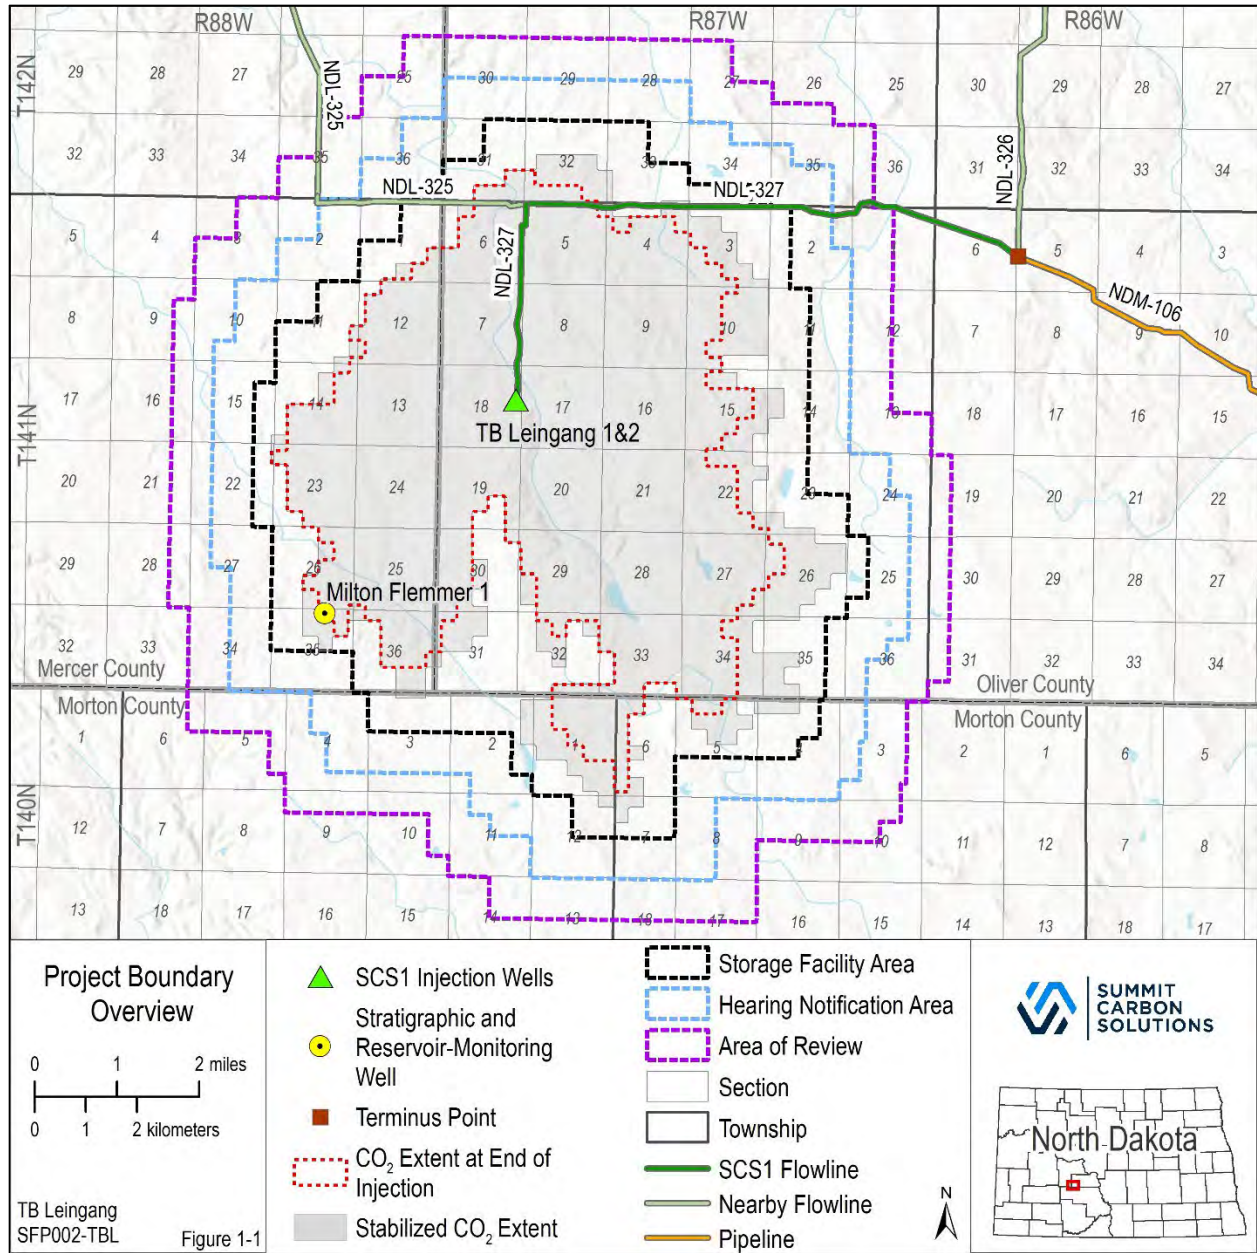

Figure 1-1. Map illustrating the pore space CO<sub>2</sub> extent at the cessation of injection (20 years), alongside the stabilized CO<sub>2</sub> extent over the life of the project. Map also depicts the storage facility area boundary, and 0.5 miles outside of the storage facility area boundary is the hearing notification area. Additionally, 0.5 miles outside the hearing notification area, the area of review boundary is depicted.

**HAND DELIVERED**

Mr. Mark Bohrer  
Assistant Director  
North Dakota Industrial Commission  
Oil and Gas Division  
1016 East Calgary Avenue  
Bismarck, North Dakota 58503

**RE: IN THE MATTER OF A HEARING  
CALLED ON A MOTION OF THE  
COMMISSION TO CONSIDER THE  
APPLICATIONS OF SUMMIT CARBON  
STORAGE #1, LLC, SUMMIT CARBON  
STORAGE #2, LLC AND SUMMIT  
CARBON STORAGE #3, LLC FOR THE  
GEOLOGIC STORAGE OF CARBON  
DIOXIDE IN THE BROOM CREEK  
FORMATION**

Dear Mr. Bohrer:

Enclosed herewith for filing in the above-captioned matters, please find copies of the following storage agreements:

1. STORAGE AGREEMENT, SCS #1 BROOM CREEK – SECURE GEOLOGIC STORAGE, MERCER, MORTON, & OLIVER COUNTIES, NORTH DAKOTA;
2. STORAGE AGREEMENT, SCS #2 BROOM CREEK – SECURE GEOLOGIC STORAGE, MERCER & OLIVER COUNTIES, NORTH DAKOTA; and
3. STORAGE AGREEMENT, SCS #3 BROOM CREEK – SECURE GEOLOGIC STORAGE, OLIVER COUNTY, NORTH DAKOTA.

Mr. Mark Bohrer

**STORAGE AGREEMENT**  
**SCS #1 BROOM CREEK – SECURE GEOLOGIC STORAGE**  
**MERCER, MORTON, & OLIVER COUNTIES, NORTH DAKOTA**

**STORAGE AGREEMENT**  
**SCS #1 BROOM CREEK – SECURE GEOLOGIC STORAGE**  
**MERCER, MORTON, & OLIVER COUNTIES, NORTH DAKOTA**

**THIS AGREEMENT** (“Agreement”) is entered into as of the \_\_\_\_ day of \_\_\_\_\_, 20\_\_, by the parties who have signed the original of this instrument, a counterpart thereof, ratification and joinder or other instrument agreeing to become a Party hereto.

**RECITALS:**

A. It is in the public interest to promote the geologic storage of carbon dioxide in a manner which will benefit the state and the global environment by reducing greenhouse gas emissions and in a manner which will help ensure the viability of the state's coal and power industries, to the economic benefit of North Dakota and its citizens;

B. To further geologic storage of carbon dioxide, a potentially valuable commodity, may allow for its ready availability if needed for commercial, industrial, or other uses, including enhanced recovery of oil, gas, and other minerals; and

C. For geologic storage, however, to be practical and effective it requires cooperative use of surface and subsurface property interests and the collaboration of property owners, which may require procedures that promote, in a manner fair to all interests, cooperative management, thereby ensuring the maximum use of natural resources.

**AGREEMENT:**

It is agreed as follows:

**ARTICLE 1**  
**DEFINITIONS**

As used in this Agreement:

1.1 **Carbon Dioxide** means carbon dioxide in gaseous, liquid, or supercritical fluid state together with incidental associated substances derived from the source materials, capture

process and any substances added or used to enable or improve the injection process.

1.2 **Commission** means the North Dakota Industrial Commission (NDIC) acting by and through the Department of Mineral Resources.

1.3 **Effective Date** is the time and date this Agreement becomes effective as provided in Article 14.

1.4 **Facility Area** is the land described by Tracts in Exhibit “B” and shown on Exhibit “A” containing 29,444.72 acres, more or less.

1.5 **Party** is any individual, corporation, limited liability company, partnership, association, receiver, trustee, curator, executor, administrator, guardian, tutor, fiduciary, or other representative of any kind, any department, agency, or instrumentality of the state, or any governmental subdivision thereof, or any other entity capable of holding an interest in the Storage Reservoir.

1.6 **Pore Space** means a cavity or void, whether natural or artificially created, in any subsurface stratum.

1.7 **Pore Space Interest** is a right to or interest in the Pore Space in any Tract within the boundaries of the Facility Area.

1.8 **Pore Space Owner** is a Party hereto who owns Pore Space Interest.

1.9 **Storage Equipment** is any personal property, lease, easement, and well equipment, plants and other facilities and equipment for use in Storage Operations.

1.10 **Storage Expense** is all costs, expense or indebtedness incurred by the Storage Operator pursuant to this Agreement for or on account of Storage Operations.

1.11 **Storage Facility** is the unitized or amalgamated Storage Reservoir created pursuant to an order of the Commission.

1.12 **Storage Facility Participation** is the percentage shown on Exhibit “C” for allocating payments for use of the Pore Space under each Tract identified in Exhibit “B”.

1.13 **Storage Operations** are all operations conducted by the Storage Operator pursuant to this Agreement or otherwise authorized by any lease covering any Pore Space Interest.

1.14 **Storage Operator** is the person or entity named in Section 4.1 of this Agreement.

1.15 **Storage Reservoir** consists of the Pore Space and confining subsurface strata underlying the Facility Area described as the Opeche/Spearfish (Upper Confining Zone), Broom Creek (Injection Zone), and Amsden (Lower Confining Zone) Formation(s) and which are defined as identified by the well logging suite performed at one stratigraphic well, the Milton Flemmer 1 well (NDIC File No. 38594) located in the NW¼ of the NE¼, Section 35, Township 141 North, Range 88 West, Mercer County, North Dakota. The Storage Reservoir is defined as the stratigraphic interval from below the top of the Opeche/Spearfish Formation found at a depth of 5,587 feet below the Kelly Bushing, to above the base of the Amsden Formation, found at a depth of 6,421 feet below the Kelly Bushing, as identified by the Array Induction Gamma log run in the Milton Flemmer 1 well. The logging suite included triple combo (gamma ray [GR], density porosity, and resistivity), caliper, spectral GR, combinable magnetic resonance (CMR), elemental capture spectroscopy (ESC), dipole sonic including four-arm caliper and inclinometer, and an image log. Further, the acquired logs were used to pick formation top depths and interpret lithology, petrophysical properties, and time-to-depth shifting of seismic data obtained from three 3D seismic surveys and one 5-mile long 2D seismic line covering an area totaling 208 miles in and around the Milton Flemmer 1 stratigraphic well. Formation top depths were picked from the top of the Pierre Formation to the base of the Amsden Formation. The average depth of the top of the Opeche/Spearfish Formation (Upper Confining Zone) across the storage facility area is 5,464 total vertical depth (TVD). The average depth of the base of the Amsden Formation (Lower Confining

Zone) across the storage facility area is 6,270 feet TVD. The average thickness of the Storage Reservoir across the storage facility area is 806 feet.

1.16 **Storage Rights** are the rights to explore, develop, and operate lands within the Facility Area for the storage of Storage Substances.

1.17 **Storage Substances** are Carbon Dioxide and incidental associated substances, fluids, and minerals.

1.18 **Tract** is the land described as such and given a Tract number in Exhibit “B.”

1.19 **Transfer Storage Facility** has the meaning given such term in Section 3.7 of this Agreement.

## **ARTICLE 2 EXHIBITS**

2.1 **Exhibits.** The following exhibits, which are attached hereto, are incorporated herein by reference:

2.1.1 Exhibit “A” is a map that shows the boundary lines of the SCS #1 Broom Creek Facility Area and the tracts therein;

2.1.2 Exhibit “B” is a schedule that describes the acres of each Tract in the SCS #1 Broom Creek Facility Area;

2.1.3 Exhibit “C” is a schedule that shows the Storage Facility Participation of each Tract; and

2.1.4 Exhibit “D” is a form of Pore Space Lease.

2.2 **Reference to Exhibits.** When reference is made to an exhibit, it is to the exhibit as originally attached or, if revised, to the last revision.

2.3 **Exhibits Considered Correct.** Exhibits “A,” “B,” “C” and “D” shall be considered to be correct until revised as herein provided.

2.4 **Correcting Errors.** The shapes and descriptions of the respective Tracts have been established by using the best information available. If it subsequently appears that any Tract, mechanical miscalculation or clerical error has been made, Storage Operator, with the approval of Pore Space Owners whose interest is affected, shall correct the mistake by revising the exhibits to conform to the facts. The revision shall not include any re-evaluation of engineering or geological interpretations used in determining Storage Facility Participation. Each such revision of an exhibit made prior to thirty (30) days after the Effective Date shall be effective as of the Effective Date. Each such revision thereafter made shall be effective at 7:00 a.m. on the first day of the calendar month next following the filing for record of the revised exhibit or on such other date as may be determined by Storage Operator and set forth in the revised exhibit.

2.5 **Filing Revised Exhibits.** If an exhibit is revised, Storage Operator shall execute an appropriate instrument with the revised exhibit attached and file the same for record in the county or counties in which this Agreement or memorandum of the same is recorded and shall also file the amended changes with the Commission.

### **ARTICLE 3 CREATION AND EFFECT OF STORAGE FACILITY**

3.1 **Unleased Pore Space Interests.** Any Pore Space Owner in the Storage Facility who owns a Pore Space Interest in the Storage Reservoir that is not leased for the purposes of this Agreement and during the term hereof, shall be treated as if it were subject to the Pore Space Lease attached hereto as Exhibit “D”.

3.2 **Amalgamation of Pore Space.** All Pore Space Interests in and to the Tracts are hereby amalgamated and combined insofar as the respective Pore Space Interests pertain to the Storage Reservoir, so that Storage Operations may be conducted with respect to said Storage Reservoir as if all of the Pore Space Interests in the Facility Area had been included in a single lease executed by all Pore Space Owners, as lessors, in favor of Storage Operator, as lessee and as

if the lease contained all of the provisions of this Agreement.

3.3 **Amendment of Leases and Other Agreements.** The provisions of the various leases, agreements, or other instruments pertaining to the respective Tracts or the storage of the Storage Substances therein, including the Pore Space Lease attached hereto as Exhibit “D”, are amended to the extent necessary to make them conform to the provisions of this Agreement, but otherwise shall remain in effect.

3.4 **Continuation of Leases and Term Interests.** Injection in to any part of the Storage Reservoir, or other Storage Operations, shall be considered as injection in to or upon each Tract within said Storage Reservoir, and such injection or operations shall continue in effect as to each lease as to all lands and formations covered thereby just as if such operations were conducted on and as if a well were injecting in each Tract within said Storage Reservoir.

3.5 **Titles Unaffected by Storage.** Nothing herein shall be construed to result in the transfer of title of the Pore Space Interest of any Party hereto to any other Party or to Storage Operator.

3.6 **Injection Rights.** Storage Operator is hereby granted the right to inject into the Storage Reservoir any Storage Substances in whatever amounts Storage Operator may deem expedient for Storage Operations, together with the right to drill, use, and maintain injection wells in the Facility Area, and to use for injection purposes.

3.7 **Transfer of Storage Substances from Storage Facility.** Storage Operator may transfer from the Storage Facility any Storage Substances, in whatever amounts Storage Operator may deem expedient for Storage Operations, to any other reservoir, subsurface stratum or formation permitted by the Commission for the storage of carbon dioxide under Chapter 38-22 of the North Dakota Century Code (a “Transfer Storage Facility”), *provided that*, the Pore Space ownership between the Storage Facility and Transfer Storage Facility is common.

3.8 **Receipt of Storage Substances.** Storage Operator may accept and receive into the Storage Facility any Storage Substances, in whatever amounts Storage Operator may deem expedient for Storage Operations, being stored in any other Transfer Storage Facility, *provided that*, the Pore Space ownership between the Storage Facility and Transfer Storage Facility is common.

3.9 **Royalty Payments Upon Transfer.** The transfer or receipt of Storage Substances to or from a Transfer Storage Facility in accordance with Section 3.7 and Section 3.8 shall be disregarded for the purposes of calculating the royalty under any lease covering a Pore Space Interest (including Exhibit “D”) and shall not affect the allocation of Storage Substances injected into the Storage Facility through the surface of the Facility Area in accordance with Article 6 of this Agreement.

3.10 **Cooperative Agreements.** Storage Operator may enter into cooperative agreements with respect to lands adjacent to the Facility Area for the purpose of coordinating Storage Operations. Such cooperative agreements may include, but shall not be limited to, agreements regarding the transfer and receipt of Storage Substances pursuant to Sections 3.7 and 3.8 of this Agreement.

3.11 **Border Agreements.** Storage Operator may enter into an agreement or agreements with owners of adjacent lands with respect to operations which may enhance the injection of the Storage Substances in the Storage Reservoir in the Facility Area or which may otherwise be necessary for the conduct of Storage Operations.

#### **ARTICLE 4 STORAGE OPERATIONS**

4.1 **Storage Operator.** Summit Carbon Storage #1, LLC is hereby designated as the initial Storage Operator. Storage Operator shall have the exclusive right to conduct Storage Operations, which shall conform to the provisions of this Agreement and any lease covering a Pore

Space Interest. If there is any conflict between such agreements, this Agreement shall govern.

4.2 **Successor Operators.** The initial Storage Operator and any subsequent operator may, at any time, transfer operatorship of the Storage Facility with and upon the approval of the Commission.

4.3 **Method of Operation.** Storage Operator shall engage in Storage Operations with diligence and in accordance with good engineering and injection practices.

4.4 **Change of Method of Operation.** As permitted by the Commission nothing herein shall prevent Storage Operator from discontinuing or changing in whole or in part any method of operation which, in its opinion, is no longer in accord with good engineering or injection practices. Other methods of operation may be conducted or changes may be made by Storage Operator from time to time if determined by it to be feasible, necessary or desirable to increase the injection or storage of Storage Substances.

## **ARTICLE 5 TRACT PARTICIPATIONS**

5.1 **Tract Participations.** The Storage Facility Participation of each Tract is shown in Exhibit "C." The Storage Facility Participation of each Tract shall be based 100% upon the ratio of surface acres in each Tract to the total surface acres for all Tracts within the Facility Area.

5.2 **Relative Storage Facility Participations.** If the Facility Area is enlarged or reduced, the revised Storage Facility Participation of the Tracts remaining in the Facility Area and which were within the Facility Area prior to the enlargement or reduction shall remain in the same ratio to one another.

## **ARTICLE 6 ALLOCATION OF STORAGE SUBSTANCES**

6.1 **Allocation of Tracts.** All Storage Substances injected shall be allocated to the several Tracts in accordance with the respective Storage Facility Participation effective during the

period that the Storage Substances are injected. The amount of Storage Substances allocated to each tract, regardless of whether the amount is more or less than the actual injection of Storage Substances from the well or wells, if any, on such Tract, shall be deemed for all purposes to have been injected into such Tract. Storage Substances transferred or received pursuant to Sections 3.7 and 3.8 of this Agreement shall be disregarded for the purposes of this Section 6.1.

6.2 **Distribution within Tracts.** The Storage Substances injected and allocated to each Tract shall be distributed among, or accounted for to the Pore Space Owners who own a Pore Space Interest in such Tract in accordance with each Pore Space Owner's Storage Facility Participation effective during the period that the Storage Substances were injected. If any Pore Space Interest in a Tract hereafter becomes divided and owned in severalty as to different parts of the Tract, the owners of the divided interests, in the absence of an agreement providing for a different division, shall be compensated for the storage of the Storage Substances in proportion to the surface acreage of their respective parts of the Tract. Subject to Section 3.9, Storage Substances transferred or received pursuant to Sections 3.7 and 3.8 of this Agreement shall be disregarded for the purposes of this Section 6.2.

## **ARTICLE 7 TITLES**

7.1 **Warranty and Indemnity.** Each Pore Space Owner who, by acceptance of revenue for the injection of Storage Substances into the Storage Reservoir, shall be deemed to have warranted title to its Pore Space Interest, and, upon receipt of the proceeds thereof to the credit of such interest, shall indemnify and hold harmless the Storage Operator and other Parties from any loss due to failure, in whole or in part, of its title to any such interest.

7.2 **Injection When Title Is in Dispute.** If the title or right of any Pore Space Owner claiming the right to receive all or any portion of the proceeds for the storage of any Storage Substances allocated to a Tract is in dispute, Storage Operator shall require that the Pore Space

Owner to whom the proceeds thereof are paid to furnish security for the proper accounting thereof to the rightful Pore Space Owner, if the title or right of such Pore Space Owner fails in whole or in part.

7.3 **Payments of Taxes to Protect Title.** The owner of surface rights to lands within the Facility Area is responsible for the payment of any *ad valorem* taxes on all such rights, interests or property, unless such owner and the Storage Operator otherwise agree. If any *ad valorem* taxes are not paid by or for such owner when due, Storage Operator may at any time prior to tax sale or expiration of period of redemption after tax sale, pay the tax, redeem such rights, interests or property, and discharge the tax lien. Storage Operator shall, if possible, withhold from any proceeds derived from the storage of Storage Substances otherwise due any Pore Space Owner who is a delinquent taxpayer up to an amount sufficient to defray the costs of such payment or redemption; *provided* that such withholding to be credited to the Storage Operator. Such withholding shall be without prejudice to any other remedy available to Storage Operator.

7.4 **Pore Space Interest Titles.** If title to a Pore Space Interest fails, but the tract to which it relates is not removed from the Facility Area, the Party whose title failed shall not be entitled to share under this Agreement with respect to that interest.

## **ARTICLE 8 EASEMENTS OR USE OF SURFACE**

8.1 **Grant of Easement.** Storage Operator shall have the right to use as much of the surface of the land within the Facility Area as may be reasonably necessary for Storage Operations and the injection of Storage Substances.

8.2 **Use of Water.** Storage Operator shall have and is hereby granted free use of water from the Facility Area for Storage Operations, except water from any well, lake, pond or irrigation ditch of a Pore Space Owner; notwithstanding the foregoing, Storage Operator may access any well, lake, or pond as provided in Exhibit “D”.

8.3 **Surface Damages.** Storage Operator shall pay surface owners for damage to growing crops, timber, fences, improvements, and structures located on the Facility Area that result from Storage Operations.

8.4 **Surface and Sub-Surface Operating Rights.** Except to the extent modified in this Agreement, Storage Operator shall have the same rights to use the surface and sub-surface and use of water and any other rights granted to Storage Operator in any lease covering Pore Space Interests. Except to the extent expanded by this Agreement or the extent that such rights are common to the effected leases, the rights granted by a lease may be exercised only on the land covered by that lease. Storage Operator will to the extent possible minimize surface impacts.

## **ARTICLE 9 ENLARGEMENT OF STORAGE FACILITY**

9.1 **Enlargement of Storage Facility.** The Storage Facility may be enlarged from time to time to include acreage and formations reasonably proven to be geologically capable of storing Storage Substances. Any expansion must be approved in accordance with the rules and regulations of the Commission.

9.2 **Determination of Tract Participation.** Storage Operator, subject to Section 5.2, shall determine the Storage Facility Participation of each Tract within the Storage Facility as enlarged, and shall revise Exhibits “A”, “B” and “C” accordingly and in accordance with the rules, regulations and orders of the Commission.

9.3 **Effective Date.** The effective date of any enlargement of the Storage Facility shall be effective as determined by the Commission.

## **ARTICLE 10 TRANSFER OF TITLE PARTITION**

10.1 **Transfer of Title.** Any conveyance of all or part of any interest owned by any Party hereto with respect to any Tract shall be made expressly subject to this Agreement. No

change of title shall be binding upon Storage Operator, or any Party hereto other than the Party so transferring, until 7:00 a.m. on the first day of the calendar month following thirty (30) days from the date of receipt by Storage Operator of a photocopy, or a certified copy, of the recorded or filed instrument evidencing such a change in ownership.

10.2 **Waiver of Rights to Partition.** Each Party hereto agrees that, during the existence of this Agreement, it will not resort to any action to partition any Tract or parcel within the Facility Area or the facilities used in the development or operation thereof, and to that extent waives the benefits or laws authorizing such partition.

## **ARTICLE 11 RELATIONSHIP OF PARTIES**

11.1 **No Partnership.** The duties, obligations and liabilities arising hereunder shall be several and not joint or collective. This Agreement is not intended to create, and shall not be construed to create, an association or trust, or to impose a partnership duty, obligation or liability with regard to any one or more of the Parties hereto. Each Party hereto shall be individually responsible for its own obligations as herein provided.

11.2 **No Joint Marketing.** This Agreement is not intended to provide, and shall not be construed to provide, directly or indirectly, for any joint marketing of Storage Substances.

11.3 **Pore Space Owners Free of Costs.** This Agreement is not intended to impose, and shall not be construed to impose, upon any Pore Space Owner any obligation to pay any Storage Expense unless such Pore Space Owner is otherwise so obligated.

11.4 **Information to Pore Space Owners.** Each Pore Space Owner shall be entitled to all information in possession of Storage Operator to which such Pore Space Owner is entitled by an existing lease or a lease imposed by this Agreement.

**ARTICLE 12  
LAWS AND REGULATIONS**

12.1 **Laws and Regulations.** This Agreement shall be subject to all applicable federal, state and municipal laws, rules, regulations and orders.

**ARTICLE 13  
FORCE MAJEURE**

13.1 **Force Majeure.** All obligations imposed by this Agreement on each Party, except for the payment of money, shall be suspended while compliance is prevented, in whole or in part, by a labor dispute, fire, war, civil disturbance, or act of God; by federal, state or municipal laws; by any rule, regulation or order of a governmental agency; by inability to secure materials; or by any other cause or causes, whether similar or dissimilar, beyond reasonable control of the Party. No Party shall be required against their will to adjust or settle any labor dispute. Neither this Agreement nor any lease or other instrument subject hereto shall be terminated by reason of suspension of Storage Operations due to any one or more of the causes set forth in this Article.

**ARTICLE 14  
EFFECTIVE DATE**

14.1 **Effective Date.** This Agreement shall become effective as determined by the Commission.

14.2 **Certificate of Effectiveness.** Storage Operator shall file for record in the county or counties in which the land affected is located a certificate stating the Effective Date of this Agreement.

**ARTICLE 15  
TERM**

15.1 Term. Unless sooner terminated in the manner hereinafter provided or by order of the Commission, this Agreement shall remain in full force and effect until the Commission has issued a certificate of project completion with respect to the Storage Facility in accordance with § 38-22-17 of the North Dakota Century Code.

15.2 **Termination by Storage Operator.** This Agreement may be terminated at any time by the Storage Operator with the approval of the Commission.

15.3 **Effect of Termination.** Upon termination of this Agreement all Storage Operations shall cease. Each lease and other agreement covering Pore Space within the Facility Area shall remain in force for ninety (90) days after the date on which this Agreement terminates, and for such further period as is provided by Exhibit “D” or other agreement.

15.4 **Salvaging Equipment Upon Termination.** If not otherwise granted by Exhibit “D” or other instruments affecting each Tract, Pore Space Owners hereby grant Storage Operator a period of six (6) months after the date of termination of this Agreement within which to salvage and remove Storage Equipment.

15.5 **Certificate of Termination.** Upon termination of this Agreement, Storage Operator shall file for record in the county or counties in which the land affected is located a certificate that this Agreement has terminated, stating its termination date.

## **ARTICLE 16 APPROVAL**

16.1 **Original, Counterpart or Other Instrument.** A Pore Space Owner may approve this Agreement by signing the original of this instrument, a counterpart thereof, ratification or joinder or other instrument approving this instrument hereto. The signing of any such instrument shall have the same effect as if all Parties had signed the same instrument.

16.2 **Joinder in Dual Capacity.** Execution as herein provided by any Party as either a Pore Space Owner or the Storage Operator shall commit all interests owned or controlled by such Party and any additional interest thereafter acquired in the Facility Area.

16.3 **Approval by the North Dakota Industrial Commission.** Notwithstanding anything in this Article to the contrary, all Tracts within the Facility Area shall be deemed to be qualified for participation if this Agreement is duly approved by order of the Commission.

**ARTICLE 17**  
**GENERAL**

17.1 **Amendments Affecting Pore Space Owners.** Amendments hereto relating wholly to Pore Space Owners may be made with approval by the Commission.

17.4 **Construction.** This agreement shall be construed according to the laws of the State of North Dakota.

**ARTICLE 18**  
**SUCCESSORS AND ASSIGNS**

18.1 **Successors and Assigns.** This Agreement shall extend to, be binding upon, and inure to the benefit of the Parties hereto and their respective heirs, devisees, legal representatives, successors and assigns and shall constitute a covenant running with the lands, leases and interests covered hereby.

## **EXHIBIT D**

### Form of Pore Space Lease

Attached to and made part of the Storage Agreement  
SCS #1 Broom Creek – Secure Geological Storage  
Mercer, Morton & Oliver Counties, North Dakota

### **PORE SPACE LEASE**

THIS PORE SPACE LEASE (this “Lease”) is made effective as of the Effective Date (as defined below) by and between \_\_\_\_\_,  
whose address is \_\_\_\_\_,  
(whether one or more, “Lessor”), and Summit Carbon Storage #1, LLC, a Delaware limited liability company, whose address is 2321 N. Loop Dr., Ames, IA 50010 (whether one or more, “Lessee”). Lessor and Lessee may be individually referred to herein as a “Party” and collectively as the “Parties”.

1. Leased Premises. Lessor, for good and valuable consideration, the receipt and sufficiency of which is hereby acknowledged, does hereby grant, demise, lease and let unto Lessee for Lessee’s geologic storage operations and other purposes set forth herein, the lands described and incorporated herein by reference in Exhibit A attached (the “Leased Premises”).

2. Term.

(a) Initial and Primary Term. This Lease shall commence on the date Lessee executes this Lease (“Effective Date”) and continue for an initial term of twenty (20) years (“Initial Term”) unless sooner terminated in accordance with the terms of this Lease. As consideration for the Initial Term, Lessee shall pay to Lessor TWENTY-FIVE and NO/100 DOLLARS (\$25.00) per acre as a single one-time bonus payment, and an annual rental of Four and No/100 Dollars (\$4.00) per acre on or before January 1 of each year of the Initial Term. The annual rental shall increase by TWO percent (2.0%) commencing on January 1, 2026 and on January 1 each year thereafter. The first year’s rental has been paid in full, the receipt and sufficiency of which is hereby acknowledged by Lessor. Lessee may, at any time prior to the expiration of the Initial Term, elect to extend the Initial Term for up to an additional twenty (20) years by providing written notice to Lessor and payment of One Hundred and No/100 Dollars (\$100.00) per acre (the Initial Term, together with all extensions shall be referred to herein as the “Primary Term”). For the avoidance of doubt, Lessor’s consent to any such extension will not be required provided that the foregoing payment is tendered to Lessor prior to the expiration of the Initial Term. Lessee shall pay to Lessor the annual rentals when due throughout the Primary Term; *provided, however*, Lessee shall not be liable to Lessor for annual rentals with respect to any portion of the Leased Premises which are or become subject to Permit as set forth in Section 2(b), below.

(b) Operational Term. This Lease shall continue beyond the Primary Term for so long as any portion of the Leased Premises or Lessee's storage facilities located in, on or under the Leased Premises (including without limitation, any Reservoirs) are subject to a permit issued by the North Dakota Industrial Commission (the "Commission") (a "Permit") or under the ownership or control of the State of North Dakota; *provided, however*, that all of Lessee's obligations under this Lease shall terminate upon issuance of a certificate of project completion pursuant to Chapter 38-22 of the North Dakota Century Code (the "Operational Term"). If the Primary Term expires and no portion of the Leased Premises or Lessee's storage facilities located in, on or under the Leased Premises is subject to a Permit, this Lease shall terminate, and Lessee shall execute a document evidencing termination of this Lease in recordable form and shall record it in the official records of the county in which the Leased Premises is located. As consideration for the Operational Term, Lessee shall pay to Lessor the royalty set forth in Section 3, below.

3. Royalty. Lessee shall pay to Lessor its proportionate share of FIFTY cents (\$0.50) per metric ton of carbon dioxide (CO<sub>2</sub>) injected into the reservoirs and subsurface pore spaces (as used herein, such terms shall have the meanings set forth in Chapter 38-22 and Chapter 47-31 of the North Dakota Century Code), stratum or strata underlying the Leased Premises (collectively, "Reservoirs"), or reservoirs and subsurface pore spaces, stratum or strata unitized or amalgamated therewith. The royalty shall increase TEN percent (10.0%) on January 1, 2026 and an additional TEN percent (10.0%) every five years thereafter, as outlined on attached Exhibit B. The quantity of CO<sub>2</sub> so injected shall be measured by meters installed by Lessee. Lessor's "proportionate share" shall be determined on a net acre basis and the Parties hereby stipulate that the acreage set forth in Section 1 shall be used to calculate Lessor's proportionate share. The quantity of CO<sub>2</sub> injected into the Reservoirs or any reservoirs or subsurface pore spaces, stratum or strata unitized or amalgamated therewith shall be determined through the use of metering equipment installed and operated by Lessee at the injection site. All royalties due hereunder for CO<sub>2</sub> injected into the Reservoirs or any reservoirs or subsurface pore spaces, stratum or strata unitized or amalgamated therewith during any calendar month shall be paid to Lessor annually on or before March 31<sup>st</sup> for the prior year's injection volumes. Lessor and Lessee agree that this Lease shall continue as specified herein even in the absence of injection operations and the payment of royalties.

4. Right to Pore Space/Storage of Carbon Dioxide. Lessor grants to Lessee the exclusive right to inject and store carbon dioxide (CO<sub>2</sub>) and other incidental gaseous substances into the Reservoirs, together with the right to construct, replace, inspect, repair, monitor, maintain, relocate, change the size of such surface or subsurface facilities on the Leased Premises that Lessee determines necessary or desirable for Lessee's storage operations, including, but not limited to fences, pipelines, tanks, reservoirs, electric and communication lines, roadways, underground facilities and equipment, surface facilities and equipment, buildings, structures and other such facilities and appurtenances. Lessor shall not grant any other person the right to inject or store CO<sub>2</sub> or any other incidental substances.

5. Facility Right of Ways/Compensation. Lessor grants Lessee the right of reasonable use of the surface of the Leased Premises, including without limitation, the rights of ingress and egress over the Leased Premises together with the right of way over, under and across the Leased Premises and the right from time to time to construct, replace, inspect, repair, monitor, maintain, relocate, change the size of such surface or subsurface facilities on the Leased Premises that Lessee determines necessary or desirable for Lessee's storage operations, including, but not limited to fences, pipelines, tanks, reservoirs, electric and communication lines, roadways, underground facilities and equipment, surface facilities and equipment, buildings, structures and other such facilities and appurtenances, (each a "Facility" and collectively the "Facilities"); *provided, however,* that (i) Lessee shall provide Lessor with notice of operations and an offer of damage, disruption and loss of production payments, as each may be applicable, prior to the installation of any such Facilities on the Leased Premises, and (ii) the agreed up terms, including the amount of damage payments to be paid to Lessor, shall be memorialized in an agreement separate from this Lease, such agreement to be consistent with the grant contained herein. Lessee shall be entitled to proceed with the installation of the Facilities while the separate agreement and amount of damage, disruption or loss is being agreed or determined. Lessee shall have the further right to fence the perimeter of any Facility on the Leased Premises and sufficiently illuminate the site for the safety and security of operations.

6. Amalgamation. Lessee, in its sole discretion, shall have the right and power, at any time and from time to time during the term of this Lease to pool, unitize, or amalgamate any reservoirs or subsurface pore spaces, stratum or strata underlying the Leased Premises with any other lands or interests into which such reservoirs or subsurface pore spaces extend and document such unit in accordance with applicable law or agency order. Amalgamated units shall be of such shape and dimensions as Lessee may elect and as are approved by the Commission. Amalgamated areas may include, but are not required to include, land upon which injection or extraction wells have been completed or upon which the injection and/or withdrawal of carbon dioxide and/or related gaseous substances has commenced prior to the effective date of amalgamation. In exercising its amalgamation rights under this Lease and if required by law, Lessee shall record or cause to be recorded a copy of the Commission's amalgamation order or other notice thereof in the county in which the amalgamated unit is located. Amalgamating in one or more instances shall, if approved by the Commission, not exhaust the rights of Lessee to amalgamate Reservoirs or portions of Reservoirs into other amalgamation areas, and Lessee shall have the recurring right to revise any amalgamated area formed under this Lease by expansion or contraction or both. Lessee may dissolve any amalgamated area at any time and document such dissolution by recording an instrument in accordance with applicable law or agency order. Lessee shall have the right to negotiate, on behalf of and as agent for Lessor, any unit, amalgamation, storage or operating agreements with respect to amalgamation of reservoir or pore space interests underlying the Leased Premises or the operation of any amalgamated areas formed under such agreements. To the extent any of the terms of such agreements conflict with the terms of this Lease, the terms of such agreements shall control, and the provisions of this Lease shall be deemed modified to conform to the terms, conditions, and provisions of any such agreements which are approved by the Commission.

7. Lessee Obligations. Lessee shall have no obligation, express or implied, to begin, prosecute or continue storage operations in, upon or under the Leased Premises, or store and/or sell or use all or any portion of the gaseous substances stored thereon. The timing, nature, manner and extent of Lessee's operations, if any, under this Lease shall be at the sole discretion of Lessee. All obligations of Lessee are expressed herein, and there shall be no covenants implied under this Lease, it being agreed that all amounts paid hereunder constitute full and adequate consideration for this Lease.

8. Ownership. Lessee shall at all times be the owner of (i) the carbon dioxide (CO<sub>2</sub>) and other gaseous substances stored in the Reservoirs or any reservoirs or subsurface pore spaces, stratum or strata unitized or amalgamated therewith, and (ii) all equipment, buildings, structures, facilities and other property constructed or installed by Lessee on the Leased Premises. Lessee shall have the right, but not the obligation, at any time during this Lease to remove all or any portion of the property or fixtures placed by Lessee on the Lease Premises. Notwithstanding the foregoing, title to the storage facility and to the stored CO<sub>2</sub> or other gaseous substances shall be transferred to the State of North Dakota upon issuance of a certificate of project completion by the Commission in accordance with Chapter 38-22 of the North Dakota Century Code.

9. Minerals, Oil and Gas. This Lease is not intended to grant or convey, nor does it grant or convey, any right to or obligation for Lessee to explore for or produce minerals, including oil and gas, that may exist on or under the Leased Premises.

10. Surrender of Leased Premises. Lessee shall have the right, but not the obligation, at any time from time to time to execute and deliver to Lessor a surrender and/or release covering all or any part of the Leased Premises for which the Reservoirs are not being utilized for storage as set forth herein, and upon delivery of such surrender and/or release to Lessor this Lease shall terminate as to such lands, and Lessee shall be released from all further obligations and duties as to the lands so surrendered and/or released, including, without limitation, any obligation to make payments provided for herein, except obligations accrued as of the date of the surrender and/or release. Lessee shall be able to surrender the any and or all of the Leased Premises if not utilizing the Reservoirs located thereunder.

11. Hold Harmless and Indemnification. The Lessee agrees to defend, indemnify, and hold harmless Lessor from any claims by any person that are a direct result of the Lessee's use of the Leased Premises or Reservoirs. Notwithstanding the foregoing, such indemnity/hold harmless obligation excludes (i) any claim or cause of action, or alleged or threatened claim or cause of action, damage, judgment, interest, penalty or other loss arising or resulting from the negligence or intentional acts of Lessor or Lessor's agents, invitees, or licensees; or third parties, and (ii) any claim for exemplary, punitive, special or consequential damages claimed by Lessor. Lessee further accepts liability and indemnifies Lessor for reasonable costs, expenses and attorneys' fees incurred in establishing and litigating the indemnification coverage provided above. The legal defense provided by Lessee to the Lessor under this paragraph must be free of any conflicts of interest even if this requires Lessee to retain separate legal counsel for Lessor.

12. Hazardous Substances. Lessee shall have no liability for any regulated hazardous substances located on the Leased Premises prior to the Effective Date or placed in, on or about the Leased Premises by Lessor or any third-party on or after the Effective Date, and nothing in this Lease shall be construed to impose upon Lessee any obligation for the removal of such regulated hazardous substances. As used herein, "hazardous substances" shall have the meaning set forth in the Comprehensive Environmental Response Compensation and Liability Act (CERCLA) and any amendments thereto, or any other local, state or federal statutes.

13. Termination. A material violation or default of any terms of this Lease by Lessee shall be grounds for termination of the Lease. Lessor shall give Lessee written notice of violation or default and Lessee shall have sixty (60) days after receipt of said notice to substantially cure such violations or defaults. If Lessee fails to substantially cure such violations or defaults within the 60-day cure period, Lessor may terminate the Lease; provided that if it is not possible to cure such violations or defaults within the 60-day cure period, Lessee shall have a reasonable longer period of time to cure such violations or defaults provided it commences cure within the initial 60-day cure period and thereafter diligently pursues such cure. Lessee may terminate the lease with thirty (30) days written notice to Lessor. Upon termination of this Lease, Lessee shall have one hundred eighty (180) days to remove all facilities and property of Lessee located on the Leased Premises. For the avoidance of doubt, Lessee shall not be required to remove any CO<sub>2</sub> or other incidental gaseous substances injected into the Reservoirs.

14. Taxes. Lessee shall pay all taxes, if any, levied against its personal property or on its improvements to the Leased Premises. Lessor shall pay for all real estate taxes and other assessments levied upon the Leased Premises. Lessee shall have the right to pay all taxes, assessments and other fees on behalf of Lessor and to deduct the amount so paid from other payments due to Lessor hereunder.

15. Conduct of Operations. In conducting its operations hereunder, Lessee shall use its best efforts to comply with all applicable laws, rules and regulations and ordinances pertaining thereto. Lessee reserves and shall have the right to challenge and/or appeal any law, ruling, regulation, order or other determination and to carry on its operations in accordance with Lessee's interpretation of the same, pending final determination.

16. Force Majeure. Should Lessee be prevented from complying with any express or implied covenant of this Lease or from utilizing the Lease Premises for underground storage purposes by reason of scarcity of or an inability to obtain or to use equipment or material or failure or breakdown of equipment, or by operation of force majeure, any federal or state law or any order, rule or regulation of governmental authority, then while so prevented, Lessee's obligation to comply with such covenant shall be suspended and the primary term of this Lease shall be extended while and so long as Lessee is prevented by any such cause from utilizing the property for underground storage purposes and the time while Lessee is so prevented shall not be counted against Lessee, anything in this Lease to the contrary notwithstanding.

17. Surface Damage Compensation. The bonus and royalty amounts contemplated and paid to Lessor hereunder is compensation for, among other things, damages sustained by Lessor for lost land value, lost use of and access to Lessor's land and lost value of improvements, if any and to the extent applicable. Subject to Lessee's obligation to compensate Lessor for the installation of any Facilities on the Leased Premises pursuant to Section 5 of this Agreement, Lessor agrees that such compensation is just and adequate for any and all such damages and all other damages which Lessor may sustain as a result of Lessee's use of the property for its storage operations.

18. Warranty of Title and Quiet Enjoyment. Lessor represents and warrants to Lessee that Lessor is the owner of the surface of the Leased Premises and the pore space located thereunder. Lessor hereby warrants and agrees to defend title to the Leased Premises and the pore space located thereunder and Lessor hereby agrees that Lessee, at its option, shall have the right to discharge any tax, mortgage, or other lien upon the Leased Premises, and in the event Lessee does so, Lessee shall be subrogated to such lien with the right to enforce the same and apply royalty payments or any other payments due to Lessor toward satisfying the same.

Lessor warrants that, except as disclosed to Lessee in writing, there are no liens, encumbrances, leases, mortgages, deeds of trust, options, or other exceptions to Lessor's fee title ownership of the Leased Premises (collectively, "Liens") which are not recorded in the public records of the County in which the Leased Premises is located. Lienholders (including tenants), whether or not their Liens are recorded, shall be Lessor's responsibility, and Lessor shall cooperate with Lessee to obtain a non-disturbance agreement from each party that holds a Lien (recorded or unrecorded) that might interfere with Lessee's rights under this Lease. A non-disturbance agreement is an agreement between Lessee and a lienholder which provides that the lienholder shall not disturb Lessee's possession or rights under the Lease or terminate this Lease so long as Lessor is not entitled to terminate this Lease under the provisions hereof.

Lessor shall have the quiet use and enjoyment of the Leased Premises in accordance with the terms of this Lease. Lessor's activities and any grant of rights Lessor makes to any person or entity, whether located on the Leased Premises or elsewhere, shall not, currently or prospectively, materially interfere with activities permitted hereunder. If Lessor has any right to select, determine, prohibit or control the location of sites for drilling, exploitation, production and/or exploration of minerals, hydrocarbons, water, gravel, or any other similar resource in, to or under the Lease Premises, then Lessor shall exercise such right so as to minimize interference with any of the foregoing.

19. Environmental Incentives and Tax Credits. Lessee shall be the owner of (i) any and all credits, benefits, emissions reductions, offsets, and allowances, howsoever entitled, attributable to Lessee's geologic storage operations, including any avoided emissions and the reporting rights related to these avoided emissions, such as 26 U.S.C. §45Q Tax Credits, and any other attributes of Lessee's ownership of the Facilities and Lessee's geologic storage operations ("Environmental Attributes"), and (ii) any and all credits, rebates, subsidies, payments or other incentives that relate to the use of technology incorporated into Lessee's geologic storage operations, environmental benefits of such operations, or other similar programs available from any regulated entity or any governmental authority ("Environmental Incentives"). Lessee is further entitled to the benefit of any and all (a) investment tax credits, (b) production tax credits, (c) credits under 26 U.S.C. §45Q credits, and (d) similar tax credits or grants under federal, state or local law relating to Lessee's geologic storage operations ("Tax Credits"). Lessor shall (i) cooperate with Lessee in obtaining,

securing and transferring all Environmental Attributes and Environmental Incentives and the benefit of all Tax Credits, and (ii) shall allow Lessee to take any actions necessary to install additional equipment on the Facilities to comply with all monitoring and reporting obligations, and allow Lessee's personnel to enter the premises and collect any data Lessee requires to satisfy its obligations required in connection with obtaining Tax Credits and Environmental Attributes. Lessor shall not be obligated to incur any out-of-pocket costs or expenses in connection with such actions unless reimbursed by Lessee. If any Environmental Incentives are paid directly to Lessor, Lessor shall immediately pay such amounts over to Lessee.

20. Assignment. The rights of either Party hereto may be assigned in whole or part. The assigning party shall provide written notice of any assignment within sixty (60) days after such assignment has become effective; *provided, however*, that an assigning party's failure to deliver written notice of assignment within such 60-day period shall not be deemed a breach of this Lease unless such failure is willful and intentional. The Lessor's consent shall not be required for an assignment by the Lessee of this Lease, whether by way of a collateral assignment to its financiers or otherwise.

21. Change of Ownership. No change of ownership in the Leased Premises shall be binding on the Lessee for purpose of making payments to Lessor hereunder until the date Lessor, or Lessor's successors or assigns, furnishes Lessee the recorded original or a certified copy of the instrument evidencing the change in ownership. The Lessor's consent shall not be required for a change in the direct or indirect control of the Lessee.

22. Notices. All notices required to be given under this Lease shall be in writing and addressed to the respective Party at the addresses set forth at the beginning of this Lease unless otherwise directed by either Party.

23. No Waiver. The failure of either Party to insist in any one or more instances upon strict performance of any of the provisions of this Lease or to take advantage of any of its rights hereunder shall not be construed as a waiver of any such provision or the relinquishment of any such rights, but the same shall continue and remain in full force and effect.

24. Notice of Lease. This Lease shall not be recorded in the real property records. Lessee shall cause a memorandum of this Lease to be recorded in the real property records of the county in which the Leased Premises are situated.

25. Confidentiality. Lessor shall maintain in the strictest confidence, for the benefit of Lessee, all information pertaining to the compensation paid under this Lease, any information regarding Lessee and its business or operations on the Leased Premises or on any other lands, the capacity and suitability of any Reservoir or reservoirs and subsurface pore spaces, stratum or strata unitized or amalgamated therewith, and any other information that is deemed proprietary or that Lessee requests or identifies to be held confidential, in each such case whether disclosed by Lessee or discovered by Lessor.

26. Counterparts. This Lease may be executed in any number of counterparts, each of which, when executed and delivered, shall be an original, but all of which shall collectively constitute one and the same instrument.

27. Severability. If any provision of this Lease is found to be invalid, illegal, or unenforceable in any respect, such provision shall be deemed to be severed from this Agreement, and the validity, legality and enforceability of the remaining provisions contained herein shall not in any way be affected or impaired thereby.

28. Governing Law. This Lease shall be governed by, construed, and enforced in accordance with the laws of the State of North Dakota and the Parties hereby submit to the jurisdiction of the state or federal courts located in the State of North Dakota.

29. Further Assurances. Each Party will execute and deliver all documents, provide all information, and take or forbear from all actions as may be necessary or appropriate to achieve the purposes of this Lease, including without limitation executing a memorandum of this Lease and all documents required to obtain any necessary government approvals.

30. Entire Agreement. This Lease constitutes the entire agreement between the Parties and supersedes all prior negotiations, undertakings, notices, memoranda and agreement between the Parties, whether oral or written, with respect to the subject matter hereof. This Lease may only be amended or modified by a written agreement duly executed by Lessor and Lessee.

31. Cooperation with Financiers. The Lessor hereby acknowledges and consents that Lessee may grant a collateral assignment or leasehold mortgage of Lessee's rights under this Lease to Lessee's debt financiers, it being understood that such collateral assignment or leasehold mortgage would only encumber the leasehold interest created hereunder.

32. Favored Nations. If, at any time within the twelve (12) month period following the Effective Date, Lessee enters into a pore space lease agreement with a third party landowner covering any part of Lessee's storage facility ("Third-Party Lease"), and if any of the payments specified in the Third-Party Lease would have been more favorable to Lessor had Lessor executed a lease agreement similar to the Third-Party Lease, then Lessor and Lessee will amend this Lease so that it reflects compensation terms similar to the Third-Party Lease, and Lessee will pay to Lessor the additional compensation, if any, that Lessor would have been paid had Lessor signed a lease agreement similar to the Third-Party Lease. For the purposes of this Section 32, "Lessee's storage facility" shall mean any storage facility (as such term is defined in ch. 38-22 of the North Dakota Century Code) operated by Lessee within a ten (10) mile radius of the Leased Premises which is subject to a permit is issued by the Commission pursuant to ch. 38-22 of the North Dakota Century Code.

33. Electronic Signatures. This Lease, and any amendments hereto, to the extent signed and delivered by means of electronic transmission in portable document format (pdf) or by DocuSign or similar electronic signature process, shall be treated in all manner and respects as an original contract and shall be considered to have the same binding legal effect as if it were the original signed version thereof delivered in person.

34. Insurance. Lessee shall obtain and maintain in force commercial general liability insurance covering the Facilities and Lessee's activities on the Leased Premises at all times during the term of this Lease, with a minimum occurrence and aggregate limit of one million dollars (\$1,000,000). Such insurance coverage for the Facilities and Leased Premises may be provided as part of a blanket policy that covers other Facilities or properties as well. Any such policies shall include Lessor as an additional insured. Lessee, or its insurer, shall provide thirty (30) days prior written notice (except ten (10) days for nonpayment of premium) to Lessor of any cancellation. Lessee shall provide Lessor with copies of certificates of insurance evidencing this coverage upon request by Lessor.

IN WITNESS WHEREOF, the Parties have executed this Lease effective for all purposes as of the Effective Date.

## **EXHIBIT B**

### **Royalty Escalation Provision**

This Lease is subject to a Royalty Escalation. The royalty shall increase TEN percent (10.0%) on January 1, 2026, and an additional TEN percent (10.0%) every five years thereafter. For the avoidance of doubt, the royalty to be paid is calculated below:

<u>Date:</u>	<u>Royalty Rate:</u>
Beginning January 1, 2026	\$0.550

**SECTION 2.0**

**GEOLOGIC EXHIBITS**

## 2.0 GEOLOGIC EXHIBITS

### 2.1 Overview of Project Area Geology

TB Leingang is situated approximately 16 miles south of Beulah, North Dakota (Figure 2-1). This project site is on the eastern flank of the Williston Basin.

Overall, the stratigraphy of the Williston Basin has been well studied, particularly the numerous oil-bearing formations. Through research conducted by the Energy & Environmental Research Center (EERC) via the Plains CO<sub>2</sub> Reduction (PCOR) Partnership, the Williston Basin has been identified as an excellent candidate for long-term CO<sub>2</sub> storage due, in part, to the thick sequence of clastic and carbonate sedimentary rocks and subtle structural character and tectonic stability of the basin (Peck and others, 2014; Glazewski and others, 2015).

The CO<sub>2</sub> storage reservoir for this project is the Broom Creek Formation, a predominantly sandstone formation 5818 ft below kelly bushing (KB) elevation at the stratigraphic and reservoir-monitoring well (Milton Flemmer 1, NDIC File No. 38594) (Figure 2-2). Unconformably overlying the Broom Creek Formation is 231 ft of predominantly siltstone with interbedded dolostone and anhydrite of the Spearfish, Minnekahta, and Opeche Formations, hereinafter referred to as the Opeche/Spearfish Formation. The Minnekahta Formation (limestone) is used to distinguish between the Spearfish Formation (above) and Opeche Formation (below). The Minnekahta Formation is interpreted to pinch out within the storage facility area. Where the Minnekahta does not exist, because of the similarity in lithology between the two formations, the Opeche and Spearfish are undifferentiated. The Opeche/Spearfish Formation serves as the primary upper confining zone (Figure 2-2). The Amsden Formation (dolostone, anhydrite, sandstone) unconformably underlies the Broom Creek Formation and serves as the lower confining zone (Figure 2-2). Together, the Opeche/Spearfish, Broom Creek, and Amsden Formations comprise the storage complex for TB Leingang (Table 2-1).

Including the Opeche/Spearfish Formation, there are 1082 ft (thickness in Milton Flemmer 1) of impermeable rock formations between the Broom Creek Formation and the next overlying permeable zone, the Inyan Kara Formation. An additional 2670 ft (thickness at Milton Flemmer 1) of impermeable intervals separates the Inyan Kara Formation and the lowest underground source of drinking water (USDW), the Fox Hills Formation (Figure 2-2).

# TB LEINGANG/MILTON FLEMMER 1

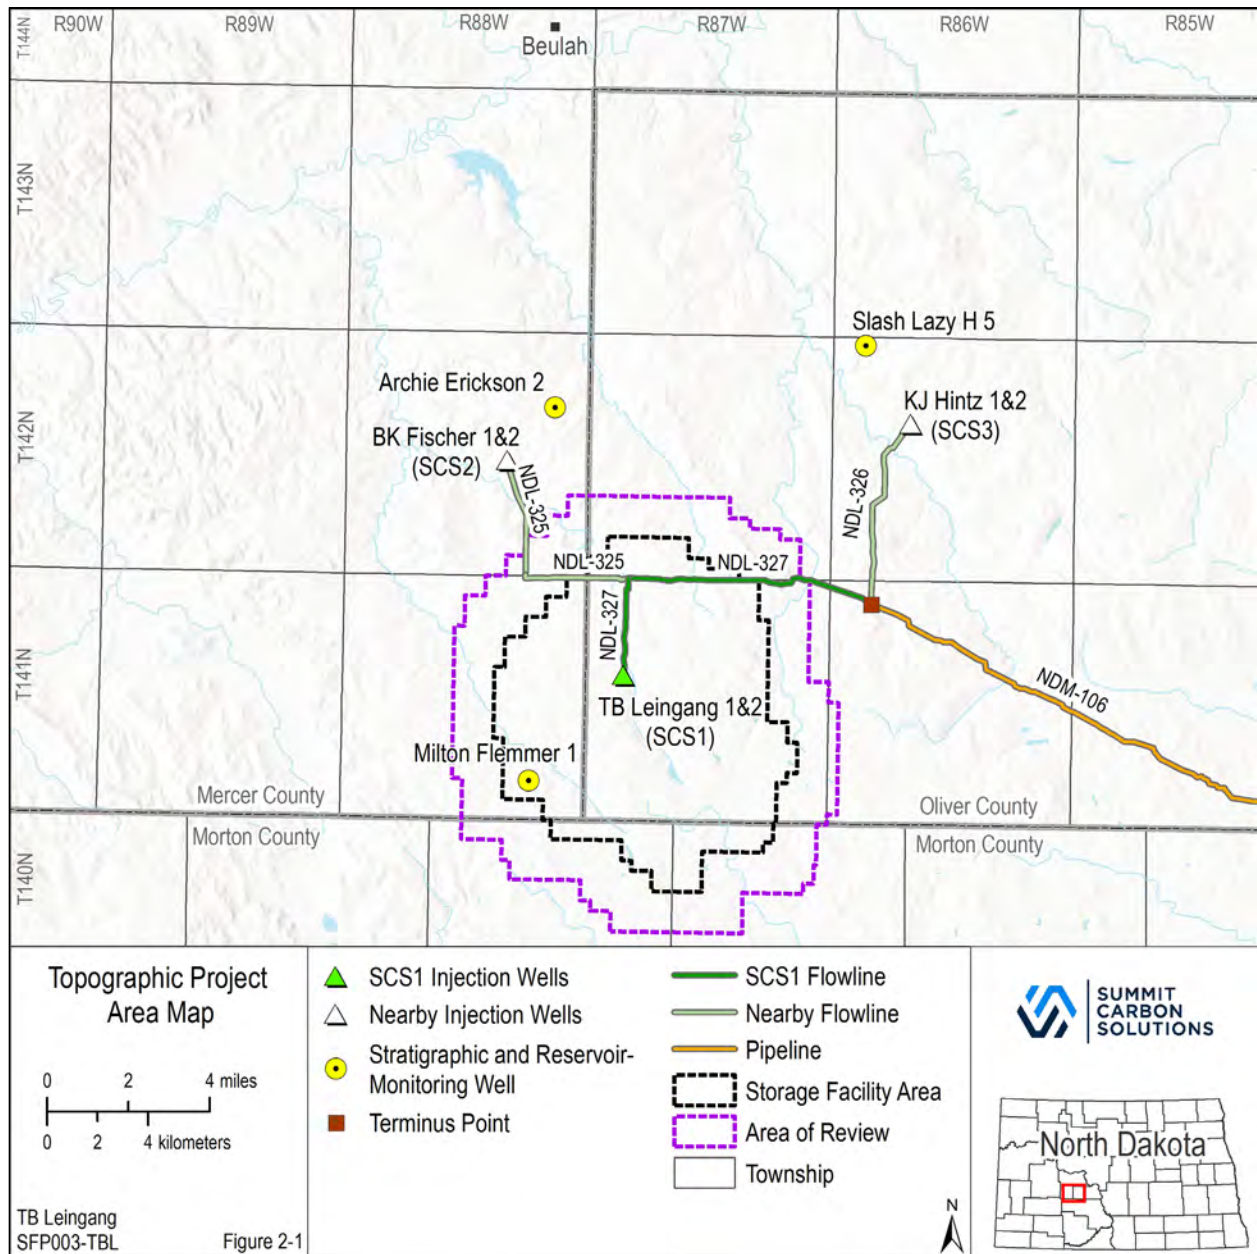

Figure 2-1. Topographic map showing well locations and TB Leingang in relation to the city of Beulah, North Dakota.

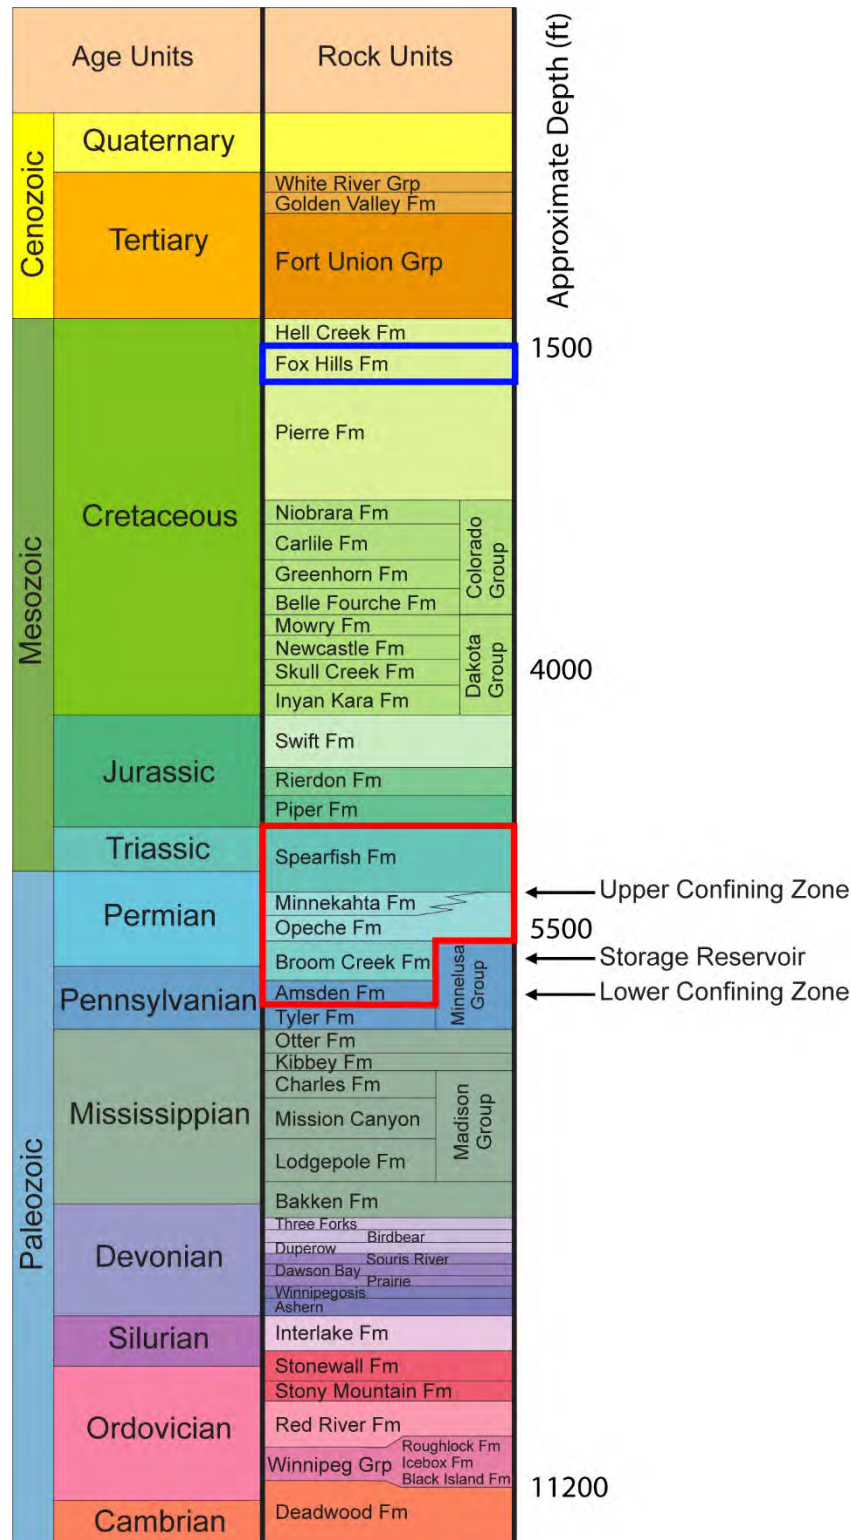

Figure 2-2. Stratigraphic column identifying the storage reservoir and confining zones (outlined in red) and the lowest USDW (outlined in blue). The Minnekahta Formation occurs at the stratigraphic test and reservoir-monitoring well location (Milton Flemmer 1) but pinches out within the simulation model area shown in Figure 2-3.

**Table 2-1. Formations Comprising the TB Leingang Storage Complex  
(simulation model values calculated from model extent shown in Figure 2-3)**

<b>Formation</b>	<b>Purpose</b>	<b>Thickness at Milton Flemmer 1, ft</b>	<b>Depth at Milton Flemmer 1, ft, MD*</b>	<b>Average Simulation Model Thickness, ft</b>	<b>Average Simulation Model Depth, ft, TVD**</b>	<b>Lithology</b>
Opeche/ Spearfish	Upper Confining Zone	231	5587	138	5106	Siltstone, dolostone anhydrite
Broom Creek	Storage reservoir (i.e., injection zone)	342	5818	280	5244	Sandstone, dolostone, anhydrite, siltstone
Amsden	Lower confining zone	261	6160	257	5524	Dolostone, sandstone, anhydrite

\* Measured depth.

\*\* True vertical depth.

## 2.2 Data and Information Sources

Several sets of data were used to characterize the injection and confining zones to establish their suitability for the storage and containment of injected CO<sub>2</sub>. Data sets used for characterization included both existing data (e.g., from published literature, publicly available databases, purchased/leased digital well logs, existing 3D and 2D seismic) and site-specific data acquired specifically to characterize the storage complex.

### 2.2.1 Existing Data

Well log data and interpreted formation top depths from 115 wellbores within the 4070-mi<sup>2</sup> (74-mi × 55-mi) area covered by the geologic model were used to characterize the depth, thickness, and extent of the subsurface geologic formations (Figure 2-3). Seismic interpretation products (seismic horizons and acoustic impedance volumes) from legacy 3D seismic data and 2D seismic data shown in Figure 2-3 were used to support generation of the 3D geologic model.

In addition to data from Milton Flemmer 1, existing laboratory measurements for core samples from the Broom Creek Formation and its confining zones were available from nine additional wells: ANG 1 (ND-UIC-101), Flemmer 1 (NDIC File No. 34243), BNI 1 (NDIC File No. 34244), J-LOC 1 (NDIC File No. 37380), Liberty 1 (NDIC File No. 37672), MAG 1 (NDIC File No. 37833), Coteau 1 (NDIC File No. 38379), Archie Erickson 2 (NDIC File No. 38622), and Slash Lazy H 5 (NDIC File No. 38701) (Figure 2-4). These measurements were compiled and used to establish relationships between measured petrophysical characteristics and estimates from well log data and were integrated with newly acquired site-specific data.

## TB LEINGANG/MILTON FLEMMER 1

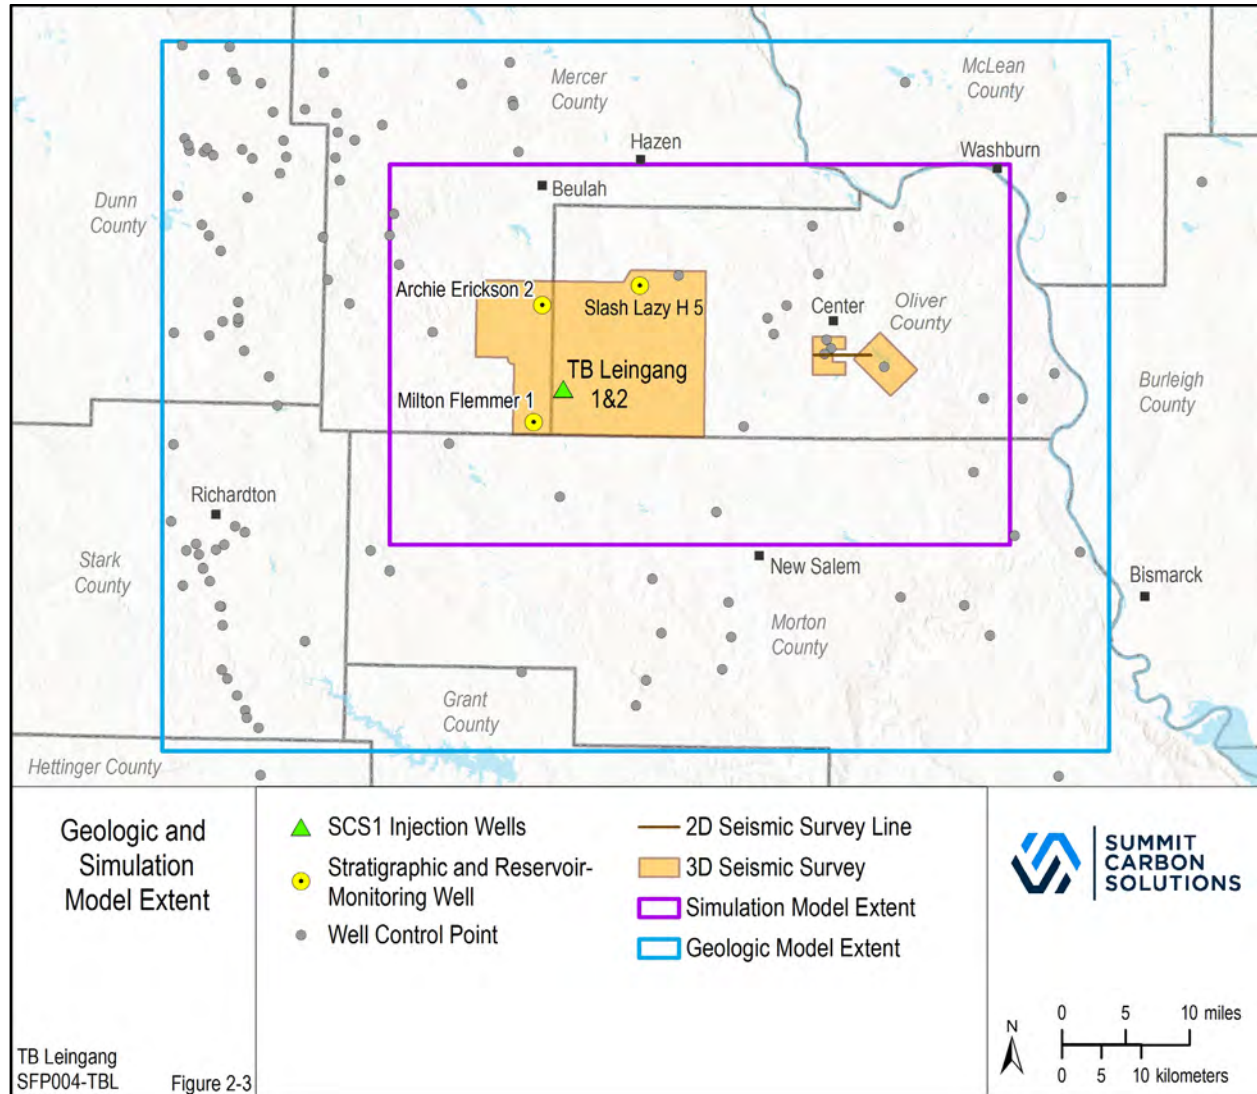

Figure 2-3. Map showing the extent of the regional geologic model, distribution of well control points, 2D and 3D seismic, and extent of the simulation model. The wells shown penetrate the storage reservoir and the upper and lower confining zones.

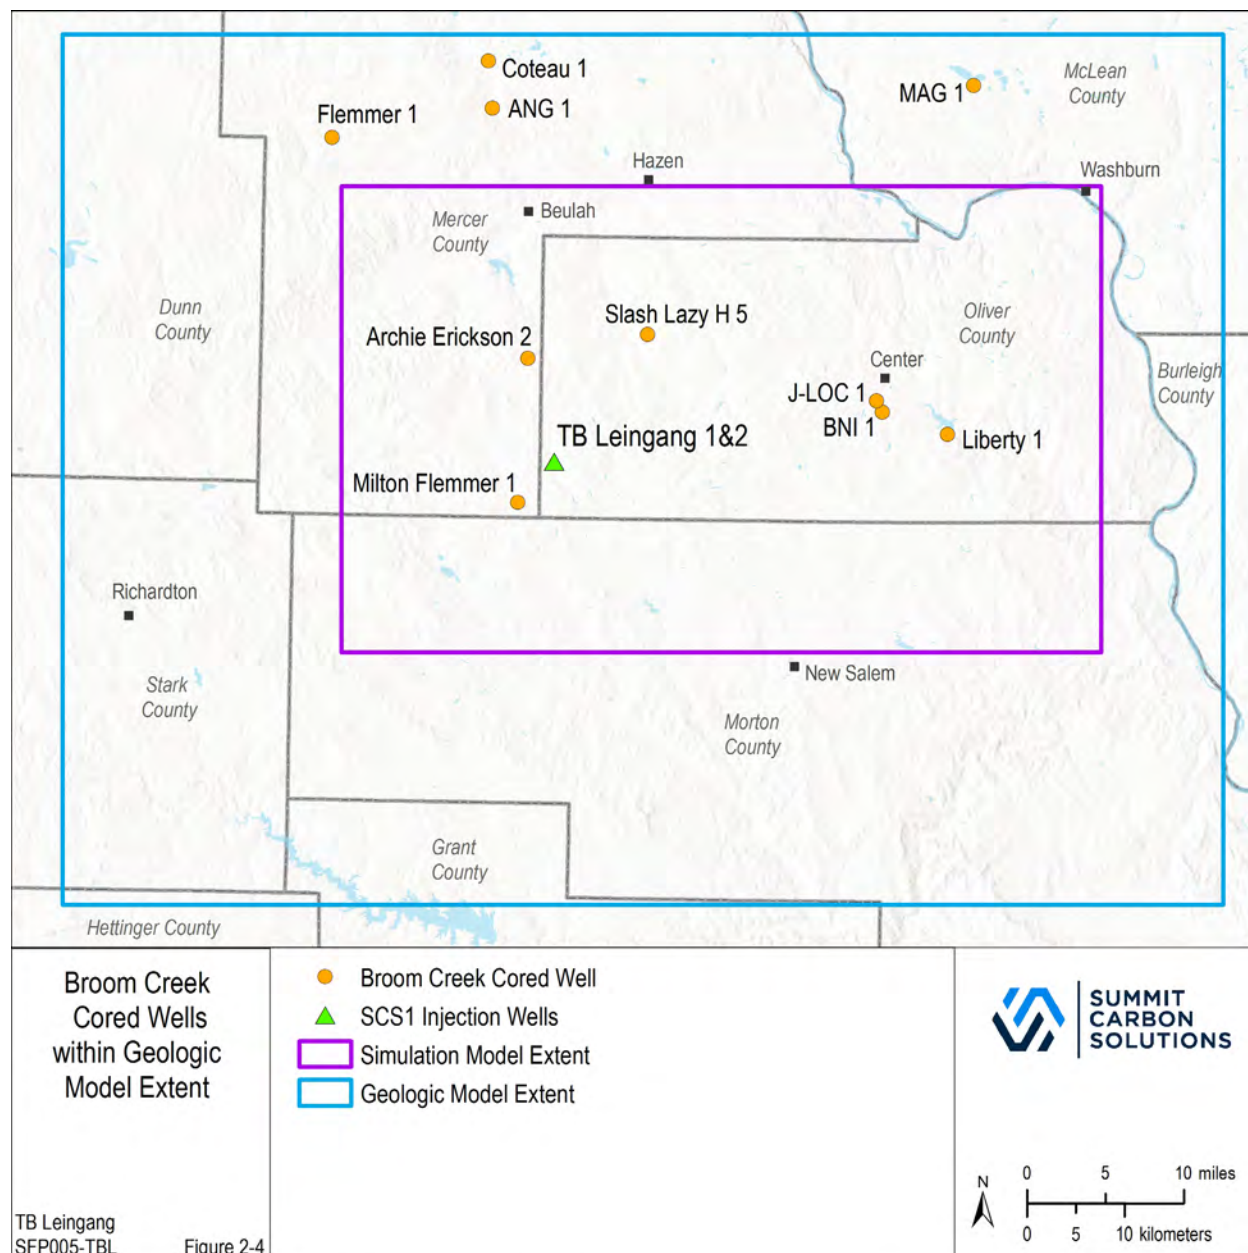

Figure 2-4. Map showing the spatial relationship between TB Leingang and ten wells where core samples were collected from the formations comprising the storage complex.

### 2.2.2 Site-Specific Data

Site-specific efforts to characterize the storage complex generated multiple data sets, including geophysical well logs, petrophysical data, fluid analyses, whole core, and 3D seismic data. Milton Flemmer 1 was drilled to a depth of 12,009 ft in 2022, specifically to gather subsurface geologic data to support the development of this CO<sub>2</sub> storage facility permit (SFP) application and serve as a future CO<sub>2</sub> reservoir-monitoring well. Downhole logs were acquired, and cores were collected from the associated storage complex (Opeche/Spearfish, Broom Creek, and Amsden Formations). Broom Creek Formation stress tests, a fluid sample, and temperature and pressure measurements were collected in the Milton Flemmer 1 (Figure 2-5).

# TB LEINGANG/MILTON FLEMMER 1

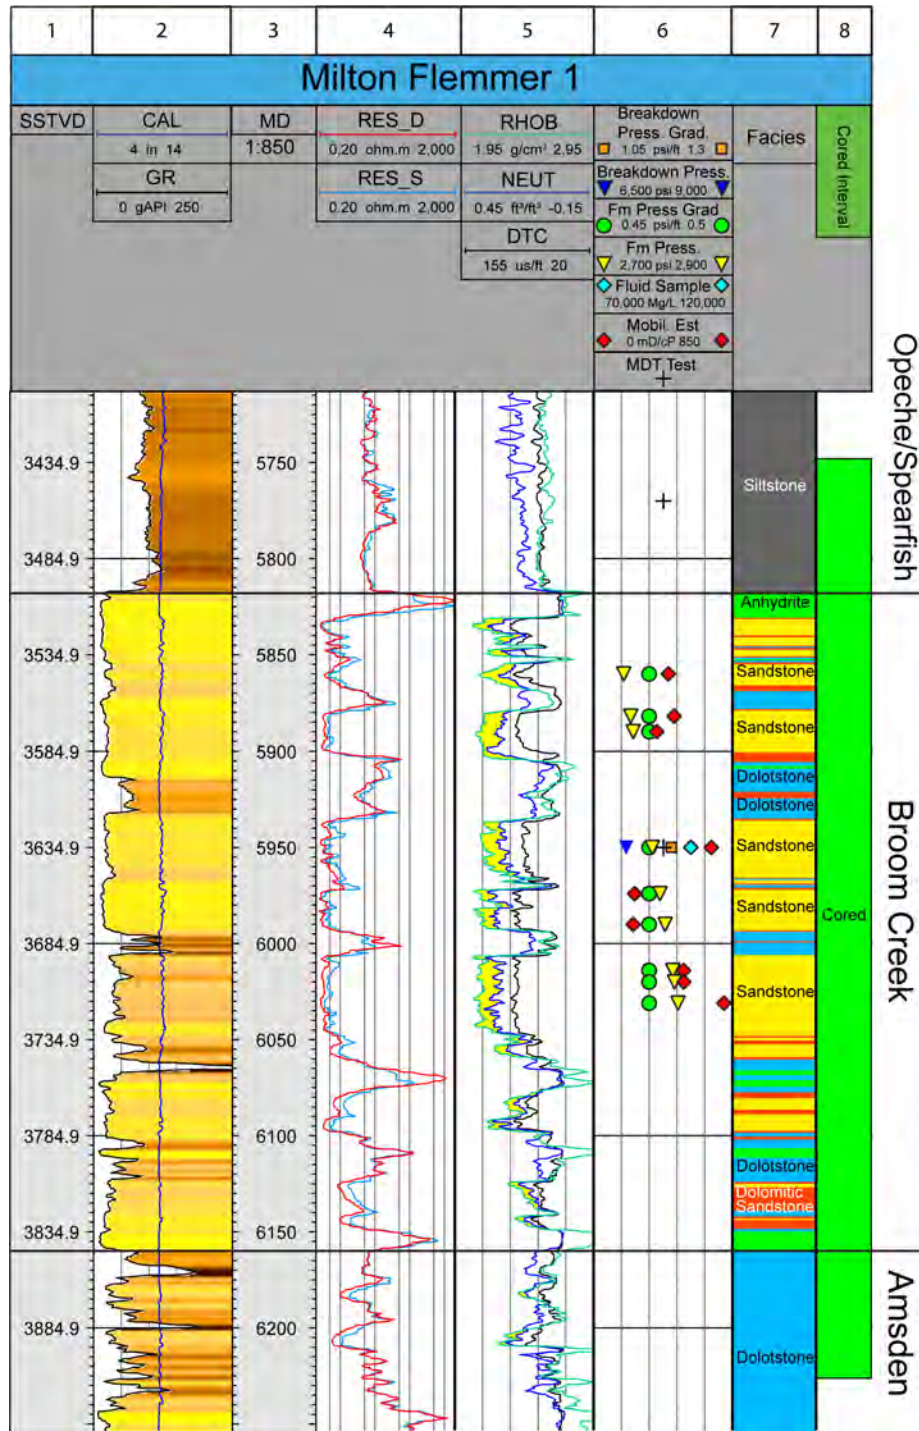

Figure 2-5. Schematic showing vertical relationship of coring and testing intervals in the Opeche/Spearfish Formation, the Broom Creek Formation, and the Amsden Formation in Milton Flemmer 1. Tracks from left to right are 1) subsea true vertical depth (SSTVD); 2) gamma ray (GR or HSGR [standard (total) gamma ray]) (black) and caliper (dark blue); 3) MD (measured depth); 4) resistivity – deep (red) and resistivity – shallow (light blue); 5) delta time (black), neutron porosity (NEUT) (blue), and density (green); 6) testing intervals; 7) facies; and 8) cored interval.

Site-specific and existing data were used to assess the suitability of the storage complex for safe and permanent storage of CO<sub>2</sub>. Site-specific data were also used as inputs for geologic model construction (Section 3.0), numerical simulations of CO<sub>2</sub> injection (Section 3.0), geochemical simulation (Appendix C), and geomechanical information (Section 2.4). The site-specific data improved the understanding of the subsurface and directly informed the selection of monitoring technologies, development of the timing and frequency for monitoring data collection, and interpretation of monitoring data with respect to potential subsurface risks. Furthermore, these data guided and influenced the design and operation of site equipment and infrastructure.

#### *2.2.2.1 Geophysical Well Logs*

Openhole wireline geophysical well logs were acquired in Milton Flemmer 1. The logging suite included triple combo (GR, density, porosity, and resistivity), caliper, spectral GR, combinable magnetic resonance (CMR), elemental capture spectroscopy (ECS), dipole sonic including four-arm caliper and inclinometer, and an image log.

The acquired well logs were used to pick formation top depths and interpret lithology, petrophysical properties, and time-to-depth shifting of seismic data. Formation top depths were picked from the Pierre Formation to the base of the Deadwood Formation (Figure 2-2). The site-specific formation top depths were added to the existing data of the 115 wellbores within the 4070-mi<sup>2</sup> area covered by TB Leingang to understand the geologic extent, depth, and thickness of the subsurface geologic strata. Formation top depths of the Opeche/Spearfish, Broom Creek, and Amsden Formations were interpolated to create structural surfaces which served as inputs for the 3D geologic model construction.

#### *2.2.2.2 Core Sample Analyses*

Four hundred seventy-eight (478) ft of 4-in. whole core was recovered from the storage complex in the Milton Flemmer 1: 77 ft of core from the Opeche/Spearfish Formation, 342 ft of core from the Broom Creek Formation, and 59 ft of core from the Amsden Formation. Core was analyzed to characterize the lithologies of the Opeche/Spearfish, Broom Creek, and Amsden Formations and correlated to the well log data. A core gamma ray log was acquired and matched to wireline gamma ray-to-depth correct core depth measurements (Table 2-2a). Core analyses included porosity and permeability measurements, x-ray diffraction (XRD), x-ray fluorescence (XRF), thin-section analysis, scanning electron microscopy (SEM), interfacial tension (IFT) and contact angle (CA), geomechanics, and capillary entry pressure measurements. The results were used to inform geologic modeling and predictive simulation inputs and assumptions, geochemical modeling, and geomechanical modeling.

**Table 2-2a. Core Depth Shift**

<b>Core No.</b>	<b>Start Bit Depth, ft</b>	<b>End Bit Depth, ft</b>	<b>Depth Shift, ft</b>
Core 6	5748	5828	-7.00
Core 7	5828	5948	-7.00
Core 8	5948	6010	-8.00
Core 9	6010	6130	-7.00
Core 10	6130	6227	-7.00

Core depth + depth shift = log depth.

### 2.2.2.3 Formation Temperature and Pressure

Temperature measurements from Milton Flemmer 1 were used to derive a temperature gradient for the proposed injection site (Table 2-2b). In combination with depth, the temperature property was used primarily to inform predictive simulation inputs and assumptions. Temperature data were also used as inputs for geochemical modeling.

Formation pressure testing at Milton Flemmer 1 was performed with the SLB (formerly Schlumberger) MDT (modular formation dynamics tester) tool. The MDT tool's formation pressure measurements from the Broom Creek Formation are included in Table 2-3. The calculated pressure gradients were used to model formation pressure profiles for use in the numerical simulations of CO<sub>2</sub> injection.

**Table 2-2b. Description of Milton Flemmer 1 Temperature Measurements and Calculated Temperature Gradients**

Formation	Sensor Depth MD, ft	Sensor Depth TVD, ft	Temperature, °F
Opeche/Spearfish	5771.02	5770.82	—*
Broom Creek	5860.03	5859.81	132.7
	5882.02	5881.80	134.7
	5890.08	5889.86	136.2
	5950.02	5949.79	137.9
	5974.04	5973.81	139.4
	5990.06	5989.83	140.4
	6014.00	6013.77	141.2
	6020.00	6019.77	141.9
	6031.02	6030.78	142.6
Mean Broom Creek Temperature, °F			138.56
Broom Creek Temperature Gradient, °F/ft			0.017**

\* Dry test. Temperature measurement is unreliable because it was impacted by tool temperature rather than fluid.

\*\* The temperature gradient is an average of the measured temperature minus the average annual surface temperature (40°F), divided by the associated test TVD depth.

**Table 2-3. Description of Milton Flemmer 1 Formation Pressure Measurements and Calculated Pressure Gradients**

<b>Formation</b>	<b>Sensor Depth MD, ft</b>	<b>Sensor Depth TVD, ft</b>	<b>Sensor Formation Pressure, psia</b>
Opeche/Spearfish	5771.02	5770.82	—*
Broom Creek	5860.03	5859.81	2743.45
	5882.02	5881.80	2753.45
	5890.08	5889.86	2757.04
	5950.02	5949.79	2784.61
	5974.04	5973.81	2795.56
	5990.06	5989.83	2802.94
	6014.00	6013.77	2814.05
	6020.00	6019.77	2816.57
	6031.02	6030.78	2821.66
Mean Broom Creek Pressure, psi			2787.70
Broom Creek Pressure Gradient, psi/ft			0.466**

\* Dry test. No fluid was withdrawn because of low permeability.

\*\* The pressure gradient is an average of the sensor-measured pressures minus standard atmospheric pressure at 14.7 psi, divided by the associated test TVD depth.

#### *2.2.2.4 Microfracture In Situ Stress Tests*

Using the SLB MDT tool, microfracture in situ stress tests were performed in the Milton Flemmer 1 wellbore. As shown in Figures 2-6 and 2-7, in situ reservoir stress-testing measurements provided real-time formation breakdown, instantaneous shut-in, propagation, and closure pressures.

Figure 2-6. Milton Flemmer 1, Broom Creek Formation MDT microfracture in situ stress pump cycle graph at 5949.98 ft MD.

Figure 2-7. Milton Flemmer 1, Opeche/Spearfish Formation MDT microfracture in situ stress pump cycle graph at 5770.99 ft MD. No clear breakdown was observed.

Microfracture in situ stress tests were performed in the Opeche/Spearfish and Broom Creek Formations (Table 2-4). The use of the dual-packer module on the MDT tool assembly to isolate the designated intervals tested a 1.5-ft section of the zone of interest. This small representative sample should be taken into consideration in the analysis of the pressures. Fracture propagation pressures determined from the microfracture test were used to calculate pressure constraints related to the maximum allowable bottomhole pressure (BHP) and a 1D mechanical earth model (1D MEM) that was generated using well log data from Milton Flemmer 1. Discussion of the 1D MEM can be found in Section 2.4.

**Table 2-4. Description of Milton Flemmer 1 Microfracture In Situ Stress Tests**

Formation	Test Depth		Breakdown Pressure		Propagation Pressure		Closure Pressure (G-func)
	MD, ft	TVD, ft	psia	Gradient, psi/ft*	Avg., psia	Gradient, psi/ft*	Avg., psia Gradient, psi/ft*
Opeche/Spearfish	5770.99	5770.79	No observed formation breakdown.		4768.79	0.82**	4287.72 0.740
Broom Creek	5949.98	5949.75	7087.75	1.19	4287.52	0.718	4047.35 0.678

\* The pressure gradient is an average of the sensor-measured pressures minus standard atmospheric pressure at 14.7 psi, divided by the associated test depth.

\*\* Propagation observed in Opeche/Spearfish is likely associated with a drilling-induced fracture.

No breakdown pressure was observed for Milton Flemmer 1 in the Opeche/Spearfish Formation at 5770.99 ft MD, Figure 2-7. The MDT stress test results show that the average formation fracture propagation pressure observed was 4768.79 psi, providing a fracture propagation pressure gradient of 0.82 psi/ft. The result indicates that the cap rock has a higher fracture propagation pressure than the injection zone (0.718 psi/ft), which means that the cap rock has good integrity to contain the injected CO<sub>2</sub>.

#### 2.2.2.5 Fluid Sample Testing

A fluid sample from the Inyan Kara Formation was collected from the Milton Flemmer 1 wellbore during the DST (drill stem test). A fluid sample from the Broom Creek Formation was collected using SLB's Saturn 3D Radial Probe. Results were analyzed by Minnesota Valley Testing Laboratories (MVTL), a state-certified lab. The salinity values from the Milton Flemmer 1 wellbore sample are shown in Table 2-5. A more detailed fluid sample analysis report can be found in Appendix A. Fluid sample analysis results were used as inputs for geochemical modeling and dynamic reservoir simulations.

**Table 2-5. Description of Fluid Sample Test and Corresponding Total Dissolved Solids (TDS) Value**

Formation	Well	Test Depth/Interval, ft MD	MVTL TDS, mg/L
Inyan Kara	Milton Flemmer 1	4480–4781	3560
Broom Creek	Milton Flemmer 1	5950	105,000

In situ fluid pressure testing was performed in the Opeche/Spearfish and Broom Creek Formations with the MDT tool. This test utilized the tool's extra-large-diameter probe to test both the mobility and reservoir pressure. The MDT probe was unable to draw down reservoir fluid from the Opeche/Spearfish Formation in order to determine the reservoir pressure or to collect an in situ fluid sample, and the formation was unable to rebound (build pressure) because of low to almost zero permeability. The testing results provide further evidence of the confining properties of the Opeche/Spearfish Formation, ensuring sufficient geologic integrity to contain the injected CO<sub>2</sub> stream.

#### 2.2.2.6 *Seismic Survey*

A 208-square-mile 3D seismic survey was conducted from November 2021 to February 2022 south of Beulah, North Dakota (Figure 2-8). The Beulah 3D seismic data provided visualization of deep geologic formations at lateral-spatial intervals as short as 82.5 ft. Additionally, seismic data from nearby 3D surveys to the east, namely, the Center 3D and Minnkota 3D, and a connecting 2D line were used to interpret and evaluate the subsurface (Figure 2-8). The seismic data were used for assessment of the geologic structure and reservoir properties.

Data products generated from the interpretation of the Beulah 3D were used as inputs for the geologic model that was used to simulate migration of the CO<sub>2</sub> plume. The Beulah 3D seismic data and the Milton Flemmer 1 well logs were used to interpret surfaces for the formations of interest within the survey area. These surfaces were converted to depth using the time-to-depth relationship derived from Archie Erickson 2, Milton Flemmer 1, and Slash Lazy H 5 dipole sonic logs. The depth-converted surfaces for the storage reservoir and upper and lower confining zones were used as inputs for the geologic model. Detailed information about the structure and varying thickness of the formations away from well control was derived from these surfaces. A prestack seismic inversion was generated from the 3D seismic data and well logs from the Milton Flemmer 1, Archie Erickson 2, and Slash Lazy H 5 stratigraphic test wells. Depth-converted surfaces and poststack seismic inversion results from the Center 3D and Minnkota 3D were also used as inputs for the geologic model.

Interpretation of the 3D seismic data suggests there are no major stratigraphic pinch-outs or structural features with associated spill points (e.g., folds, domes, or fault traps) in TB Leingang. No structural features, faults, or discontinuities that would cause a concern about seal integrity in the strata above the Broom Creek Formation extending to the deepest USDW, the Fox Hills Formation, were observed in the 3D seismic data in the TB Leingang.

## TB LEINGANG/MILTON FLEMMER 1

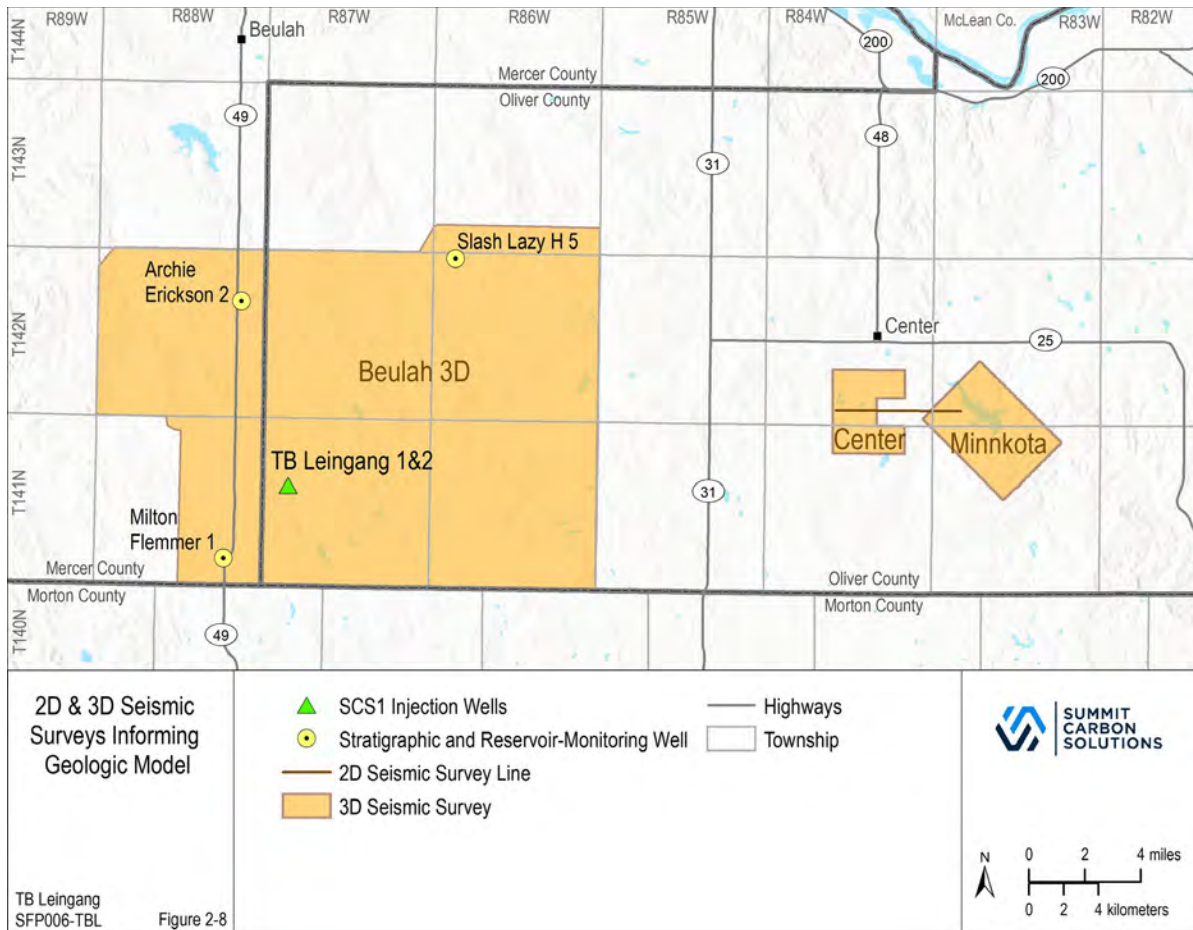

Figure 2-8. Map showing the 2D and 3D seismic surveys used to characterize TB Leingang and inform the construction of the geologic model. The 3D seismic surveys from west to east are the Beulah 3D, Center 3D, and Minnkota 3D.

### 2.3 Storage Reservoir (injection zone)

The Broom Creek Formation is laterally extensive across the simulation model area and surrounding region (Figure 2-9). The Broom Creek Formation comprises interbedded eolian/nearshore marine sandstone (permeable storage intervals) and dolostone layers (impermeable layers) with minor amounts of siltstone and anhydrite layers. The Broom Creek Formation unconformably overlies the Amsden Formation and is unconformably overlain by the Opeche/Spearfish Formation (Figure 2-2) (Murphy and others, 2009).

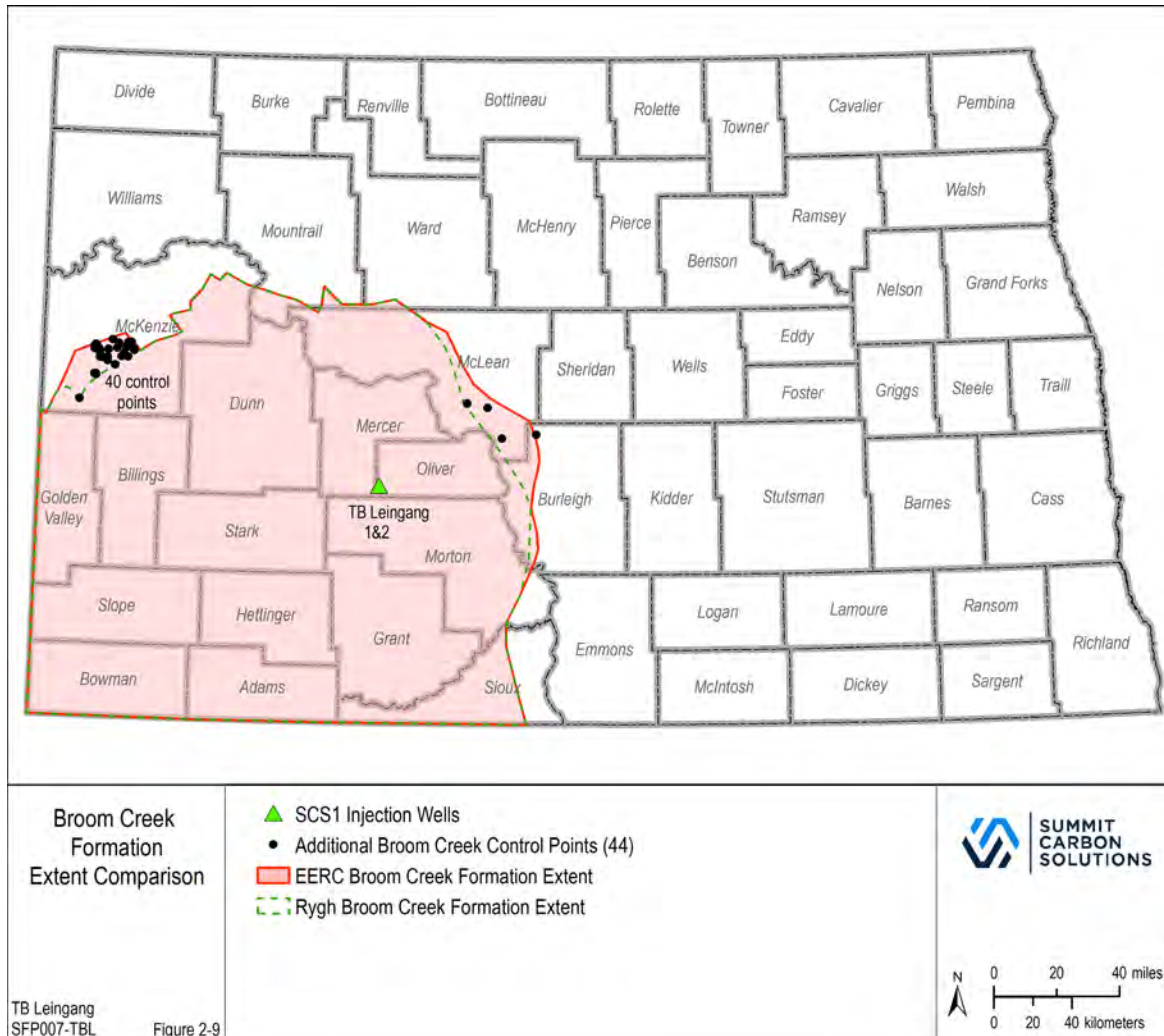

Figure 2-9. Broom Creek Formation in North Dakota. The area within the green dashed line shows the extent originally proposed by Rygh (1990), and the area outside of the green dashed line has been modified based on new well control.

The top of the Broom Creek Formation is located at a depth of 5818 ft below KB elevation at Milton Flemmer 1, and the cored interval is made up of 240 ft of sandstone, 81 ft of dolostone, and 21 ft of anhydrite. The thickness of the Broom Creek Formation at Milton Flemmer 1 is 342 ft. Cored wells within the extent of the simulation model show minor anhydrite and siltstone intervals are also present in the Broom Creek Formation. Across the simulation model area, the Broom Creek Formation ranges in thickness from 139 to 492 ft (Figure 2-10a, 2-10b), with an average thickness of 280 ft based on offset-well data and geologic model characteristics. The net sandstone thickness within the simulation model area ranges from 6 to 397 ft, with an average thickness of 140 ft.

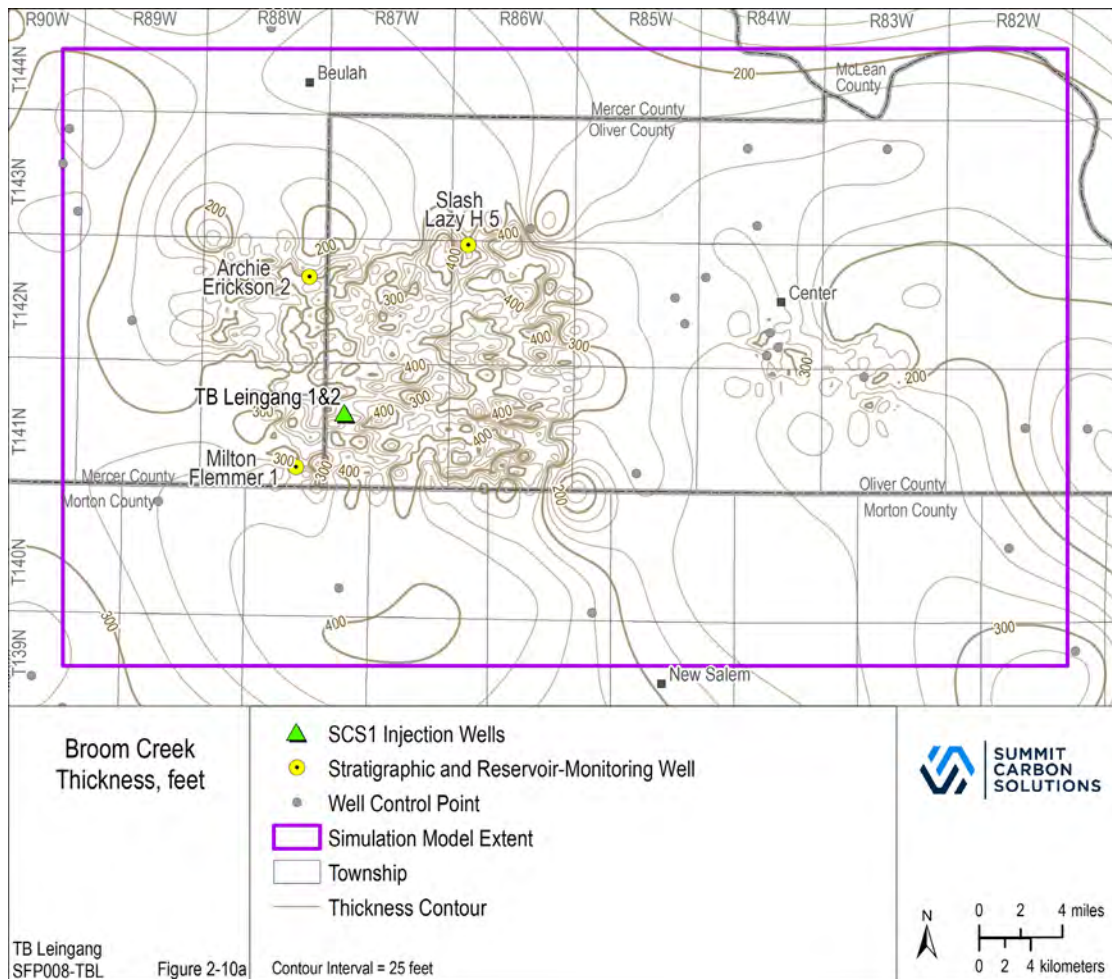

Figure 2-10a. Isopach map of the Broom Creek Formation in the simulation model area. A convergent interpolation gridding algorithm was used with well formation tops, 3D seismic, and 2D seismic in the creation of this map (thickness of the Broom Creek Formation at Milton Flemmer 1 is 342 ft, see Table 2-6).

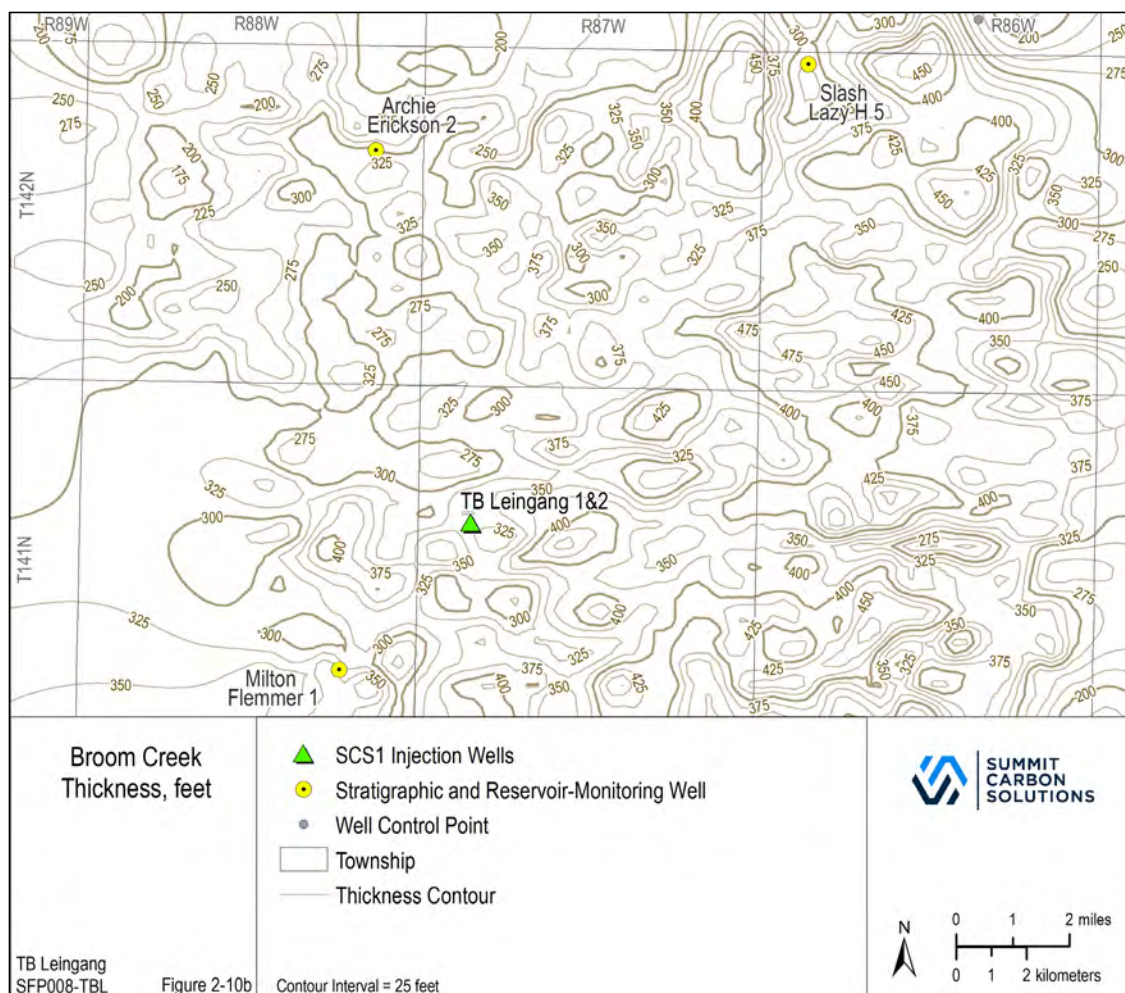

Figure 2-10b. Isopach map of the Broom Creek Formation focused around the three stratigraphic and reservoir-monitoring wells (thickness of the Broom Creek Formation at Milton Flemmer 1 is 342 ft, see Table 2-6).

The top of the Broom Creek Formation was picked based on the stratigraphic transition from a relatively low GR signature of sandstone and dolostone lithologies within the Broom Creek Formation to a relatively high GR signature representing the siltstones of the Opeche/Spearfish Formation (Figure 2-11). This transition is also noted with a drop in bulk density (RHOB) and dipole sonic compressional slowness values (DTC) and an increase in NEUT and resistivity (RES\_D, RES\_S). The bottom of the Broom Creek Formation was placed at the base of a relatively low GR package representing a 10-ft package of anhydrite that can be correlated across much of the study area. This rock package divides the clean sandstones and dolostone lithologies of the Broom Creek Formation from the dolostone and anhydrite of the Amsden Formation. Seismic data collected as part of site characterization efforts (Figure 2-8) were used to reinforce structural correlation and thickness estimations of the storage reservoir. The combined structural correlation and seismic interpretation indicate that the formation is continuous across the area near Milton Flemmer 1 (Figures 2-12 and 2-13). A structure map of the Broom Creek Formation shows no detectable features with associated spill points in the simulation model area (Figures 2-14 and 2-15).

Figure 2-11. Well log display of the interpreted facies of the Opeche/Spearfish, Broom Creek, and Amsden Formations in the Milton Flemmer 1. Tracks from left to right are 1) SSTVD; 2) GR (black) and caliper (dark blue); 3) MD; 4) resistivity – deep (red) and resistivity – shallow (light blue); 5) delta time (black), NEUT (blue), and density (green); and 6) facies.

# TB LEINGANG/MILTON FLEMMER 1

Figure 2-12. Regional well log stratigraphic cross sections of the upper confining zone and injection zone flattened on the top of the Amsden Formation. Logs displayed in tracks from left to right are 1) SSTVD, 2) GR (black) and caliper (dark blue), 3) MD, 4) NEUT (blue) and bulk density (green), and 5) facies. The different depth scales are used between A-A' and B-B' for image display purposes.

Note: Wells in these cross sections are spaced evenly. These figures do not portray the relative distance between wells. Because of the spacing, the structure may appear more drastic than it actually is.

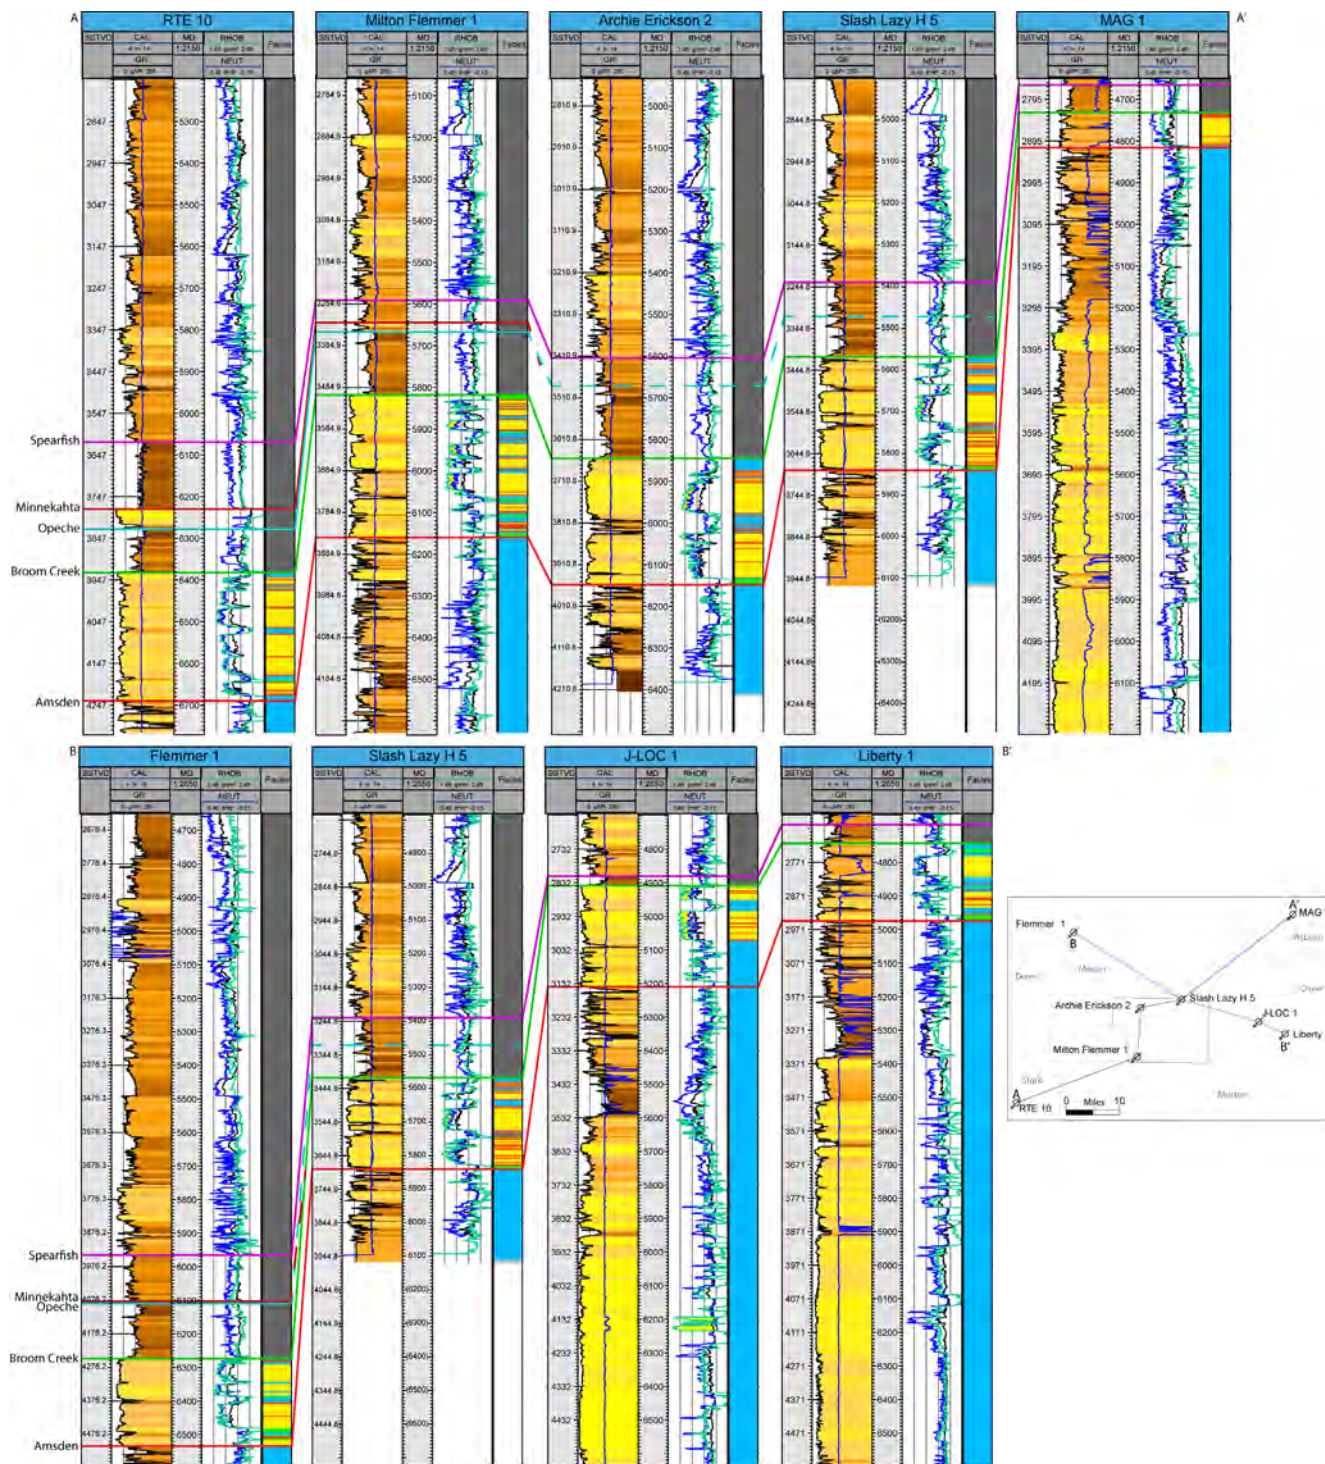

Figure 2-13. Regional well log cross sections showing the structure of the upper confining zone and injection zone. Displayed in tracks from left to right are 1) SSTVD, 2) GR (black) and caliper (dark blue), 3) MD, 4) NEUT (blue) and bulk density (green), and 5) facies. The different depth scales are used between A-A' and B-B' for image display purposes.

Note: Wells in these cross sections are spaced evenly. These figures do not portray the relative distance between wells. Because of the spacing, the structure may appear more drastic than it actually is.

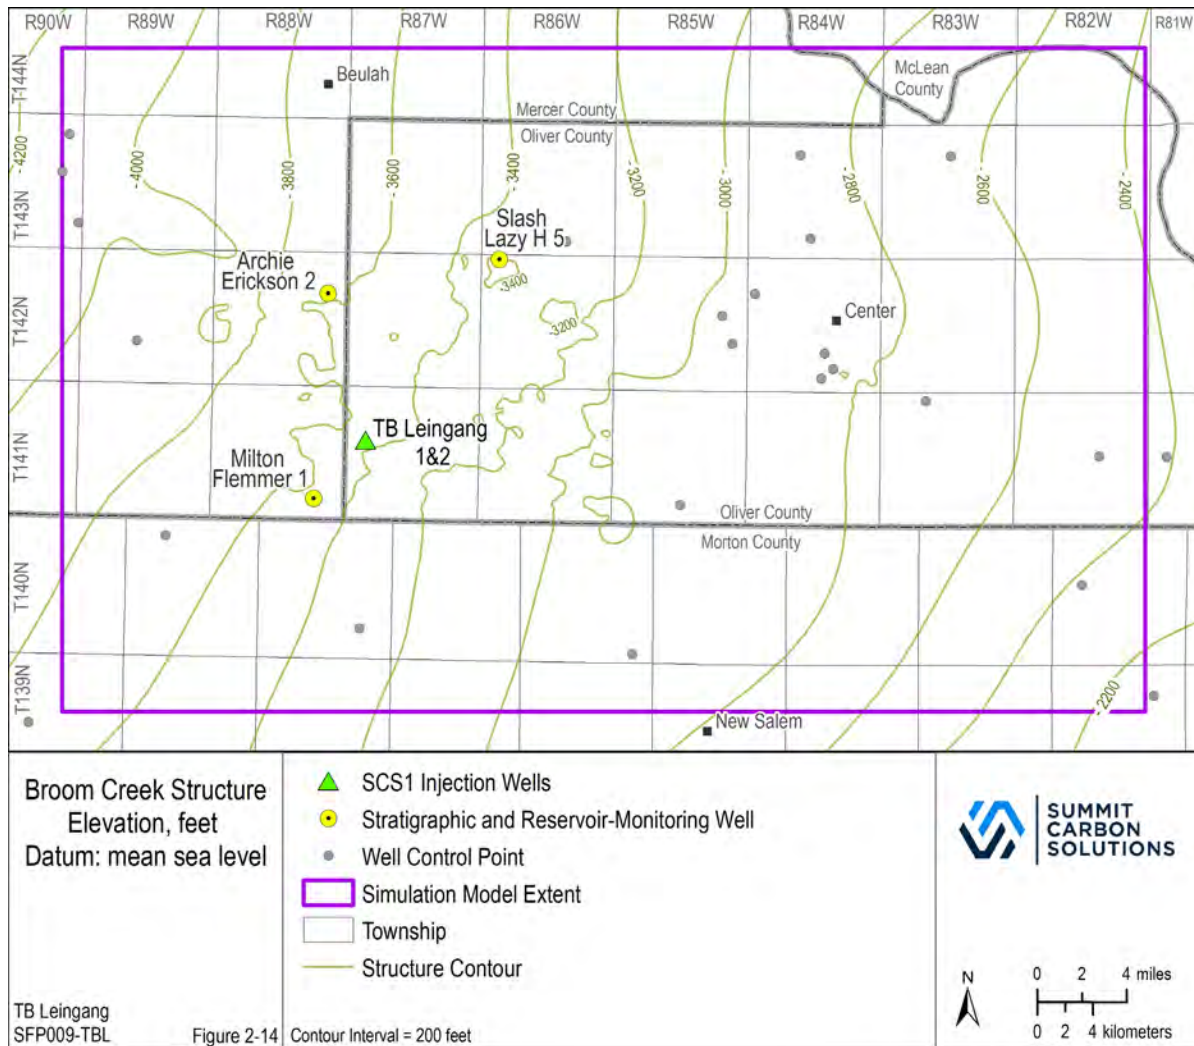

Figure 2-14. Structure map of the Broom Creek Formation in the simulation model referenced in feet below mean sea level. A convergent interpolation gridding algorithm was used with well formation tops, 3D seismic, and 2D seismic in the creation of this map.

Thirty-two (32) 1-in.-diameter core plugs collected from the Broom Creek Formation were sampled and used to determine the distribution of porosity and permeability values throughout the formation (Table 2-6, Figure 2-16). The range in porosity and permeability predominantly captured the sandstone variability as this rock type was prominent in the sampling program over the dolostone.

Figure 2-15. Cross section of the TB Leingang storage complex from the geologic model showing facies distribution in the Broom Creek Formation. Depths are referenced as feet below mean sea level. Geologic model extent is displayed by the blue box in the inset map in the upper-left corner.

**Table 2-6. Description of CO<sub>2</sub> Storage Reservoir (injection zone) at Milton Flemmer 1**

**Injection Zone Core Derived Properties**

Property	Description
Formation Name	Broom Creek
Lithology	Sandstone, dolostone, anhydrite
Formation Top Depth (MD), ft	5818
Thickness, ft	342 (sandstone 240, dolostone 81, anhydrite 21)
Capillary Entry Pressure (brine/CO <sub>2</sub> ), psi	1.12

**Geologic Properties**

Formation	Property	Laboratory Analysis	Simulation Model Property Distribution
Broom Creek (sandstone)	Porosity, % *	15.5 (0.3–26.1)	22.0 (0.0–35.3)
	Permeability, mD**	674.71, 13.55 (0.00103–2700)	458.79, 136.96 (0.0–3401.2)
Broom Creek (dolostone)	Porosity, %*	6.1 (1.4–14.6)	4.4 (0.0–34.9)
	Permeability, mD**	0.4107, 0.0147 (0.0005–3.34)	2.07, 0.0221 (0.0–919.6)

\* Porosity values are reported as the arithmetic mean followed by the range of values in parentheses. Values are measured at 2400 psi.

\*\* Permeability values are reported as the arithmetic mean and geometric mean, respectively, followed by the range of values in parentheses and do not have the 2.5 permeability calibration factor applied during simulation. Values are measured at 2400 psi.

Core-derived measurements from Milton Flemmer 1 were used as the foundation for the generation of porosity and permeability properties within the 3D geologic model. The 1-in.-diameter core plug sample measurements showed good agreement with the geologic model property distribution at the location of Milton Flemmer 1. This agreement gave confidence to the geologic model, which is a spatially and computationally larger data set created with the extrapolation of porosity and permeability from offset well logs. The geologic model property distribution statistics shown in Table 2-6 are derived from a combination of the core plug analysis and the larger data set derived from offset well logs.

Sandstone intervals in the Broom Creek Formation are associated with low GR, low density, high porosity (neutron, density, and sonic), low resistivity because of brine salinity, and high sonic slowness measurements (Figure 2-11). The dolostone intervals in the formation are associated with an increase in GR measurements compared to the sandstone intervals, in addition to high density, low porosity (neutron, density, and sonic), high resistivity, and low sonic slowness measurements. The dolomitic sandstone intervals in the formation are the transitions between sandstone and dolostone, where the porosity begins to decrease, and density begins to increase in a transition from predominantly sandstone to dolostone (Figure 2-16).

# TB LEINGANG/MILTON FLEMMER 1

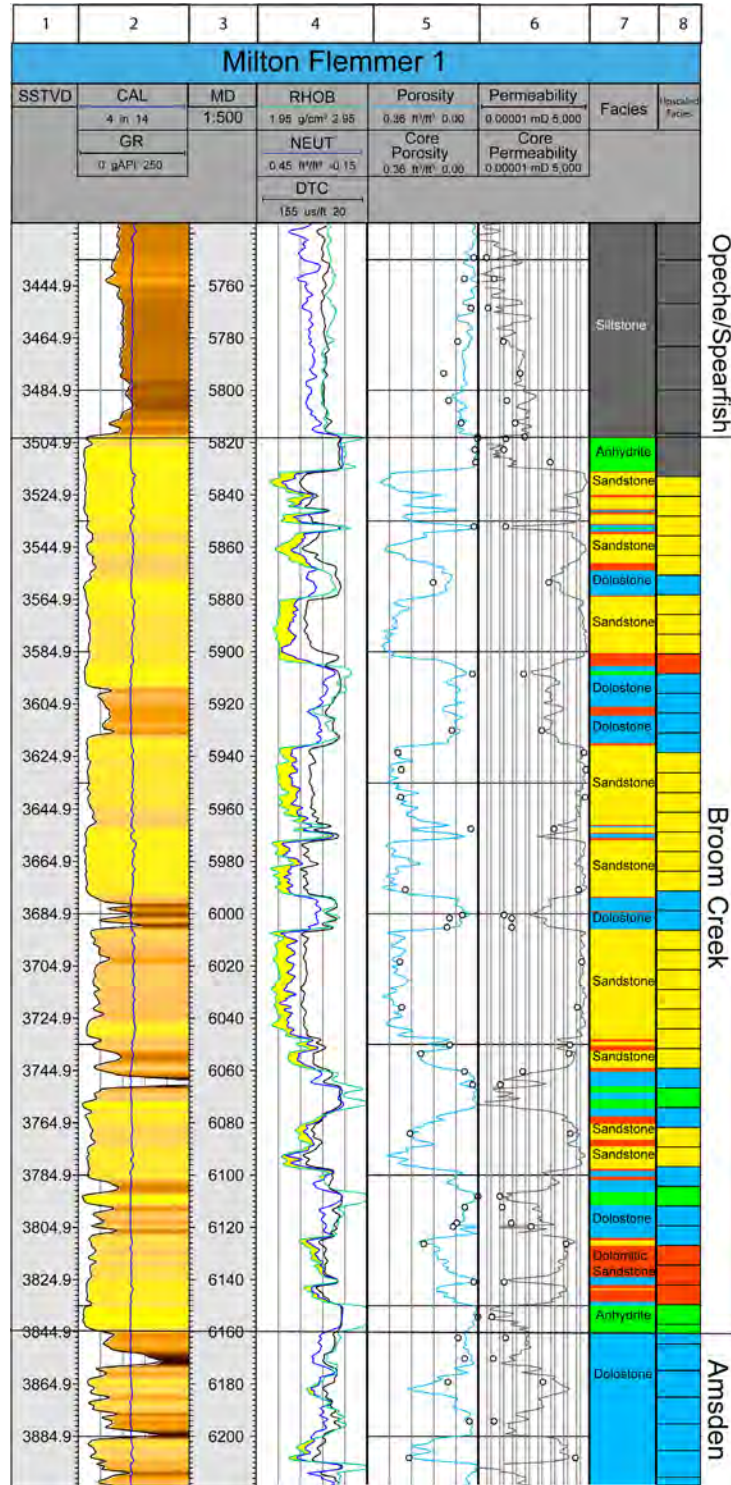

Figure 2-16. Vertical distribution of core-derived porosity and permeability values in the TB Leingang storage complex from Milton Flemmer 1. Tracks from left to right are 1) SSTVD; 2) GR (black) and caliper (dark blue); 3) MD; 4) delta time (black), NEUT (blue), and bulk density (green); 5) core porosity (2400 psi) and log porosity (light blue); 6) core permeability (2400 psi) and log permeability (black); 7) facies; and 8) upscaled facies.

### 2.3.1 Mineralogy of the Injection Zone

Powder XRD for average bulk composition analysis of 36 finely ground, homogenized samples from the Broom Creek Formation shows quartz as the most common mineral (~52%) followed by carbonates (~22%, primarily dolomite with minor contributions from ankerite and siderite), sulfates (~16%, mostly anhydrite with a minor amount of gypsum), feldspar (~6%, mostly K-feldspar), and clay minerals (~3%, mostly illite) (Figure 2-17a). Minor amounts of oxide/hydroxide (~0.3%), halide (~0.1%), and sulfide (~0.1%) make up the rest of the mineralogy. The major constituents of the Broom Creek Formation are shown in Table 2-7a. These results align with the average elemental composition obtained by XRF which shows silica (Si) as the dominant element followed by calcium (Ca), sulfur (S), magnesium (Mg), aluminum (Al), potassium (K), and other trace elements (Figure 2-17b).

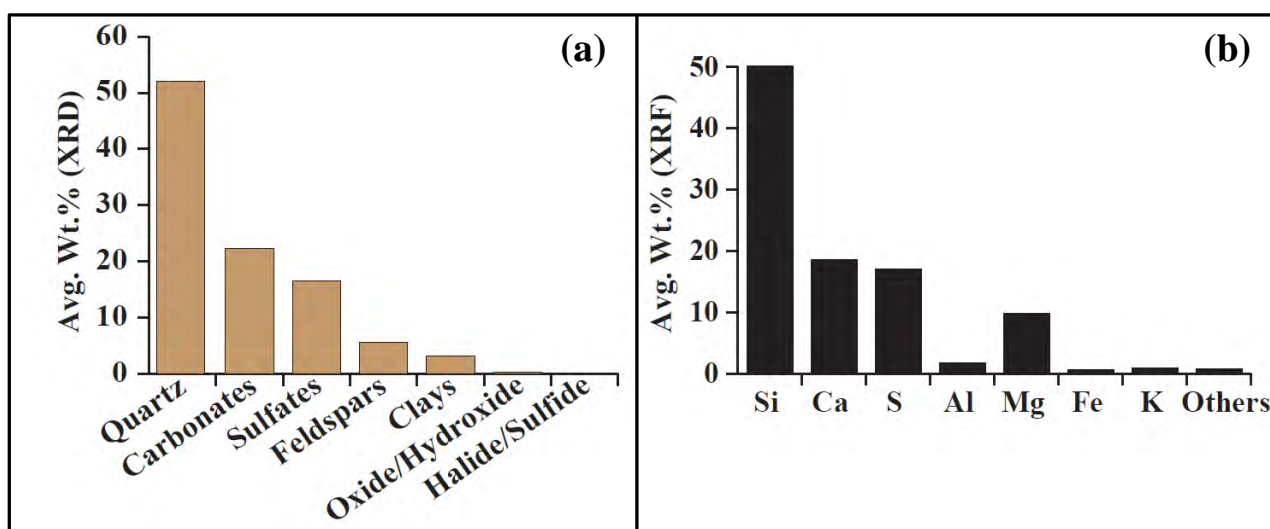

Figure 2-17a. Bar charts showing a) average mineralogy (wt%) and b) average elemental composition (wt%) of the Broom Creek Formation at Milton Flemmer 1 (note: elemental data by XRF were determined as oxides of the respective elements).

XRF analysis of the Broom Creek Formation (Figure 2-17b) shows a high percentage of  $\text{SiO}_2$  (0.4%–97%),  $\text{CaO}$  (0.1%–40%), and  $\text{MgO}$  (0%–21%) that confirms the presence of sandstone and dolomite intervals in the Broom Creek Formation. A high percentage of  $\text{CaO}$  and  $\text{SO}_3$  at the top and the base of the formation indicates the presence of anhydrite layers that isolate the Broom Creek Formation from the Opeche/Spearfish Formation from the top and Amsden Formation from the bottom. The Broom Creek Formation consists of a clay content ranging from 0% to 24%, with illite being the dominant clay type.

\*Illite component of clays.

\*\*NA; no illite component was detected by XRD.

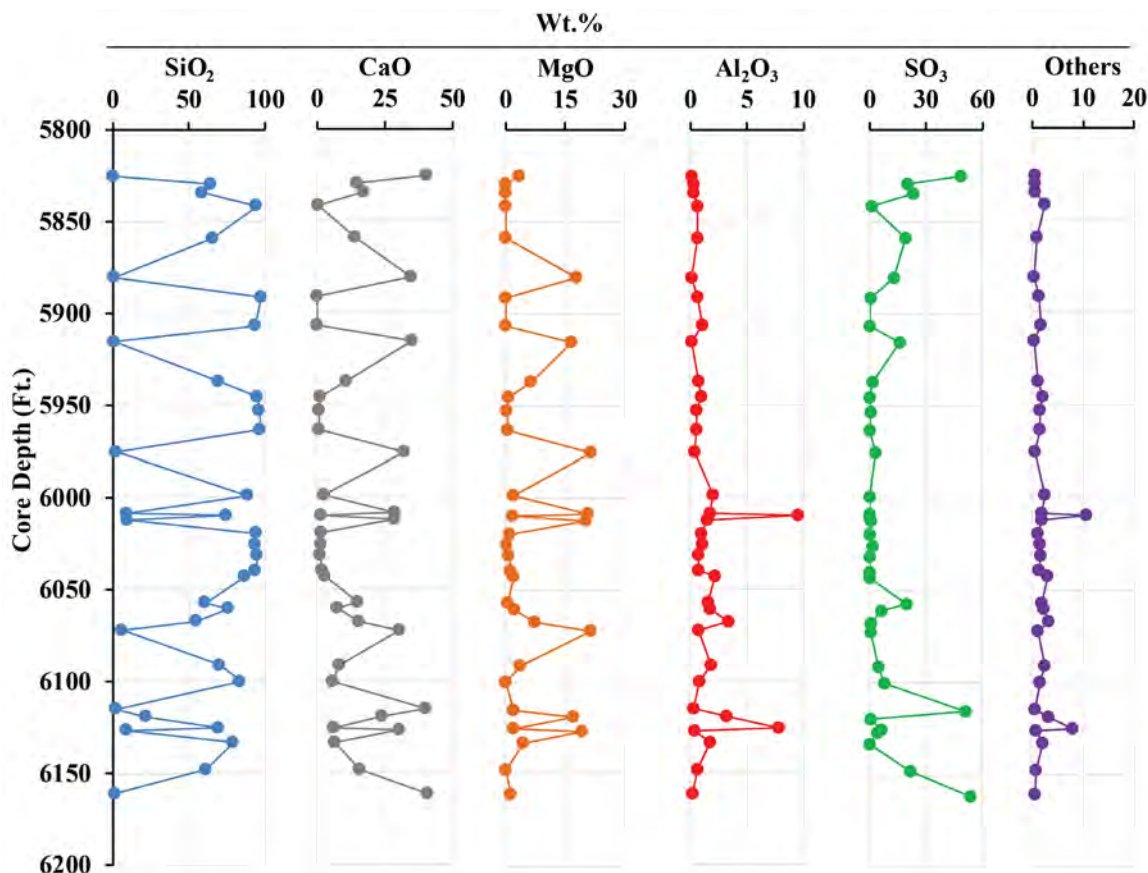

Figure 2-17b. Elemental composition by XRF as a function of depth in the Broom Creek Formation at Milton Flemmer 1.

The Broom Creek Formation midsection at a core depth of 5945.6–6091.1 ft and KB elevation of 5938.6–6084.1 ft represents a highly porous and permeable zone averaging more than 20% total porosity, reaching as high as 33% total porosity at some intervals, with permeability of >1000 mD. Thin-section and SEM–EDS (energy-dispersive spectroscopy) micrographs of the most porous sample show moderately to well-sorted, subrounded to subangular, and fine quartz and feldspar grains, with quartz grains constituting about 87% of the composition (Figures 2-18a and c). Contacts between the grains are mostly tangential with intergranular spaces occasionally occupied by minor amounts of siderite, dolomite, and silica (Figure 2-18c). In contrast, the least porous sample with ultralow permeability located at the Opeche/Spearfish Formation–Broom Creek Formation boundary primarily consists of anhydrite (~87%), dolomite (~8%), and clay minerals with some microfractures (Figures 2-18b and d). Figure 2-19 shows changes in the mineralogy at Milton Flemmer 1 as a function of depth next to the core sample porosity and permeability data. The Broom Creek Formation is highlighted in gray.

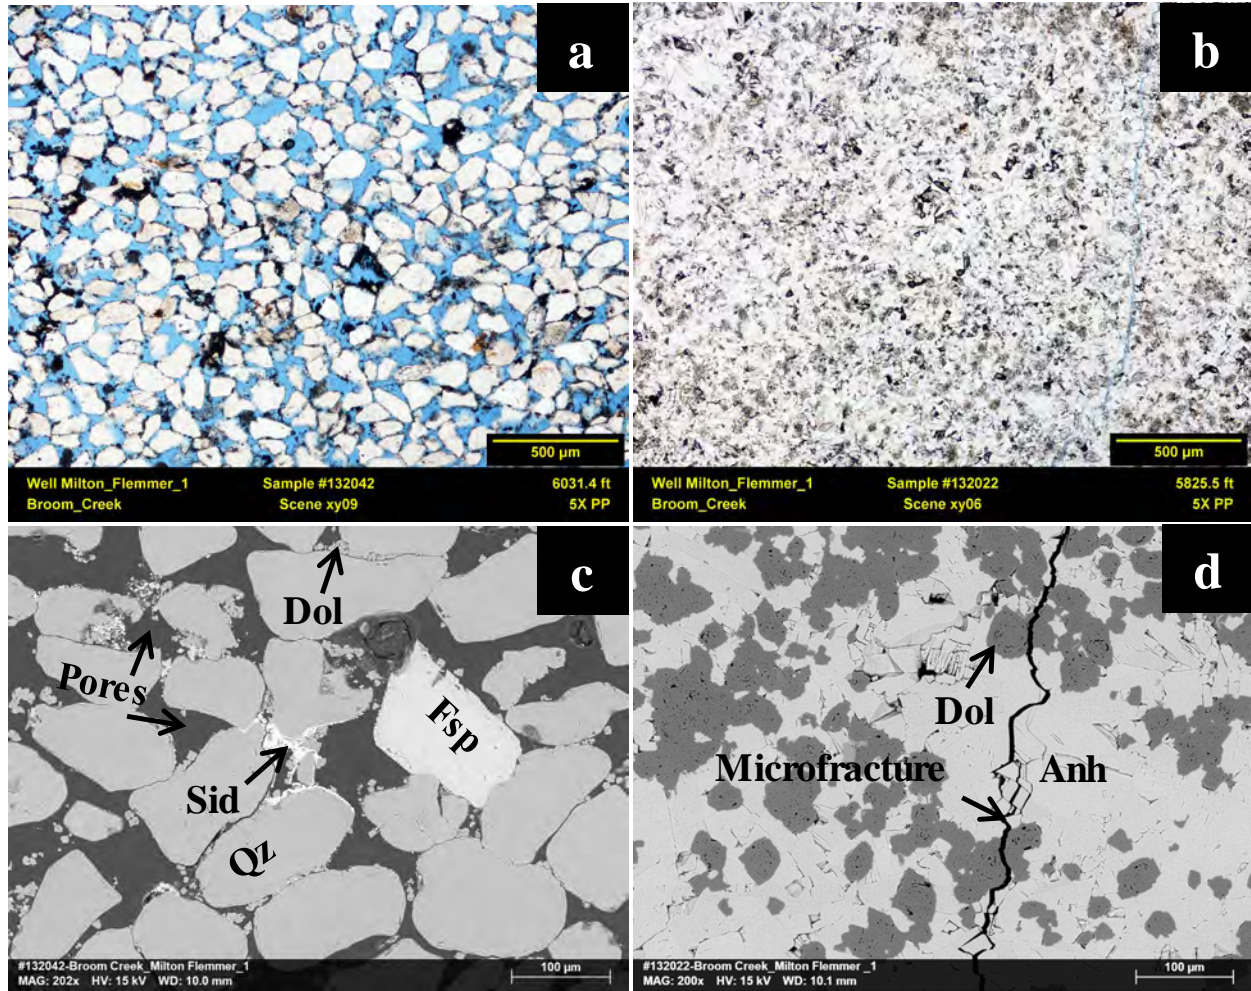

Figure 2-18. Thin-section (a, b) and SEM (c, d) micrographs of the most porous (a, c) and the least porous (b, d) samples from the Broom Creek Formation at Milton Flemmer 1. The most porous sample has a total porosity and permeability of 33% and >1000 mD, respectively, which notably reduced to 0.37% and 0.000891 mD in the least porous sample. The blue color in the thin-sections (a and b) represents porosity.

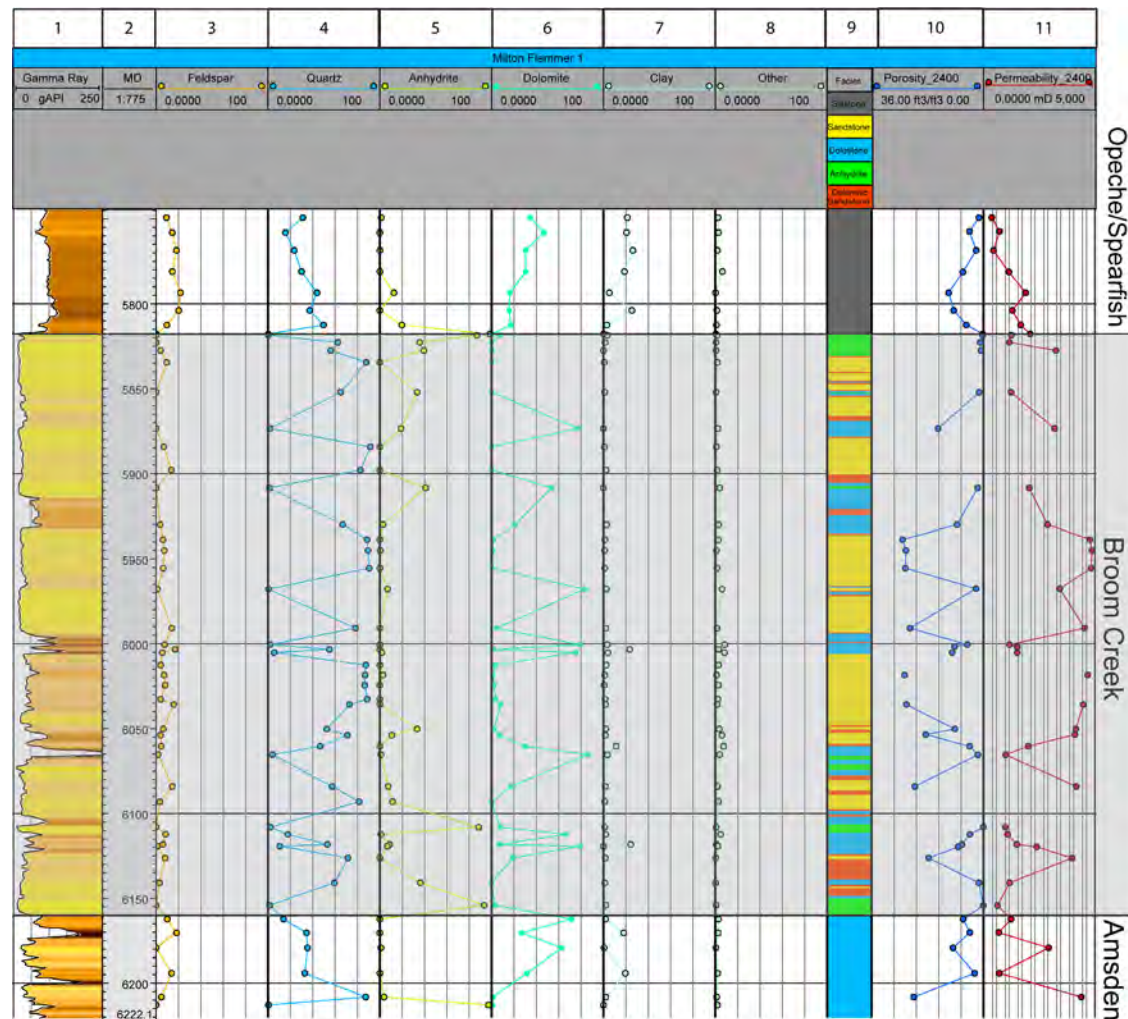

Figure 2-19. Change in the mineralogy of the target reservoir Broom Creek Formation (highlighted in gray) at Milton Flemmer 1 as a function of depth based on XRD in comparison to GR, facies, core sample total porosity (%), and permeability (mD). Data gaps in the porosity and permeability plots are due to the inability to obtain testable samples as solid plugs (e.g., samples too soft/brittle). Tracks from left to right are 1) GR (black), 2) MD, 3) total feldspar (orange), 4) quartz (blue), 5) anhydrite (yellow green), 6) dolomite (green), 7) total clay (light blue), 8) other (light green), 9) facies, 10) core porosity (2400 psi) (dark blue), and 11) core permeability (2400 psi) (red).

### 2.3.2 *Mechanism of Geologic Confinement*

For TB Leingang, the initial mechanism for geologic confinement of CO<sub>2</sub> injected into the Broom Creek Formation will be the upper confining formation (Opeche/Spearfish Formation), which will contain the initially buoyant CO<sub>2</sub> in the reservoir under the effects of relative permeability and capillary pressure. Lateral movement of the injected CO<sub>2</sub> will be restricted by residual gas trapping (relative permeability) and solubility trapping (dissolution of the CO<sub>2</sub> into the native formation brine), confining the CO<sub>2</sub> within the proposed storage reservoir. After injected CO<sub>2</sub> becomes dissolved in the formation brine, the brine density will increase. This higher-density brine will ultimately sink in the storage formation (convective mixing). Over a much longer period (>100 years), mineralization of the injected CO<sub>2</sub> will ensure long-term, permanent geologic confinement. Injected CO<sub>2</sub> is not expected to adsorb to any of the mineral constituents of the target formation; therefore, this process is not considered to be a viable trapping mechanism in this project.

### 2.3.3 *Geochemical Information of the Injection Zone*

Geochemical simulation was performed to calculate the effects of introducing the CO<sub>2</sub> stream to the injection zone. The injection zone, the Broom Creek Formation, was investigated using the geochemical analysis option available in GEM, the compositional simulation software package from Computer Modelling Group Ltd. (CMG). For this geochemical modeling study, the injection scenario consisted of a single injection well injecting for a 20-year period with maximum BHP and maximum wellhead pressure (WHP) constraints of 3663 and 2100 psi, respectively. A postinjection period of 25 years was run in the model to evaluate any dynamic behavior and/or geochemical reaction after the CO<sub>2</sub> injection is stopped.

A geochemical simulation scenario was run with and without the geochemical model analysis option included, and results from the two cases were compared. The results do not show an evident difference in the CO<sub>2</sub> gas molality fraction between the two cases for volume injected and injection pressure simulation results. As a result of geochemical reactions in the reservoir, cumulative volume and injection rate have no observable difference between the geochemical and nongeochemical cases. Additionally, the simulation results showed no significant precipitation caused by the presence of O<sub>2</sub> that would affect the CO<sub>2</sub> injection volume as demonstrated by the comparison in injection rates between the case with and without geochemical modeling. Simulation results show that, during CO<sub>2</sub> injection, the supercritical CO<sub>2</sub> (free-CO<sub>2</sub> gas) remains dominant. CO<sub>2</sub> dissolution in the formation water and residual trapping of CO<sub>2</sub> slowly increased over time, while CO<sub>2</sub> mineralization is negligible. The result is a small change in simulated porosity, less than 0.01% porosity units, equating to a maximum increase in average porosity from 22.00% to 22.01% after the 20-year injection period plus 25 years of postinjection. A full description of the geochemical results for the injection zone can be found in Appendix C.

## 2.4 **Confining Zones**

The confining zones for the Broom Creek Formation are the overlying Opeche/Spearfish Formation and the underlying Amsden Formation (Figure 2-2, Table 2-7b). Both the overlying and underlying confining formations consist primarily of impermeable rock layers.

**Table 2-7b. Properties of Upper and Lower Confining Zones at Milton Flemmer 1**

Confining Zone Properties	Upper Confining Zone	Lower Confining Zone	
Stratigraphic Unit	Opeche/Spearfish	Amsden	
Lithology	Siltstone/anhydrite/ dolostone	Dolostone/ anhydrite/sandstone	
Formation Top Depth (MD), ft	5587	6160	
Thickness, ft	231	261	
Capillary Entry Pressure (brine/CO <sub>2</sub> ), psi	750.8	306.5	
Depth below Lowest Identified USDW, ft	3788	4361	

Formation	Property	Laboratory Analysis	Simulation Model Property Distribution
Opeche/Spearfish	Porosity, %*	5.2 (0.2–11.2)	2.1 (0.0–14.6)
	Permeability, mD **	0.009189, 0.001224 (0.0000439–0.0434)	0.1088, 0.0021 (0.00–6.37)
Amsden	Porosity, % *	9.2 (2.9–22.5)	2.9 (0.0–35.1)
	Permeability, mD **	81.83, 0.028012 (0.000152–408)	0.7056, 0.0070 (0.00–156.05)

\* Porosity values recorded at 2400-psi confining pressure. Porosity values from the model are reported as the arithmetic mean followed by the range of values in parentheses.

\*\* Permeability values recorded at 2400-psi confining pressure. Permeability values are reported as the arithmetic mean and geometric mean, respectively, followed by the range of values in parentheses and do not have the 2.5 permeability calibration factor applied during simulation.

#### **2.4.1 Upper Confining Zone**

In TB Leingang, the upper confining zone, the Opeche/Spearfish Formation, consists of predominantly siltstone with interbedded dolostone and anhydrite (Table 2-7a). The upper confining zone is laterally extensive across the simulation model area (Figure 2-20) and is 5587 ft below KB elevation and 231 ft thick as observed in Milton Flemmer 1 (Figures 2-20 and 2-21). The contact between the underlying Broom Creek Formation and the upper confining zone is an unconformity that can be correlated across the Broom Creek Formation extent where the resistivity and GR logs show a significant change across the contact. A relatively low GR signature of sandstone and dolostone lithologies within the Broom Creek Formation changes to a relatively high GR signature representing the siltstones of the Opeche/Spearfish Formation (Figure 2-11).

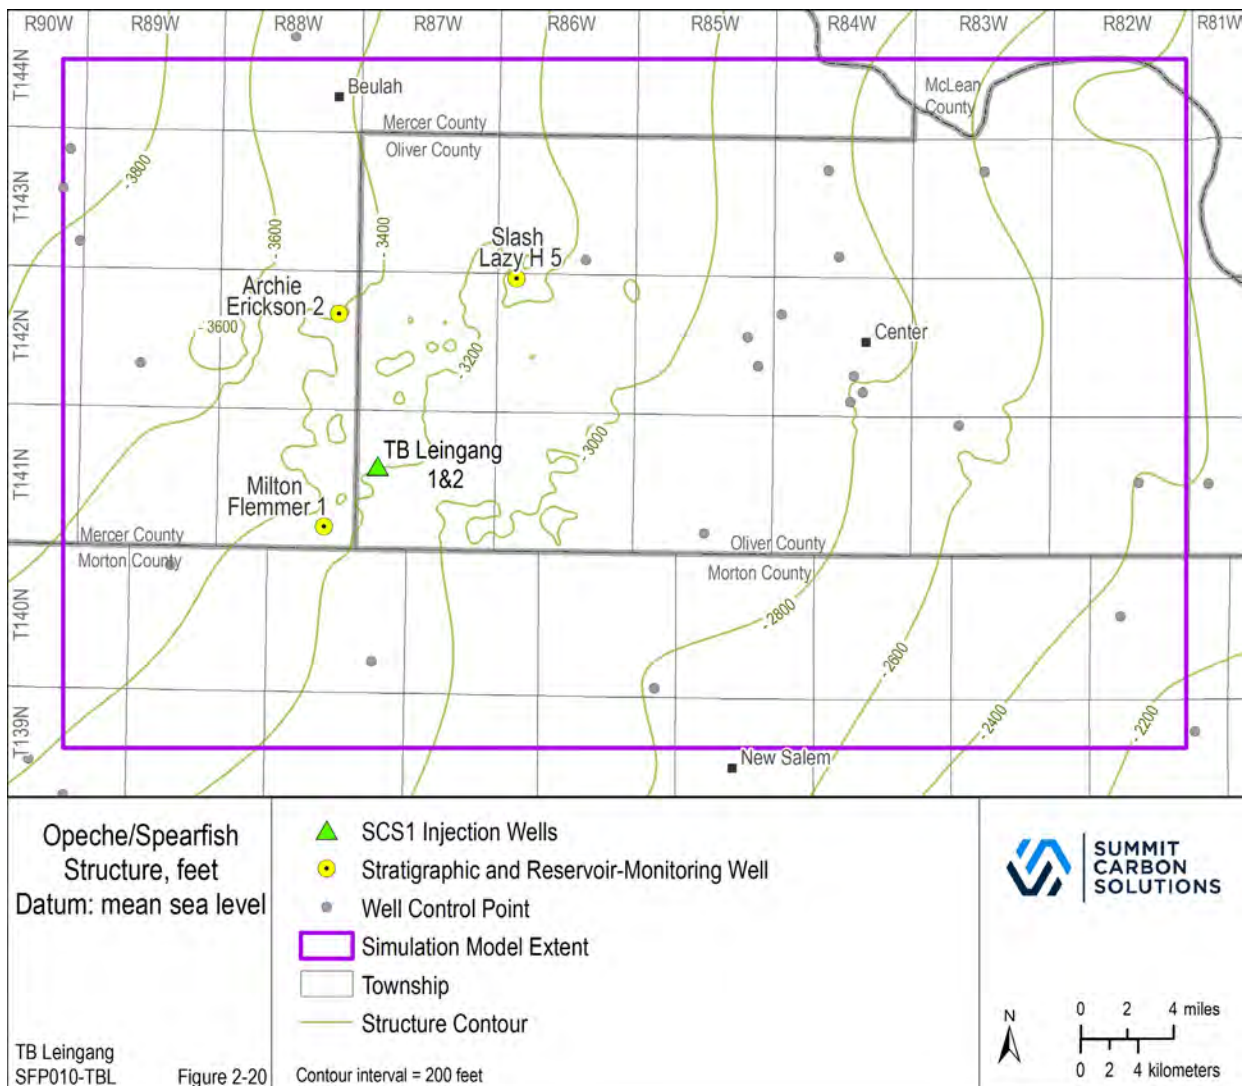

Figure 2-20. Structure map of the Opeche/Spearfish Formation across the simulation model area in feet below mean sea level. A convergent interpolation gridding algorithm was used with well formation tops, 3D seismic, and 2D seismic in creation of this map.

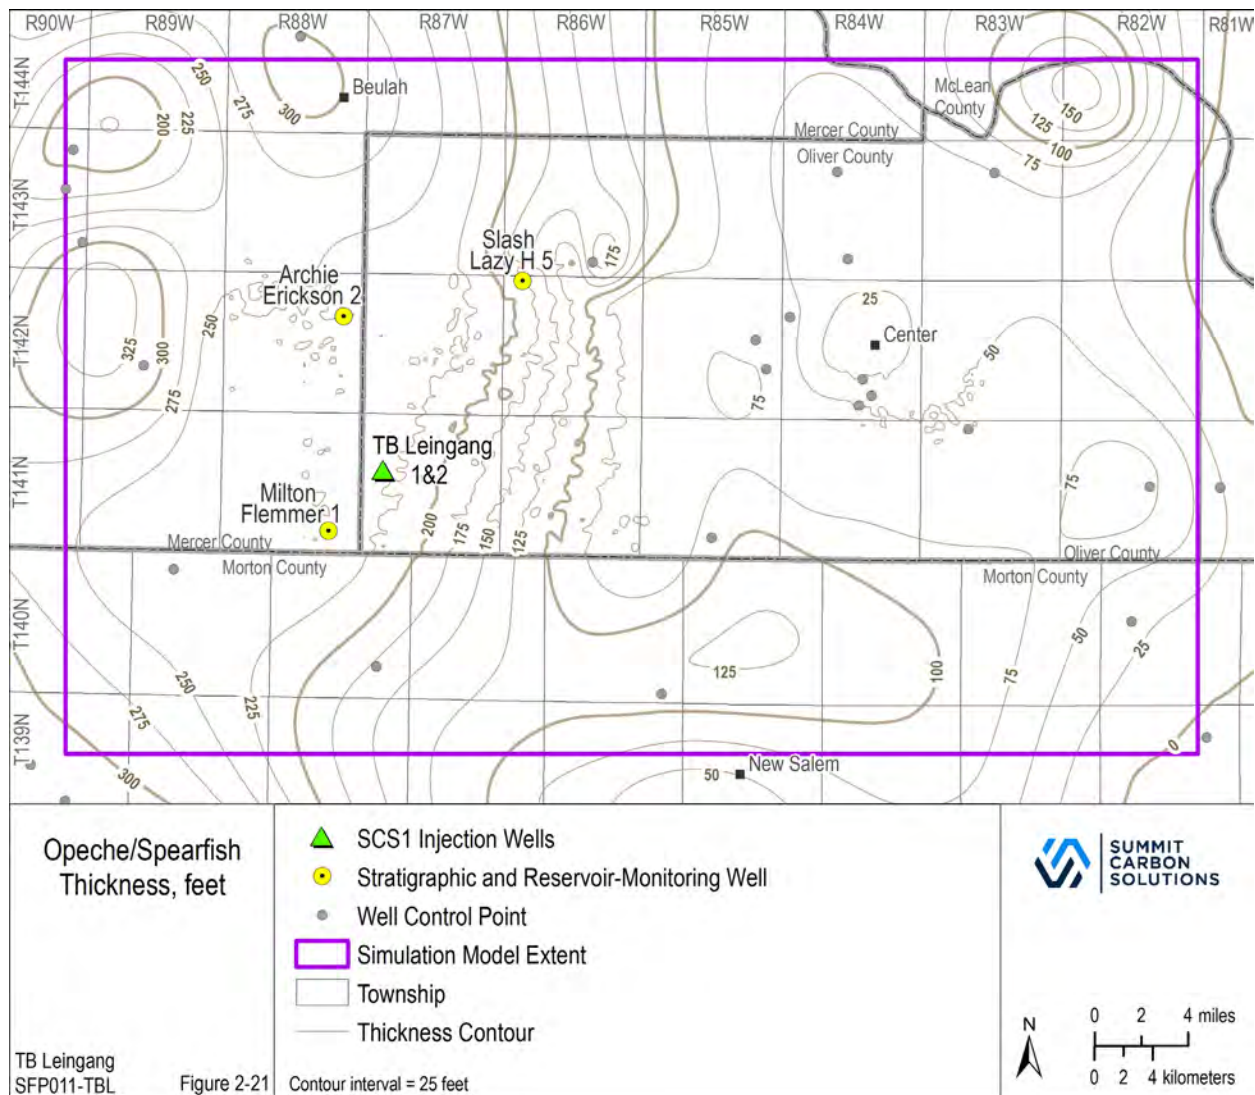

Figure 2-21. Isopach map of the Opeche/Spearfish Formation in the simulation model area. A convergent interpolation gridding algorithm was used with well formation tops, 3D seismic, and 2D seismic in creation of this map.

#### 2.4.1.1 Mineralogy of the Upper Confining Zone

Powder XRD for average bulk composition analysis of eight finely ground, homogenized samples from the Opeche/Spearfish Formation shows quartz as the most common mineral (~29%) followed by carbonates (~25%, mostly dolomite with a minor contribution from ankerite), sulfates (~17%, mostly anhydrite), potassium- and sodium-feldspar (~7% each), and clay minerals (~15%, mostly illite and chlorite) (Figure 2-22a). Minor amounts of sulfide (~0.1%) and oxide/hydroxide (~0.1%) minerals make up the rest of the mineralogy. The major constituents of the Opeche/Spearfish Formation are also shown in Table 2-7c. XRD data align with the average elemental composition obtained by XRF which show silica (Si) as the dominant element followed by calcium (Ca), sulfur (S), aluminum (Al), magnesium (Mg), potassium (K), iron (Fe), and other trace elements (Figure 2-22b).

Figure 2-22a. Bar charts showing a) average mineralogy (wt%) and b) average elemental composition (wt%) of the Opeche/Spearfish Formation at Milton Flemmer 1 (note: elemental data by XRF were determined as oxides of the respective elements).

XRF analysis of the Opeche/Spearfish Formation (Figure 2-22b) identifies  $\text{SiO}_2$  (0.3%–61%),  $\text{CaO}$  (5%–41%), and  $\text{MgO}$  (0.2%–16%) correlating well with the silicate, carbonate, and aluminum-rich mineralogy determined by XRD. A high percentage of  $\text{CaO}$  and  $\text{SO}_3$  at the base of the Opeche/Spearfish Formation indicates the presence of an anhydrite interval separating the Opeche/Spearfish Formation from the Broom Creek Formation. The Opeche/Spearfish Formation consists of a much higher clay content compared to the Broom Creek Formation ranging from 56% to 89%, with illite being the most dominant clay type.

**Table 2-7c. XRD Analysis of the Opeche/Spearfish Formation at Milton Flemmer 1. Only major constituents are shown.**

Sample Name	Core Depth, ft, MD	Log Depth, ft, MD	Feldspar, wt%	Quartz, wt%	Anhydrite, wt%	Dolomite, wt%	Clay, wt%	Others, wt%	Illite/Total Clay,* %
Opeche/Spearfish	5756.2	5749.2	9.18	31.17	1.28	34.56	21.33	2.48	85
Opeche/Spearfish	5764.3	5758.0	14.40	15.59	0.00	46.57	20.59	2.85	83
Opeche/Spearfish	5775.5	5768.5	18.15	23.44	0.00	30.34	26.28	1.79	89
Opeche/Spearfish	5788.3	5781.0	14.41	30.01	0.00	30.49	18.74	6.35	85
Opeche/Spearfish	5800.5	5793.5	21.77	43.89	12.57	16.24	5.29	0.24	56
Opeche/Spearfish	5810.9	5803.9	20.19	37.33	0.00	15.66	25.42	1.40	88
Opeche/Spearfish	5819.5	5812.5	9.55	49.66	19.71	17.15	3.02	0.91	84
Opeche/Spearfish	5824.8	5817.8	0.00	0.29	98.34	0.96	0.00	0.41	NA**

\*Illite component of clays.

\*\*NA; no Illite component was detected by XRD.

Figure 2-22b. Elemental composition by XRF as a function of depth in the Opeche/Spearfish Formation at Milton Flemmer 1.

Thin-section and SEM-EDS micrographs of the most porous sample located at the midsection (core depth of 5800.5 ft KB elevation of 5793.5 ft) of the Opeche/Spearfish Formation show tightly associated fine grains of quartz, feldspar, and dolomite with anhydrite and clay cement (Figures 2-23a and c). Contacts between the grains are mostly long, sutured, and concavo-convex, giving rise to isolated and discontinuous pore spaces (Figure 2-23c). The least porous sample, located at the Opeche/Spearfish Formation–Broom Creek Formation boundary (core depth of 5824.8 ft KB elevation of 5817.8 ft) primarily consists of anhydrite (~98%) with some microfractures (Figures 2-23b and d). Figure 2-24 shows changes in the mineralogy at Milton Flemmer 1 as a function of depth next to the core sample porosity and permeability data. The Opeche/Spearfish Formation is highlighted in gray.

Figure 2-23. Thin-section (a, b) and SEM (c, d) micrographs of the most porous (a, c) and the least porous (b, d) samples from the Opeche/Spearfish Formation at Milton Flemmer 1. The most porous sample has a total porosity and permeability of 11% and 0.0359 mD, respectively, which is notably reduced to 0.33% and 0.178 mD in the least porous sample. The blue color in the thin-sections (a and b) represents porosity.

Figure 2-24. Change in the mineralogy of the upper-confining Opeche/Spearfish Formation (highlighted in gray) at Milton Flemmer 1 as a function of depth based on XRD in comparison to GR, facies, core sample total porosity (%), and permeability (mD). Very low total porosity and permeability with a high clay content make the Opeche/Spearfish Formation an ultralow permeable formation. Data gaps in the porosity and permeability plots are due to the inability to obtain testable samples as solid plugs (i.e., samples too soft/brittle). Tracks from left to right are 1) GR (black), 2) MD, 3) total feldspar (orange), 4) quartz (blue), 5) anhydrite (yellow green), 6) dolomite (green), 7) total clay (light blue), 8) other (light green), 9) facies, 10) core porosity (2400 psi) (dark blue), and 11) core permeability (2400 psi) (red).

#### 2.4.1.2 Geochemical Interaction

Geochemical simulation using the PHREEQC geochemical software was performed to calculate the potential effects of an injected multicomponent CO<sub>2</sub> stream on the Opeche/Spearfish Formation. This geochemical simulation was run for 45 years to represent 20 years of injection plus 25 years of postinjection.

Results showed geochemical processes at work. The pH at the interface between the injection zone and upper confining zone has the greatest change in value, declining from its initial value of 6.47 to a level of 5.05 after 10 years of injection, and stabilizes at 5.03 by the end of 25 years of postinjection. K-feldspar starts to dissolve from the beginning of the simulation period, while illite and quartz start to precipitate at the same time. The net change due to precipitation or dissolution at a 1–2-meter interval above the injections zone is less than 5 kg per cubic meter, with little dissolution or precipitation taking place during the later years of simulation. The overall net porosity changes from dissolution and precipitation are minimal, less than 0.1% change during the life of the simulation. These results suggest that geochemical change from exposure to CO<sub>2</sub> is minor; therefore, the ability of the Opeche/Spearfish Formation to maintain its sealing integrity will not be compromised by geochemical processes. A full description of the geochemical results for the upper confining zone can be found in Appendix C.

#### **2.4.2 Additional Overlying Confining Zones**

Several other formations provide additional confinement above the Opeche/Spearfish Formation. Impermeable rocks above the primary seal include the Piper, Rierdon, and Swift Formations, which make up the first additional group of confining formations (Table 2-8a). At Milton Flemmer 1, together with the Opeche/Spearfish Formation, these intervals are 1082 ft thick and will isolate Broom Creek Formation fluids from migrating upward to the next permeable interval, the Inyan Kara Formation (Figure 2-25). Above the Inyan Kara Formation, 2670 ft of impermeable rocks acts as an additional seal between the Inyan Kara sandstone interval and the lowermost USDW, the Fox Hills Formation (Figure 2-26). Confining layers above the Inyan Kara sandstone interval include the Skull Creek, Mowry, Belle Fourche, Greenhorn, Carlile, Niobrara, and Pierre Formations (Table 2-8a).

The formations between the Broom Creek and Inyan Kara Formations and between the Inyan Kara Formation and lowest USDW have demonstrated the ability to prevent the vertical migration of fluids throughout geologic time and are recognized as impermeable flow barriers in the Williston Basin (Downey, 1986; Downey and Dinwiddie, 1988).

**Table 2-8a. Description of Zones of Confinement above the Immediate Upper Confining Zone (data based on Milton Flemmer 1)**

Name of Formation	Lithology	Formation		Depth below Lowest Identified USDW, ft
		Top Depth MD, ft	Thickness, ft	
Pierre	Mudstone	1799	1480	0
Niobrara	Mudstone	3279	418	1480
Carlile	Mudstone	3697	49	1898
Greenhorn	Mudstone	3746	116	1947
Belle Fourche	Mudstone	3862	291	2063
Mowry	Mudstone	4153	75	2354
Skull Creek	Mudstone	4231	238	2432
Swift	Mudstone	4736	458	2937
Rierdon	Mudstone	5193	196	3394
Piper (Kline Member)	Carbonate	5389	94	3590
Piper (Picard Member)	Mudstone	5483	104	3684

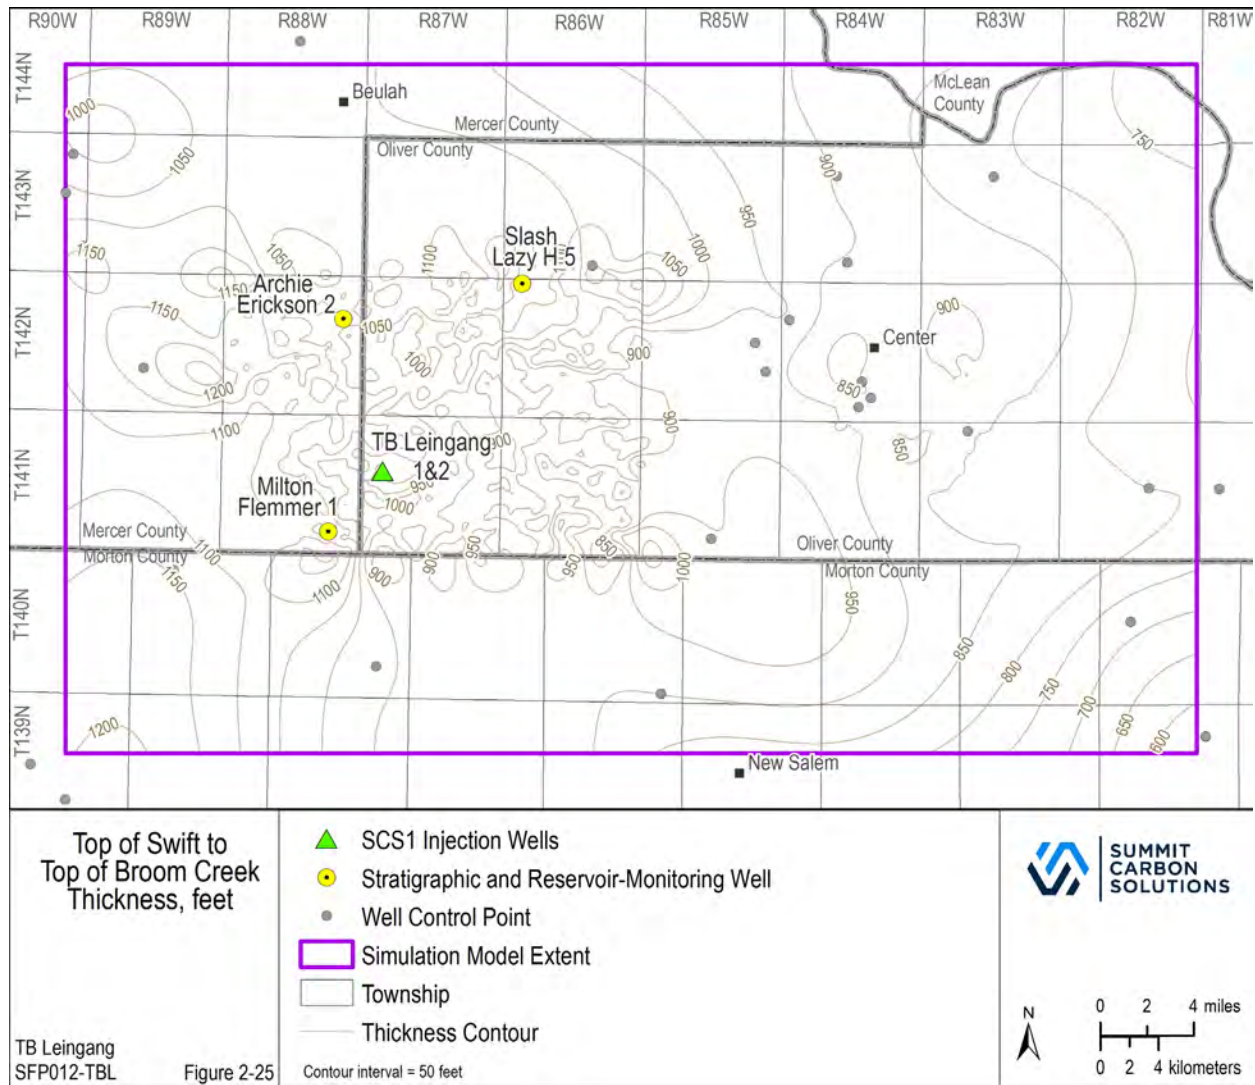

Figure 2-25. Isopach map of the interval between the top of the Broom Creek Formation and the top of the Swift Formation. This interval represents the primary and secondary confinement zones. A convergent interpolation gridding algorithm was used with well formation tops, 3D seismic, and 2D seismic in creation of this map.

Sandstones of the Inyan Kara Formation comprise the first unit with relatively high porosity and permeability stratigraphically above the injection zone and the primary sealing formation. The Inyan Kara represents the most likely candidate to act as an overlying pressure dissipation zone. Monitoring distributed temperature sensor data for the Inyan Kara Formation using the downhole fiber-optic cable provides an additional opportunity for mitigation and remediation (Section 5.0). In the unlikely event of out-of-zone migration through the primary and secondary sealing formations, CO<sub>2</sub> would become trapped in the Inyan Kara Formation. The depth to the Inyan Kara Formation at the Milton Flemmer 1 location is approximately 4469 ft below KB elevation, and the interval itself is 267 ft thick.

## TB LEINGANG/MILTON FLEMMER 1

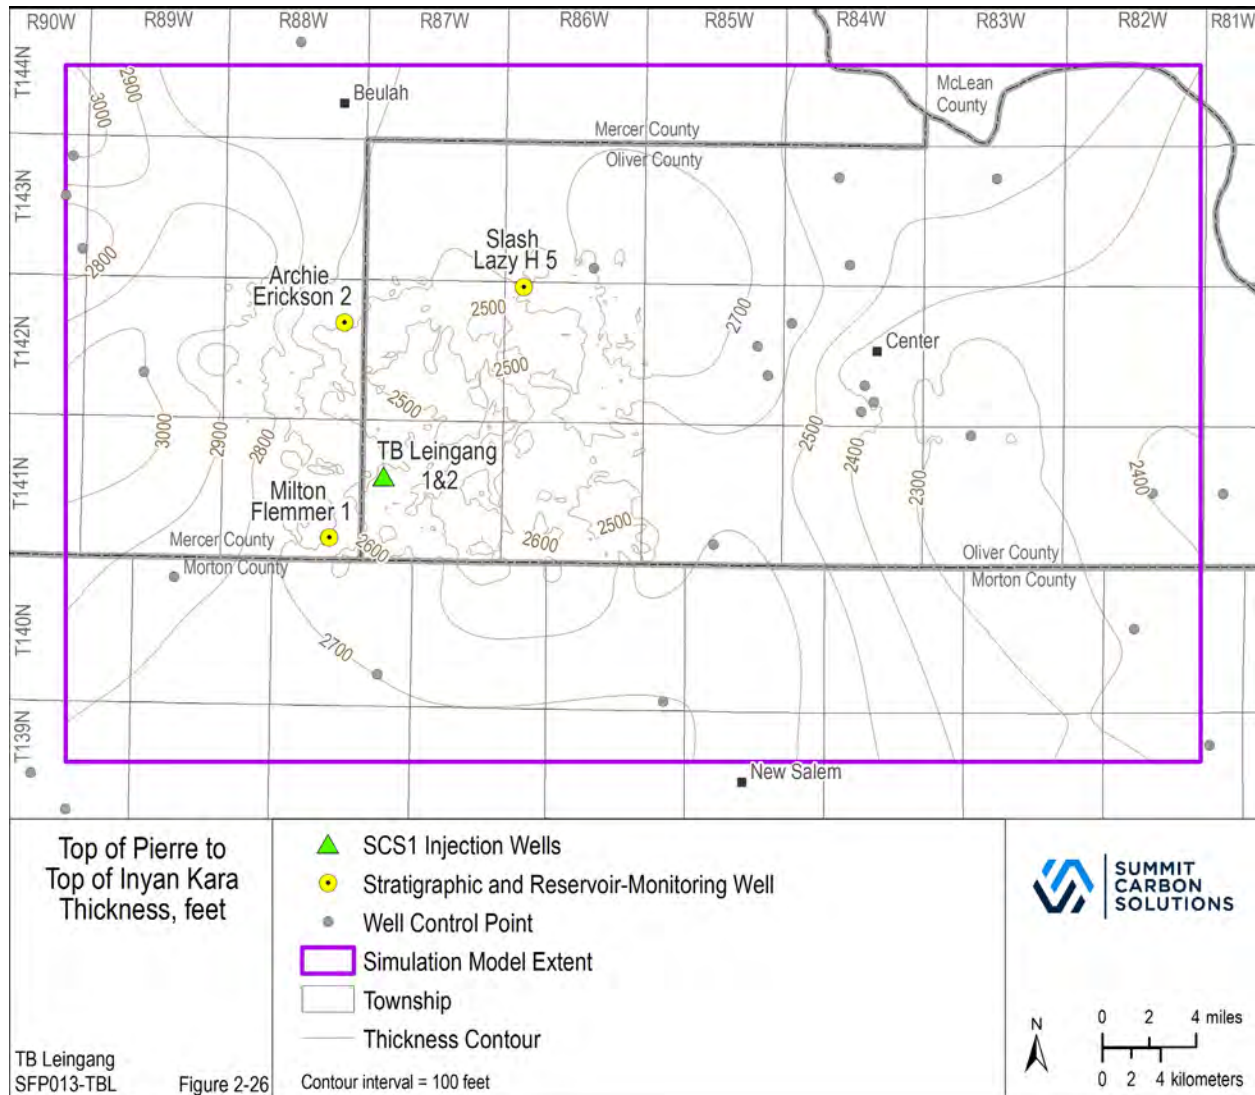

Figure 2-26. Isopach map of the interval between the top of the Inyan Kara Formation and the top of the Pierre Formation. This interval represents the tertiary confinement zone. A convergent interpolation gridding algorithm was used with well formation tops, 3D seismic, and 2D seismic in creation of this map.

### 2.4.3 Lower Confining Zone

The lower confining zone of the storage complex is the Amsden Formation, which comprises primarily dolostone and anhydrite. The Amsden Formation does include some thin sandstone intervals on the order of 1 to 8 in. thick. The sandstone intervals in the Amsden Formation are isolated from the sandstones of the Broom Creek Formation by thick impermeable dolostone and anhydrite intervals. The top of the Amsden Formation was placed at the top of an argillaceous dolostone, which has relatively high GR character that can be correlated across the simulation model area (Figure 2-11). The Amsden Formation is 6160 ft below KB elevation and 261 ft thick at TB Leingang as determined at Milton Flemmer 1 (Figures 2-27 and 2-28).

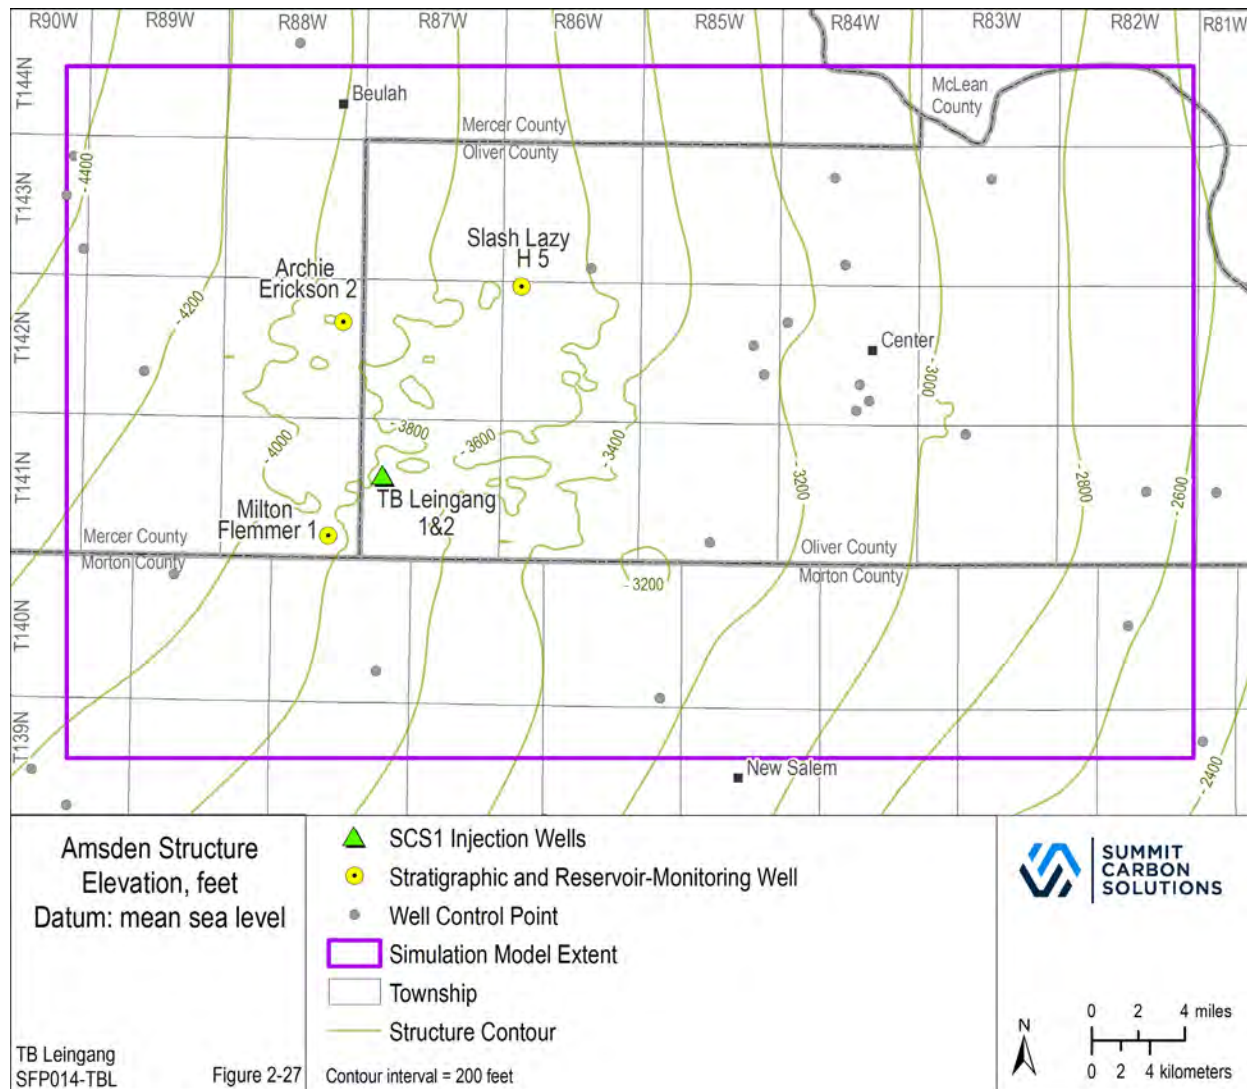

Figure 2-27. Structure map of the Amsden Formation across the simulation model area in feet below mean sea level. A convergent interpolation gridding algorithm was used with well formation tops, 3D seismic, and 2D seismic in creation of this map.

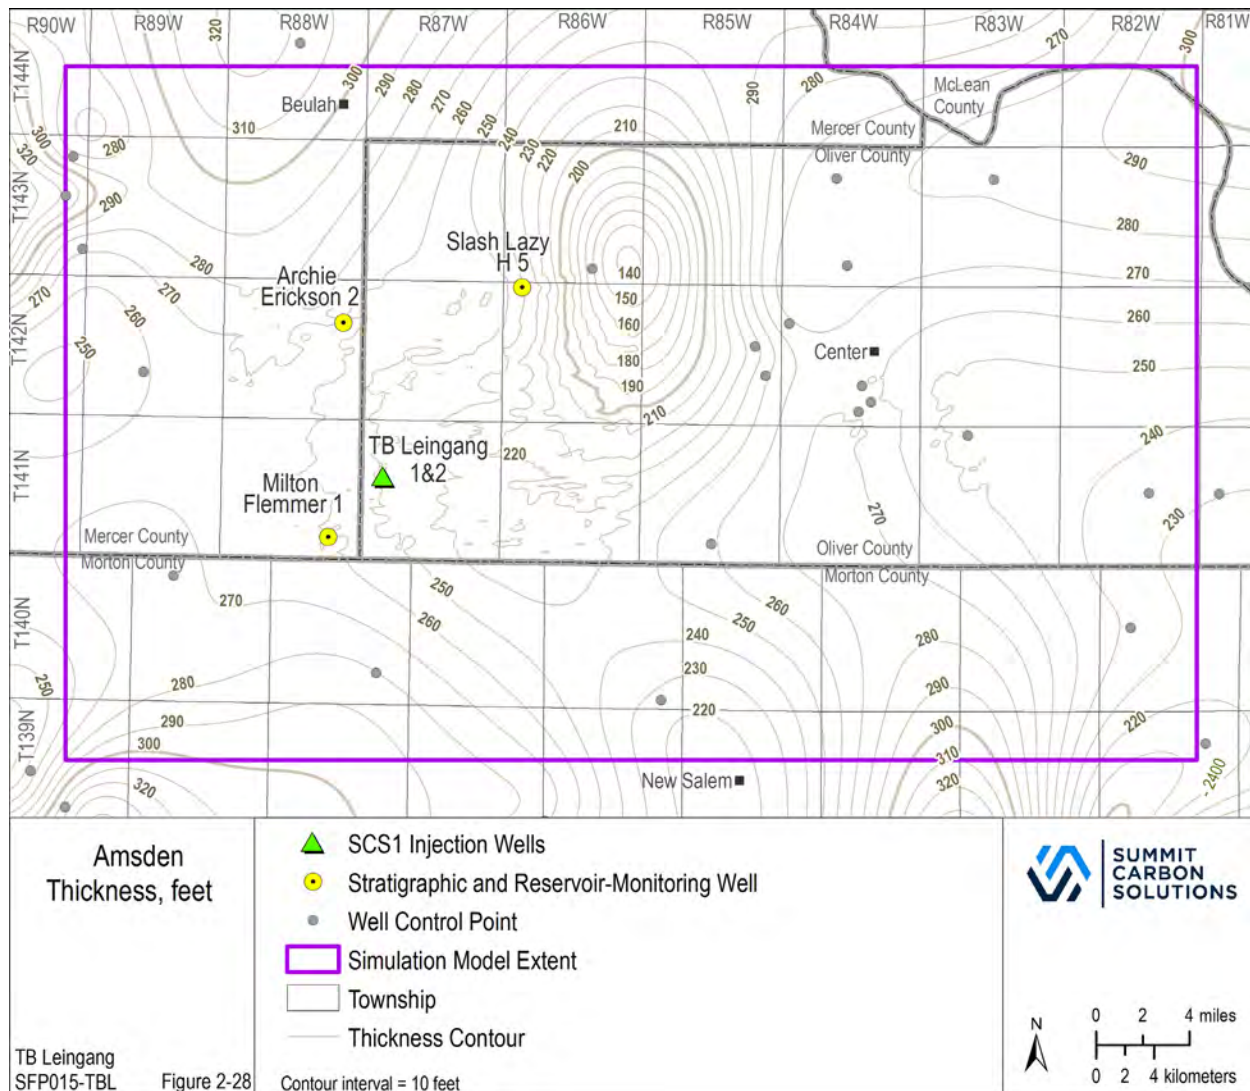

Figure 2-28. Isopach map of the Amsden Formation across the simulation model area. The convergent interpolation gridding algorithm was used with well formation tops, 3D seismic, and 2D seismic in creation of this map.

The contact between the underlying Amsden Formation and the overlying Broom Creek Formation is evident on wireline logs as there is a lithological change from the dolostone and anhydrite beds of the Amsden Formation to the porous sandstones of the Broom Creek Formation (Figure 2-11). The top of the Amsden in Milton Flemmer 1 is picked at the base of a 10-ft anhydrite bed which can be correlated across much of the study area. This lithologic change is also recognized in the core from Milton Flemmer 1. The lithology of the cored section of the Amsden Formation from Milton Flemmer 1 is predominantly dolostone and anhydrite, with lesser predominant lithologies of sandstone.

#### 2.4.3.1 Mineralogy of the Lower Confining Zone

Powder XRD for average bulk composition analysis of six finely ground, homogenized samples from the Amsden Formation shows equal proportions of quartz (~34%) and carbonates (~33%, mostly dolomite with minor contributions from calcite and ankerite) followed by sulfate (~17%, mostly anhydrite) (Figure 2-29a[a]). Feldspar (mostly K-feldspar) and clay minerals (mostly illite) each account for about 7% of the composition of the Amsden Formation with minor amounts of halide (~0.1%), oxide/hydroxide (~0.1%), and sulfide (~0.2%). The major constituents of the Amsden Formation are also shown in Table 2-8b. These data align with the average elemental composition obtained by XRF which show Si as the dominant element followed by calcium (Ca), sulfur (S), magnesium (Mg), aluminum (Al), potassium (K), iron (Fe), and other trace elements (Figure 2-29a[b]).

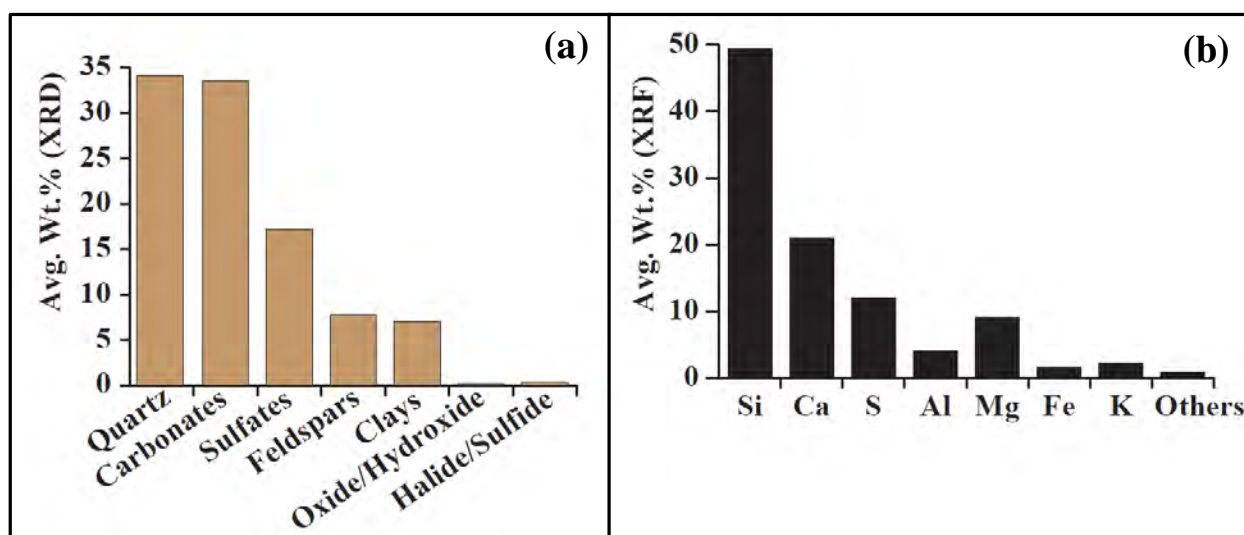

Figure 2-29a. Bar charts showing a) average mineralogy (wt%) and b) average elemental composition (wt%) of the Amsden Formation at the Milton Flemmer 1 well. Elemental data by XRF were determined as oxides of the respective elements.

XRF analysis of the Amsden Formation (Figure 2-29b) shows that the contact between the Amsden and Broom Creek Formations is dominated by CaO and MgO, indicating the presence of dolomite. As the formation gets deeper, the chemistry changes to more anhydrite-rich, fine to medium-grained sandstones, as shown by the high percentage of SiO<sub>2</sub>, CaO, and SO<sub>3</sub>. The Amsden Formation contains clay up to 20% with illite being the dominant clay type.

Similar to the Opeche/Spearfish Formation, the higher content of anhydrite (~17%) and clay minerals (~7%) makes the Amsden Formation less porous and more impermeable compared to the target Broom Creek Formation. The thin-section and SEM-EDS micrographs of the most porous sample at the cored depth of 6215.2 ft (6208.2 ft KB elevation) show moderately sorted, fine-grained subangular quartz and feldspar grains with anhydrite cement (Figures 2-30a and c).

**Table 2-8b. XRD Analysis of the Amsden Formation at Milton Flemmer 1. Only major constituents are shown.**

Sample Name	Core Depth, ft, MD	Log Depth, ft, MD	Feldspar, wt%	Quartz, wt%	Anhydrite, wt%	Dolomite, wt%	Clay, wt%	Others, wt%	Illite/Total Clay,* wt%
Amsden	6169.3	6162.3	9.93	13.91	0.00	71.44	1.87	2.85	100
Amsden	6177.2	6170.4	18.23	34.48	0.00	26.79	18.03	2.47	100
Amsden	6186.2	6179.2	0.00	35.33	0.99	62.75	0.51	0.42	100
Amsden	6201.2	6194.2	13.78	32.94	0.00	31.62	19.56	2.10	100

Amsden	6219.9	6212.9	0.00	0.43	97.10	0.62	0.00	1.85	NA**

\* Illite component of clays.

\*\*NA; no illite component was detected by XRD.

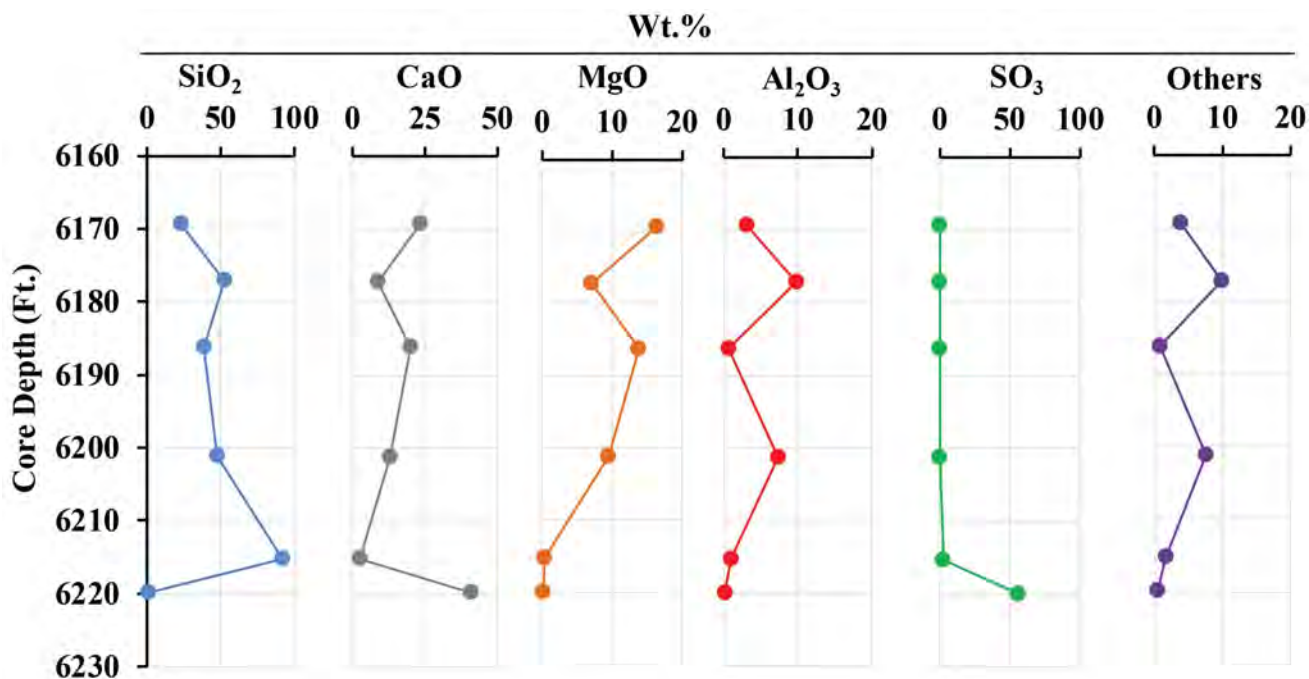

Figure 2-29b. Elemental composition by XRF as a function of depth in the Amsden Formation at Milton Flemmer 1.

The least porous sample, located at the bottom of the section at the core depth of 6219.9 ft (6212.9 ft KB elevation), predominantly consists of anhydrite (~97%) with microfractures (Figures 2-30b and d). Figure 2-31 shows changes in the mineralogy at the Milton Flemmer 1 well as a function of depth next to the core sample porosity and permeability data. The Amsden Formation is highlighted in gray. Although a total porosity of 22% with a permeability of 419 mD was observed at the core depth of 6215.2 ft (6208.2 ft KB elevation), it must be noted that this layer is isolated and confined between ultralow permeable layers (a clay-rich quartz dolomite layer above and an anhydrite-rich layer below).

Figure 2-30. Thin-section (a, b) and SEM (c, d) micrographs of the most porous portion (a, c) and the least porous (b, d) samples of the Amsden Formation at Milton Flemmer 1 well. The most porous sample of the Amsden Formation has a total porosity and permeability of 22% and 419 mD, respectively, which is notably reduced to 0.26% and 0.0008 mD in the least porous sample. The blue color in the thin-sections (a and b) represents porosity.

Figure 2-31. Change in the mineralogy of the lower confining Amsden Formation (highlighted in gray) at Milton Flemmer 1 as a function of depth based on XRD in comparison to GR, facies, core sample total porosity (%), and permeability (mD). Data gaps in the porosity and permeability plots are due to the inability to obtain testable samples as solid plugs (samples too soft/brittle). Tracks from left to right are 1) GR (black), 2) MD, 3) total feldspar (orange), 4) quartz (blue), 5) anhydrite (yellow green), 6) dolomite (green), 7) total clay (light blue), 8) other (light green), 9) facies, 10) core porosity (2400 psi) (dark blue), and 11) core permeability (2400 psi) (red).

#### 2.4.3.2 Geochemical Interaction

Geochemical simulation using PHREEQC geochemical software was performed to calculate the potential effects of an injected multicomponent CO<sub>2</sub> stream on the Amsden Formation. This simulation was run for 45 years to represent 20 years of injection plus 25 years of postinjection.

Modeling results show geochemical processes at work. The pH at the interface between the injection zone and lower confining zone has the greatest change in value, declining to a level of 5.7 after 7 years of injection, further declining to 4.8 by the end of the modeled injection period, and hits 4.5 by the end of simulation period. Progressively lower or slower pH changes occur for

each cell that is more distant from the CO<sub>2</sub> interface. Albite and K-feldspar start to dissolve from the beginning of the simulation period, while quartz and illite start to precipitate. Albite and K-feldspar are the primary minerals that dissolve, and their initial fractions have almost completely dissolved. No dissolution is observed for illite and quartz. The minerals that experience dissolution in the model are almost completely replaced by the precipitation of other minerals. The overall net porosity changes from dissolution and precipitation are minimal, less than 2% change during the life of the simulation. These results suggest that geochemical change from exposure to CO<sub>2</sub> is minor and therefore the ability of the Amsden Formation to maintain its sealing integrity will not be compromised by geochemical processes. A full description of the geochemical results for the upper confining zone can be found in Appendix C.

#### **2.4.4 Geomechanical Information of Confining Zone**

##### *2.4.4.1 Fracture Analysis*

Fractures within the overlying confining zone (the Opeche/Spearfish Formation) and the underlying confining zone (Amsden Formation) were assessed during the description of the Milton Flemmer 1 well core. Observable fractures were categorized by attributes including morphology, orientation, aperture, and origin. Secondly, natural fractures and in situ stress were assessed through the interpretation of the image log acquired during the drilling of the Milton Flemmer 1 well.

##### *2.4.4.2 Core-Fracture Analysis*

The fractures observed in the Opeche Formation were tectonic, vertical to subvertical, closed, and cemented with anhydrite. The Amsden Formation was determined to be a nonfractured interval. A few discontinuous closed fractures were noted. The presence of stylolites was also noted in the dolomitic intervals of the Amsden Formation.

##### *2.4.4.3 Borehole Image Fracture Analysis*

Natural fractures and in situ stresses were assessed through the interpretation of borehole image log, dipole shear sonic slowness (DTS), and DTC logs acquired during the drilling of the Milton Flemmer 1 well. Borehole image logs provide a 360-degree image of the formation of interest and are oriented to provide an understanding of the general orientation of the observed features. The fractures within the upper confining zone formations, specifically Spearfish, Minnekahta, and Opeche, exhibit unique characteristics and are classified individually.

Fractures within Opeche Formation were primarily litho-bound resistive fractures, mainly oriented NNW-SSE with the presence of other fracture sets oriented N-S, NW-SE, and NE-SW. They were commonly filled with anhydrite. Some litho-bound conductive fractures were identified and determined to have a N-S and NW-SE orientation. The litho-bound conductive fractures are filled with clay and are interpreted as closed fractures (Figure 2-32a). In the Spearfish formation, one resistive litho-bound fracture and one resistive continuous fracture, oriented N-S and NNE-SSW, were highlighted (Figure 2-32b). In the Minnekahta Formation, one conductive litho-bound fracture, oriented NE-SW was highlighted (Figure 2-32C). The fractures vary in orientation and exhibit horizontal, oblique, and vertical trends. They are closed, and the aperture varies from close to centimeter-scale (Figures 2-33 and 2-34). No microfaults were found in the Spearfish, Minnekahta, and Opeche intervals.

Figure 2-32a. Strike orientation per type of fracture that characterizes the Opeche Formation: resistive litho-bound fractures (pink), resistive continuous fractures (brown), and conductive litho-bound fractures (blue). The colored dots represent the dip value for the corresponding type of fracture and the dip azimuth of the fracture.

Figure 2-32b. Strike orientation per type of fracture that characterizes the Spearfish Formation: resistive litho-bound fracture (pink) and resistive continuous fracture (brown). The colored dots represent the dip value for the corresponding type of fracture and the dip azimuth of the fracture.

Figure 2-32c. Strike orientation per type of fracture that characterizes the Minnekahta Formation: conductive litho-bound fracture (blue). The colored dot represents the dip value for the corresponding type of fracture and the dip azimuth of the fracture.

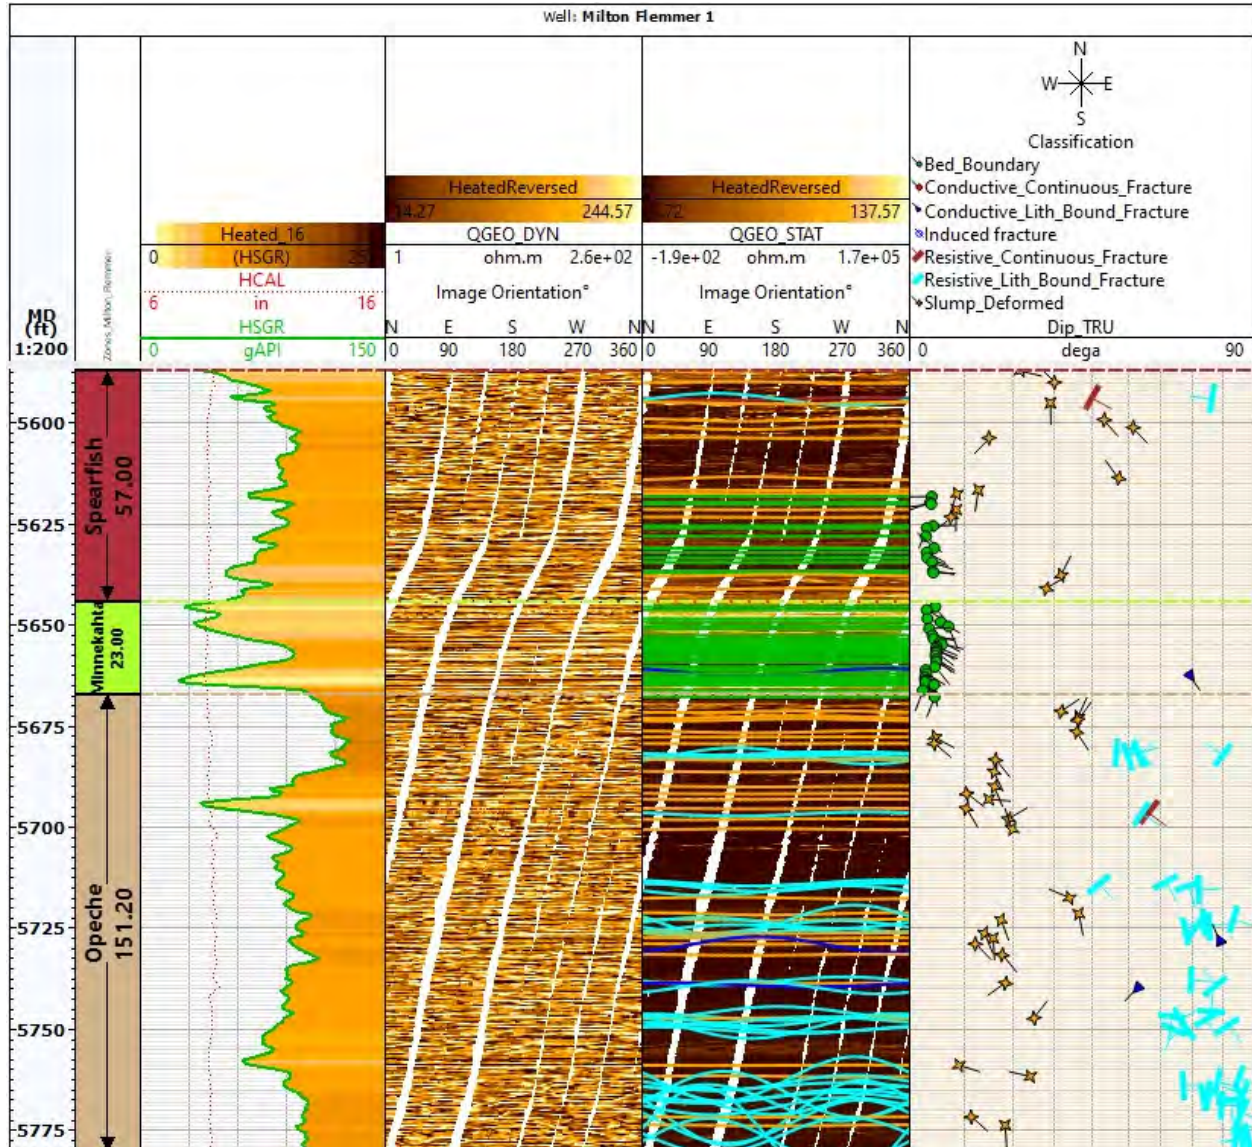

Figure 2-33. Sedimentary and tectonic features in Spearfish, Minnekahta, and Opeche Formations observed on the borehole image log. The tracks from left to right are 1) MD; 2) formation; 3) HSGR, caliper (HCAL); 4) borehole dynamic image log; 5) borehole static image log; and 6) tectonic and sedimentary tadpole orientation in the interval between 5,595 and 5,777 ft MD.

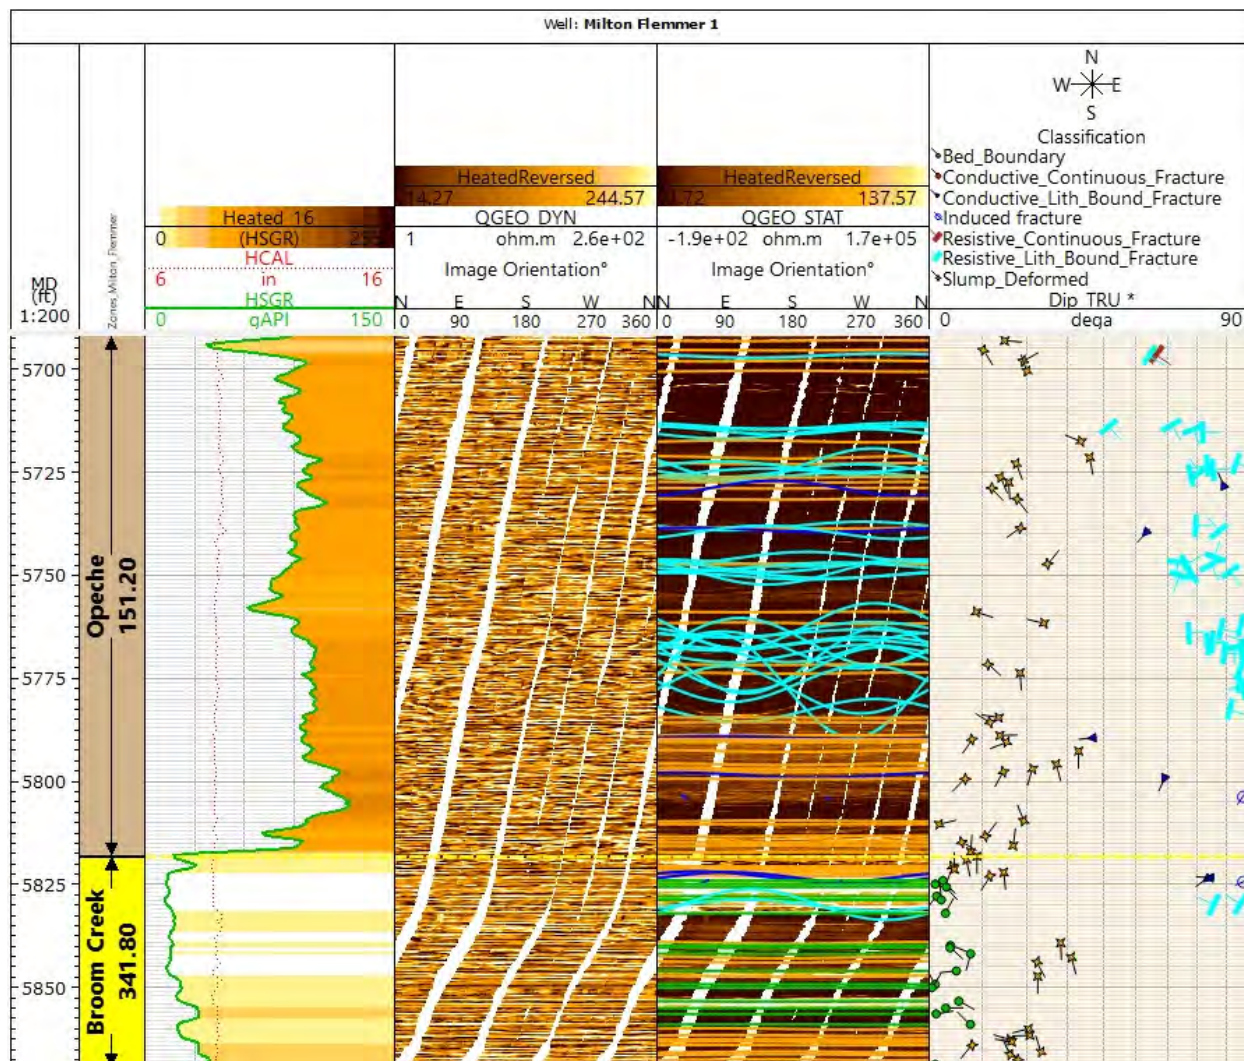

Figure 2-34. Sedimentary and tectonic features, and tensile fractures in Opeche and Upper Broom Creek Formations observed on the borehole image log. The tracks from left to right are 1) MD; 2) formation; 3) HSGR, HCal; 4) borehole dynamic image log; 5) borehole static image log; and 6) induced fracture, tectonic, and sedimentary tadpole orientation in the interval between 5,692.5 and 5,872.5 ft MD.

The Amsden Formation is considered to be a nonfractured interval; however, a few litho-bound conductive and resistive fractures are highlighted with the presence of horizontal compaction features (stylolites). The fractures are oriented E-W, NNE-SSW, and NNW-SSE (Figure 2-35). The fractures vary in orientation and exhibit oblique and vertical trends. The fractures are filled, and the aperture varies from closed to millimeter-scale (Figures 2-36 and 2-37). No microfaults were found in the Amsden interval.

Figure 2-35. Strike orientation per type of fracture that characterizes the Amsden Formation: resistive litho-bound fractures (pink) and conductive litho-bound fractures (blue). Colored dots represent the dip value for the corresponding type of fracture and the dip azimuth of the fracture.

Figure 2-36. Sedimentary and tectonic features, and tensile fractures in lower Broom Creek and Amsden Formation (upper part) observed on the borehole image log. The tracks from left to right are 1) MD; 2) formation; 3) HSGR, HCAL; 4) borehole dynamic image log; 5) borehole static image log; and 6) induced fracture, tectonic, and sedimentary tadpole orientation in the interval between 6130 and 6282.5 ft MD.

Figure 2-37. Sedimentary and tectonic features, and tensile fractures in the Amsden Formation (lower part) observed on the borehole image log. The tracks from left to right are 1) MD; 2) formation; 3) HSGR, HCAL; 4) borehole dynamic image log; 5) borehole static image log; and 6) induced fracture, tectonic, and sedimentary tadpole orientation in the interval between 6130 and 6422.5 ft MD.

Breakout and tensile fractures induced by drilling were identified in several formations such as Precambrian and Ordovician units and Amsden, Broom Creek, and Opeche Formations. Breakouts and tensile fractures have NW-SE and NE-SW orientations, respectively (Figure 2-38). In the confining and injection zones, the tensile fractures were identified at different depths 5804, 5826, 6195, and 6307 ft MD. The tensile fractures are oriented NE-SW, indicating that the maximum horizontal stress ( $SH_{max}$ ) has an orientation of N050°.

Figure 2-38. Orientation of the tensile fractures and breakout in Milton Flemmer 1 observed mainly in Precambrian and Ordovician units and Amsden, Broom Creek, and Opeche Formations, showing maximum horizontal stress (SHmax) direction about N050° and minimum horizontal stress (Shmin) about N140°.

#### 2.4.4.4 Stress, Ductility and Rock Strength

The dynamic elastic properties (dynamic Young's modulus and Poisson's ratio) for the Opeche/Spearfish, Broom Creek, and Amsden Formations were calculated by using DTC, DTS, and density log collected from Milton Flemmer 1. These dynamic elastic properties were converted to static elastic properties with calibrations of geomechanical lab core measurements.

A 1D MEM in the Broom Creek section was built for Milton Flemmer 1 using the available wireline data such as GR logs, caliper logs, density logs (RHOB), dipole sonic logs (DTC, DTS), and image logs. The 1D MEM consists of pore pressure, the vertical in situ stress (Sv, overburden), minimum and maximum horizontal in situ stresses (Shmin, SHmax), static and dynamic Young's moduli (E), static and dynamic Poisson's ratio (v), bulk modulus (K), shear modulus (G), unconfined compressive strength (UCS), tensile strength (To), and friction angle (FA or FANG) (Tables 2-9 and 2-10).

**Table 2-9. Ranges and Averages of the Elastic Properties Estimated from 1D MEM in the Opeche/Spearfish, Broom Creek, and Amsden Formations: Static Young's Modulus (E\_Stat), Static Poisson's Ratio (v\_Stat), Static Bulk Modulus (K), Static Shear Modulus (G), Unconfined Compressive Strength (UCS), Dynamic Young's Modulus (E\_Dyn), and Dynamic Poisson's Ratio (v\_Dyn)**

	Average	6258.59	2743.53	4375.16	54.20

$S_v$  is one of the three principal stresses that act upon a rock. It is defined as the stress applied by the overlaying lithostatic column, at the depth ( $z$ ), and is estimated using the Plumb and others (1991) equation.  $S_v$  is calculated using the RHOB log as an input. For the pore pressure, porosity proxy logging data based on a normal compaction trendline concept were used (for hydraulic static pressure,  $1.03 \text{ g/cm}^3 = 0.44675 \text{ psi/ft} = 8.6 \text{ ppg}$ ). For the Broom Creek Formation, the MDT data taken in sand bodies show pore pressure equivalent to 9 ppg equivalent to  $0.466 \text{ psi/ft}$ , which is slightly overpressured. The pore pressure estimation honored the MDT measurement. Dynamic to static Young's modulus function used a linear conversion where a dynamic Young's modulus log was calculated from the available sonic (DTC, DTS) and density logs. For Poisson's ratio, dynamic and static parameters are assumed to be equal. The Biot factor was estimated using the formula Biot's factor  $= 1 - (K_0/K_{\text{mineral}})$ , where  $K_0$  is the bulk modulus of the porous medium and  $K_{\text{mineral}}$  is the bulk modulus of solid parts of the porous medium. It is a function of mineral volumes and minerals' bulk modulus. For rock properties, Young's modulus and Poisson's ratio were estimated from well logs and were calibrated with the triaxial core laboratory measurements (Figure 2-39).

Unconfined compressive strength (UCS) was calculated using empirical correlations between UCS and DTC for shale, sandstone, and dolostone: the Chang (2006) method was used for shale formation, the McNally (1987) method was used for sandstone formation, and the Golubev and Rabinovich (1976) method was used for dolostone formation. The tensile strength was assumed to be 10% of the calculated UCS. The friction angle (FA or FANG) was estimated using an empirical correlation between the internal angle of friction and DTC: Lal's approach (1999) was used to calculate the FA in the Opeche/Spearfish and Amsden Formations, and Weingarten and Perkins (1995) in Broom Creek Formation. Horizontal stresses ( $S_{\text{hmin}}$  and  $S_{\text{Hmax}}$ ) were estimated using the poroelastic equations (Plumb and others, 2000). The orientations of  $S_{\text{hmin}}$  and  $S_{\text{Hmax}}$  were estimated with the help of image logs (Figure 2-38). The magnitude of  $S_{\text{hmin}}$  was calibrated by the closure pressures which were measured with a mini-frac stress test. In addition, the 1D MEM shows that the stress regime observed in the Opeche/Spearfish, Broom Creek, and Amsden Formations is normal ( $S_v > S_{\text{Hmax}} > S_{\text{hmin}}$ ).

The analysis of the pore pressure measured in the Broom Creek Formation attests that it could be considered an overpressured reservoir with a gradient equal to  $0.466 \text{ psi/ft}$ .

Triaxial test (static elastic properties), ultrasonic velocity (dynamic elastic properties), destructive test (compressive strength) at reservoir conditions, and pore volume compressibility (PVC) for reservoir samples were conducted on nine core samples acquired from the Opeche/Spearfish, Broom Creek, and Amsden Formations in the Milton Flemmer 1 well. These values were used to calibrate the static and dynamic Young's modulus and Poisson's ratio generated from well logs (Table 2-11).

Figure 2-39. Geomechanical parameters in the Spearfish, Minnekahta, Opeche, Broom Creek, and Amsden Formations. The tracks from left to right are 1) MD; 2) formation; 3) GR, HCAL; 4) TNPH (neutron porosity), and RHOZ (bulk density); 5) dynamic Young's modulus (E\_dyn), and static Young's modulus (E\_Stat)\_calibrated with core measurements (E\_Core); 6) dynamic Poisson's ratio (PR\_dyn) calibrated with core measurements (PR\_Core); 7) cohesion, bulk modulus (K\_dyn), shear modulus (G\_dyn), and Biot's factor; 8) UCS, tensile strength, and FA; 9) pore pressure, hydropressure calibrated with MDT pressure data; 10) Sv, SHmax, and Shmin calibrated with the MDT stress test; and 11) pore pressure, Shmin, and Eaton fracture gradients.

**Table 2-11. Formation, Lithology, Sample Depth (MD), Vertical Stress, Pore Pressure, Effective Vertical Stress, Horizontal Stress, Static Young's Modulus, Poisson's Ratio, and Compressive Strength in Opeche/Spearfish, Broom Creek, and Amsden Formations**

Sample Information		Reservoir Conditions					Elastic Properties		
Formation	Lithology/ Rock Type	Depth, * ft, MD	Vertical Stress, psi	Pore Pressure, psi	Effective Stress, psi	Horizontal Stress, psi	Static Young's Modulus, Mpsi	Static Poisson's Ratio, unitless	Compressive Strength,*** psi
Opeche/ Spearfish	Siltstone	5811	5753	2673	3080	1232	4.61	0.20	19,279
Opeche/ Spearfish	Silty sandstone	5820	5761	2677	3084	1234	6.95	0.30	6866
Broom Creek	Anhydrite	5825	5767	2679	3087	1235	8.90	0.37	18,148

Broom Creek	Anhydritics sandstone	6091	6030	2802	3228	1291	NA**	NA**	9822
Broom Creek	Dolomitic sandstone	6133	6072	2821	3251	1300	8.34	0.11	12,733
Amsden	Dolostone	6169	6108	2838	3270	1308	9.69	0.28	29,612
Amsden	Dolomitic sandstone	6186	6124	2846	3279	1311	5.85	0.15	27,394
Amsden	Sandy dolostone	6201	6139	2853	3287	1315	6.51	0.17	23,985

\* Sample depth corresponds to cored depth. A depth shift must be applied to align the values with log depth (see Table 2-2a).

\*\* Because of the unconsolidated nature of the Broom Creek sandstone and anhydritic sandstone samples, velocity and triaxial test data could not be collected.

\*\*\* Compressive strength is equivalent to the peak failure pressure of the sample.

## 2.5 Faults, Fractures, and Seismic Activity

This section discusses local and regional faults, including a regional structural feature, the Stanton Fault, and interpreted basement faults. In the area of review (AOR), none of these known or suspected faults or fractures has sufficient permeability and vertical extent to allow fluid movement out of the storage reservoir. The absence of transmissive faults is supported by fluid sample analysis results from Milton Flemmer 1 that suggest the injection interval, the Broom Creek Formation (105,000 mg/L), is isolated from the next permeable interval, the Inyan Kara Formation (3560 mg/L) (Appendix A).

This section also discusses the seismic history of North Dakota and the low probability that seismic activity will interfere with containment.

### 2.5.1 *Stanton Fault*

The Stanton Fault is a suspected Precambrian basement fault interpreted by Sims and others (1991) using available borehole data and regional gravity and magnetic data as a northeast-southwest trending feature. The Stanton Fault as interpreted by Sims and others (1991) is ~11.5 mi from the Milton Flemmer 1 stratigraphic and reservoir-monitoring well (Figure 2-40). Given the resolution of the regional gravity and magnetic data and limited amount of borehole data used to interpret this suspected fault, there is a lot of uncertainty in the lateral extent and the location of the feature. No studies describing the possible vertical extent of this feature or impact on overlying sedimentary layers have been published. The Beulah 3D survey was used to characterize the subsurface, with a primary objective of identifying structures. No basement faults were identified with the orientation of the mapped Stanton fault, which was mapped just north of the survey extent. No indication of the Stanton fault was interpreted within the Beulah 3D survey.

### 2.5.2 *Interpreted Basement Faults*

Basement-rooted faults with offset apparent in the overlying rock formations were interpreted from the 3D seismic data (Figures 2-40 and 2-41). Displacement along the interpreted basement faults diminishes below or within the Interlake Formation, the top of which is located over 3000 feet below the base of the Broom Creek Formation. These faults do not extend into the Broom Creek formation or into any associated Broom Creek confining intervals.

Figure 2-41 shows a map and cross-sectional view of the discontinuities that are interpreted as faults and fractures. The linear trends visible in Figure 2-41 are interpreted as basement-rooted faults. The bottom of Figure 2-41 shows Section A-A' from the Beulah 3D survey where offset is visible along basement-rooted faults in the Deadwood Formation. These faults extend through the Deadwood Formation into the overlying confining interval, the Winnipeg group. Some of the interpreted faults extend into the Red River Formation with offset ultimately diminishing by the Interlake Formation.

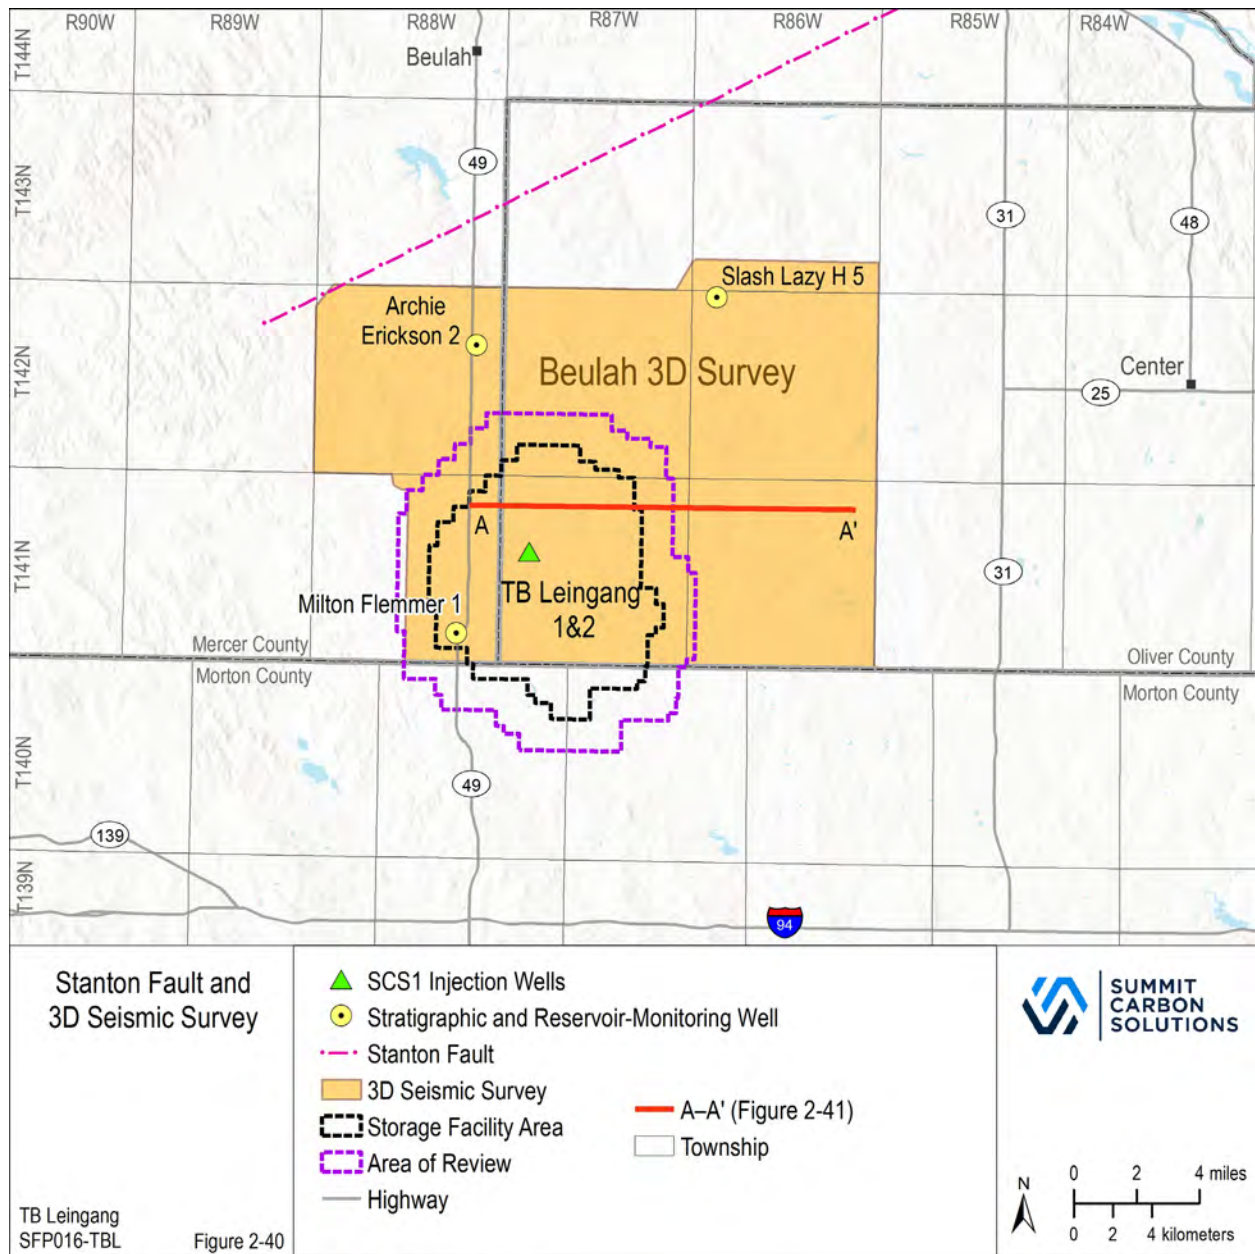

Figure 2-40. Suspected location of the Stanton Fault as interpreted by Sims and others (1991) and Anderson (2016) in relation to the Beulah 3D seismic survey extent. The red line on the map shows the location of the seismic section A-A' shown in Figure 2-41.

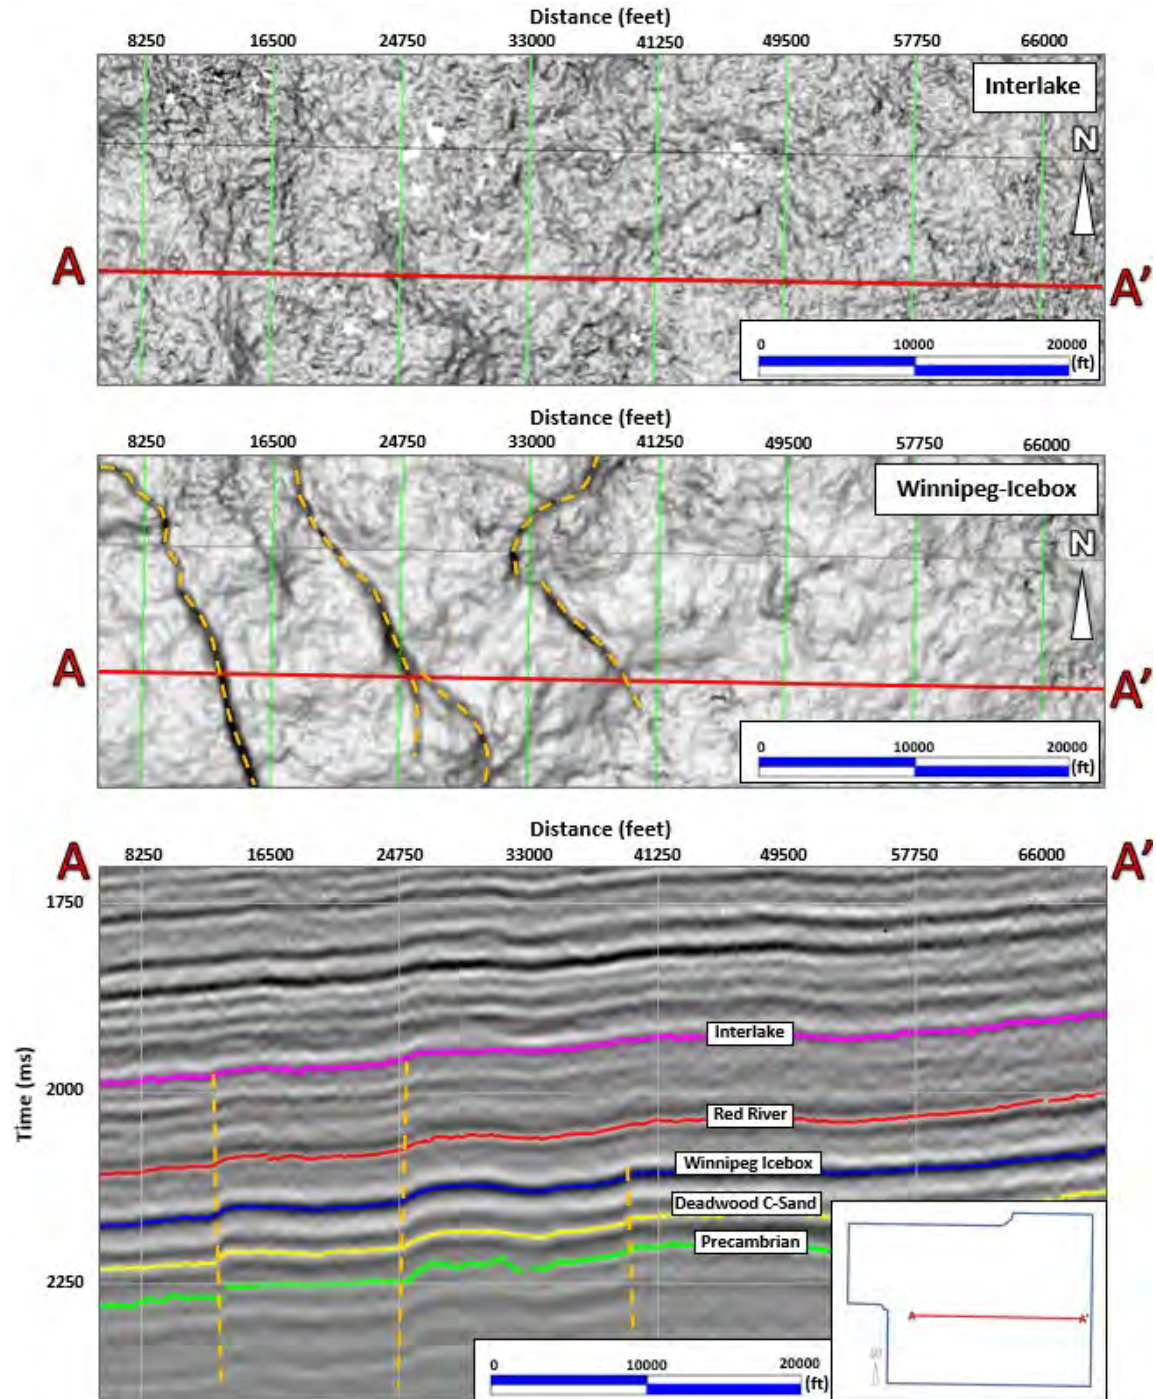

Figure 2-41. Top: similarity attribute map taken from the Beulah 3D survey of the Interlake Formation (magenta horizon) and the Winnipeg-Icebox Formation (blue horizon). Time is displayed on the y-axis in milliseconds; distance is shown on x-axis in feet. Bottom: cross-section A-A' (location within the Beulah 3D extent shown in the inset) showing seismic amplitude data, interpreted horizons, and interpreted faults. Similarity attributes highlight discontinuities shown as black linear trends marked with dashed yellow lines in the top figure. These linear trends are interpreted as faults and fractures rooted within the Precambrian basement (green horizon). Displacement along these faults diminishes below the Interlake Formation (magenta horizon).

### 2.5.3 *Mohr–Coulomb Critical Stress Analysis of Faults*

An integrated Mohr–Coulomb deterministic and probabilistic critical stress analysis study was carried out across the Beulah 3D seismic survey area. Results of the study allowed for evaluation of the risk and range of uncertainty for potential fault slippage in response to CO<sub>2</sub> injection. The analysis used the fault segments interpreted from the 3D seismic data which exhibit a range of strikes and dips. Four injection locations were selected for this evaluation with the objective of testing a full range of fault slip stability scenarios. Three of these locations are planned SCS injection wells, Wells 1, 2, and 4 in Figure 2-42, with Well 3 being a potential location that was ultimately not selected for further development.

The Milton Flemmer 1 1D MEM was used as a basis for the boundary conditions for the Mohr–Coulomb critical stress analysis across the Beulah 3D seismic study area. SLB Techlog, Ikon RokDoc, and Stanford University Fault Slip Potential (FSP) software tools were used to carry out the integrated study.

The evaluation's main conclusion is the interpreted fault segments have a low probability of slippage in response to pore pressure increases caused by CO<sub>2</sub> injection, if the maximum differential pressure increase at the fault is below ~3000 psi (Figures 2-42 and 2-43). The pore pressure necessary to initiate slip on the interpreted fault segments is dominantly controlled by the geomechanical factors: fault strike, SH<sub>max</sub> azimuth, and pore pressure gradient. Additionally, the fault segments have a very low probability of slippage in response to pore pressure increases from injection in the Broom Creek Formation because of the large vertical distance between the reservoir and the interpreted fault (>3000 ft).

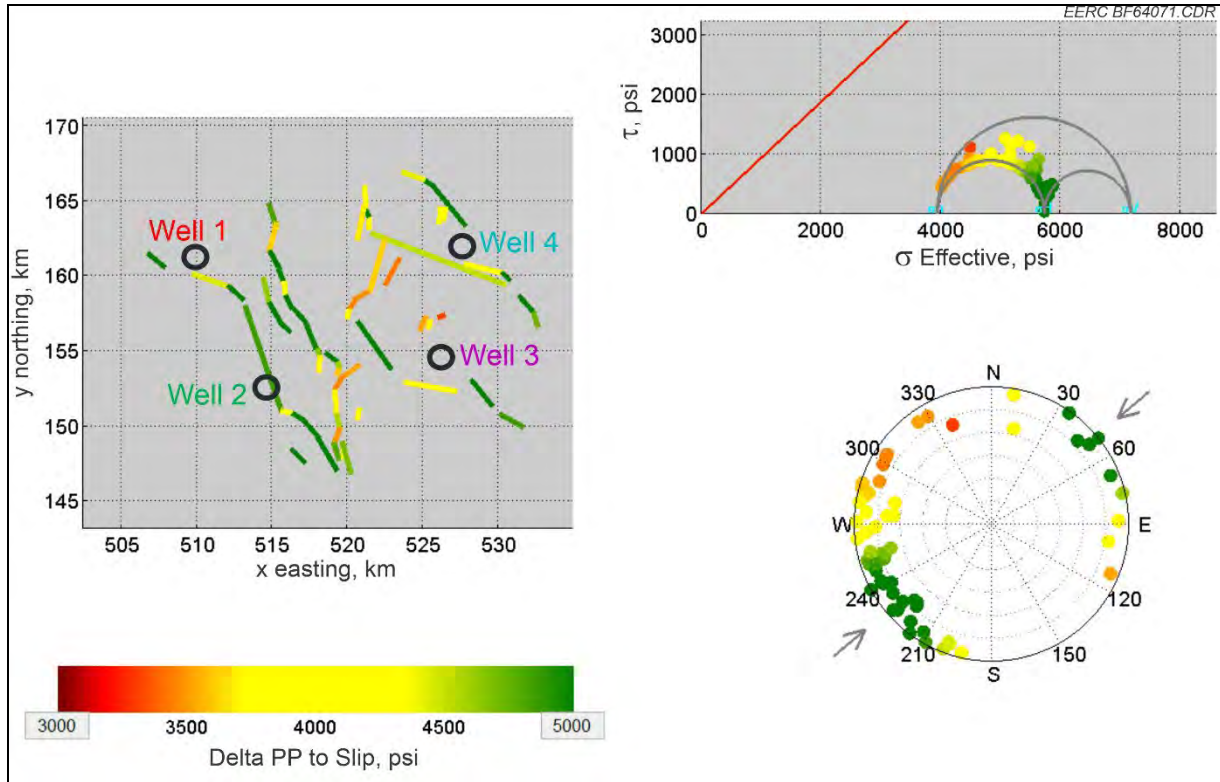

Figure 2-42. Results of the deterministic FSP analysis of the interpreted fault segments in response to pore pressure increase associated with injection at four well locations. Dominant SHmax azimuth is north 50 degrees east, indicated by the arrows in the polar plot of fault strikes and dips in the lower right of the figure.

Figure 2-43. Probabilistic FSP analysis of the interpreted fault segments in response to pore pressure and four injection well locations showing a minimum of ~3000-psi pressure increase is needed to initiate slip on the most unstable interpreted faults in red vs. the more stable faults in green, where a minimum of ~5000 psi is required to initiate slip.

#### 2.5.4 Seismic Activity

The Williston Basin is a tectonically stable region of the North American Craton. Zhou and others (2008) summarize that “the Williston Basin as a whole is in an overburden compressive stress regime,” which could be attributed to the general stability of the North American Craton. Interpreted structural features associated with tectonic activity in the Williston Basin in North Dakota include anticlinal and synclinal structures in the western half of the state, lineaments associated with Precambrian basement block boundaries, and faults (North Dakota Industrial Commission, 2022).

Between 1870 and 2015, 13 earthquakes were detected within the North Dakota portion of the Williston Basin (Table 2-12) (Anderson, 2016). Of these 13 earthquakes, only three occurred along one of the eight Precambrian basement faults interpreted by Anderson (2016) in the North Dakota portion of the Williston Basin (Figure 2-44). The earthquake recorded closest to the project area occurred in 1927, located 19.15 miles southwest of the TB Leingang 1 injection well, near Hebron, North Dakota (Table 2-12). The magnitude of this earthquake is estimated to have been 3.2.

**Table 2-12. Summary of Earthquakes Reported to Have Occurred in North Dakota (from Anderson, 2016)**

<b>Map Label</b>	<b>Date</b>	<b>Magnitude</b>	<b>Depth, miles</b>	<b>Longitude</b>	<b>Latitude</b>	<b>City or Vicinity of Earthquake</b>	<b>Distance to TB Leingang 1 Well, miles</b>

\* Estimated depth.

\*\* Magnitude estimated from reported modified Mercalli intensity (MMI) value.

\*\*\* Unknown.

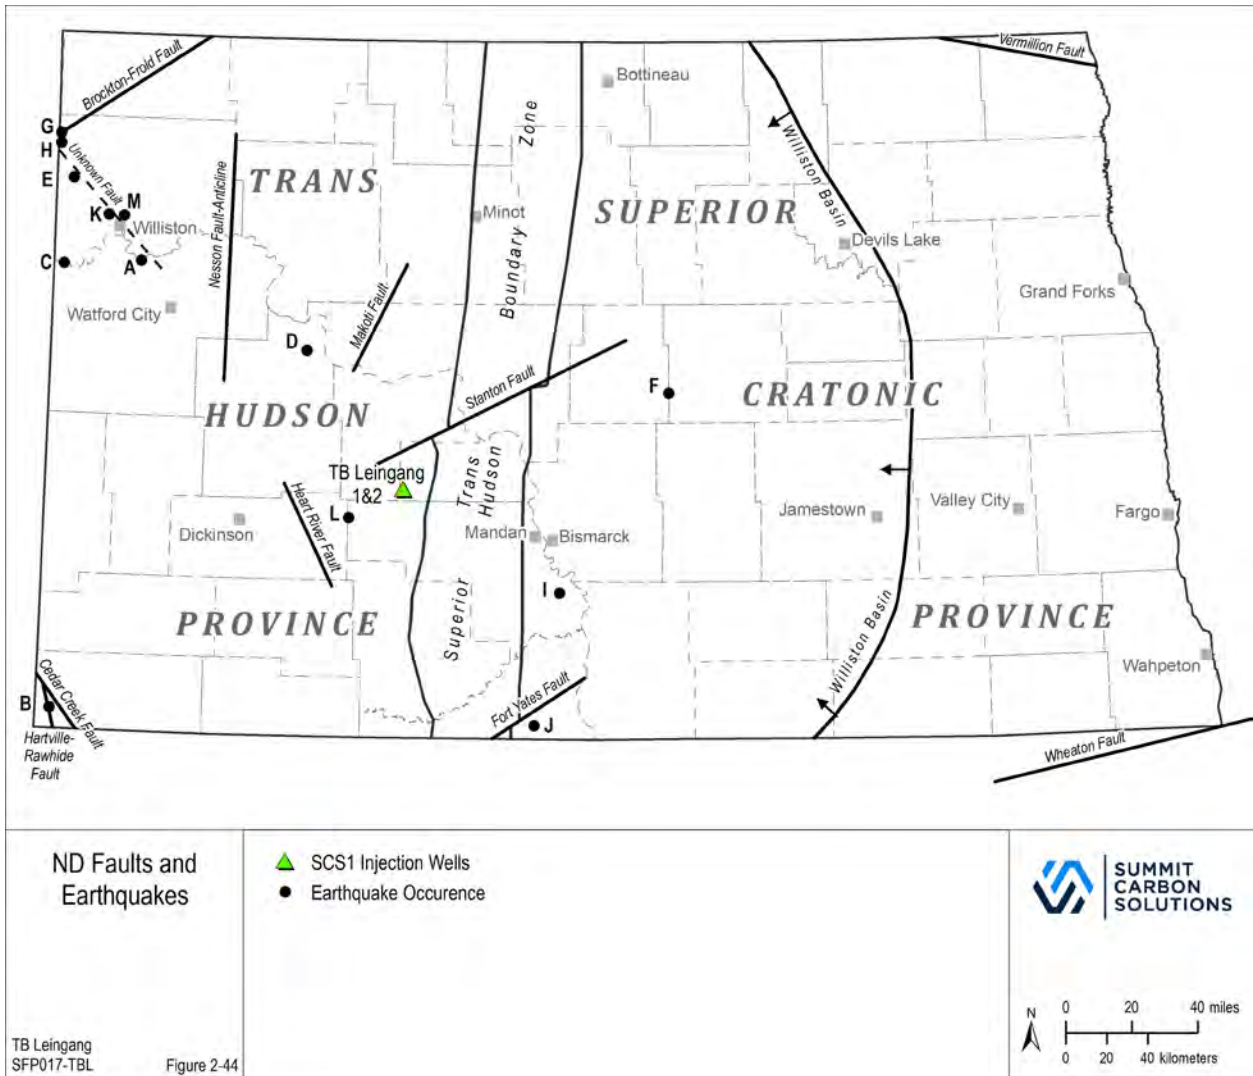

Figure 2-44. Location of major faults, tectonic boundaries, and earthquakes in North Dakota (modified from Anderson, 2016). The black dots indicate earthquake locations listed in Table 2-12.

Studies completed by the U.S. Geological Survey (USGS) indicate there is a low probability of earthquake events occurring in North Dakota that would cause damage to infrastructure, with less than two damaging earthquake events predicted to occur over a 10,000-year time period (Figure 2-45) (U.S. Geological Survey, 2019). A 1-year seismic forecast (including both induced and natural seismic events) released by USGS in 2016 determined North Dakota has very low risk (less than 1% chance) of experiencing any seismic events resulting in damage (U.S. Geological Survey, 2016). Frohlich and others (2015) state there is very little seismic activity near injection wells in the Williston Basin. They noted only two historic earthquake events in North Dakota that could be associated with nearby oil and gas activities. Additionally, no earthquakes occurring along the Stanton Fault have been reported. This indicates stable geologic conditions in the region

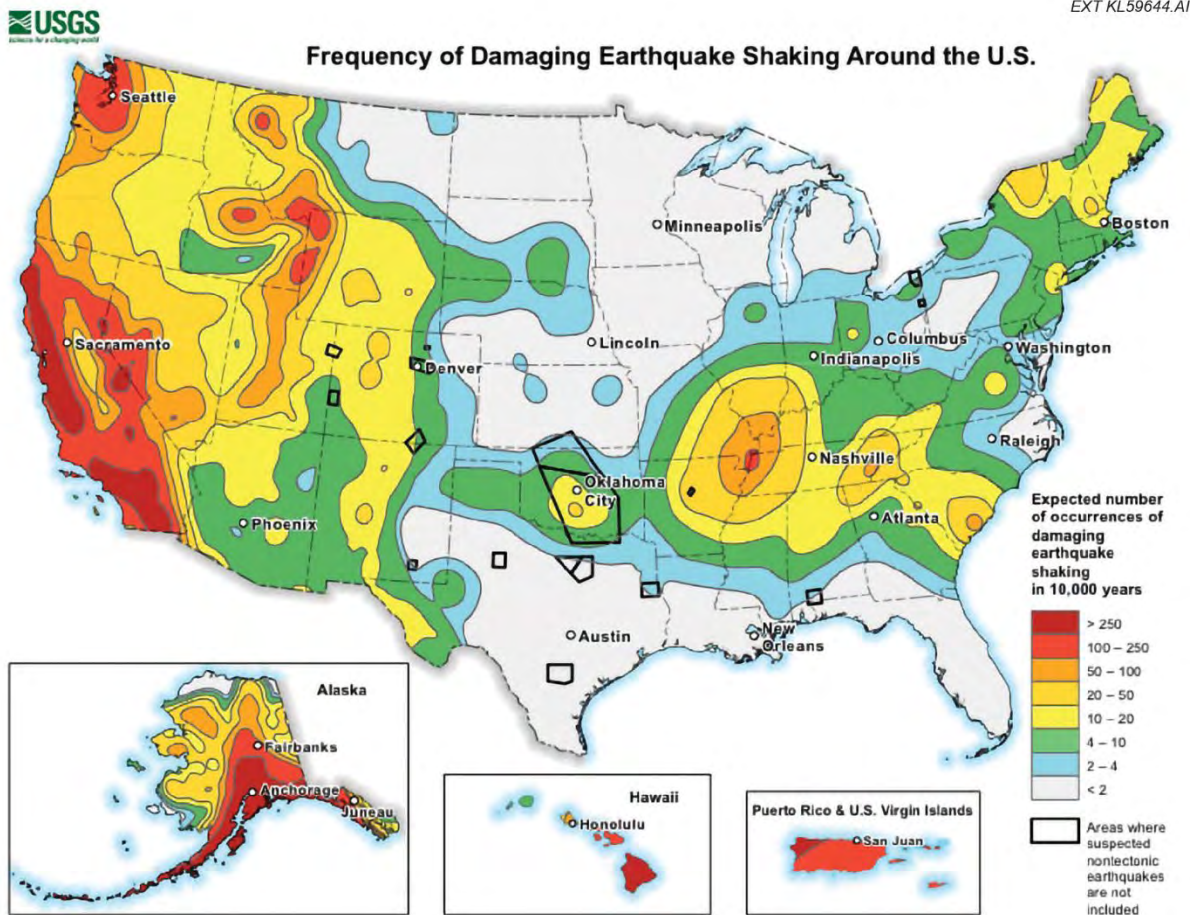

Figure 2-45. Probabilistic map showing how often scientists expect damaging earthquake shaking around the United States (U.S. Geological Survey, 2019). The map shows there is a low probability of damaging earthquake events occurring in North Dakota.

surrounding the potential injection site. The results from the USGS studies (the low risk of induced seismicity due to the basin stress regime and the depth of the target reservoir in proximity to the basement and vertical extents of the interpreted faults) suggest the probability that seismicity interfering with CO<sub>2</sub> containment is low.

## 2.6 Potential Mineral Zones

The North Dakota Geological Survey recognizes the Spearfish Formation as the only potential oil-bearing formation above the Broom Creek Formation. However, production from the Spearfish Formation is limited to the northern tier of counties in western North Dakota (Figure 2-46). There has been no exploration for, nor development of, a hydrocarbon resource from the Spearfish Formation in the storage facility area. There has not been historic hydrocarbon exploration in, or production from, formations below the Broom Creek Formation in the storage facility area. The two wells closest to the storage facility area, NDIC File No. 7818 and 7340, drilled to the Duperow Formation and the Precambrian, respectively, were dry and did not suggest the presence of

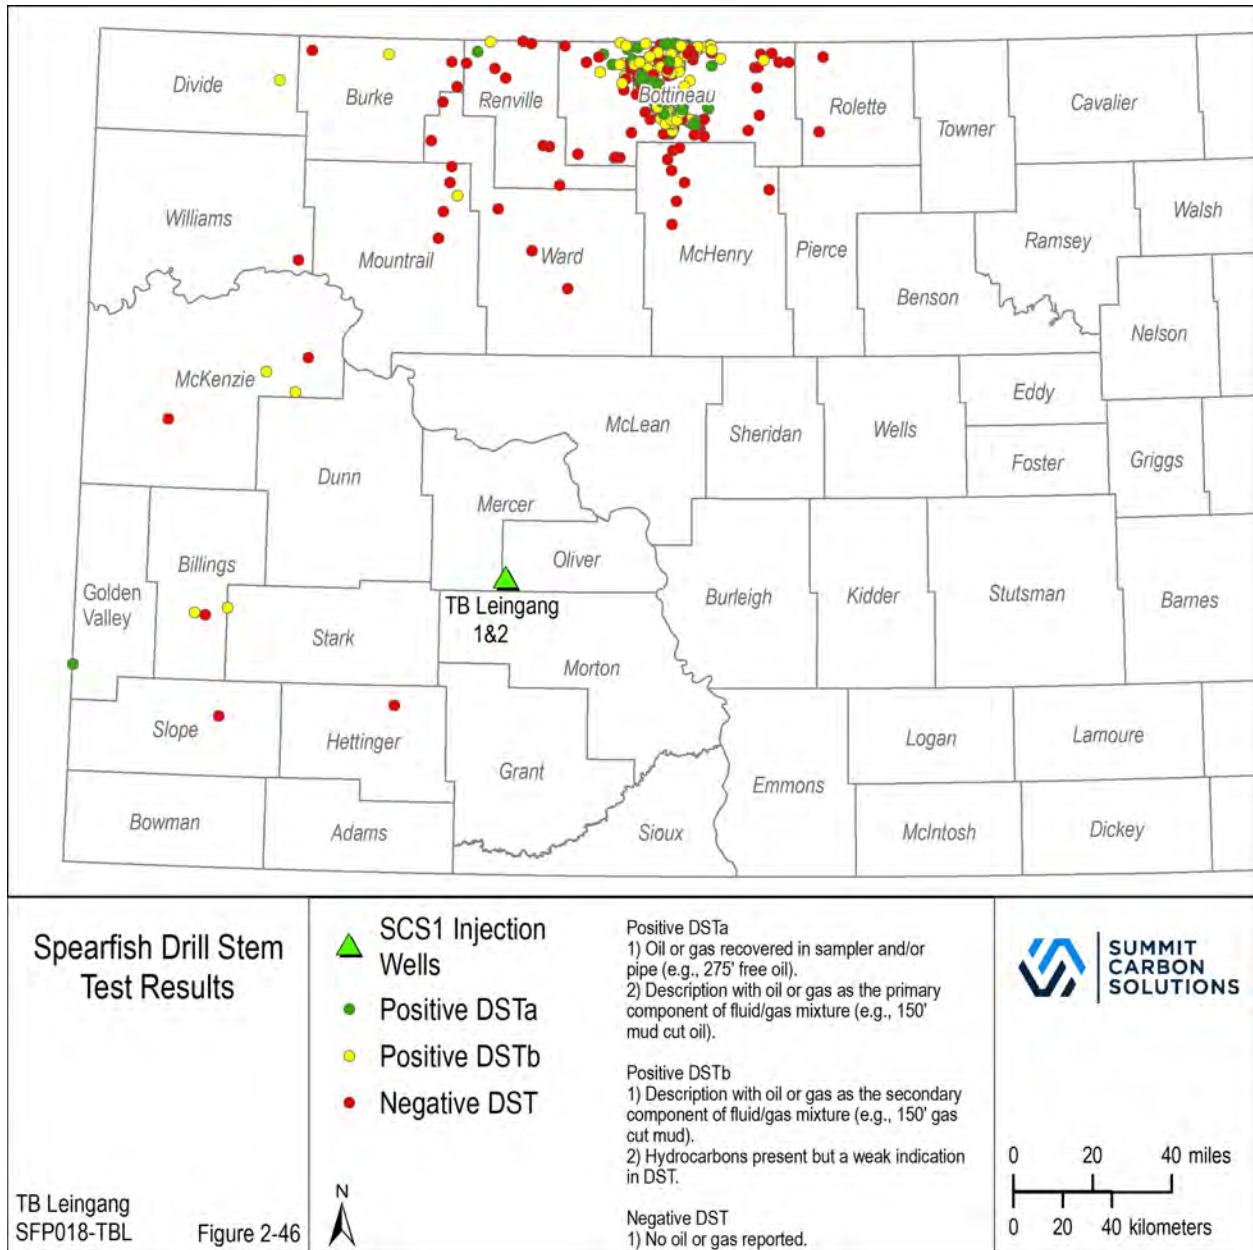

Figure 2-46. DST results indicating the presence of oil in the Spearfish Formation (modified from Stollendorf, 2020).

hydrocarbons. Published studies suggest no economic deposits of hydrocarbons in the Bakken Formation in the storage facility area (Bergin, 2012; Theloy, 2016). The nearest hydrocarbon production well is Entze 29 1 (NDIC File No. 7616), located ~19 mi northwest (Figure 2-47). Entze 29 1 was drilled in June 1980 and produced from the Red River Formation a cumulative total of 7799 barrels (bbl) until June 1982. The well is now plugged and abandoned (P&A).

Shallow gas resources can be found in many areas of North Dakota. Shallow gas is “gas produced from a gas well completed in or producing from a shallow gas zone...,” which consists of “strata or formation, including lignite or coal strata or seam, located above the depth of five thousand feet [1524 meters] below the surface, or located more than five thousand feet (1524 meters) below the surface but above the top of the Rierdon Formation [Jurassic], from which gas is or may be produced” (N.D.C.C. §§ 57-51-01[10]-[11]).

In the event that hydrocarbons are discovered in commercial quantities below the Broom Creek Formation, a horizontal well could be used to produce hydrocarbons while avoiding drilling through the CO<sub>2</sub> plume, or a vertical well could be drilled using proper controls. Aside from meeting regulatory and jurisdictional requirements, should an operator decide to drill wells for hydrocarbon exploration or production, real-time Broom Creek Formation BHP data will be available while the TB Leingang 1 and TB Leingang 2 wells are in operation, which will allow prospective operators to design an appropriate well control strategy via increased drilling mud weight. Pressure increase in the Broom Creek caused by injection of CO<sub>2</sub> will relax postinjection as the area returns to its preinjection pressure profile. Any future wells drilled for hydrocarbon exploration or production that may encounter the CO<sub>2</sub> should be designed to include an intermediate casing string placed across the storage reservoir, with CO<sub>2</sub>-resistant cement used to anchor the casing in place.

Active and reclaimed coal mines are near the storage facility area. Coal is mined from the Sentinel Butte Formation of the Fort Union Group of Paleocene age (the Beulah of the Beulah–Zap interval and Twin Butte coal beds) (Figure 2-48). The thickness of the Beulah–Zap interval averages between 18 and 22 ft (Figure 2-49). Above the Beulah horizon are several thin beds of lignite. In ascending order, these are the Schoolhouse and Twin Butte beds. Overburden on top of the Beulah horizon ranges from 95 to 145 ft (Figure 2-50). The Twin Butte has an average thickness of about 6 ft, under 25–30 ft of overburden, where it is actively mined (Zygarlicke and others, 2019). The Beulah, Twin Butte, and other coal seams thicken and deepen to the west. The Beulah–Zap and Twin Butte seams pinch out to the east. The underlying Hagel coal seam is mined farther to the east by BNI Coal at its Center Mine and the Falkirk Mine near Falkirk, North Dakota. Coal seams in the Bullion Creek Formation exist in the area below the Hagel seam but are too deep to be economically mined. Currently, no existing mine has plans to mine coal in the storage facility area during the project’s operational period. The Coyote Creek Mine is the closest mine to the storage facility area. Figure 2-51 depicts the future mining area for the Coyote Creek Mine through 2040. The Beulah Mine is a mine near the storage facility area that no longer has active coal removal and is undergoing final reclamation. Figure 2-51 depicts areas that have been mined out at both the Coyote Creek Mine and the Beulah Mine.

## TB LEINGANG / MILTON FLEMMER 1

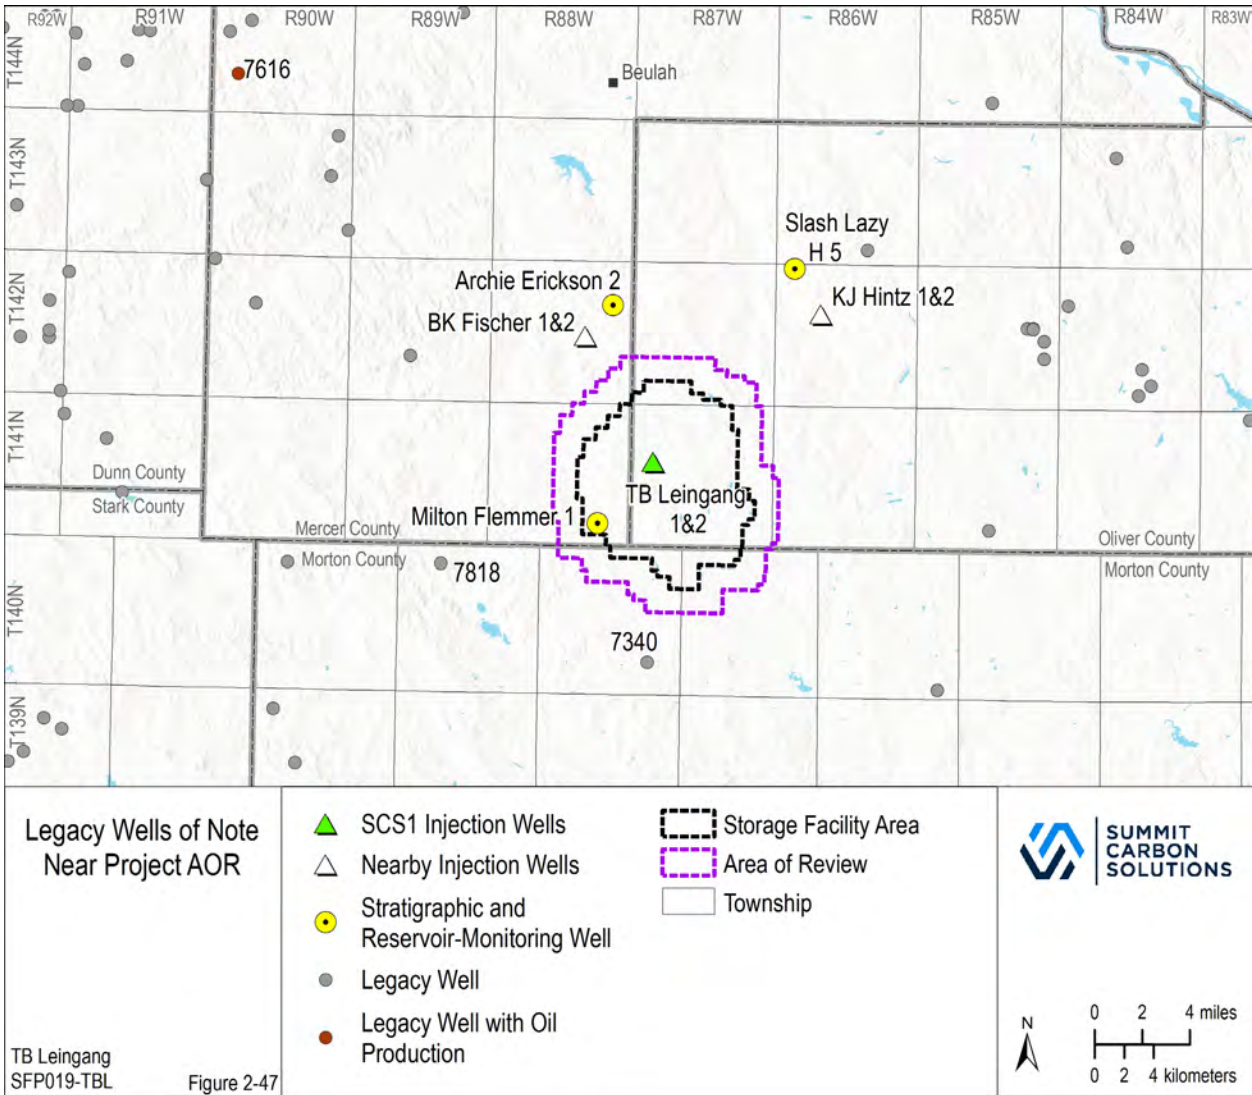

Figure 2-47. Map showing stratigraphic wells for the project and nearest legacy wells. Gray circles indicate dry wells. The red circle indicates the closest oil and gas producing well (NDIC File No. 7616).

## **SECTION 3.0**

# **GEOLOGIC MODEL CONSTRUCTION AND NUMERICAL SIMULATION OF CO<sub>2</sub> INJECTION**

### 3.0 GEOLOGIC MODEL CONSTRUCTION AND NUMERICAL SIMULATION OF CO<sub>2</sub> INJECTION

#### 3.1 Introduction

Existing and site-specific subsurface data were analyzed and interpreted (Section 2.2). The data and interpretations were used as inputs to SLB's Petrel software (Schlumberger, 2020) to construct a geologic model of the injection zone (Broom Creek Formation), the upper confining zone (Opeche/Spearfish Formation), and the lower confining zone (Amsden Formation). The geologic model encompasses a 4070-mi<sup>2</sup> (74-mi × 55-mi) area around the TB Leingang site to characterize the geologic extent, depth, and thickness of the subsurface geologic strata (Figure 2-3). Geologic properties were distributed within the 3D model, including facies, porosity, and permeability.

The geologic model and properties served as inputs for numerical simulations of CO<sub>2</sub> injection using Computer Modelling Group Ltd.'s (CMG's) GEM software (Computer Modelling Group Ltd., 2021). Numerical simulations of CO<sub>2</sub> injection were conducted to assess potential CO<sub>2</sub> injection rate, disposition of injected CO<sub>2</sub>, wellhead pressure (WHP), bottomhole pressure (BHP), and pressure changes in the storage reservoir throughout the expected injection time frame and postinjection period. Results of the numerical simulations were then used to determine the project's area of review (AOR) pursuant to North Dakota's geologic CO<sub>2</sub> storage regulations.

#### 3.2 Overview of Simulation Activities

##### 3.2.1 *Modeling of the Injection Zone and Overlying and Underlying Seals*

A geologic model was constructed to characterize the injection zone along with the upper and lower confining zones. Activities included data aggregation, structural framework creation, data analysis, and property distribution. Major inputs for the geologic model included geophysical logs from all existing wells that penetrate both the storage reservoir and associated upper and lower confining zones within the geologic model area. Major inputs for the geologic model also included seismic survey data and core sample measurements. The core sample measurements acted as control points during the distribution of the geologic properties throughout the modeled area. The geologic properties distributed throughout the model include acoustic impedance (AI), total porosity, effective porosity, permeability, and facies.

Three 3D seismic AI volumes (Figure 2-8) were upscaled and integrated into the geologic model grid using a volume-weighted method (Figure 2-3). The volumes were used to guide the facies and petrophysical property distributions within the 3D geologic model and determine lateral heterogeneity through a variogram assessment. Horizontal variogram directions and structures were determined from the resampled 3D Beulah seismic AI volume because it covered the largest areal extent and captured multiple dune structures, producing the most reliable variogram calculation.

##### 3.2.2 *Structural Framework Construction*

SLB's Petrel software was used to interpolate structural surfaces for the undifferentiated Opeche/Spearfish (i.e., Spearfish, Minnekahta, Opeche), Broom Creek, and Amsden Formations. Input data included formation top depths from the online North Dakota Industrial Commission (NDIC) Department of Mineral Resources Oil and Gas Division (DMR-O&G) database; data

collected from ten cored wells: ANG 1, Flemmer 1, BNI 1, J-LOC 1, Liberty 1, MAG 1, Coteau 1, Milton Flemmer 1, Archie Erickson 2, and Slash Lazy H 5 (Figure 2-4); three 3D seismic surveys (Figure 2-8); and one 5-mi-long 2D seismic line (Figure 2-8). The interpolated data were used to constrain the model extent in 3D space.

### **3.2.3 Data Analysis and Property Distribution**

#### **3.2.3.1 Confining Zones (Opeche/Spearfish and Amsden Formations)**

The upper confining zone (Opeche/Spearfish Formation) and the lower confining zone (Amsden Formation) were each assigned a single facies. Based on their primary lithology determined by well log analysis, the upper confining zone is assigned siltstone, and the lower confining zone is assigned dolostone. The lower Piper Formation was included in the geologic model in addition to the Opeche/Spearfish Formations because the Opeche/Spearfish Formation pinches out within the geologic model, approximately ~36 miles east of the Milton Flemmer 1. The lower Piper is assigned as siltstone. AI, porosity, and permeability logs were upscaled from a well-log scale to the scale of the geologic model grid to serve as control points for property distributions (Figure 2-16). The control points were used in combination with variograms, Gaussian random function simulation algorithms, and secondary trend data to distribute the properties. A 6800-ft major and minor axis length variogram model in the lateral direction and a 160-ft vertical variogram length were used within the lower Piper Formation. An 8200-ft major and 7500-ft minor axis length variogram model along an azimuth of 144° and 90-ft vertical variogram length were used for the Opeche/Spearfish Formation. A major axis length of 6500 ft and a minor axis length of 5300 ft along an azimuth of 180° in the lateral direction and 13-ft vertical variogram length were used for the Amsden Formation. Vertical variogram lengths were determined from the upscaled well logs.

#### **3.2.3.2 Injection Zone (Broom Creek Formation)**

Seismic data were resampled to the geologic model grid and used to determine lateral heterogeneity through a variogram assessment. Nonreservoir facies (dolostone, anhydrite) captured a major axis range of 8200 ft and a minor axis range of 6000 ft in the lateral direction. Reservoir facies (sandstone, dolomitic sandstone) captured a major axis range of 5000 ft and a minor axis range of 4500 ft along an azimuth of 45°. Vertical variogram lengths were determined from the upscaled well logs (Table 3-1).

**Table 3-1. Lateral and Vertical Variogram Lengths for Facies Distributions Within the Injection Zone**

<b>Facies</b>	<b>Azimuth, degrees</b>	<b>Major Length, ft</b>	<b>Minor Length, ft</b>	<b>Vertical Length, ft</b>
Sandstone	45	5000	4500	30
Dolostone	90	8200	6000	35
Dolomitic Sandstone	45	5000	4500	28
Anhydrite	90	8200	6000	17

AI from 3D seismic surveys was upscaled to the resolution of the geologic model grid to serve as control points for facies and petrophysical property distributions. Calculated AI logs, derived from available sonic and bulk density well logs in the geologic model area, were also upscaled to aid in discovering trends between well log data and seismic AI data and serve as additional control points for property distributions. After identification of a trend between the AI data and well logs, an AI property was then distributed throughout the model using the upscaled seismic AI data and upscaled AI logs as control points, the horizontal variogram parameters described above, and Gaussian random function simulation algorithms.

Facies classifications were interpreted from well log data and correlated with descriptions of core taken from the Milton Flemmer 1, Archie Erickson 2, Slash Lazy H 5, Flemmer 1, ANG 1, J-LOC 1, Liberty 1, BNI 1, MAG 1, and Coteau 1 wells. Four facies were modeled within the Broom Creek Formation: 1) sandstone, 2) dolostone, 3) dolomitic sandstone, and 4) anhydrite (Figure 2-11). Facies logs were generated from gamma ray, density, neutron porosity, sonic, and resistivity logs. Seismic facies probability volumes interpreted from the 3D Beulah seismic area were used to guide the facies distribution. Three probability volumes corresponding to the predominant facies of sandstone, dolostone, and dolomitic sandstone were resampled into the geologic model. Upscaled mineral fraction logs were also used to generate a facies trend model, which were guided by the resampled seismic probability, kriging algorithm, and variogram ranges described above. The facies logs were upscaled to the resolution of the 3D model to serve as control points for geostatistical distribution using sequential indicator simulation and guided by the facies trend model (Figure 2-15).

Prior to distributing the porosity and permeability properties, total porosity (PHIT), effective porosity (PHIE; total porosity less occupied or isolated pore space), and intrinsic permeability (KINT) well logs were calculated and compared with core porosity and permeability measurements to ensure good agreement with the ten cored wells: Milton Flemmer 1, Archie Erickson 2, Slash Lazy H 5, Flemmer 1, ANG 1, J-LOC 1, Liberty 1, BNI 1, MAG 1, and Coteau 1. The Gaussian random function simulation algorithm was used to distribute the PHIE property using calculated PHIE well logs. The PHIE well logs were upscaled to the resolution of the 3D model and were used as control points and as the variogram structures described previously. The PHIE was cokriged with the AI seismic volumes and conditioned to the distributed facies (Figure 3-1). A KINT property was distributed using the same variogram structures and Gaussian random-function algorithm but was paired with PHIE volume cokriging (Figure 3-2).

Figure 3-1. Distributed PHIE property along a roughly W-E cross section. The distributed PHIE property was used to distribute permeability throughout the model. Units on the y-axis represent feet below mean sea level (50× vertical exaggeration shown).

Figure 3-2. Illustration of the relationship between the modeled porosity and permeability of the Broom Creek Formation facies. Upscaled well log values are represented by triangles, while circles represent distributed values. Values are colored according to facies classification.

### 3.3 Numerical Simulation of CO<sub>2</sub> Injection

#### 3.3.1 Simulation Model Development

Numerical simulations of CO<sub>2</sub> injection into the Broom Creek Formation were conducted using the geologic model described above. Simulations were carried out using CMG's GEM, a compositional reservoir simulation module. Calculated values based on measured temperature and pressure data, along with the reference datum depth, were used to initialize the reservoir equilibrium conditions for performing numerical simulation. Figures 3-3 and 3-4 display a 3D and aerial view, respectively, of the simulation model with the permeability property and injection wells (TB Leingang 1 and 2) for TB Leingang. BK Fischer 1 and 2 and KJ Hintz 1 and 2 were also included to represent adjacent injection sites.

Figure 3-3. 3D view of the simulation model with the permeability property and injection wells displayed. The low-permeability layers (light blue and green) at the top and bottom of the figure should be noted. These layers represent the Opeche/Spearfish Formation (upper confining zone) and the Amsden Formation (lower confining zone). The varied permeability of the Broom Creek Formation is shown between these layers.

Figure 3-4. Aerial view of the simulation model with the permeability property of Broom Creek Formation (Layer 26, 5668 ft TVD at TB Leingang 1 top perforation, estimated prior to wellsite selection) and the injection wellsites displayed.

The simulation model encompasses an area of 48.5 mi by 29.7 mi. TB Leingang is located approximately 17.4 mi from the north edge of the model and approximately 13.6 mi from the west edge of the model. The simulation model boundaries were assigned partially closed conditions as the Broom Creek Formation pinches out in the northern and eastern parts of the modeled area. Distances from the edge of the model to the pinch-out are assumed to be 56,500 ft (~10.7 mi) to the east, 19,400 ft (~3.7 mi) to the northeast, and 184,800 ft (35 mi) to the west. Therefore, the volume modifiers are 28.25, 283, 10, 185, and 286 for east, north, northeast, west, and south, respectively. These modifiers are multipliers to a block's bulk volume when rock and pore volume are considered. A fluid sample from the Broom Creek Formation collected from Milton Flemmer 1 was analyzed by Minnesota Valley Testing Laboratories, and the measured total dissolved solids (TDS) of 105,000 mg/L was used as input for the numerical simulation. The reservoir was assumed to be 100% brine-saturated with the initial TDS as indicated from Milton Flemmer 1 TDS analysis. Table 3-2 shows the general reservoir properties extracted from the model and used for numerical simulation analysis.

**Table 3-2. Summary of Reservoir Properties in the Simulation Model**

<b>Formation</b>	<b>Pore Volume (PV) Weighted Average Permeability, mD</b>	<b>Average Porosity, %*</b>	<b>Initial Pressure, P<sub>i</sub>, psi</b>	<b>Salinity, mg/L</b>	<b>Boundary Condition</b>
Opeche/Spearfish	0.019	3.8	2741		Partially closed
Broom Creek	1105.5	21.3	(at 5882 ft,	105,000	
Amsden	6.67	6.7	TVD**)		

\* Porosity and permeability values are reported as PV weighted mean. Permeability averages were calculated after a 2.5 multiplier was applied.

\*\* True vertical depth.

Numerical simulations of CO<sub>2</sub> injection performed allowed CO<sub>2</sub> to dissolve into the native formation brine. Mercury injection capillary pressure (MICP) data for the Opeche/Spearfish, Broom Creek, and Amsden Formations were used to generate relative permeability and the capillary pressure curves for the five representative facies in the simulation model (sandstone, siltstone, dolostone, dolomitic sandstone, and anhydrite) (Figures 3-5 through 3-9). Samples tested within the Opeche/Spearfish, Broom Creek, and Amsden Formations included all five facies.

Capillary pressure curves calculated from MICP data were modified to the model scale based on the permeability and porosity values of the simulation model for the five representative facies and used in the numerical simulations. These modified capillary pressure curves are also shown in Figures 3-5 through 3-9. The capillary entry pressure values applied in the model were determined by deriving a ratio between the reservoir quality index of core samples of the modeled region from MICP data and modeled properties to scale the capillary entry pressure value derived from core testing (Table 3-3). The capillary pressure curves for siltstone and anhydrite were also modified based on the simulation model domain. This resulted in two different ratios derived first from MICP data (same MICP sample for both facies) and second from the porosity and permeability properties for each of these facies in the model. These results demonstrated that there are two different capillary pressure curves for siltstone and anhydrite facies, Figures 3-6 and 3-9. It is worth noting that the relative permeability and capillary data selection are based on a broader data selection from the modeled region. All site-specific data in the modeled region, collected from Milton Flemmer 1, Archie Erickson 2, Slash Lazy H 5, and J-LOC 1, are screened, and the data from the most representative samples that are close to the reservoir properties are selected in dynamic flow simulations.

The calculated temperature and pressure based on reported temperature and pressure gradients derived from data recorded in the Milton Flemmer 1 wellbore (Tables 2-2 and 2-3) were used to initialize the numerical simulation model for the proposed injection site. In combination with depth, a temperature gradient of 0.017°F/ft was used to calculate subsurface temperatures throughout the simulation model area. A pressure reading recorded from the Broom Creek Formation was used to derive a pore pressure gradient of 0.466 psi/ft (Table 2-3).

A fracture gradient of 0.718 psi/ft was calculated from a microfracture in situ stress test using a SLB MDT (modular dynamics testing) tool (Figure 2-6, Table 2-4). The calculated maximum BHP constraints of 3663 and 3669 psi for TB Leingang 1 and TB Leingang 2, respectively, were derived by multiplying the fracture gradient by the depth of the top perforation in the injection

zone of the model (5668 ft TVD for TB Leingang 1 and 5678 ft TVD for TB Leingang 2), and then multiplying this product by 90% as a safety factor. These values were used as the injection constraint in the numerical simulation of the expected injection scenario. The top perforations were placed within the uppermost sandstone of the Broom Creek just below the capping anhydrite, which will act as a barrier to CO<sub>2</sub> flow because of the anhydrite's low porosity and permeability. Perforation depths for the TB Leingang 1 and TB Leingang 2 were calculated prior to final injection site selection and are based on expected ground-level elevation.

The simulation model permeability was tuned globally by applying a permeability multiplier to match the reservoir properties estimated from the well-testing data in the Broom Creek Formation near the Milton Flemmer 1 well. The permeability multiplier was calculated based on the area of study during the injectivity test, the radius of investigation, and the permeability thickness (transmissibility) values from the pressure transient analysis. Ultimately, a global multiplier of 2.5 was applied before numerical simulations to provide a more conservative input for simulation.

The CO<sub>2</sub> stream used to conduct numerical simulations of CO<sub>2</sub> injection was composed of 98.25% (by volume) CO<sub>2</sub> and 1.75% trace quantities of other constituents, including 1.44% nitrogen (N<sub>2</sub>), 0.31% oxygen (O<sub>2</sub>), and 0.001% hydrogen sulfide (H<sub>2</sub>S). This is the anticipated average CO<sub>2</sub> injection stream based on compositional studies of CO<sub>2</sub> from potential sources. Other constituents such as sulfur, hydrocarbons, glycol, amine, aldehydes, NO<sub>x</sub>, and NH<sub>3</sub> may also be present but in a negligible amount that would impact neither fluid flow dynamics nor geochemical reactions in the storage formation and were not included. Approximately 6 mi northwest from TB Leingang is the injection site identified for BK Fischer and approximately 9.4 mi northeast is KJ Hintz, as shown in Figures 2-1 and 3-4. TB Leingang is included in the numerical model and simulated injecting simultaneously with BK Fischer and KJ Hintz. TB Leingang consists of two Broom Creek injection wells (TB Leingang 1 and 2), which are proposed to inject at the maximum allowable BHP (90% of the product when multiplying the fracture gradient by top perforation depth) with a secondary maximum allowable WHP constraint of 2100 psi for a total 20-year CO<sub>2</sub> injection period. The well constraints and wellbore model inputs for the simulation model are shown in Table 3-4. The wells (BK Fischer 1 and 2 and KJ Hintz 1 and 2) at nearby sites are also operated under the same conditions with their corresponding maximum BHPs and WHP (2100 psi).

Results using the 7-in. tubing simulation case are presented in this section and used for purposes of boundary delineations (storage facility area, AOR), as the resulting areal extent of these boundaries was greater and, therefore, represents a more conservative scenario.

### 3.3.2 Sensitivity Analysis

Because the availability of data for this study included well logs, core sample data, and rock–fluid properties, the need for typical sensitivity studies of influential reservoir parameters has been reduced. A preliminary sensitivity analysis of the wellbore model parameters suggested that, at the given injection volume rates and BHP conditions, the wellhead temperature (WHT) played a prominent role in determining WHP response. Sensitivity simulations of different WHTs indicated that injection at a higher WHT would require a higher WHP. For evaluating the expected injection design, a WHT value of 60°F was chosen to most closely represent the expected operational temperature.

**Table 3-4. Well Constraints and Wellbore Model in the Simulation Model\***

<b>Well Constraint, maximum BHP</b>	<b>Secondary Well Constraint, WHP</b>	<b>Tubing Size</b>	<b>Wellhead Temp.</b>	<b>Downhole Temperature**</b>
3663 psi (TB Leingang 1)	2100 psi (TB Leingang 1 and 2)			136.4°F at 5668 ft TVD (TB Leingang 1)
3669 psi (TB Leingang 2)				136.5°F at 5678 ft TVD (TB Leingang 2)
3633 psi (BK Fischer 1)	2100 psi (BK Fischer 1 and 2)	7 in.	60°F	127.6°F at 5841 ft TVD (BK Fischer 1)
3624 psi (BK Fischer 2)				127.4°F at 5828 ft TVD (BK Fischer 2)
3828 psi (KJ Hintz 1)	2100 psi (KJ Hintz 1 and 2)			116°F at 5426 ft TVD (KJ Hintz 1)
3808 psi (KJ Hintz 2)				115.5°F at 5397 ft TVD (KJ Hintz 2)

\* A WHT temperature of 60°F was used for wellbore modeling, and an average ambient surface temperature of 40°F was used for reservoir modeling.

\*\* The formula used to calculate downhole/reservoir temperature in both wellbore and reservoir modeling is  
 $\text{Depth} \times \text{Reservoir Temperature Gradient} + 40^\circ\text{F} = \text{Downhole/Reservoir Temperature}.$

### 3.4 Simulation Results

The maximum WHP constraint of 2100 psi was one of the constraints on the injection wells for the entire 20 years of simulated injection. The maximum BHP constraint of 3663 psi for TB Leingang 1 and 3669 psi for TB Leingang 2 (equal to 90% of the product when multiplying the fracture gradient by top perforation depth) was approached near Year 20 of injection but was never reached (Figure 3-10), translating to a cumulative combined 124.4 MMt of CO<sub>2</sub> injected into the Broom Creek Formation by TB Leingang 1 and 2 (Figure 3-11). Simulations of CO<sub>2</sub> injection with the given well constraints, listed in Table 3-4, predicted the injection rate would decline from a maximum initial injection rate of approximately 3.65 MMt/yr per well to a final rate of approximately 2.85 MMt/yr per well (with a 20-year combined average of approximately 3.11 MMt/yr per injection well) (Figure 3-12).

Figure 3-10. Predicted WHP and BHP responses.

Figure 3-11. Cumulative injected gas mass over 20 years of injection with well pressure constraints.

Figure 3-12. Predicted mass injection rate over 20 years of injection with well pressure constraints.

WHP and BHP responses depend on several factors, including predicted injection rate, injection tubing parameters (tubing internal radius and relative roughness), and surface injection temperature. For the designed tubing size of 7 in., the wells are operated at the maximum WHP of 2100 psi during the 20-year injection period (Figure 3-10).

During and after injection, supercritical CO<sub>2</sub> (free-phase CO<sub>2</sub>) accounts for the majority of CO<sub>2</sub> observed in the modeled pore space. Throughout the injection operation, a portion of the free-phase CO<sub>2</sub> is trapped in the pore space through a process known as residual trapping. Residual trapping can occur as a function of low CO<sub>2</sub> saturation and inability to flow under the effects of relative permeability. CO<sub>2</sub> also dissolves into the formation brine throughout injection operations (and continues afterward), although the rate of dissolution slows over time. The free-phase CO<sub>2</sub> transitions to either residually trapped or dissolved CO<sub>2</sub> during the postinjection period, resulting in a decline in the mass of free-phase CO<sub>2</sub>. The relative portions of supercritical, trapped, and dissolved CO<sub>2</sub> can be tracked throughout the duration of the simulation (Figure 3-13).

Figure 3-13. Simulated total supercritical free-phase CO<sub>2</sub>, trapped CO<sub>2</sub>, and dissolved CO<sub>2</sub> in brine for the three adjacent project sites (comprising six injection wells, namely, TB Leingang 1 and 2, BK Fischer 1 and 2, and KJ Hintz 1 and 2).

The pressure fronts (Figures 3-14a–d) show the distribution of average pressure increase throughout the Broom Creek Formation after 5, 10, and 20 years of injection as well as 10 years postinjection. A maximum increase of approximately 1024 psi was estimated in the near-wellbore area at the end of the 20-year injection period (Figure 3-14c).

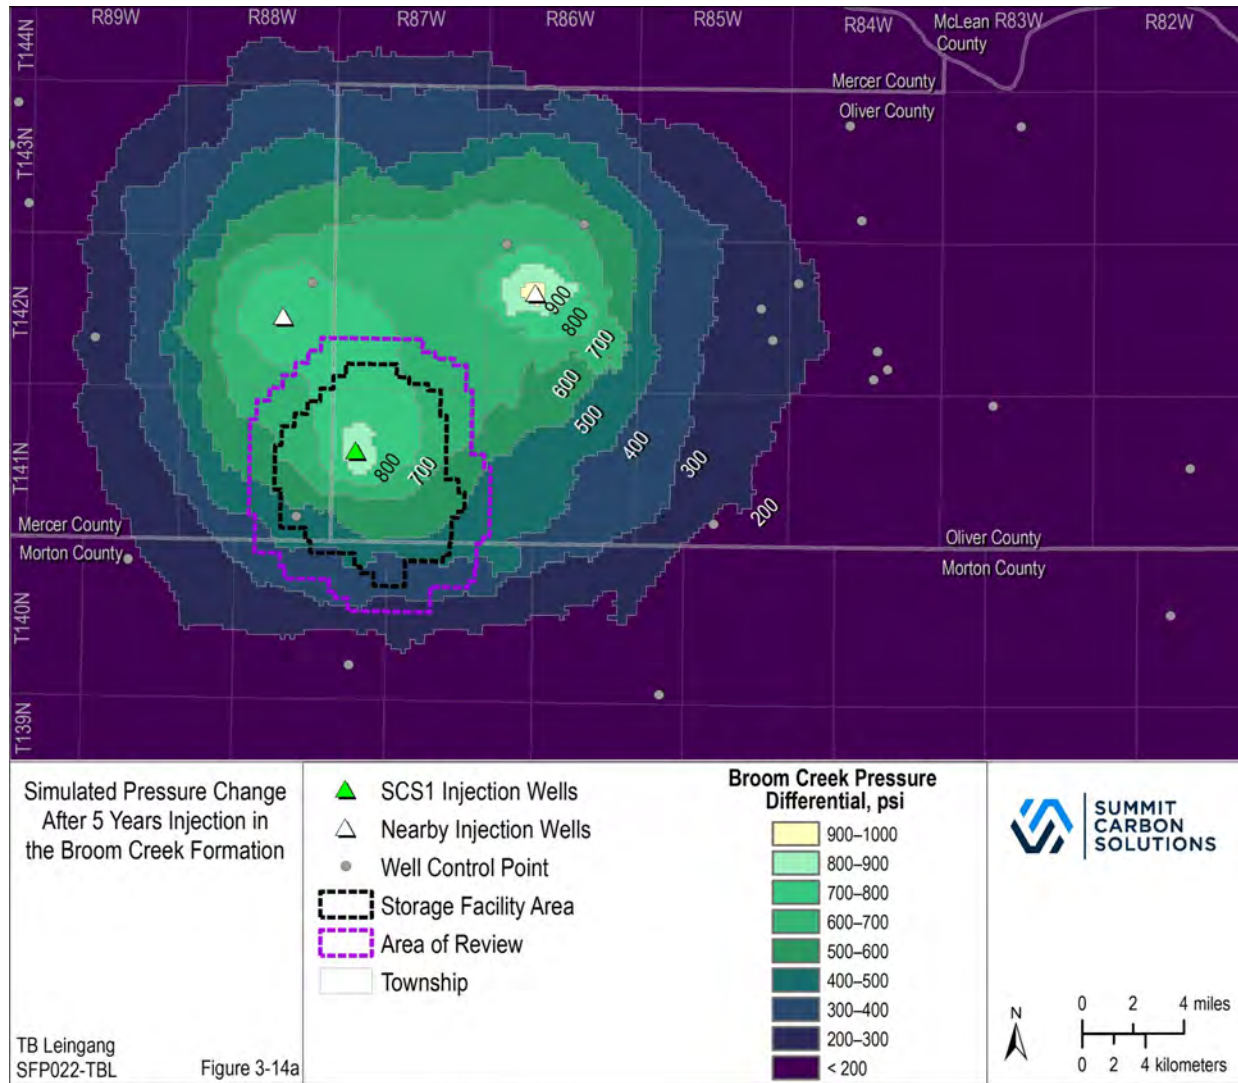

Figure 3-14a. Average pressure increase within the Broom Creek Formation after 5 years of simulated CO<sub>2</sub> injection operation.

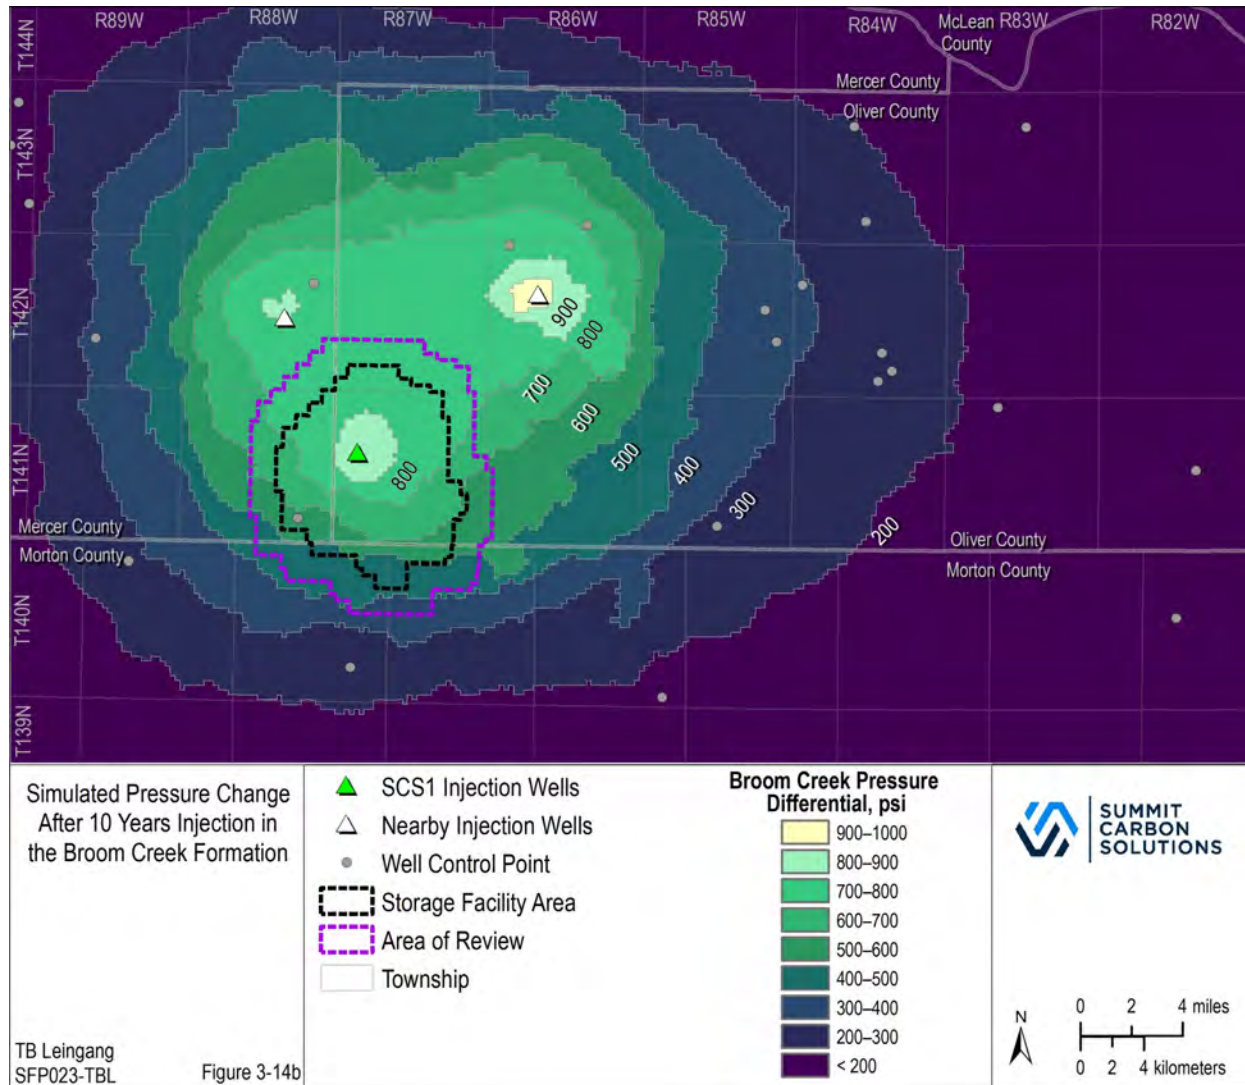

Figure 3-14b. Average pressure increase within the Broom Creek Formation after 10 years of simulated CO<sub>2</sub> injection operation.

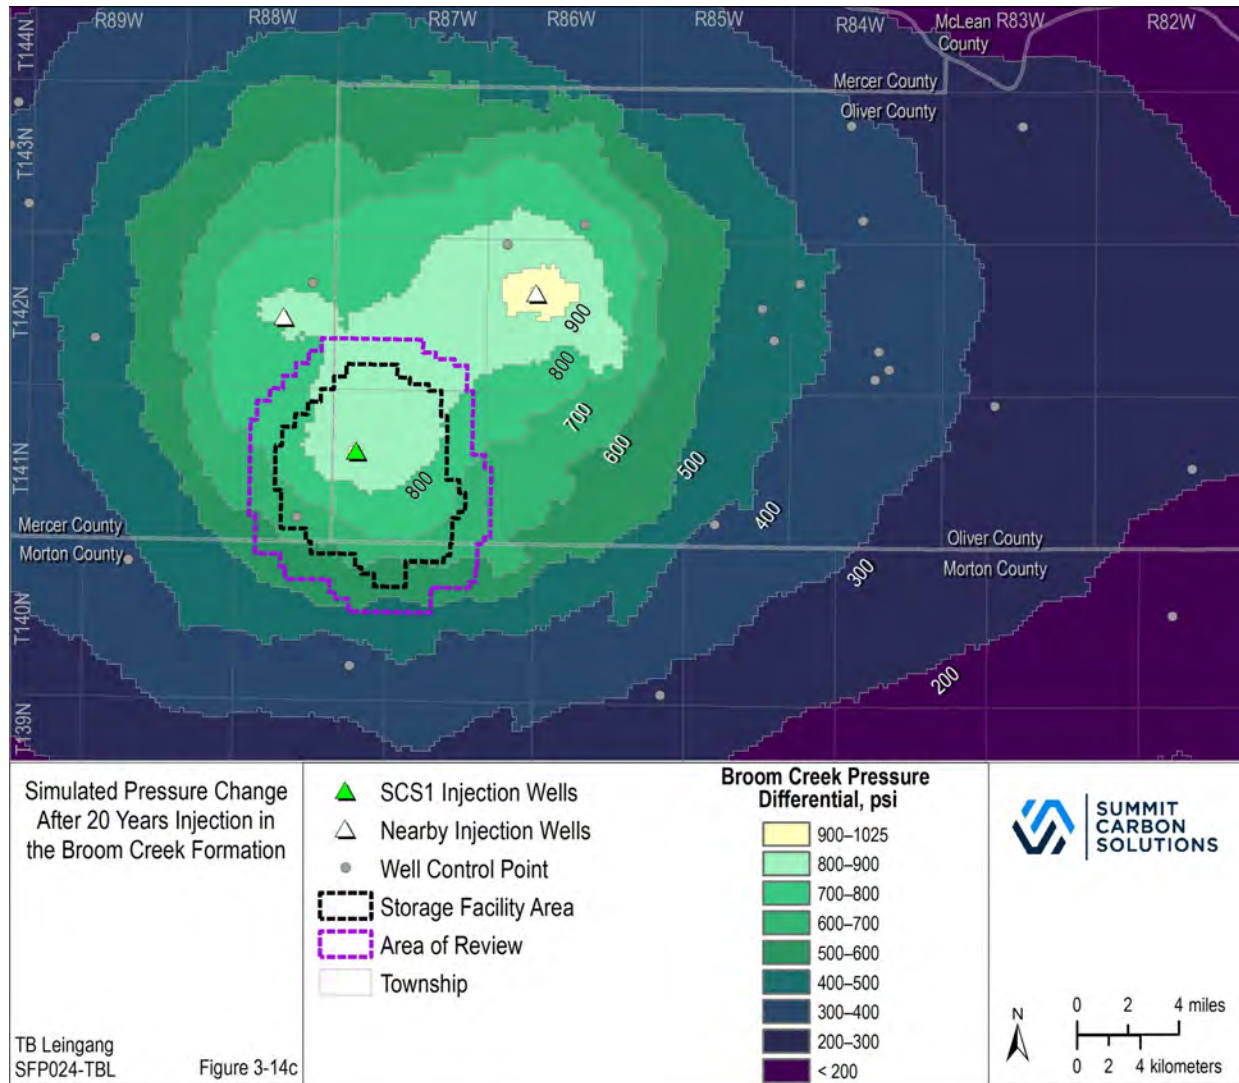

Figure 3-14c. Average pressure increase within the Broom Creek Formation after 20 years of simulated CO<sub>2</sub> injection operation (end of injection operation).

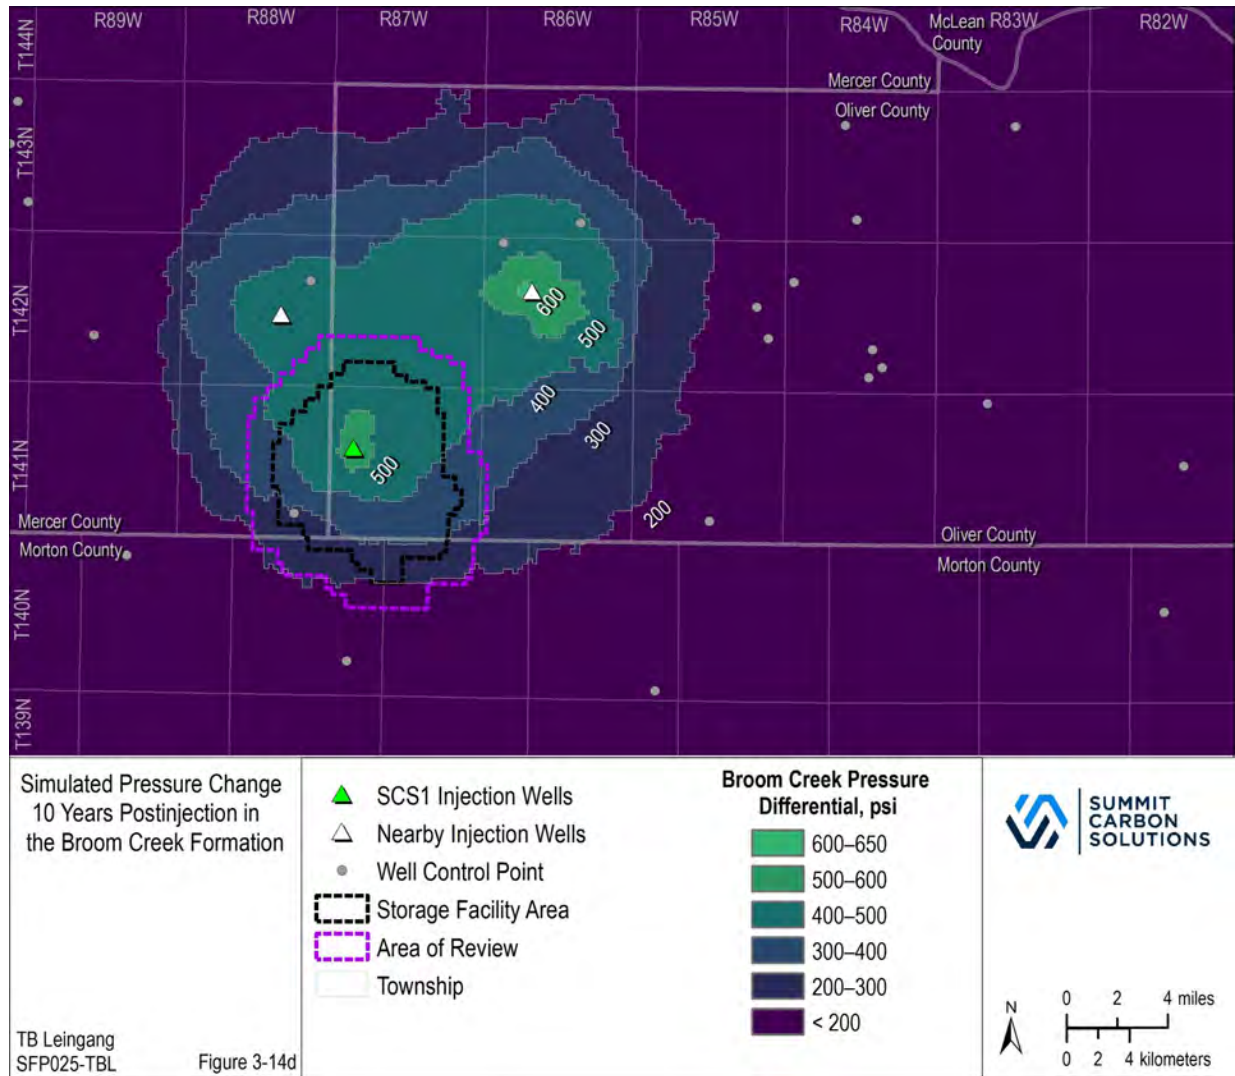

Figure 3-14d. Predicted decrease in pressure in the storage reservoir over a 10-year period following the cessation of CO<sub>2</sub> injection.

Long-term CO<sub>2</sub> migration potential was also investigated through numerical simulation efforts. The slow lateral migration of the plume is caused by the effects of buoyancy where the free-phase CO<sub>2</sub> injected into the formation rises to the bottom of the upper confining zone or lower-permeability layers present in the Broom Creek Formation and then outward. This process results in a higher concentration of CO<sub>2</sub> at the center which gradually spreads out toward the model edges where the CO<sub>2</sub> saturation is lower. Trapped CO<sub>2</sub> saturations, employed in the model to represent fractions of CO<sub>2</sub> trapped in small pores as immobile supercritical fluids, ultimately immobilize the CO<sub>2</sub> plume and limit the plume's lateral migration and spreading. Figures 3-15a–c show the CO<sub>2</sub> saturation at the end of injection in west-to-east and north-to-south cross-sectional views.

Figure 3-15a. West-to-east cross section (J-layer 65) showing the CO<sub>2</sub> plume at the end of injection. White cells or “empty” intervals contain CO<sub>2</sub> saturation that is less than 5%. 50× vertical exaggeration is shown. Please note the plume geometry south of the injection wells as shown in the map insert is the result of low-permeability zones creating baffles to CO<sub>2</sub> flow. The distribution of these low-permeability zones is supported by the 3D seismic inversion results.

Figure 3-15b. West-to-east cross section (J-layer 64) showing the CO<sub>2</sub> plume at the end of injection. White cells or “empty” intervals contain CO<sub>2</sub> saturation that is less than 5%. 50× vertical exaggeration is shown.

Figure 3-15c. North-to-south cross section (I-layer 72) showing the CO<sub>2</sub> plume at the end of injection. White cells or “empty” intervals contain CO<sub>2</sub> saturation that is less than 5%. 50× vertical exaggeration is shown.

### 3.4.1 *Maximum Injection Pressure and Rates*

An additional case was run to determine if a well would ultimately be limited by the maximum WHP of 2100 psi or maximum calculated downhole pressure of 90% of the fracture propagation pressure at the perforated depth (3663 psi [TB Leingang 1] and 3669 psi [TB Leingang 2]). The estimated fracture propagation pressure gradient of 0.718 psi/ft was used for the calculated maximum BHP as the only injection constraint to evaluate maximum storage potential for each injection well.

When a single injection well reaches the maximum BHP condition of 3663 or 3669 psi in the simulation, the corresponding predicted average WHPs are reaching approximately 5500 and 5120 psi, respectively, for TB Leingang 1 and TB Leingang 2 (Figure 3-16). The predicted maximum daily injection rate could reach approximately 26,016 and 24,570 tonnes/day, respectively, for TB Leingang 1 and TB Leingang 2.

A total volume of 184.8 and 176.7 MMt of gas was injected over 20 years, respectively, resulting in the calculated daily averaged maximum gas injection rate of 25,315 and 24,205 tonnes/day (the total volume divided by 20 years  $\times$  365 days), respectively, for TB Leingang 1 and TB Leingang 2 (see Table 11-1).

Figure 3-16. Maximum pressure and gas rate response when the well was operated at max BHP only (without any WHP limits) for TB Leingang 1 (top) and TB Leingang 2 (bottom).

### 3.4.2 Stabilized Plume and Storage Facility Area

Movement of the injected CO<sub>2</sub> plume is driven by the potential energy found in the buoyant force of the injected CO<sub>2</sub>. As the plume spreads out within the reservoir and CO<sub>2</sub> is trapped residually through the effects of relative permeability and dissolution, the potential energy of the buoyant CO<sub>2</sub> is gradually lost. Eventually, the buoyant force of the CO<sub>2</sub> is no longer able to overcome the capillary entry pressure of the surrounding reservoir rock. At this point, the CO<sub>2</sub> plume ceases to move within the subsurface and becomes stabilized. The extent of the stabilized plume is important for determining the project's AOR and the corresponding scale and scope of the project's monitoring plans.

Plume stabilization can be visualized at the microscale as CO<sub>2</sub> being unable to exit its current pore space and enter the neighboring pore space, but at the macroscale, these interactions cannot be measured. Instead, plume stabilization may be estimated using the tools available to predict the CO<sub>2</sub> plume's extent.

For this permit, the CO<sub>2</sub> plume was assessed in 1-year time steps until the rate of total areal extent change slowed to less than 0.2 square mi per 1-year time step to define the stabilized plume extent boundary and the associated buffers and boundaries. This estimate is anticipated to be regularly updated during the CO<sub>2</sub> storage operation as data collected from the site are used to update predictions made about the behavior of the injected CO<sub>2</sub>.

### **3.5 Delineation of the Area of Review**

The North Dakota Administrative Code (N.D.A.C.) defines an AOR as “the region surrounding the geologic sequestration project [storage project] where underground sources of drinking water [USDWs] may be endangered by the [CO<sub>2</sub>] injection activity” (N.D.A.C. § 43-05-01-01[4]). The primary endangerment risk is the potential for vertical migration of CO<sub>2</sub> and/or formation fluids from the storage reservoir into a USDW. At a minimum, the AOR includes the areal extent of the CO<sub>2</sub> plume within the storage reservoir.

However, the CO<sub>2</sub> plume has an associated pressure front where CO<sub>2</sub> injection increases the formation pressure above initial (preinjection) conditions. Generally, the pressure front is larger in areal extent than the CO<sub>2</sub> plume. Therefore, the AOR encompasses both the areal extent of the CO<sub>2</sub> plume within the storage reservoir and the extent of the reservoir fluid pressure increase sufficient to drive formation fluids (e.g., brine) into a USDW, assuming pathways for this migration (e.g., legacy oil and gas wells or fractures) are present. Because the pressure front is larger in areal extent than the CO<sub>2</sub> plume, AOR delineation focuses on the pressure front.

The minimum pressure increase in the reservoir that results in a sustained flow of brine upward from the storage reservoir into an overlying drinking water aquifer is referred to as the “critical threshold pressure increase” and resultant pressure as the “critical threshold pressure.” Therefore, the AOR is the areal extent of the storage reservoir that exceeds the critical pressure threshold. U.S. Environmental Protection Agency (EPA) guidance for AOR delineation under the underground injection control (UIC) program for Class VI wells provides several methods for estimating the critical threshold pressure increase and resulting critical threshold pressure.

In this document, “storage reservoir” refers to the Broom Creek Formation (the injection zone), “potential thief zone” refers to the Inyan Kara Formation, and “lowest USDW” refers to the Fox Hills Formation.

#### **3.5.1 EPA Methods 1 and 2: AOR Delineation for Class VI Wells**

EPA guidance for AOR evaluation includes several computational methods for estimating the pressure buildup in the storage reservoir in response to CO<sub>2</sub> injection and the resultant areal extent of pressure buildup above a “critical threshold pressure” that could potentially drive higher-salinity formation fluids from the storage reservoir up an open conduit to the lowest USDW (U.S. Environmental Protection Agency, 2013). The following equations and analytical approach define the EPA methods used to delineate AOR. Each method can be applied both at a single location

(e.g., the TB Leingang 1 simulation well) using site-specific data or for each vertical stack of grid cells in a geocellular model, considering the varying stratigraphic thickness between storage reservoir and lowest USDW.

EPA Method 1 (*pressure front based on bringing the injection zone and USDW to equivalent hydraulic heads*) is presented as a method for determining whether a storage reservoir is in hydrostatic equilibrium with the lowest USDW (U.S. Environmental Protection Agency, 2013). Under Method 1, the maximum pressure increase that may be sustained in the injection zone (critical threshold pressure increase) is given by Equation 1:

$$\Delta P_{i,f} = P_u + \rho_i g (z_u - z_i) - P_i \quad [\text{Eq. 1}]$$

Where:

- $P_u$  is the initial fluid pressure in the USDW (Pa).
- $\rho_i$  is the storage reservoir fluid density (kg/m<sup>3</sup>).
- $g$  is the acceleration due to gravity (m/s<sup>2</sup>).
- $z_u$  is the representative elevation of the USDW (m amsl\*).
- $z_i$  is the representative elevation of the injection zone (m amsl).
- $P_i$  is the initial pressure in the injection zone (Pa).
- $\Delta P_{i,f}$  is the critical threshold pressure increase (Pa).
- (\* amsl = above mean sea level)

Equation 1 assumes that the hypothetical open borehole is perforated exclusively within the injection zone and USDW. If  $\Delta P_{i,f} = 0$ , then the reservoir and USDW are in hydrostatic equilibrium; if  $\Delta P_{i,f} > 0$ , then the reservoir is underpressured relative to the USDW; and if  $\Delta P_{i,f} < 0$ , then the reservoir is overpressured relative to the USDW.

In scenarios where the storage reservoir and USDW are in hydrostatic equilibrium ( $\Delta P_{i,f} = 0$ ), EPA Method 2 (*pressure front based on displacing fluid initially present in the borehole*) can be used to calculate the critical pressure threshold. Method 2 was originally presented by Nicot and others (2008) and Bandilla and others (2012). Method 2 calculates the critical threshold pressure increase ( $\Delta P_c$ ), which is the fluid pressure increase sufficient to drive formation fluids into the lowermost USDW. This  $\Delta P_c$  is determined using Equations 2 and 3, assuming 1) hydrostatic conditions, 2) initially linear densities in the borehole, and 3) constant density once the injection zone fluid is lifted to the top of the borehole (i.e., uniform density approach):

$$\Delta P_c = \frac{1}{2} g \xi (z_u - z_i)^2 \quad [\text{Eq. 2}]$$

Where  $\xi$  is a linear coefficient determined by:

$$\xi = \frac{\rho_i - \rho_u}{z_u - z_i} \quad [\text{Eq. 3}]$$

Where:

- $\Delta P_c$  is the critical threshold pressure increase (Pa).
- $g$  is the acceleration of gravity (m/s<sup>2</sup>).

$z_u$  is the elevation of the base of the lowermost USDW (m amsl).

$z_i$  is the elevation of the top of the injections zone (m amsl).

$\rho_i$  is the fluid density in the injection zone ( $\text{kg/m}^3$ ).

$\rho_u$  is the fluid density in the USDW ( $\text{kg/m}^3$ ).

### 3.5.2 *Risk-Based AOR Delineation*

The methods described by EPA (2013) for estimating the AOR under the Class VI rule (40 U.S. Code of Federal Regulations [CFR] 146.81 et seq.) were developed assuming that the storage reservoirs would be in hydrostatic equilibrium with overlying aquifers. However, in the state of North Dakota, and potentially elsewhere around the United States, candidate storage reservoirs are already overpressured relative to overlying aquifers and thus subject to potential vertical formation fluid migration from the storage reservoir to the lowermost USDW, even prior to the planned storage project. Consequently, applying EPA (2013) methods to these geologic situations essentially results in an infinite AOR, which makes regulatory compliance infeasible.

Several researchers have recognized the need for alternative methods for estimating the AOR for locations that are already overpressured relative to overlying aquifers. For example, Birkholzer and others (2014) described the “unnecessary conservatism” in EPA’s definition of critical pressure, which could lead to a heavy burden on storage facility permit (SFP) applicants. As an alternative, Burton-Kelly and others (2021) proposed a risk-based reinterpretation of this framework that would allow for a reduction in the AOR while ensuring protection of drinking water resources.

A computational framework for estimating a risk-based AOR was proposed by Oldenburg and others (2014, 2016), who compared formation fluid leakage through a hypothetical open flow path in the baseline scenario (no  $\text{CO}_2$  injection) to the incrementally larger leakage that would occur in the  $\text{CO}_2$  injection case. The modeling for the risk-based AOR used semianalytical solutions to single-phase flow equations to model reservoir pressurization and vertical migration through leaky wells. These semianalytical solutions were extensions of earlier work for formation fluid leakage through abandoned wellbores by Raven and others (1990) and Avcı (1994), which were creatively solved, coded, and compiled in FORTRAN under the name ASLMA (Analytical Solution for Leakage in Multilayered Aquifers) and extensively described by Cihan and others (2011, 2012) (hereafter “ASLMA Model”).

White and others (2020) outlined a similar risk-based approach for evaluating the AOR using the National Risk Assessment Partnership (NRAP) Integrated Assessment Model for Carbon Storage (NRAP-IAM-CS). However, NRAP-IAM-CS and the subsequent open-sourced version (NRAP-Open-IAM) are constrained to the assumption that the storage reservoir is in hydrostatic equilibrium with overlying aquifers and, therefore, may not accurately estimate the AOR for storage projects located in regions where the storage reservoir is overpressured relative to overlying aquifers.

Building a geologic model in a commercial-grade software platform (like Petrel; Schlumberger, 2020) and running fluid flow simulations using numerical reservoir simulation in a commercial-grade software platform (like CMG’s compositional simulator, GEM) provide the “gold standard” for estimating pressure buildup in response to  $\text{CO}_2$  injection (e.g., Bosshart and

others, 2018). However, these numerical reservoir simulations are typically limited to the storage reservoir and primary seal formation (cap rock) and do not include the geologic units overlying the cap rock because of the computational burden of conducting such a complex simulation. In addition, geologic modeling of the overlying units may add a substantial amount of time and effort during prefeasibility-phase projects that are unwarranted given the amount of uncertainty that may be present if only a few nearby wells can be used for characterization activities. Earlier studies (e.g., Nicot and others, 2008; Birkholzer and others, 2009; Bandilla and others, 2012; Cihan and others, 2011, 2012) have shown that far-field fluid pressure changes outside of the CO<sub>2</sub> plume domain can be reasonably described by a single-phase flow calculation by representing CO<sub>2</sub> injection as an equivalent-volume injection of brine (Oldenburg and others, 2014).

The semianalytical solutions embedded within the ASLMA Model have been shown to compare with the numerical model, TOUGH2-ECO2-N, and provided accurate results for pressures beyond the CO<sub>2</sub> plume zone (Birkholzer and others, 2009; Cihan and others, 2011, 2012). Therefore, the proposed workflow for delineating a risk-based AOR uses the ASLMA Model to examine pressure buildup in the storage reservoir and resultant effects of this buildup on the vertical migration of formation fluid via (single) hypothetical leaky wellbores located at progressively greater distances from the injection well (Figure 3-17).

An important distinction between EPA Methods 1 and 2, which both calculate a critical pressure threshold (either  $\Delta P_{i,f}$  for Method 1 or  $\Delta P_c$  for Method 2) and the risk-based AOR approach is that the risk-based approach 1) calculates and maps the potential incremental flow of formation fluids from the storage reservoir to the USDW that could occur and then 2) delineates the areal extent beyond which no significant leakage would occur. Therefore, the region beyond which no significant leakage would occur does not present an endangerment to the USDW; hence, the region inside of this areal extent is the risk-based AOR.

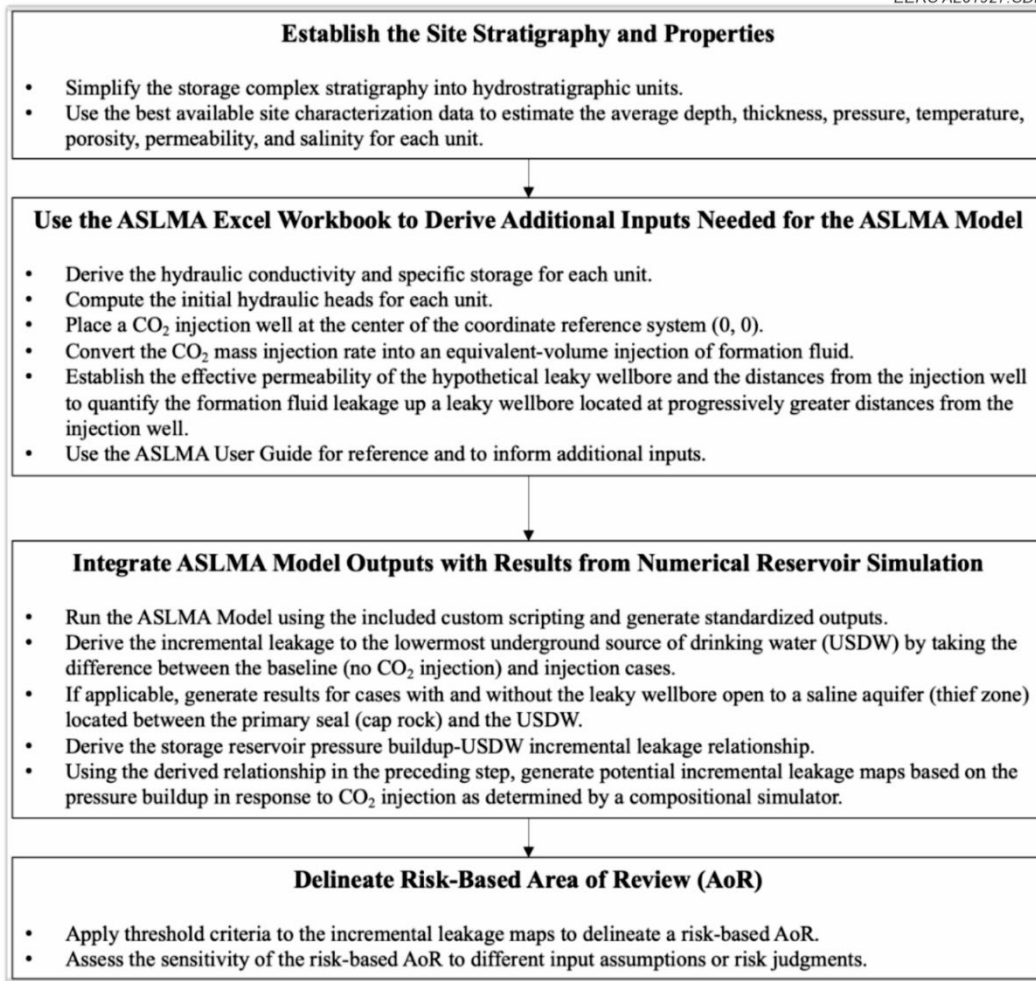

Figure 3-17. Workflow for delineating a risk-based AOR for an SFP (modified from Burton-Kelly and others, 2021).

### 3.5.3 Critical Threshold Pressure Increase Estimation

For the purposes of delineating AOR for this permit, constant fluid densities for the lowermost USDW (Fox Hills Formation) and injection zone (Broom Creek Formation) were used in the calculations. Respective fluid densities were used to represent the injection zone fluids ( $\rho_i$ ), which are estimated based on the in situ estimated brine salinity, temperature, and pressure at the Milton Flemmer 1 stratigraphic test well.

Application of EPA Method 1 (Eq. 1) using model data from the TB Leingang 1 simulation well shows that the injection zone is overpressured with respect to the lowest USDW (i.e., Method 1  $\Delta P_{i,f} < 0$ ). An example of the EPA Method 1 application showing negative  $\Delta P_{i,f}$  (relative overpressure) is given in Table 3-5, with similar results when applied to each column of the grid cells in the Broom Creek Formation simulation model.

**Table 3-5. EPA Method 1 Critical Threshold Pressure Increase Calculated at the TB Leingang 1 Simulation Well**

Location		$P_i$	$P_u$	$\rho_i$	$Z_u$	$Z_i$	$\Delta P_{i,f}$	
Depth,*		Injection	USDW	Injection	USDW	Reservoir	Threshold Pressure	
ft	m	Zone	Base	Zone	Base	Elevation,	Increase,	
		Pressure,	Pressure,	Density,	Elevation,	m amsl	MPa	psi
		MPa	MPa	kg/m <sup>3</sup>	m amsl			
5830.3	1777	19.00	4.32	1063	142.3	-1088.8	-1.87	-271

\* Ground surface elevation is 688 m amsl. Depth provided is the midpoint of the Broom Creek Formation in feet below ground surface.

In accordance with EPA (2013) guidance, the combination of a) a Method 1 negative  $\Delta P_{i,f}$  value and b) lack of evidence for hydrostatic equilibrium between the reservoir and the USDW (i.e., Method 2 does not apply) indicates that a risk-based approach to AOR delineation may be pursued.

#### **3.5.4 Risk-Based AOR Calculations**

Complete details of the risk-based AOR model are found in Burton-Kelly and others (2021). The inputs, assumptions, and results discussed here provide the necessary details for reproducing and verifying the results. A macro-enabled Microsoft Excel file was used to define the inputs and calculations that were employed in the method (hereafter “ASLMA Workbook”).

##### **3.5.4.1 Initial Hydraulic Heads**

The original ASLMA Model (Cihan and others, 2011) initially assumed hydrostatic pressure distributions in the entire system. The current work uses a modified version of the ASLMA Model to simulate pressure perturbations and leakage rates when there are initial head differences in the aquifers (Oldenburg and others, 2014). The initial hydraulic heads are calculated assuming a total head based on the unit-specific elevations and pressures. The total heads are entered into the ASLMA Model and establish the initial pressure conditions for the storage complex prior to CO<sub>2</sub> injection.

For example, the initial reference case total heads for the storage reservoir (Aquifer 1), potential thief zone (Aquifer 2), and USDW (Aquifer 3) are shown in Table 3-6. They illustrate the state of overpressure in the storage complex because Aquifer 1 has a greater initial hydraulic head than Aquifer 2 and Aquifer 3. Therefore, the storage complex requires different treatment than the default AOR calculations described by EPA (2013). Details on the calculations of initial hydraulic head are provided in Burton-Kelly and others (2021).

**Table 3-6. Simplified Stratigraphy and Average Properties Used to Represent the Storage Complex**

Hydrostratigraphic Unit	Depth to Top,* m	Thickness, m	Pressure, MPa	Temperature, °C	Salinity, ppm	Brine Density, kg/m <sup>3</sup>	Porosity, %	Permeability, mD		HCON,** m/d	Specific Storage, m <sup>-1</sup>	Total Head, m

### 3.5.4.2 CO<sub>2</sub> Injection Parameters

The ASLMA Model for the project used a Broom Creek CO<sub>2</sub> injection rate that matched the simulation scenario. A single injector is placed at the center of the ASLMA Model grid at an x,y location of (0,0) in the coordinate reference system. The ASLMA Model requires the CO<sub>2</sub> injection rate to be converted into an equivalent-volume injection of formation fluid in units of cubic meters per day. Microsoft Excel Visual Basic for Applications (VBA) functions were used to estimate the CO<sub>2</sub> density from the storage reservoir pressure and temperature, which resulted in an estimated density, shown in Table 3-7. The CO<sub>2</sub> mass injection rate and CO<sub>2</sub> density are then used to derive the daily equivalent-volume injection rate, shown in Table 3-7.

**Table 3-7. CO<sub>2</sub> Density and Injection Parameters Used for the ASLMA Model**

<b>CO<sub>2</sub> Density, Reservoir Conditions, kg/m<sup>3</sup></b>	<b>Average CO<sub>2</sub> Injection Rate, tonnes per day</b>	<b>Average Equivalent Water Injection Rate, m<sup>3</sup> per day</b>	<b>Injection Period, years</b>
704	17,041	24,197	20

### 3.5.4.3 Hypothetical Leaky Wellbore

In the simulation model area, few wellbores are known to exist that penetrate the primary seal of the Broom Creek storage reservoir. However, for heuristic, “what-if” scenario modeling, which is needed to generate the data for delineating a risk-based AOR, a single hypothetical leaky wellbore is inserted into the ASLMA Model at 1, 2, ..., 100 km from the CO<sub>2</sub> injection well. The pressure buildup in the storage reservoir at each distance, along with the recorded cumulative volume of formation fluid vertically migrating through the leaky wellbore from the storage reservoir to the USDW (i.e., from Aquifer 1 to Aquifer 2) throughout the 20-year injection period, provides the data set needed to derive the risk-based AOR.

Published ranges for the effective permeability of a leaky wellbore (Figure 3-18) have included an “open wellbore” with an effective permeability as high as  $10^{-5} \text{ m}^2$  ( $10^{10} \text{ mD}$ ) to values more representative of leakage through a wellbore annulus of  $10^{-12}$  to  $10^{-10} \text{ m}^2$  ( $10^3$  to  $10^5 \text{ mD}$ ) (Watson and Bachu, 2008, 2009; Celia and others, 2011). Carey (2017) provides probability distributions for the effective permeability of potentially leaking wells at CO<sub>2</sub> storage sites and estimated a wide range from  $10^{-20}$  to  $10^{-10} \text{ m}^2$  ( $10^{-5}$  to  $10^5 \text{ mD}$ ). For the project Broom Creek ASLMA Model, the effective permeability of the leaky wellbore is set to  $10^{-16} \text{ m}^2$  (0.1 mD), which is a conservative (highly permeable) value near the top of the published range for the effective permeability of potentially leaking wells at CO<sub>2</sub> storage sites (Figure 3-18).

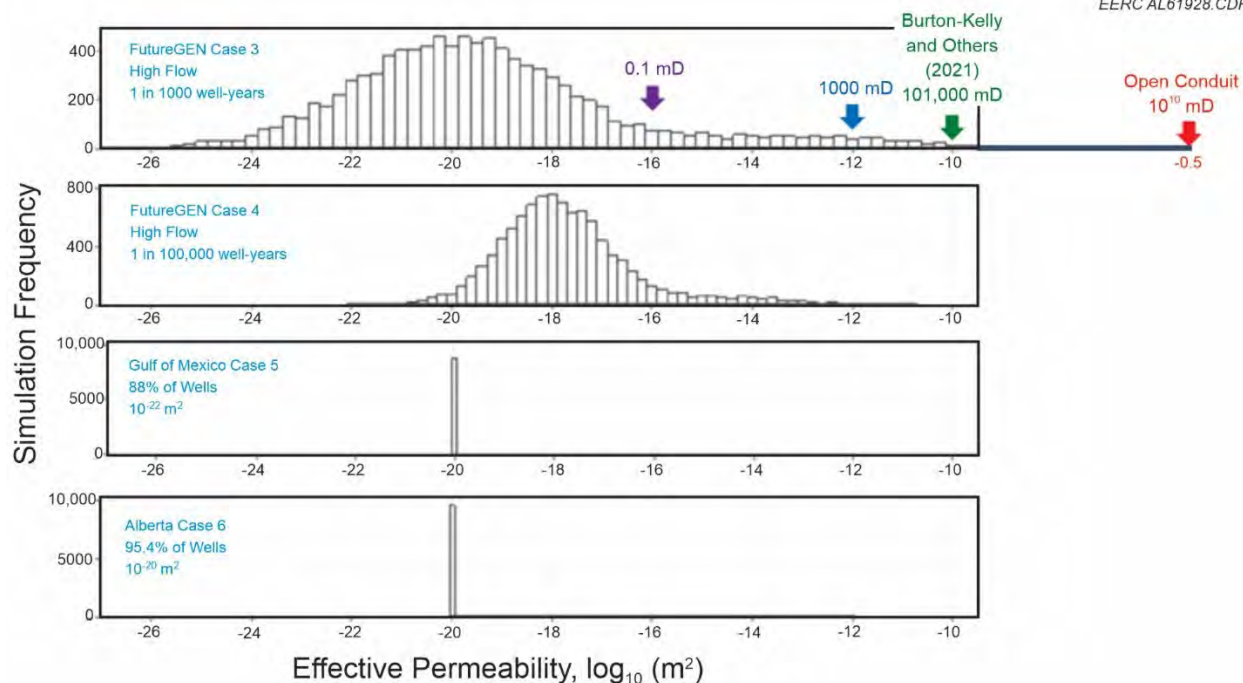

Figure 3-18. Histograms describing the expected frequency of leaky wellbore effective permeabilities under different scenarios. The ASLMA Model used for AOR delineation used a value of approximately 0.1 mD (constructed from data presented by Carey [2017]).

The current work uses the ASLMA Model Type 1 feature (focused leakage only) for the nominal model response, which makes the conservative assumption that the aquitards are impermeable. This assumption prevents the pressure from diffusing into the overlying aquitards, resulting in a greater pressure buildup in the storage reservoir and a commensurately greater amount of formation fluid vertically migrating from the storage reservoir through the leaky wellbore. The conservative assumption of Model Type 1 rather than Model Type 3 (coupled focused and diffuse leakage) provides an added level of protection to the delineation of a risk-based AOR by projecting a larger pressure buildup in the storage reservoir than a scenario in which pressure is allowed to dissipate through the upper seal and, therefore, a greater leakage of formation fluid up the leaky wellbore.

#### 3.5.4.4 Saline Aquifer Potential Thief Zone

As shown in Table 3-6, a saline aquifer (Aquifer 2, Inyan Kara Formation) exists between the storage reservoir primary seal and the USDW (Aquifer 3, Fox Hills Formation). Formation fluid migrating up a leaky wellbore that is open to Aquifer 2 will preferentially flow into Aquifer 2, and the continued flow up the wellbore and into the USDW will be reduced. Therefore, Aquifer 2 may act as a thief zone and reduce the potential for formation fluid impacts to the groundwater.

The thief zone phenomenon was described by Nordbotten and others (2004) as an “elevator model” by analogy to an elevator full of people on the main floor, who then get off at various floors as the elevator moves up, such that only very few people ride all the way to the top floor.

The term “thief zone” is also used in the oil and gas industry to describe a high-permeability zone encountered during drilling into which circulating fluids can be lost. Models with and without opening the leaky wellbore to Aquifer 2 were run and the results evaluated to quantify the effect of a thief zone on the risk-based AOR.

#### *3.5.4.5 Aquifer- and Aquitard-Derived Properties*

The ASLMA Model assumes homogeneous properties within each hydrostratigraphic unit (Table 3-6). For each unit shown in Table 3-6, pressure, temperature, porosity, permeability, and salinity are used to derive two key inputs for the ASLMA Model: HCON and specific storage (SS). Average porosity and permeability values were derived as follows: Broom Creek, from distributed properties in the geologic model; Fox Hills, from regional well log data. Porosity is represented as an arithmetic mean and permeability as a geometric mean value within each hydrostratigraphic unit (excluding nonsandstone rock types).

VBA functions included in the ASLMA Workbook are used to estimate the formation fluid density and viscosity from the aquifer or aquitard pressure, temperature, and salinity inputs, which are then used to estimate HCON and SS. The estimated reference case HCON for the storage reservoir (Aquifer 1) potential thief zone (Aquifer 2) and USDW (Aquifer 3) are shown in Table 3-6. Details about the HCON and SS derivations are provided in supporting information for Burton-Kelly and others (2021).

### **3.5.5 Risk-Based AOR Results**

#### *3.5.5.1 Relating Pressure Buildup to Incremental Leakage with ASLMA Model and Compositional Simulation*

Figure 3-19 shows the relationship between the maximum pressure buildup in the storage reservoir and incremental leakage to Aquifer 3 (USDW) for scenarios with and without the leaky wellbore open to Aquifer 2 (thief zone). The curvilinear relationship between pressure buildup in the storage reservoir and incremental leakage to Aquifer 3 is used to predict the incremental leakage from the pressure buildup map produced by the compositional simulation of the geocellular model. The average simulated pressure buildup in the reservoir is represented by a raster (grid) map of pressure buildup values. For each raster value (grid cell map location), the relationship between pressure buildup and incremental leakage (Figure 3-19) is used to predict incremental leakage using a linear interpolation between the points making up the curve. The estimated cumulative leakage potential from Aquifer 1 to Aquifer 3 along a hypothetical leaky wellbore without injection occurring (i.e., leakage due to natural overpressure) and no thief zone is shown in Table 3-8.

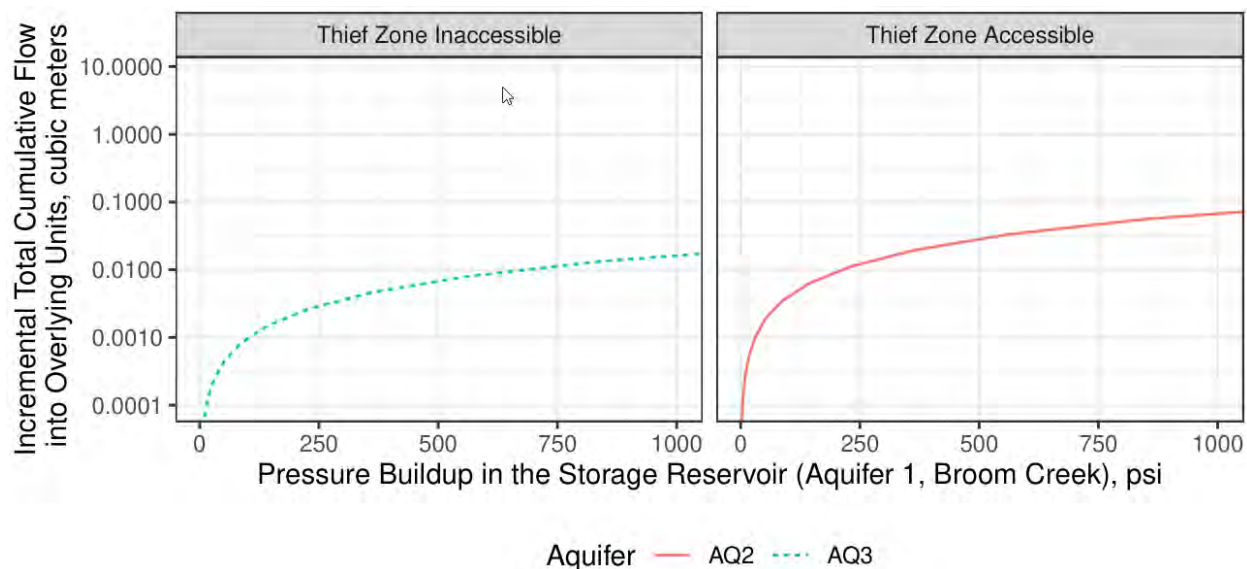

Figure 3-19. Relationship between pressure buildup (x-axis, psi) in the storage reservoir (Aquifer 1, Broom Creek) and incremental total cumulative leakage (y-axis,  $m^3$ ) into Aquifer 2 (thief zone, Inyan Kara, red solid line) and Aquifer 3 (USDW, Fox Hills, dashed blue line). In the left-hand scenario, the leaky wellbore is closed to Aquifer 2, so all flow is from the storage reservoir to the USDW. In the right-hand scenario, the leaky wellbore is open to Aquifer 2, so the vast majority of flow is from the storage reservoir to the Aquifer 2 thief zone, and the curve showing flow into the Aquifer 3 USDW is not visible on this plot.

### 3.5.5.2 Incremental Flow Maps and AOR Delineation

The pressure buildup–incremental flow relationship, shown in Figure 3-19, results in the incremental flow map, shown in Figure 3-20, which shows the estimated total cumulative incremental flow potential from a hypothetical leaky well into Aquifer 3 (USDW) over the entire injection period if the modeled leaky wellbore is not open to the thief zone.

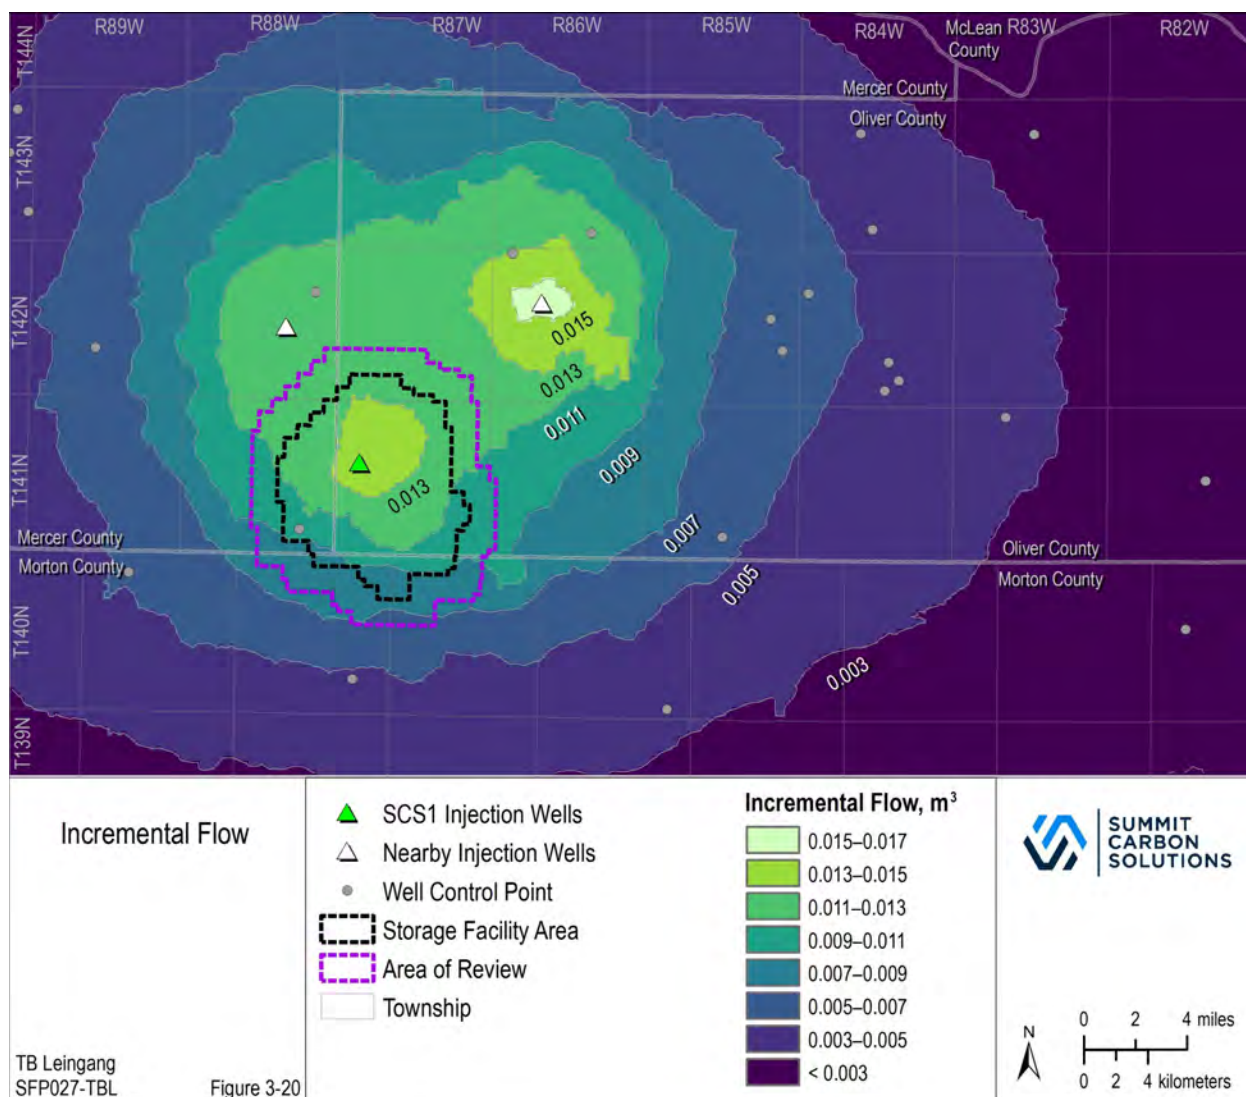

Figure 3-20. Map of potential incremental flow into the USDW at the end of 20 years of CO<sub>2</sub> injection for the scenario where the modeled leaky wellbore is closed to Aquifer 2 (thief zone).

The final step of the risk-based AOR workflow is to apply a threshold criterion to the incremental flow maps to delineate a risk-based AOR. For the Broom Creek Formation injection at the project site, a threshold of 1 m<sup>3</sup> of potential incremental flow into the Fox Hills Formation USDW along a hypothetical leaky wellbore over the injection period is established. A value of 1 m<sup>3</sup> is the lowest meaningful value that can be produced by the ASLMA Model; although the model can return smaller values, they likely represent statistical noise. This potential incremental flow threshold is greater than all calculated potential incremental flow values described by the curve in Figure 3-19. The maximum vertically averaged change in pressure in the storage reservoir at the end of the simulated injection period and the corresponding flow over the injection period are shown in Table 3-8. This pressure is below the potential incremental flow threshold of 1 m<sup>3</sup>.

Therefore, the storage reservoir pressure buildup is not a deciding factor in determining the AOR extent.

**Table 3-8. Summary Results from the Risk-Based AOR Method of Estimated Potential Cumulative Leakage after 20 years of Injection and No Thief Zone**

Maximum Vertically Averaged Change in Reservoir Pressure, psi	1004
Estimated Cumulative Leakage (reservoir to USDW) along Leaky Wellbore <i>Without</i> Injection, m <sup>3</sup>	0.010
Maximum Estimated Cumulative Leakage (reservoir to USDW) along Leaky Wellbore <i>Attributable to</i> Injection, m <sup>3</sup>	0.017

The assumptions and calculations used to determine the risk-based AOR at the project site incorporate at least four safety factors for the protection of groundwater resources. If the ASLMA Model has resulted in an underestimation of the amount of potential leakage over the injection period, such underestimation is likely to be mitigated by:

- The statistical overestimation of hypothetical leaky wellbore permeability compared to known and estimated values in the literature—a more statistically likely hypothetical leaky wellbore permeability would be lower and allow less flow into the USDW.
- The lack of communication between the hypothetical leaky wellbore and Inyan Kara Formation, which would act as a thief zone—a real leaky wellbore would likely communicate with the Inyan Kara Formation, which would receive much, if not all, of the brine leaked from the storage reservoir.
- The low density of known legacy wellbores in the TB Leingang area—CO<sub>2</sub> injection is proposed to occur in an area with few available leakage pathways.
- The continued overpressured nature of the Broom Creek Formation with respect to overlying saline aquifers—over relatively short (e.g., 1 year) timescales, overpressured aquifers with leakage pathways would demonstrate a change in upward flow rate and corresponding pressure (Oldenburg and others, 2016).

The risk-based method detailed above shows that storage reservoir pressure buildup is not necessary for determining AOR because the potential incremental flow into the USDW is below the identified threshold of 1 m<sup>3</sup>. Therefore, the AOR is delineated as the storage facility area plus a 1-mi buffer (Figure 3-21).

## TB LEINGANG/MILTON FLEMMER 1

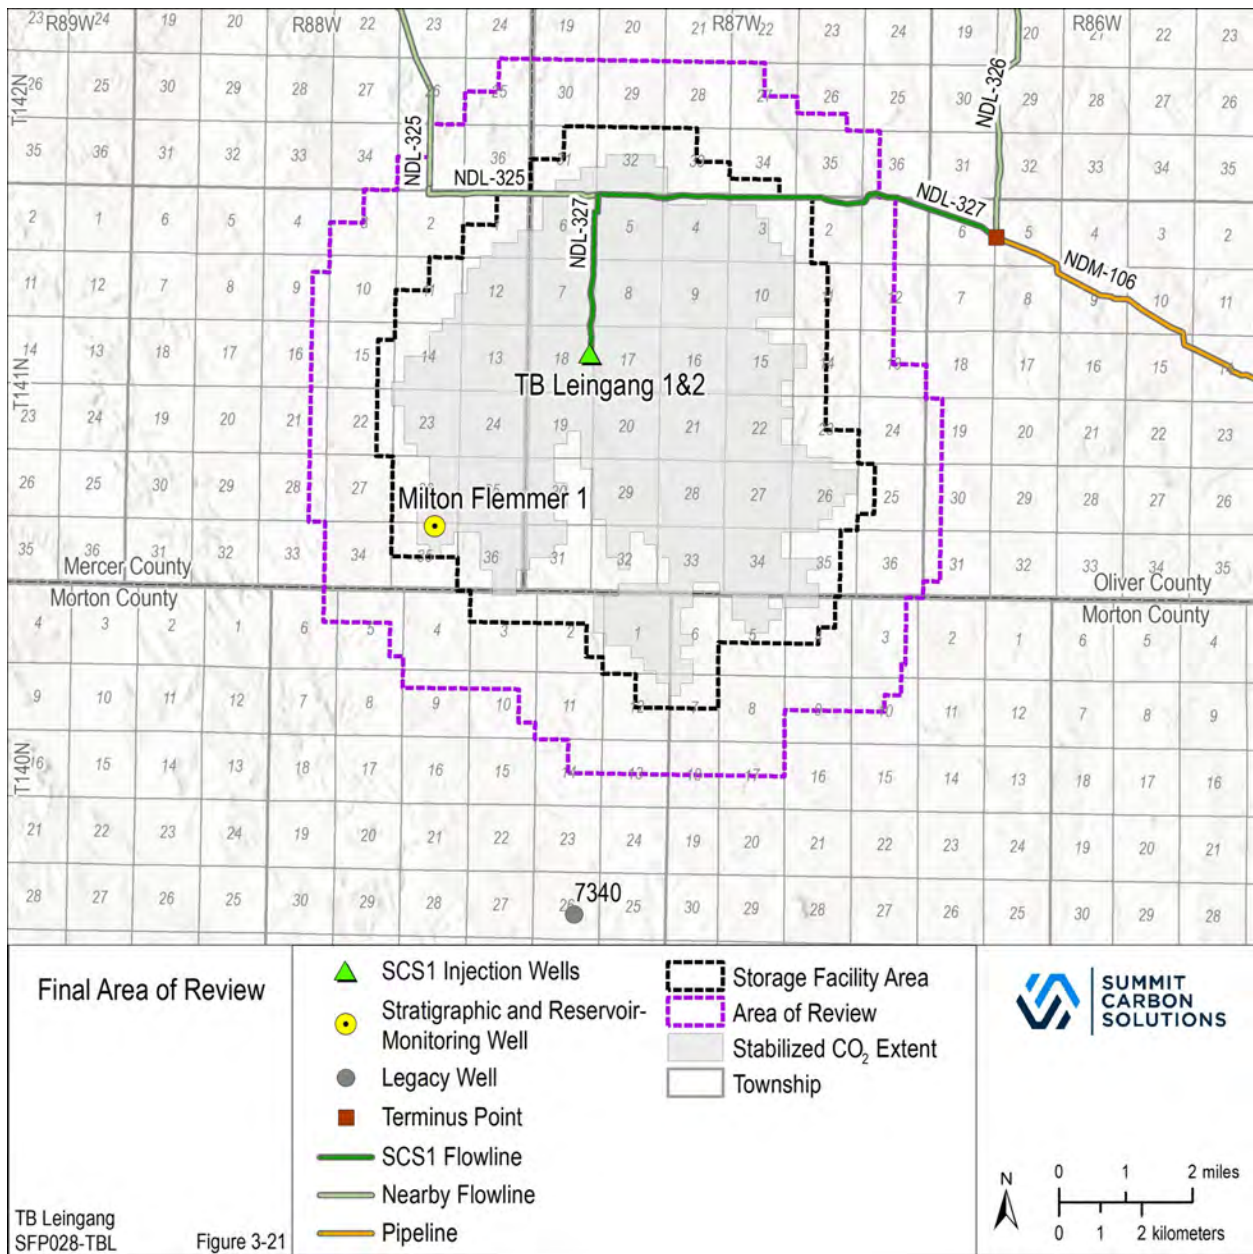

Figure 3-21. Final AOR estimations and stabilized CO<sub>2</sub> extent of the TB Leingang storage facility area in relation to nearby legacy wells. Shown is the storage facility area (black dashed line) and AOR (purple dashed line). The gray circle represents a legacy oil and gas well near the storage facility area.

## **SECTION 4.0**

### **AREA OF REVIEW**

## 4.0 AREA OF REVIEW

### 4.1 Area of Review (AOR) Delineation

North Dakota regulations for geologic storage of CO<sub>2</sub> require that each storage facility permit (SFP) delineate an AOR, which is defined as “the region surrounding the geologic storage project where underground sources of drinking water (USDWs)<sup>1</sup> may be endangered by the injection activity” (North Dakota Administrative Code [N.D.A.C.] § 43-05-01-01[4]). Concern regarding the endangerment of USDWs is related to the potential vertical migration of CO<sub>2</sub> and/or brine from the injection zone to the USDW. Therefore, the AOR encompasses the region overlying the injected free-phase CO<sub>2</sub> plume and the region overlying the extent of formation fluid pressure increase that is sufficient to drive formation fluids (e.g., brine) into USDWs, assuming pathways for this migration (e.g., abandoned wells or transmissive faults) are present.

The minimum fluid pressure increase in the reservoir that results in a sustained flow of brine upward into an overlying drinking water aquifer is referred to as the “critical threshold pressure increase” and resultant pressure as the “critical threshold pressure.” Calculation of the allowable increase in pressure using site-specific data from Milton Flemmer 1 (North Dakota Industrial Commission [NDIC] File No. 38594) shows that the storage reservoir in the project area is overpressured with respect to the lowest USDW (i.e., the allowable increase in pressure is less than zero). The storage reservoir is calculated to be overpressured, with a value of -271 psi calculated using data from the Milton Flemmer 1 well. The maximum vertically averaged storage reservoir change in pressure at the end of the simulated injection period was 1004 psi in the raster cell intersected by the injection well, which corresponds to less than 0.017 m<sup>3</sup> of flow over 20 years (Section 3.5). Based on the computational methods used to simulate CO<sub>2</sub> injection activities and the associated pressure front (Figure 4-1), the resulting AOR for TB Leingang is delineated as being 1 mi beyond the storage facility area boundary. This extent ensures compliance with existing state regulations.

In accordance with N.D.A.C. § 43-05-01-05(1)(b)(3), a geologist or engineer reviewed the data of public record for all wells within the storage facility area, including those which penetrate the storage reservoir or primary or secondary seals overlying the reservoir, and all wells within 1 mi of the storage facility area boundary (Table 4-1).

---

<sup>1</sup> The Fox Hills Aquifer underlying western North Dakota, including TB Leingang, is a confined-aquifer system that does not receive measurable flow from overlying aquifers or the underlying Pierre Shale. The overlying confining layer in the Hell Creek Formation comprises impermeable clays, and the underlying Pierre Shale serves as the lower confining layer (Trapp and Croft, 1975). Recharge occurs hundreds of miles to the southwest in the Black Hills of South Dakota, where the corresponding geologic layers are exposed at the surface. Flow within the aquifer is to the east with a rate on the order of single feet per year. Groundwater in the Fox Hills Aquifer at TB Leingang is geochemically stable, as it is isolated from its source of recharge and does not receive other sources of recharge (Fischer, 2013). The aquifer itself is a quartz-rich sand and is not known to contain reactive mineralogy. Minimal geochemical variation can be expected to occur across the site, attributable to minor variations in the geologic composition of the aquifer sediments.

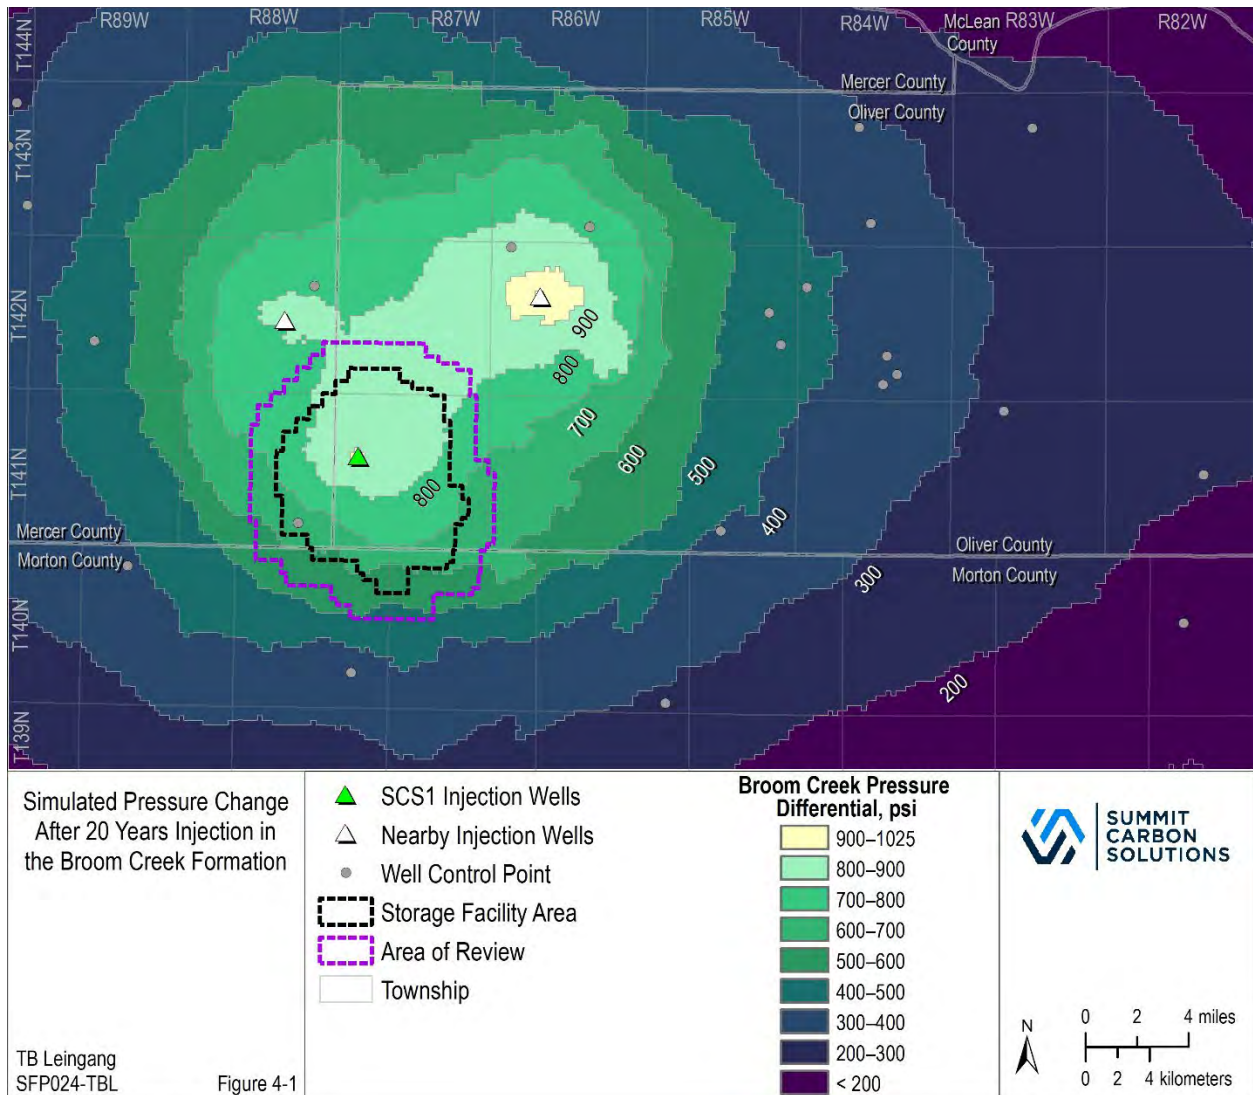

Figure 4-1. Pressure map showing the maximum subsurface pressure influence associated with CO<sub>2</sub> injection in the Broom Creek Formation for TB Leingang. Shown are the storage facility area and AOR boundary in relation to the predicted maximum subsurface pressure influence. Subsurface pressure subsides at the cessation of injection.

This section of the SFP application is accompanied by maps and tables that include information required and in accordance with N.D.A.C. § 43-05-01-05(1)(a) and (b) and § 43-05-01-05.1(2), such as the storage facility area; location of any proposed injection wells; presence of occupied structures, gravel pits, and wind turbines (Figure 4-2); and location of water wells, springs, and any other wells within the AOR (Figure 4-3). Table 4-1 lists all the surface and subsurface features that were investigated as part of the AOR evaluation. Surface features that were investigated but not found within the AOR boundary are also identified in Table 4-1.

**Table 4-1. Investigated and Identified Surface and Subsurface Features in the AOR (Figures 2-50, 4-2, and 4-3)**

\* No cathodic protection boreholes are currently included in the site design, and none were identified within the AOR.

An extensive geologic and hydrogeologic characterization performed by a team of geologists from the Energy & Environmental Research Center (EERC) resulted in no evidence of transmissive faults or fractures in the upper confining zone within the AOR (Section 2.5) and revealed that the upper confining zone has sufficient geologic integrity to prevent vertical fluid movement. All geologic data and investigations indicate the storage reservoir within the AOR has sufficient containment and geologic integrity, including geologic confinement above and below the injection zone, to prevent vertical fluid movement.

## TB LEINGANG/MILTON FLEMMER 1

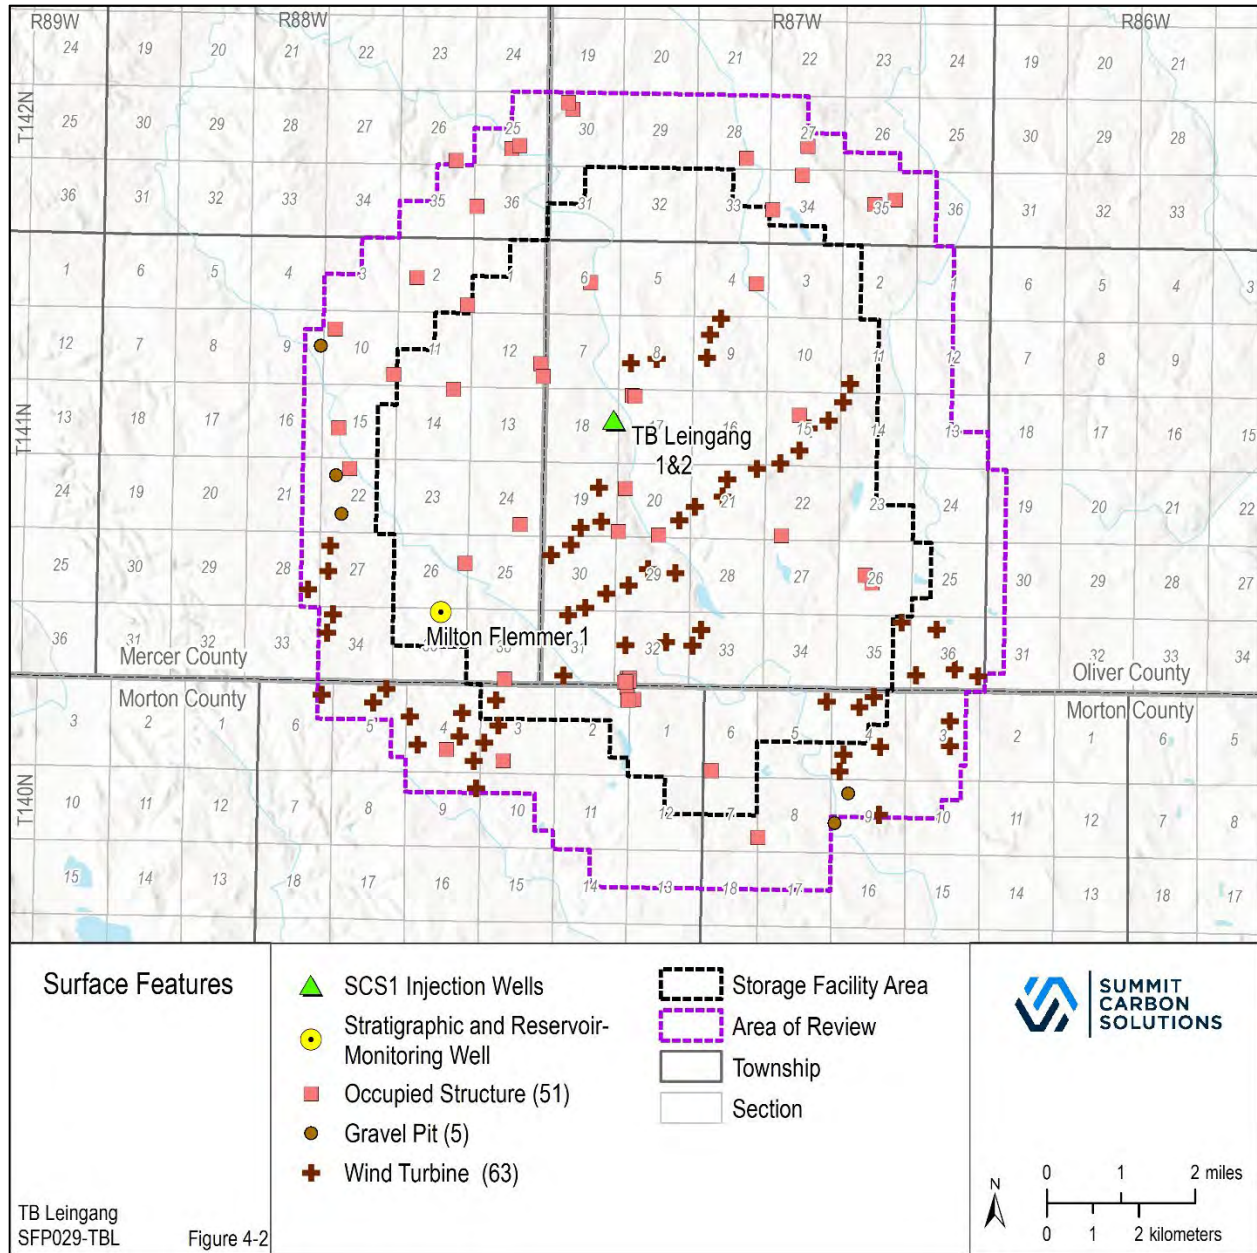

Figure 4-2. Final AOR map showing the TB Leingang storage facility area (dashed black boundary) and AOR (dashed purple boundary). Pink squares represent occupied structures, brown crosses represent wind turbines, and brown circles represent gravel pits (note: gravel pits were identified using the North Dakota Geographic Information System [GIS] Hub landmarks data layer from the North Dakota Department of Transportation [2002]).

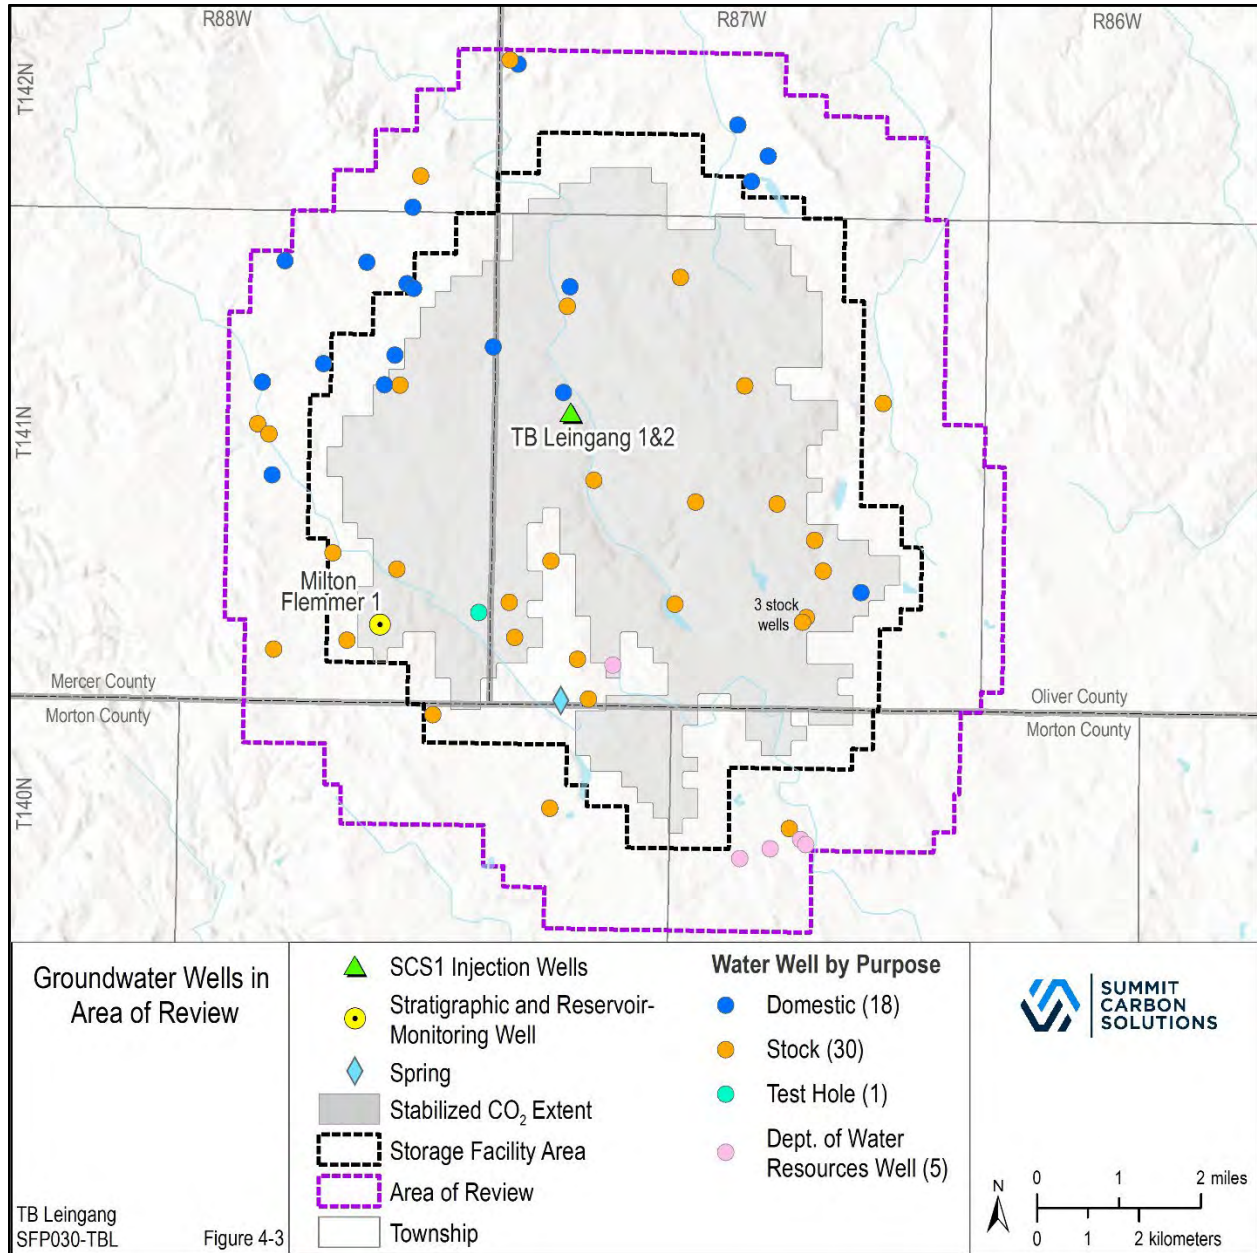

Figure 4-3. Map showing all wells located in the AOR. Shown are the stabilized CO<sub>2</sub> plume extent postinjection (gray-shaded area), storage facility area (dashed black boundary), and AOR (dashed purple boundary). All groundwater wells in the AOR are identified based on data available from the Department of Water Resources (DWR). The only existing well penetrating the Broom Creek Formation and its primary overlying seal (Opeche/Spearfish Formation) within the AOR is the Milton Flemmer 1 well. No other legacy oil and gas wells are present in the AOR (see Figure 2-47 for any nearby legacy wells outside of the AOR). One spring is present in the southern portion of the AOR (note: the spring was identified using the National Map hosted by the U.S. Geological Survey [2023]).

#### **4.2 Corrective Action Evaluation**

As identified in Table 4-1, any active and abandoned wells and underground mines in the AOR that may penetrate the confining zone were evaluated pursuant to N.D.A.C. § 43-05-01-05.1(2). Tables 4-2 and 4-3 and Figure 4-4 provide a description of each identified well, including well type, construction, date drilled, location, depth, record of plugging and completion, and any additional pertinent information. The evaluation determined that all wells within the AOR have sufficient isolation to prevent formation fluids or injected CO<sub>2</sub> from vertically migrating outside of the storage reservoir or into USDWs and that no corrective action is necessary.

Table 4-2. Well(s) in AOR Evaluated for Corrective Action\*

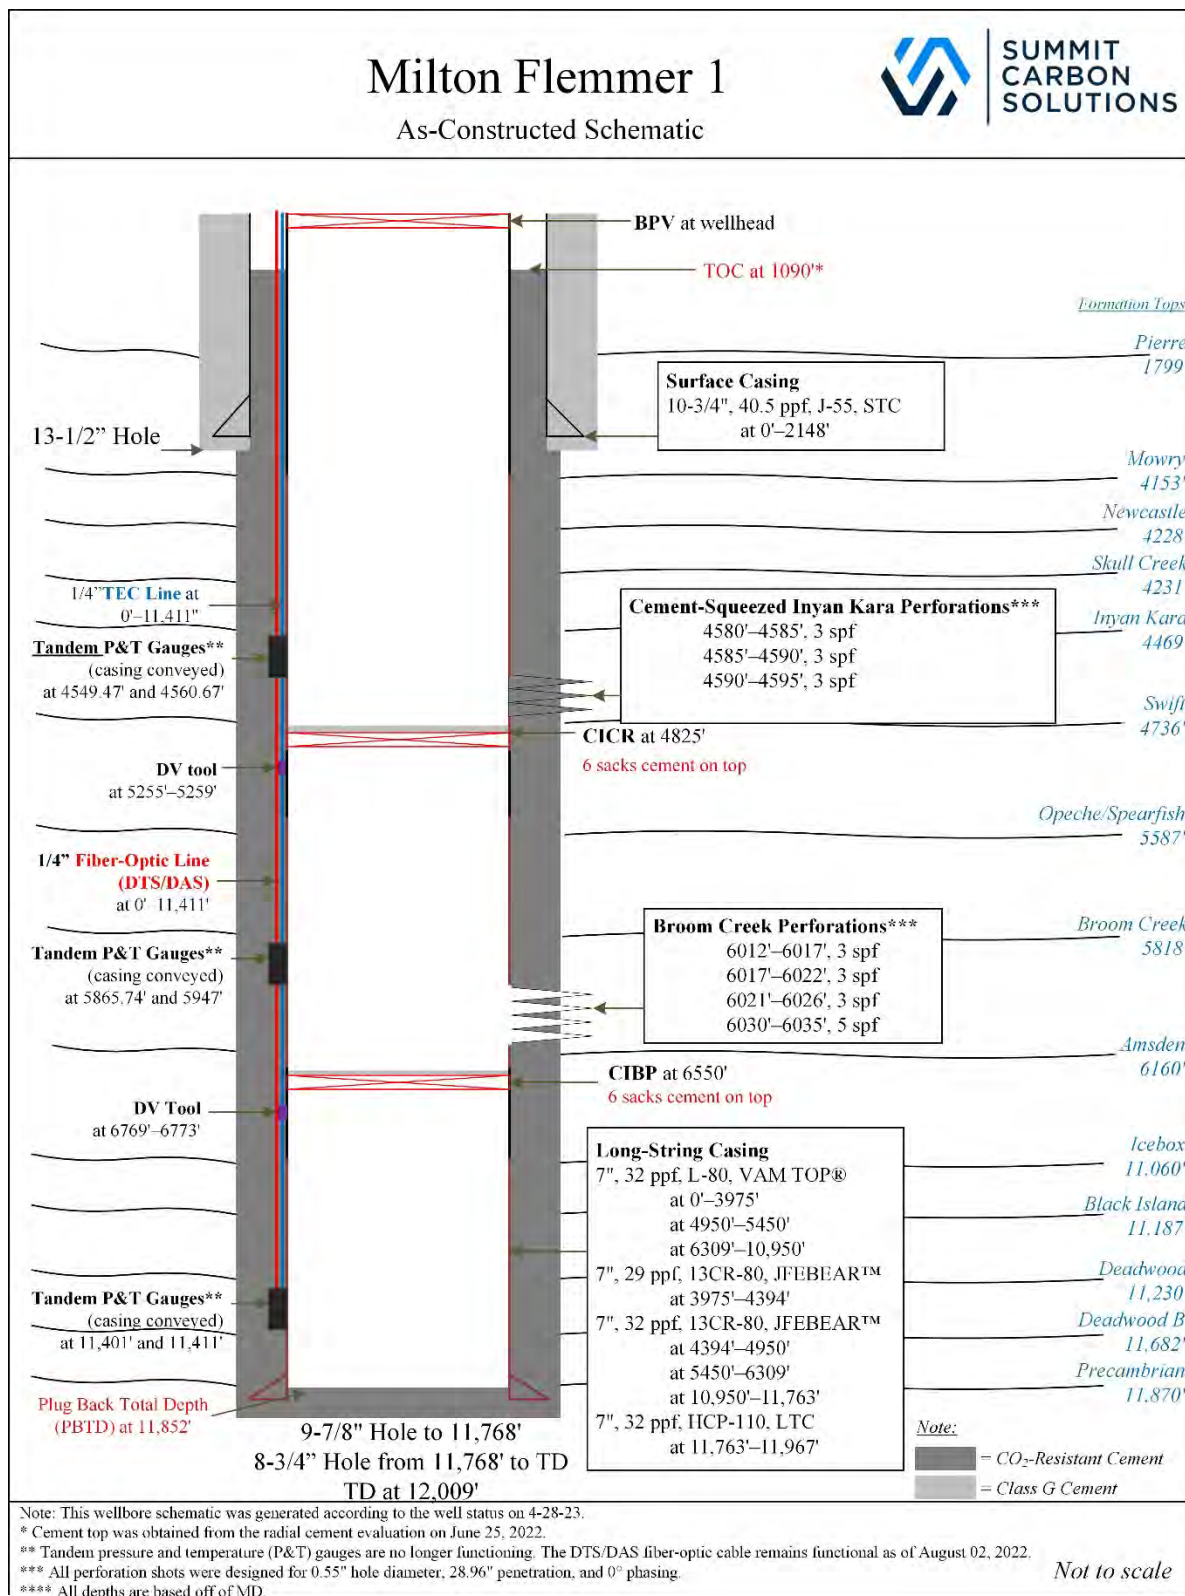

Figure 4-4. Milton Flemmer 1 (NDIC File No. 38594) well schematic showing the location of cement plugs.

### 4.3 Reevaluation of AOR and Corrective Action Plan

The AOR and corrective action plan will be reevaluated in accordance with N.D.A.C. § 43-05-01-05.1, with the first reevaluation taking place at a period not to exceed 5 years from the date the permit for CO<sub>2</sub> injection is issued (N.D.A.C. § 43-05-01-10) or when monitoring and operational conditions warrant a reevaluation. Each successive reevaluation shall take place at a period not to exceed 5 years from the date of the previous reevaluation (each referred to as a “Reevaluation Date”). The AOR reevaluations will address the following:

- Monitoring and operational data (e.g., injection rate and pressure) will be used to update the geologic model and the computational simulations. These updates will then be used to inform a reevaluation of the AOR and corrective action plan, including the computational model that was used to determine the AOR and the operational data to be utilized as the basis for that update will be identified.
- The protocol to conduct corrective action, if necessary, will be determined, including 1) what corrective action will be performed and 2) how corrective action will be adjusted if there are changes in the AOR delineation.

As part of the reevaluation, Summit Carbon Storage #1, LLC (SCS1) will either a) demonstrate to the NDIC Department of Mineral Resources-Oil and Gas Division (DMR-O&G) using monitoring data and modeling results that no plan amendment is necessary or b) submit an amended AOR and corrective action plan for DMR-O&G approval. Plan amendments must be incorporated into the permit and are subject to permit modification requirements.

### 4.4 Protection of USDWs

#### 4.4.1 Introduction of USDW Protection

The primary confining zone and additional overlying confining zones geologically isolate the Fox Hills and Hell Creek Formations, the lowest USDWs in the AOR, from the underlying injection zone. The Opeche/Spearfish Formation is the primary confining zone for the injection zone with additional confining layers above, geologically isolating all USDWs from the injection zone. The uppermost confining layer is the Pierre Formation, an impermeable shale more than 1000 ft thick, providing an additional seal for all USDWs in the region (Table 4-4).

**Table 4-4. Description of Zones of Confinement above the Immediate Upper Confining Zone (data based on Milton Flemmer 1)**

<b>Name of Formation</b>	<b>Lithology</b>	<b>Formation Top Depth MD, ft</b>	<b>Thickness, ft</b>	<b>Depth below Lowest Identified USDW, ft</b>
Pierre	Mudstone	1799	1480	0

Opeche/Spearfish	Mudstone	5587	231	3788

#### **4.4.2 Geology of USDW Formations**

The hydrogeology of western North Dakota comprises several shallow freshwater-bearing formations of the Quaternary, Tertiary, and upper Cretaceous-aged sediments underlain by multiple saline aquifer systems of the Williston Basin (Figure 4-5). These saline and freshwater systems are separated by the Cretaceous Pierre shale of the Williston Basin, a regionally extensive shale between 1000 and 1500 ft thick (Thamke and others, 2014).

Figure 4-5. Major aquifer systems of the Williston Basin (modified from Downey and Dinwiddie, 1988).

The freshwater aquifers comprise the Cretaceous Fox Hills and Hell Creek Formations; the overlying Cannonball, Tongue River, and Sentinel Butte Formations of the Tertiary Fort Union Group; and the Tertiary Golden Valley Formation (Figure 4-6). Above these formations are undifferentiated alluvial and glacial drift Quaternary aquifer layers, which are not necessarily present in all parts of the AOR (Croft, 1973).

<b>Era</b>	<b>Period</b>	<b>Group</b>	<b>Formation</b>	<b>Freshwater Aquifer(s) Present</b>
<b>Cenozoic</b>	<b>Quaternary</b>		Glacial Drift	Yes
			Golden Valley	Yes
	<b>Tertiary</b>	<b>Fort Union</b>	Sentinel Butte	Yes
			Tongue River	Yes
			Cannonball	Yes
<b>Mesozoic</b>	<b>Cretaceous</b>		Hell Creek	Yes
			Fox Hills	Yes
			Pierre	No
		<b>Colorado</b>	Niobrara	No
			Carlile	No
			Greenhorn	No
			Belle Fourche	No

EERC C063916.CDR

Figure 4-6. Upper stratigraphy of Mercer, Oliver, and Morton Counties showing the stratigraphic relationship of Quaternary, Cretaceous and Tertiary groundwater-bearing formations (modified from Croft, 1973).

The lowest USDW in the AOR is the Fox Hills Formation, which together with the overlying Hell Creek Formation, is a confined aquifer system. The Hell Creek Formation is a poorly consolidated unit composed of interbedded sandstone, siltstone, and claystones with occasional carbonaceous beds, all of fluvial origin. The underlying Fox Hills Formation is interpreted as interbedded nearshore marine deposits of sand, silt, and shale deposited as part of the final Western Interior Seaway retreat (Fischer, 2013). The Fox Hills Formation in the AOR is approximately 1500 ft deep and 250–300 ft thick (information reported from stratigraphic well installation). The structure of the Fox Hills and Hell Creek Formations follows that of the Williston Basin, dipping gently toward the center of the basin to the northwest of the AOR (Figure 4-7).

The Pierre Shale is a thick, regionally extensive shale unit which forms the lower boundary of the Fox Hills–Hell Creek system, also isolating all overlying freshwater aquifers from the deeper saline aquifer systems. The Pierre Shale is a dark gray to black marine shale and is typically over 1000 ft thick in the AOR (Thamke and others, 2014).

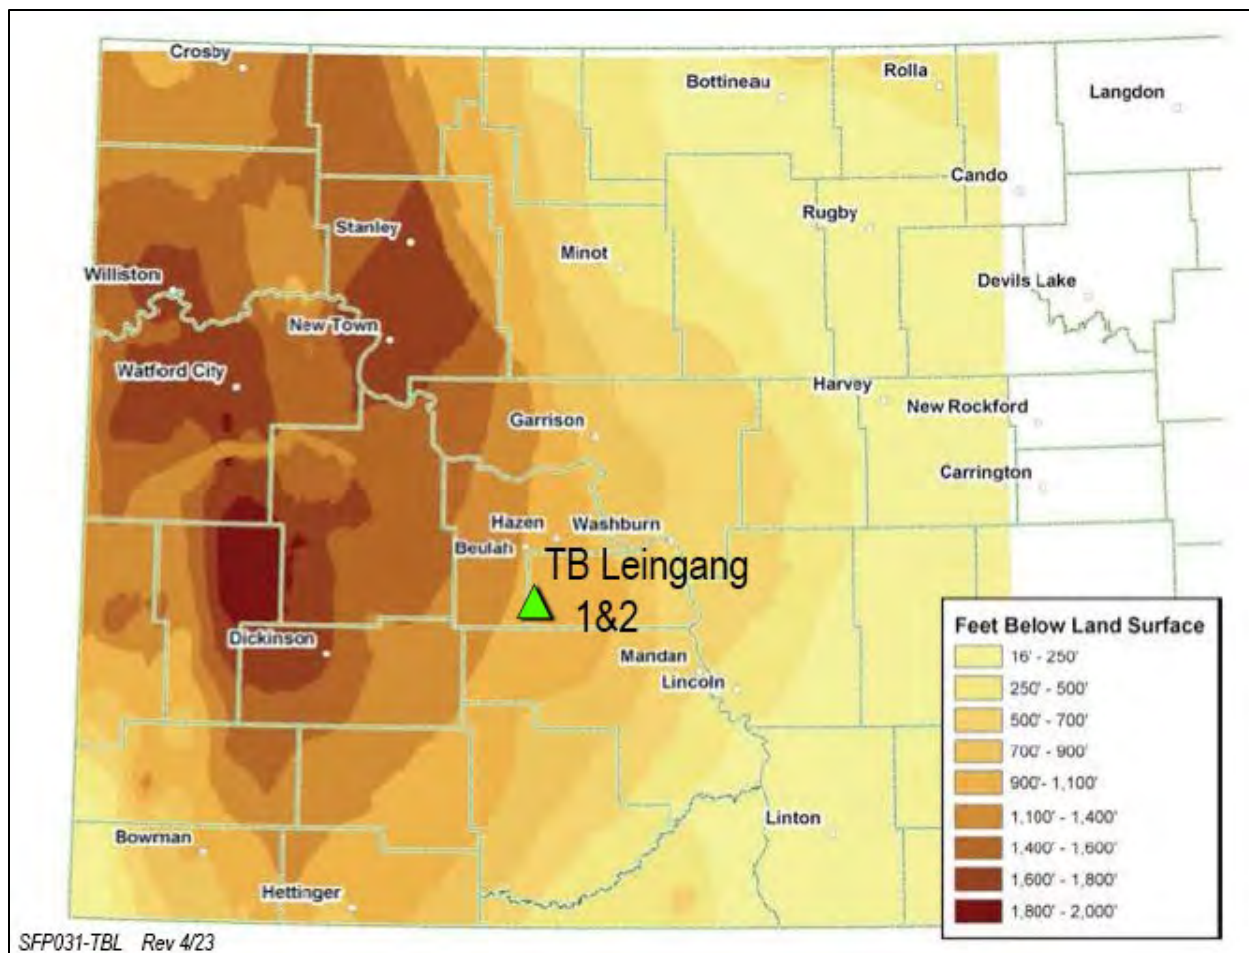

Figure 4-7. Depth to surface of the Fox Hills Formation in western North Dakota (Fischer, 2013).

#### 4.4.3 Hydrology of USDW Formations

The aquifers of the Fox Hills and Hell Creek Formations are hydraulically connected and function as a single confined aquifer system (Fischer, 2013). The Bacon Creek Member of the Hell Creek Formation forms a regional aquitard for the Fox Hills–Hell Creek aquifer system, isolating it from the overlying aquifer layers. Recharge for the Fox Hills–Hell Creek aquifer system occurs in southwestern North Dakota along the Cedar Creek Anticline and discharges into overlying strata under central and eastern North Dakota (Fischer, 2013). Flow through the AOR is to the east (Figure 4-8).

Water sampled from the Fox Hills Formation is a sodium bicarbonate type with a total dissolved solids (TDS) content of approximately 1500–1600 ppm. Previous analysis of Fox Hills Formation water has also noted high levels of fluoride in excess of 5 mg/L (Trapp and Croft, 1975). As such, the Fox Hills–Hell Creek system is typically not used as a primary source of drinking water. However, it is occasionally produced for irrigation and/or livestock watering.

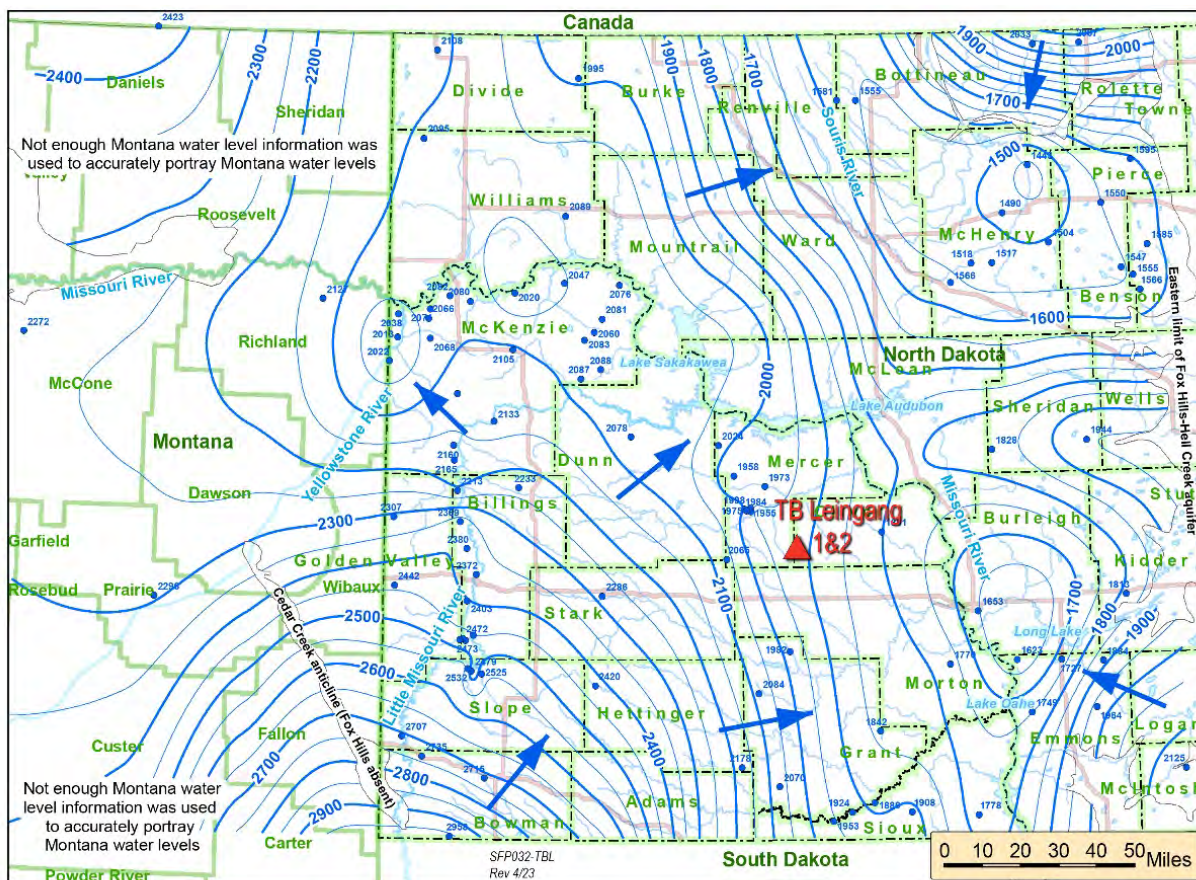

Figure 4-8. Potentiometric surface of the Fox Hills–Hell Creek aquifer system shown in feet of hydraulic head above sea level. Flow is to the east through the AOR in Mercer, Oliver, and Morton Counties (modified from Fischer, 2013).

Multiple other freshwater-bearing units, primarily of Tertiary age, overlie the Fox Hills–Hell Creek aquifer system in the AOR. A cross section of these formations is presented in Figure 4-9. The upper formations are generally used for domestic and agricultural purposes. The Cannonball and Tongue River Formations comprise the major aquifer units of the Fort Union Group, which overlies the Hell Creek Formation. The Cannonball Formation consists of interbedded sandstone, siltstone, claystone, and thin lignite beds of marine origin. The Tongue River Formation is predominantly sandstone interbedded with siltstone, claystone, lignite, and occasional carbonaceous shales. The basal sandstone member of the Tongue River is persistent and a reliable source of groundwater in the region. The thickness of this basal sand ranges from approximately 200 to 500 ft, and it directly underlies surficial glacial deposits in the AOR. Tongue River groundwaters are generally a sodium bicarbonate type with a TDS of approximately 1000 ppm (Croft, 1973).

Figure 4-9. West-east cross section of the major aquifer layers in Oliver County. Wells used in the cross section are shown in the inset map and labeled with corresponding well names (NDIC File No. 4942 is Raymond Jensen 1-34).

The Sentinel Butte Formation, a silty fine-to-medium-grained sandstone with claystone and lignite interbeds, overlies the Tongue River Formation in western portions of the AOR. The Sentinel Butte Formation is predominantly sandstone with lignite interbeds. While the Sentinel Butte Formation is another important source of groundwater in the region, primarily to the west of the AOR, the Sentinel Butte Formation is not a source of groundwater within the AOR. TDS in the Sentinel Butte Formation range from approximately 400 to 1000 ppm (Croft, 1973). Above these are undifferentiated alluvial and glacial drift Quaternary aquifer layers.

#### **4.4.4 Protection for USDWs**

The Fox Hills–Hell Creek aquifer system is the lowest USDW in the AOR. The injection zone (Broom Creek Formation) and the lowest USDW (Fox Hills–Hell Creek aquifer system) are isolated geologically and hydrologically by multiple impermeable rock layers consisting of shale and siltstone formations (Figure 4-5).

The primary seal of the injection zone is the Permian-aged Opeche/Spearfish Formation with the shales of the Permian-aged Spearfish, Jurassic-aged Piper (Picard), Rierdon, and Swift Formations, all of which overlie the Opeche Formation. Above the Swift Formation is the confined saltwater aquifer system of the Inyan Kara Formation that extends across much of the Williston Basin. Above the Inyan Kara Formation are Cretaceous-aged shale formations, namely, the Skull Creek, Mowry, Belle Fourche, Greenhorn, Carlisle, Niobrara, and Pierre Formations. The Pierre Formation is the thickest shale formation in the AOR and primary geologic barrier between the USDWs and injection zone. The geologic strata overlying the injection zone consists of multiple impermeable rock layers that are free of transmissive faults or fractures and provide adequate isolation of the USDWs from CO<sub>2</sub> injection activities in the AOR.

Figure 4-10 shows the location of groundwater wells selected to be included in the near-surface baseline and operational monitoring plan, which includes one new Fox Hills monitoring well, and up to four existing groundwater wells. The four existing wells (1 – Fox Hills, 1 – Cannonball-Ludlow, and 2 – Tongue River) were chosen based on depth (>300 ft), location within the AOR, and accessibility. SCS1 field verified each of these wells to confirm accessibility, operational characteristics, and land-use permissions. Table 4-5 correlates DWR well numbers with the well numbers used by SCS1 throughout this permit application.

## TB LEINGANG/MILTON FLEMMER 1

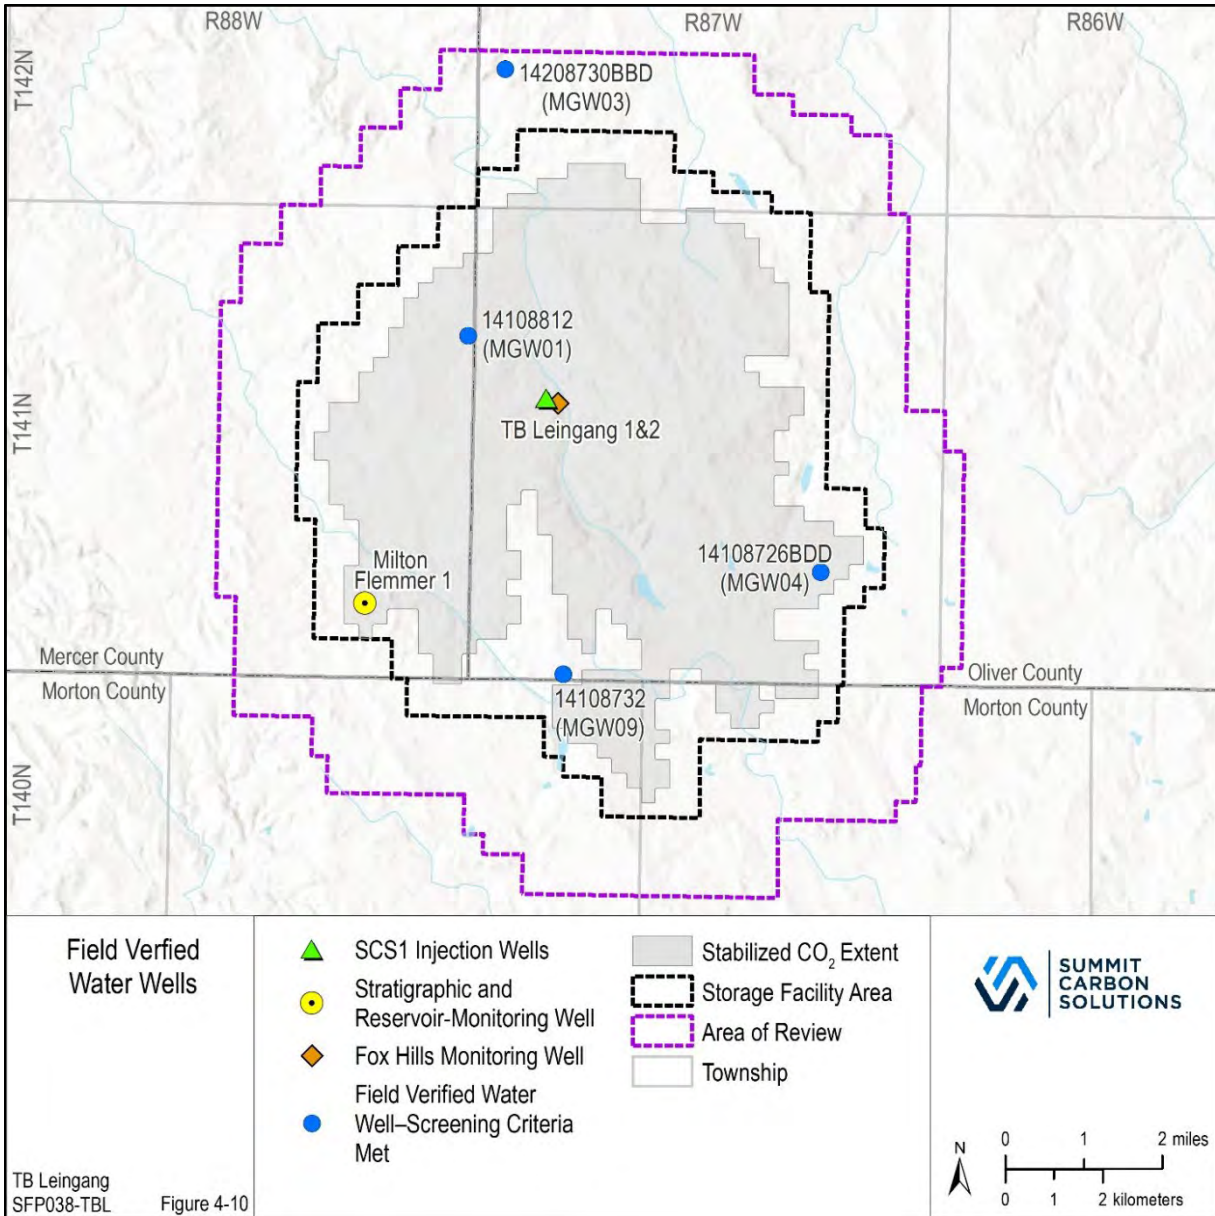

Figure 4-10. Field-verified water wells located within the AOR.

**Table 4-5. DWR and SCS1 Well No. Correlation**

DWR Well No.	SCS1 Field Verified Location*	SCS1 Well No.	Formation
14208730BBD	142-087-30BAC	MGW03	Cannonball–Ludlow
14108812	141-088-12DAD	MGW01	Fox Hills
14108726BDD	141-087-26CAA	MGW04	Tongue River
14108732	141-087-32CCD	MGW09	Tongue River

\* SCS1 Field Verified Location follows an alpha numeric system indicating the township - range - section and quarter-quarter-quarter. This is a similar system used by the DWR but adds the precise quarter-quarter-quarter location from field verification.

SCS1 will work with landowners of the four existing groundwater wells to collect 3–4 samples from each well to establish baseline conditions prior to CO<sub>2</sub> injection and periodically thereafter during subsequent phases of the project as outlined in Section 5.0. The actual number of wells and samples collected from each existing groundwater well location may vary because some of the groundwater wells may not be operated year-round or site accessibility may be limited (e.g., snow cover during winter months).

SCS1 will install one Fox Hills monitoring well adjacent to the CO<sub>2</sub> injection well pad. The Fox Hills monitoring well will be sampled three to four times prior to CO<sub>2</sub> injection to establish a seasonal baseline and periodically thereafter during subsequent phases of the project as outlined in Section 5.0.

## **SECTION 5.0**

# **TESTING AND MONITORING PLAN**

## 5.0 TESTING AND MONITORING PLAN

Pursuant to North Dakota Administrative Code (N.D.A.C.) § 43-05-01-11.4(1)(k), this testing and monitoring plan includes 1) a plan for analyzing the captured CO<sub>2</sub> stream, 2) leak detection and corrosion-monitoring plans for surface facilities and all wells associated with the geologic CO<sub>2</sub> storage project, 3) a well-logging and -testing plan, 4) an environmental monitoring plan to verify the injected CO<sub>2</sub> is contained in the storage reservoir, and 5) a quality assurance and surveillance plan (QASP).

This site-specific testing and monitoring plan was informed by the injection scenario (as described in the Project Summary), site characterization activities (Section 2.0), geologic modeling and simulations (Section 3.0), area of review delineation and corrective action evaluation (Section 4.0), and well design (Section 9.0). Activities described in Table 5-1 will be used to establish preinjection (baseline) conditions at the storage site. Pursuant to N.D.A.C. § 43-05-01-11.4, the set of activities described in Table 5-2 will be used to verify that TB Leingang is operating as permitted and is not endangering underground sources of drinking water (USDW). Summit Carbon Storage #1, LLC (SCS1) will specify data-quality measures through the QASP.

SCS1 will review this testing and monitoring plan at a minimum of every 5 years from the start of injection, as required by N.D.A.C. § 43-05-01-11.4(j), to ensure the technologies and strategies deployed remain appropriate for demonstrating containment of CO<sub>2</sub> in the storage reservoir and conformance with predictive modeling and simulations.

A detailed testing and monitoring plan for the baseline and operational phases is provided in the remainder of this section. Section 6.0 describes the testing and monitoring activities associated with the postinjection phase.

**Table 5-1. Overview of Major Components of the Testing and Monitoring Plan – Preinjection**

Monitoring Type	Parameter	Activity Description	Primary Purpose(s) of Activity	Equipment/Test	Location	Preinjection/Baseline Sampling Frequency
<b>CO<sub>2</sub> Stream Analysis</b>	<b>Injection composition</b>	CO <sub>2</sub> stream sampling	CO <sub>2</sub> accounting and ensures stream compatibility with project materials in contact with CO <sub>2</sub>	Gas chromatograph and CO <sub>2</sub> stream compositional commercial laboratory results	Downstream of pipeline inspection gauge (PIG) receiver	At least once
<b>Wellbore Mechanical Integrity (external)</b>	<b>Casing wall thickness</b>	Ultrasonic logging or other equivalent casing inspection log [CIL] and sonic array logging (inclusive of casing collar locator [CCL], variable-density log [VDL], and radial cement bond log [RCBL]), and gamma ray (GR)	Mechanical integrity demonstration and operational safety assurance	Ultrasonic or other equivalent CIL and sonic array tools (inclusive of CCL, VDL, and RCBL) and GR	CO <sub>2</sub> injection and reservoir-monitoring wells	Once per well
	<b>Radial cement bond</b>				CO <sub>2</sub> injection and reservoir-monitoring wells (run log from Opeche/Spearfish Formation to surface)	
	<b>Saturation profile</b> (behind casing)	Pulsed-neutron logging (PNL)		PNL tool	CO <sub>2</sub> injection and reservoir-monitoring wells	
	<b>Temperature profile</b>	Temperature logging		Temperature log	CO <sub>2</sub> injection and reservoir-monitoring wells	Install at casing deployment
		Real-time, continuous data recording via supervisory control and data acquisition (SCADA) system		Distributed temperature sensing (DTS) casing-conveyed fiber-optic cable	Along the outside of the long-string casing of the CO <sub>2</sub> injection and reservoir-monitoring wells	
<b>Wellbore Mechanical Integrity (internal)</b>	<b>Pressure/temperature</b> (P/T)	Real-time, continuous data recording via SCADA system	Mechanical integrity demonstration and operational safety assurance	Digital surface P/T gauge	Between surface and long-string casing annulus on CO <sub>2</sub> injection and reservoir-monitoring wells	Install at well completion
	<b>Annulus pressure</b>	Tubing-casing annulus pressure testing		Pressure testing truck with pressure chart	CO <sub>2</sub> injection and reservoir-monitoring wells	Once per well
	<b>P/T</b>	Real-time, continuous data recording via SCADA system		Digital surface P/T gauge	Between tubing and long-string casing annulus of CO <sub>2</sub> injection and reservoir-monitoring wells	Install at well completion
	<b>Annular fluid level</b>	Real-time, continuous data recording via SCADA system	Prevention of microannulus and monitoring annular fluid volume	Nitrogen (N <sub>2</sub> ) cushion on tubing-casing annulus with seal pot system	On well pad for each CO <sub>2</sub> injection well	Add initial volumes to TB Leingang 1 and 2
	<b>P/T</b>	Real-time, continuous data recording via SCADA system	Mechanical integrity demonstration and operational safety assurance	Digital surface P/T gauge	Tubing of CO <sub>2</sub> injection and reservoir-monitoring wells	Install at well completion
	<b>Saturation profile</b> (tubing-casing annulus)	PNL		PNL tool	CO <sub>2</sub> injection and reservoir-monitoring wells (run log from Opeche/Spearfish Formation to surface)	Once per well
<b>Downhole Corrosion Detection</b>	<b>Saturation profile</b> (behind casing)	PNL	Corrosion detection of project materials in contact with CO <sub>2</sub> and operational safety assurance	PNL tool	CO <sub>2</sub> injection and reservoir-monitoring wells (run log from Opeche/Spearfish Formation to surface)	Once per well
	<b>Casing wall thickness</b>	Ultrasonic logging or other equivalent CIL and sonic array logging (inclusive of CCL, VDL, and RCBL), and GR		Ultrasonic or other equivalent CIL and sonic array tools (inclusive of CCL, VDL, and RCBL), and GR	CO <sub>2</sub> injection and reservoir-monitoring wells

Table 5-1. Overview of Major Components of the Testing and Monitoring Plan – Preinjection (continued)

Monitoring Type	Parameter	Activity Description	Primary Purpose(s) of Activity	Equipment/Test	Location	Preinjection/Baseline Sampling Frequency
Near-Surface	Soil gas composition	Soil gas sampling (see Figure 5-4)	Assurance near-surface environment is protected	Two soil gas profile stations: MSG01 & MSG04	One station per CO <sub>2</sub> injection and reservoir-monitoring well pad	3–4 seasonal samples per station (with isotopes)
	Soil gas isotopes		Source attribution			
	Water composition	Groundwater well sampling (see Figure 5-4)	Assurance that USDWs are protected	Up to four existing groundwater wells from the Tongue River, Cannonball-Ludlow, and Fox Hills Aquifers (e.g., MGW01, MGW03, MGW04, and MGW09)	Within area of review (AOR)	3–4 seasonal samples per well (water quality with isotopes)
	Water isotopes		Source attribution			
	Water composition		Assurance that lowest USDW is protected	Fox Hills monitoring well	MGW11 adjacent to CO <sub>2</sub> injection well pad	3–4 seasonal samples (water quality with isotopes)
	Water isotopes		Source attribution			
Above-Zone Monitoring Interval (Opeche/Spearfish to Skull Creek)	Saturation profile	PNL	Assurance of containment in the storage reservoir and protection of USDWs	PNL Tool	CO <sub>2</sub> injection and reservoir-monitoring wells	Once per well
	Temperature profile	Real-time, continuous data recording via SCADA system		DTS casing-conveyed fiber-optic cable		Install at casing deployment
		Temperature logging		Temperature log		Once per well
Storage Reservoir (direct)	P/T	Real-time, continuous data recording via SCADA system	Storage reservoir monitoring and conformance with model and simulation projections	Casing-conveyed (CO <sub>2</sub> injection wells) and tubing-conveyed (monitoring well) downhole P/T gauge	CO <sub>2</sub> injection and reservoir-monitoring wells	Install at casing (CO <sub>2</sub> injection wells) and tubing (monitoring well) deployment
	Temperature profile	Real-time, continuous data recording via SCADA system		DTS casing-conveyed fiber-optic cable		Install at casing deployment
		Temperature logging		Temperature log		Once per well
	Storage reservoir performance	Injectivity testing	Demonstration of storage reservoir performance	Pressure falloff test	CO <sub>2</sub> injection wells	Once per injection well
Storage Reservoir (indirect)	CO <sub>2</sub> saturation	3D time-lapse seismic surveys	Site characterization and CO <sub>2</sub> plume tracking to ensure conformance with model and simulation projections	Vibroseis trucks (source) and geophones and distributed acoustic sensing (DAS) fiber-optic cable (receivers)	Within AOR	Collect 3D baseline survey
	Seismicity	Continuous data recording	Seismic event detection and source attribution and operational safety assurance	Seismometer stations and DAS fiber optics	Area around injection wells (within 1 mile)	Install stations

									File quarterly <sup>4</sup>
									Annual report <sup>5</sup>

<sup>1</sup> In addition to the reports, submittals, notifications, and other information described in Table 5-1 and N.D.A.C. § 43-05-01-18, Reporting Requirements, the Director may require other additional information to be reported not outlined in Table 5-1.

<sup>2</sup> SCS1 will notify the Director as soon as possible of any planned changes which may result in noncompliance with permit requirements.

<sup>3</sup> Reports of compliance or noncompliance with, or any progress reports on, interim and final requirements shall be submitted no later than 30 days following each scheduled reporting date. SCS1 shall file with the Director an annual report that summarizes the quarterly reports.

<sup>4</sup> The storage operator shall file with the Director quarterly, or more frequently, if the Director requires. The quarterly report shall also contain events that trigger a shutoff device and any monitoring results.

<sup>5</sup> SCS1 shall file with the Director an annual report that summarizes the quarterly reports and include projections of the response and storage capacity of the storage reservoir including anomalies and assumptions. All anomalies in predicted behavior as indicated in permit conditions or in the assumptions upon which the permit was issued must be explained and, if necessary, the permit conditions amended in accordance with N.D.A.C. § 43-05-01-12. The annual report is due 45 days after the end of the year.

<sup>6</sup> SCS1 shall verbally report noncompliance or malfunction within 24 hours from the time SCS1 became aware of the circumstances. A written submission shall also be provided within 5 days of the time SCS1 became aware and include a description of the noncompliance and its cause; the period of noncompliance, including exact dates and times; and if the noncompliance has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent reoccurrence of the noncompliance.

### 5.1 CO<sub>2</sub> Stream Analysis

The CO<sub>2</sub> stream will be monitored during injection operations to accurately measure CO<sub>2</sub> volumes transported from the CO<sub>2</sub> flowline to the CO<sub>2</sub> injection wellheads (TB Leingang 1 and 2). A pressure/temperature (P/T) gauge and Coriolis mass flowmeter installed near each of the CO<sub>2</sub> injection wellheads will provide continuous, real-time measurements of the injection volume, flow rate, pressure, and temperature of the CO<sub>2</sub> stream during operations. The equipment will be spliced to a supervisory control and data acquisition (SCADA) system and have automated triggers and alarms for notifying the operations center in the event of any anomalous readings.

Another goal of monitoring the CO<sub>2</sub> stream is to ensure materials and equipment in contact with the stream are protected. Prior to injection, SCS1 determined the composition of each individual CO<sub>2</sub> source and the resultant CO<sub>2</sub> stream to establish a system specification, as shown in Table 5-3. Selected flowline and well materials are designed to meet or exceed the system specification. Any new CO<sub>2</sub> streams from third-party entities not accounted for at the time of permitting must also meet or exceed the system specification once commingled with the existing CO<sub>2</sub> stream as described in Table 5-3.

**Table 5-3. CO<sub>2</sub> Stream System Specification**

Chemical Content	System Specification
Carbon Dioxide, CO <sub>2</sub>	≥98.25%
Inert, N <sub>2</sub>	≤1.44%
Oxygen, O <sub>2</sub>	≤0.31%
Water, H <sub>2</sub> O*	≤20 lb/MMscf
Total Hydrocarbons*	≤1800 ppm by volume
Hydrogen Sulfide, H <sub>2</sub> S*	≤10 ppm by volume
Total Sulfur, S*	≤10 ppm by volume
Glycol	≤0.3 gallons/MMscf

\* Denotes trace constituents that do not make up notable percentages of stream composition.

N.D.A.C. § 43-05-01-11.4(1)(a) requires “[a]nalysis of the CO<sub>2</sub> stream in compliance with applicable analytical methods and standards generally accepted by industry and with sufficient frequency to yield data representative of its chemical and physical characteristics.” Key chemical and physical characteristics of interest include composition, corrosiveness, temperature, and density (N.D.A.C. § 43-05-01-11[9][b]). SCS1 plans to sample the CO<sub>2</sub> stream continuously with a gas chromatograph installed on the injection well pad. The gas chromatograph will be spliced to the SCADA system to collect real-time data. Tables 5-1 and 5-2 specify the CO<sub>2</sub> stream-sampling strategy.

For isotopic analysis of the CO<sub>2</sub> stream, a sample port will be placed upstream of the gas chromatograph to collect samples. Figure 5-1 illustrates the anticipated ranges for stable carbon isotopes from various CO<sub>2</sub> source signals. At the time of permitting, the CO<sub>2</sub> stream is expected to be sourced by ethanol (biofuel) facilities. Therefore, the corresponding stable carbon isotope signature of the CO<sub>2</sub> stream is anticipated to be approximately –10 ‰ to –20 ‰, as shown in Figure 5-1. If sources of CO<sub>2</sub> other than ethanol are added that were not originally accounted for at the time of permitting, SCS1 will repeat sampling of the CO<sub>2</sub> stream within a year of adding the new CO<sub>2</sub> source(s) to redetermine its isotopic signature.

Figure 5-1. Stable carbon isotope signatures of various CO<sub>2</sub> source signals (Dixon and Romanak, 2015).

### 5.1.1 CO<sub>2</sub> Stream Analysis QASP

SCS1 will follow manufacturer guidelines to regularly calibrate and maintain the gas chromatograph (specification sheet provided in Appendix D, Attachment D-1). The gas chromatograph will measure the CO<sub>2</sub> stream's individual chemical components for concentration analysis using a thermal conductivity detector. The onboard electronics and software will calculate the concentrations of each individual chemical component and output the results in a tabulated format, similar to what is shown in Table 5-3. CO<sub>2</sub> stream analysis with the gas chromatograph will be performed at regularly scheduled intervals determined by SCS1 that meets N.D.A.C. § 43-05-01-11.4(1)(a). Isotopic analyses of the CO<sub>2</sub> stream will be outsourced to commercial laboratories that will employ standard analytical quality assurance/quality control (QA/QC) protocols used by the industry. CO<sub>2</sub> stream sampling will be performed at regularly scheduled intervals determined by SCS1 that meets N.D.A.C. § 43-05-01-11.4(1)(a) and analyzed by a third-party commercial laboratory.

## 5.2 Surface Facilities Leak Detection Plan

The purpose of this leak detection plan is to specify the monitoring strategies SCS1 will use to quantify any losses of CO<sub>2</sub> from surface facilities during operations. Surface facilities include the CO<sub>2</sub> injection wellheads (TB Leingang 1 and 2), the reservoir-monitoring wellhead (Milton Flemmer 1), and the NDL-327 CO<sub>2</sub> flowline, which begins at the pipeline terminus of NDM-106 and ends at the inlet valve upstream of the automated emergency shutoff valve at each CO<sub>2</sub> injection wellhead. Figure 5-2 illustrates the CO<sub>2</sub> flowline path to CO<sub>2</sub> injection wellsite, and Figure 5-3 is a generalized flow diagram from the pipeline terminus of NDM-106 to the CO<sub>2</sub> injection wellheads, illustrating key surface facilities' connections and monitoring equipment.

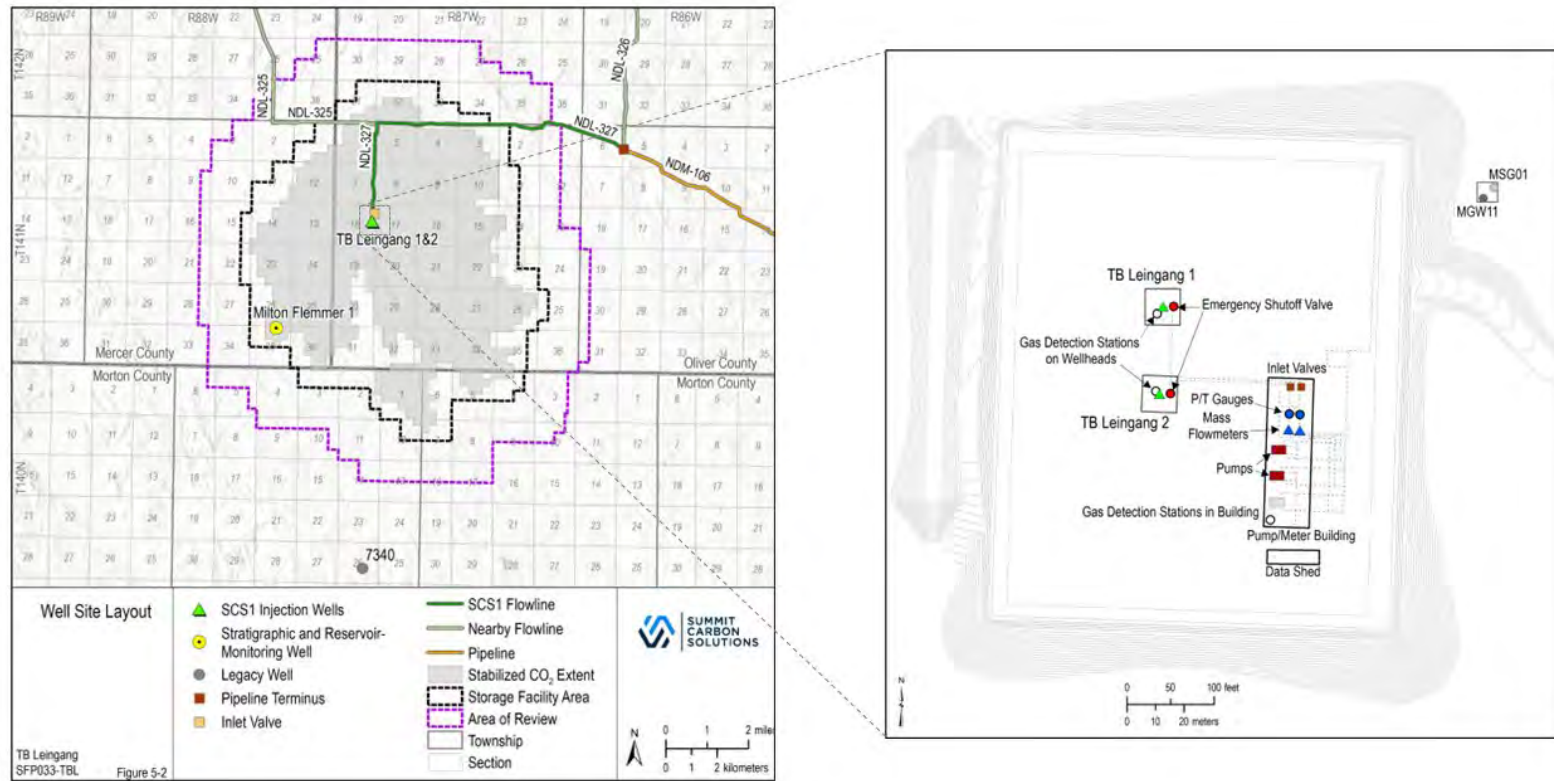

Figure 5-2. Map detailing CO<sub>2</sub> flowline path to CO<sub>2</sub> injection wellsite (left) and layout of surface facilities at the wellsite (right), illustrating key surface facility leak detection and monitoring equipment. Soil gas profile station, MSG01, and groundwater well, MGW11, off-pad monitoring locations are also shown on the surface facilities map inset.

## Generalized Flow Diagram TB Leingang 1

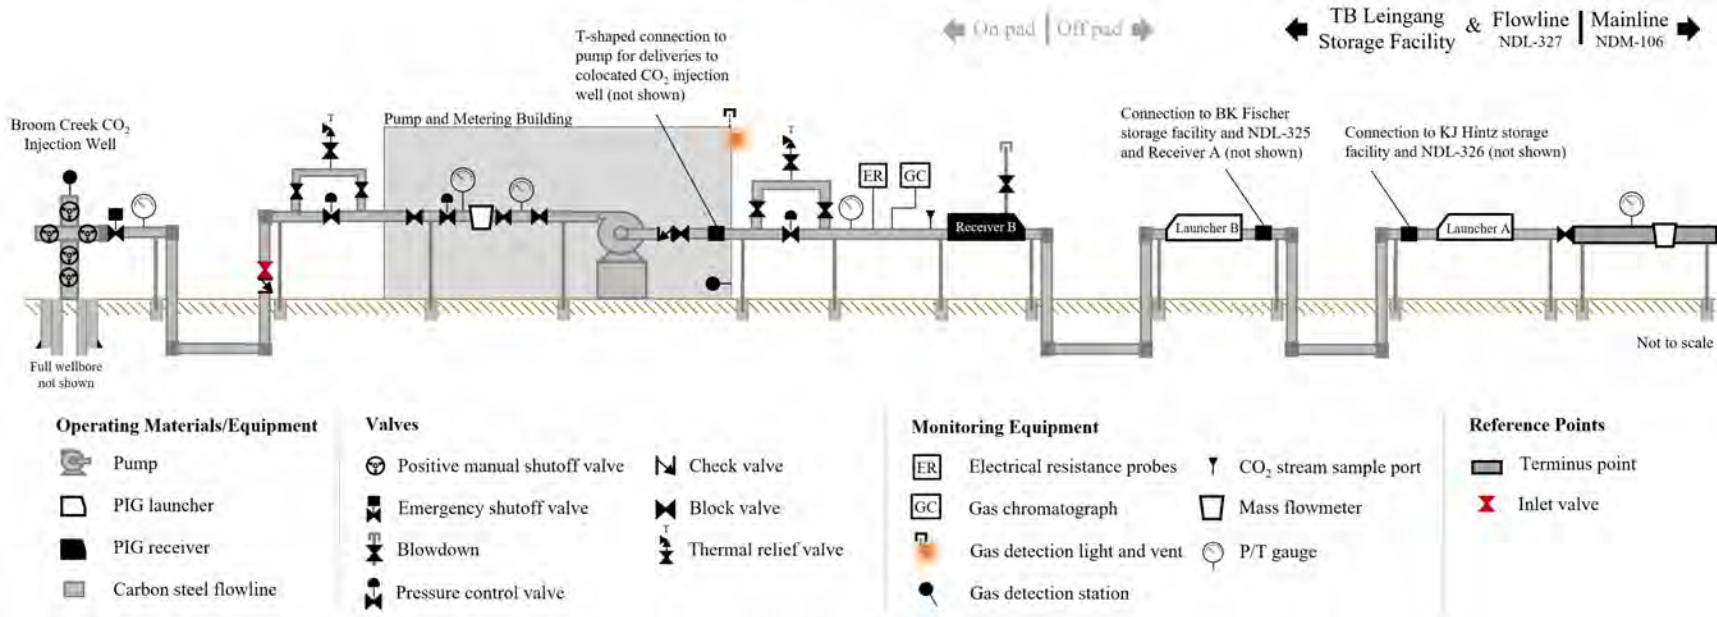

Figure 5-3. Generalized flow diagram from the pipeline terminus to the TB Leingang 1 CO<sub>2</sub> injection well, illustrating key surface facilities' connections and monitoring equipment. The flow diagram is identical for the TB Leingang 2 CO<sub>2</sub> injection well (not shown).

As illustrated in Figure 5-3, leak detection equipment includes 1) P/T gauges along the flowline, 2) a Coriolis mass flowmeter placed near each of the injection wellheads, and 3) gas detection stations placed on the CO<sub>2</sub> injection wellheads pursuant to N.D.A.C. § 43-05-01-14(1) and inside the pump/metering building. The gas detection stations, which will detect gases such as CO<sub>2</sub>, methane (CH<sub>4</sub>), and hydrogen sulfide (H<sub>2</sub>S), will have automated triggers and alarms to alert SCS1 of any anomalous readings. The SCADA system, which will continuously collect data streams from the leak detection equipment in real time, will also monitor for leaks with leak detection software.

Field personnel from SCS1 will have multigas detectors with them for visiting wellsites or conducting flowline inspections. In addition, gas detection safety lights (part of the integrated alarm system) will be placed outside of the pump/metering building to warn field personnel of potential indoor air quality threats.

#### ***5.2.1 Data Sharing and Custody Transfer***

The entire CO<sub>2</sub> flowline (NDL-327), which begins at the pipeline terminus of NDM-106 and ends at the inlet valve upstream of the automated emergency shutoff valve at each CO<sub>2</sub> injection wellhead, will be owned by SCS1 and operated by SCS Carbon Transport LLC (Figure 5-3). NDL-327 consists of 8.6 miles of 20- to 24-inch flowline within Oliver County.

NDM-106 and NDL-327 to the CO<sub>2</sub> injection wellsite will be operated as one integrated SCADA system with data flowing to a single operations center. SCS1; Summit Carbon Storage #2, LLC; Summit Carbon Storage #3, LLC; SCS Permanent Carbon Storage LLC; and SCS Carbon Transport LLC will share operational data and controls in real time and ensure operational parameters (e.g., flowline pressures) are safely maintained between all injection sites at all times. Data shared will include, but are not limited to, defining the financial and operational responsibilities, mass balance and custody transfers, data access and data sharing, and general operations including leak detection and reporting, emergency response, monitoring, and maintenance of NDL-327 and respective wellsites.

Custody transfer of the CO<sub>2</sub> will occur using flowmeters placed at each individual CO<sub>2</sub> capture facility prior to entering NDM-106 operated by SCS Carbon Transport LLC. Once the transported CO<sub>2</sub> stream reaches the NDM-106 pipeline terminus, the CO<sub>2</sub> will be metered with a Coriolis mass flowmeter to transfer custody from SCS Carbon Transport LLC to SCS1 at the start of the NDL-327 flowline. Separate Coriolis mass flowmeters will also be located at each CO<sub>2</sub> injection well (TB Leingang 1 and 2) and at each injection site associated with SCS2 and SCS3 for performing mass balance calculations and attributing injected CO<sub>2</sub> volumes per well (Figure 5-3).

#### ***5.2.2 Surface Facilities Leak Detection Plan QASP***

Pursuant to N.D.A.C. § 43-05-01-14(1), the leak detection equipment will be inspected and tested on a semiannual basis. If equipment is defective, SCS1 will repair or replace the equipment within 10 days or, acting with good cause, SCS1 will propose an alternate timeline for approval by the DMR-O&G. Each repaired or replaced detector will be retested, if required. The gas detection stations are described in Appendix D, Attachment D-2. The SCADA system and leak detection software are described in further detail in Appendix D, Attachment D-3, and the personnel

multigas detectors are described in Appendix D, Attachment D-4. SCS1 will install the leak detection equipment according to the manufacturer's recommendations.

The flowline will be regularly inspected for any visual or auditory signs of equipment failure. Any release of CO<sub>2</sub> to the atmosphere or near-surface environments from the surface facilities will be reported to DMR-O&G within 24 hours pursuant to N.D.A.C. § 43-05-01-18(9)(e).

#### 5.2.2.1 NDL-327 Flowline Design

The NDL-327 flowline will be manufactured with a high-frequency electrical resistance weld or double submerged arc weld process. Based upon volume requirements and pressure service, the 20/24-inch NDL-327 flowline design is summarized in Table 5-4.

**Table 5-4. NDL-327 Flowline Design Specification<sup>1</sup>**

Parameter	Design Specification
Maximum Operating Pressure	2183 psig
Maximum Discharge Pressure <sup>2</sup>	2160 psig
Typical Operating Pressure	1250–2150 psig
Design Temperature (above-grade piping)	–50°–120°F
Design Temperature (below-grade piping)	23°–120°F
Anticipated CO <sub>2</sub> Stream Temperature Range	30°–115°F
Maximum Design Flow Rate	936 million scf per day <sup>3</sup>

<sup>1</sup>Abbreviation used in table: pounds per square inch gauge; standard cubic foot

<sup>2</sup>At pump stations or individual capture facilities.

<sup>3</sup>Approximately equivalent to 18 million tonnes of CO<sub>2</sub> annually.

The NDL-327 flowline and associated structures will be designed, constructed, inspected, tested, and operated in accordance with industry standards. The flowline will be constructed of high-strength carbon steel pipe, exceeding the American Petroleum Institute (API) 5L (2018) Pipe Specification. API 5L is the industry standard specification for seamless and welded steel line pipes used in pipeline transportation systems, including the energy industry. These regulations and industry standards specify pipeline and associated facilities materials and qualification and other controls to mitigate the risk of an incident while providing protection for the public and environment.

### 5.3 CO<sub>2</sub> Flowline Corrosion Prevention and Detection Plan

The purpose of this plan is to prevent and detect any signs of corrosion in the flowline.

#### 5.3.1 Corrosion Prevention

To protect against corrosion, an external fusion-bonded epoxy coating will be applied to the NDL-327 flowline. Flowline installed by trenchless methods, such as road crossings, will also have an abrasion-resistant overcoat installed as a secondary coating, over the fusion-bonded epoxy, prior to installation.

SCS1 will install an impressed current cathodic protection (ICCP) system along the buried flowline to mitigate the threat of external soil corrosion on the line. The ICCP system, which will

be continuously monitored, involves the installation of deep anode beds along the flowline that are connected to external power through a rectifier. The power provides the current needed to drive an electrochemical reaction whereby the anodes corrode instead of the flowline. Except for a rectifier, junction box, and small diameter vent pipe posted above the anode beds, the ICCP system will be buried.

Because the CO<sub>2</sub> stream will contain only trace amounts of water (Table 5-3), SCS1 will operate the surface facilities above the saturation point of water to prevent corrosive conditions from forming.

#### *5.3.1.1 Corrosion Prevention QASP*

The flowline construction materials will be in accordance with API 5L X-70 PSL 2 (2018) requirements, which includes applying external coatings to the pipe (e.g., fusion-bonded epoxy) and any borings or crossings (e.g., abrasive-resistant overcoats) to prevent corrosion. The flowline's ICCP system will be in accordance with Title 49 of the Code of Federal Regulations (CFR), Part 195 and will be pressure-tested prior to CO<sub>2</sub> injection operations. SCS1 will supply DMR-O&G with a map of cathodic protection borehole locations to meet N.D.A.C. § 43-05-01-05(1)(a) prior to injection.

#### *5.3.2 Corrosion Detection*

Real-time, continuous monitoring of the CO<sub>2</sub> flowline with P/T gauges and Coriolis mass flowmeter measurements from the pump/metering building to the terminus of the pipeline combined with continuous analysis of the CO<sub>2</sub> stream with the gas chromatograph will provide strong evidence that noncorrosive conditions are maintained in the flowline during injection operations. The equipment will be spliced to the SCADA system and have automated triggers and alarms for alerting SCS1 of any anomalous readings.

The flowline segment from the terminus of the pipeline to the pipeline inspection gauge (PIG) receiver (shown in Figure 5-3) will allow the passage of internal inspection devices (commonly referred to as “smart PIGs”), which are designed to detect certain internal and external anomalies in the line, such as loss of mass/wall thickness, dents, pitting, cracking, and scratches. The launchers and receiver facilities are designed to launch and receive these internal inspection devices along with other types of PIGs (e.g., maintenance pigs). The launchers and receivers will be located at standalone sites in Oliver and Mercer Counties. The frequency for running PIGs in the flowline during operations is described in Table 5-2.

In addition to the activities described above, SCS1 will install at least one electrical resistance (ER) probe along the CO<sub>2</sub> flowline upstream of the gas chromatograph to continuously monitor for loss of mass throughout the operational phase. The ER probe will be spliced to the SCADA system for real-time monitoring and will be removable for visual inspection and replacement, if required. The SCADA system will have automated triggers and alarms for alerting SCS1 of any anomalous readings.

#### *5.3.2.1 Corrosion Detection QASP*

SCS1 will utilize PIG equipment that has been maintained and calibrated according to the manufacturer's recommendations and 40 CFR Part 195 rules and regulations. The ER probe will

be exposed to the CO<sub>2</sub> stream and spliced to the SCADA system for continuously measuring losses of mass to calculate a real-time corrosion rate. The ER measurements are mathematically translated into terms of changes in mass, and the results are plotted over time. Changes in the regression of the data trend correspond to changes in the corrosion rate. Changes in mass of the exposed probe material can be attributable to changes in the length or cross-sectional area of the probe material, which may include pitting. The ER probe will be spliced to the SCADA system and programmed with triggers and alarms for alerting the operations center of anomalous ER measurements. Specification sheets for the ER probe and data transmitter are provided in Appendix D, Attachments D-5 and D-6, respectively.

SCS1 will investigate anomalies in flowline operating parameters to ensure noncorrosive conditions are maintained during injection operations, including pulling the ER probe for inspection and replacement, as required by DMR-O&G.

#### **5.4 Wellbore Mechanical Integrity Testing**

Pursuant to N.D.A.C. § 43-05-01-11.1, SCS1 will conduct mechanical integrity testing of the CO<sub>2</sub> injection and reservoir-monitoring wellbores to ensure there is no significant leak in the casing, tubing, or packer and that there is no significant fluid movement into an USDW adjacent to the wellbore. Below is a summary of the methods that SCS1 will use to verify mechanical integrity. Tables 5-1 and 5-2 specify the sampling frequency for the set of activities described in this section.

External mechanical integrity in the CO<sub>2</sub> injection wells and reservoir-monitoring well will be demonstrated with the following:

- 1) Ultrasonic or other equivalent casing inspection log (CIL) and sonic array logging tools [inclusive of variable-density log (VDL), casing collar log (CCL), and radial cement bond log (RCBL)].
- 2) Pulsed-neutron logging (PNL) to examine the saturation profile behind casing from the Opeche/Spearfish Formation to surface. If repeat PNLs detect evidence of unexpected vertical migration of CO<sub>2</sub>, then SCS1 will notify and work with DMR-O&G to identify and take appropriate action, such as pulling tubing and running an ultrasonic or other equivalent CIL tool for attributing the source of the suspected out-of-zone migration.
- 3) Distributed temperature sensing (DTS) fiber-optic cable installed outside of the long-string casing will continuously monitor the temperature profile of each wellbore from the storage reservoir to surface. A baseline temperature log will be acquired in case the DTS fiber-optic cable fails and temperature logging is required in the future pursuant to N.D.A.C. § 43-02-05-07(3)(b).

Internal mechanical integrity in the CO<sub>2</sub> injection wells and reservoir-monitoring well will be demonstrated with the following:

- 1) The surface and long-string casing annulus will be continuously monitored with a digital surface P/T gauge.

- 2) Tubing-casing annulus pressure testing.
- 3) The tubing-casing annulus pressure will be continuously monitored with a digital surface P/T gauge on each wellhead.
- 4) A seal pot system with a nitrogen (N<sub>2</sub>) cushion will be used to continuously monitor and maintain the packer fluid pressure in the tubing-casing annular space at the surface below 300 psi. The N<sub>2</sub> cushion accommodates for packer fluid level/volume changes due to temperature fluctuations to ensure that the tubing-casing annular space is kept full.
- 5) The tubing conditions will be continuously monitored with a digital surface P/T gauge on each wellhead.
- 6) PNL to examine the saturation profile in the tubing-casing annulus from the Opeche/Spearfish Formation to surface. If repeat PNLs detect evidence of unexpected vertical migration of CO<sub>2</sub>, then SCS1 will notify and work with DMR-O&G to identify and take appropriate action, such as performing a tubing-casing annulus pressure test or pulling tubing and performing a casing pressure test or running an ultrasonic or other equivalent CIL tool for attributing the source of the suspected out-of-zone migration.

All digital P/T gauges mentioned in the plan will be spliced to the SCADA system for real-time monitoring. Wellbore schematics illustrating the monitoring equipment for the CO<sub>2</sub> injection wells and reservoir-monitoring well are shown in Figures 11-2, 11-4, and 11-5, respectively, in Section 11.0.

#### **5.4.1 Wellbore Mechanical Integrity Testing QASP**

Specification sheets for the ultrasonic, array sonic, and PNL tools are provided in Appendix D, Attachments D-7, D-8, and D-9, respectively, and specification sheets for the DTS fiber-optic cable and interrogator are provided in Appendix D, Attachments D-10 and D-11, respectively.

An example procedure for conducting an annulus pressure test prior to CO<sub>2</sub> injection is provided in Appendix D, Attachment D-12. A diagram of the seal pot system design is provided in Appendix D, Attachment D-13.

Digital surface P/T gauges will be maintained and calibrated according to the manufacturer's recommendations; copies of calibration certificate will be submitted. Pursuant to N.D.A.C. § 43-05-01-14(1), the leak detection equipment (i.e., P/T gauges on wellheads and seal pot system) will be inspected and tested on a semiannual basis. If equipment is defective, SCS1 will repair or replace the equipment within 10 days or, acting with good cause, SCS1 will propose an alternate timeline for approval by DMR-O&G. Each repaired or replaced detector will be retested, if required.

For all well-logging activities, SCS1 will ensure that third-party contractors follow industry standard or better QA/QC protocols. SCS1 will also ensure reports of logging activities are prepared by a qualified geologist or engineer.

SCS1 will contract a third-party entity to conduct a feasibility study to quantify the CO<sub>2</sub> detection capabilities using the proposed PNL method based on the design of the CO<sub>2</sub> injection and reservoir-monitoring wellbores. Results of the feasibility study will be submitted to DMR-O&G prior to injection.

#### **5.5 Baseline Wellbore Logging and Testing Plan (Site Characterization)**

Pursuant to N.D.A.C. § 43-05-01-11.2, SCS1 will collect baseline well-logging and -testing measurements from subsurface geologic formations in the CO<sub>2</sub> injection wellbores to 1) verify the depth, thickness, porosity, permeability, lithology, and salinity of the storage complex; 2) ensure conformance with the injection well construction requirements; and 3) establish accurate baseline data for making future time-lapse measurements. Baseline well-logging and -testing measurements will also be collected from the reservoir-monitoring well.

Table 5-5 specifies baseline well-logging and -testing activities completed in the reservoir-monitoring well (Milton Flemmer 1), and Table 5-6 identifies the well-logging and -testing plan for the TB Leingang 1. The plan for the TB Leingang 2 wellbore will be the same as what is presented for the TB Leingang 1 but may exclude dipole sonic logging (assuming dipole sonic logging is successful in the TB Leingang 1).

Tables 5-1 and 5-2 specify well-logging and -testing activities associated with establishing mechanical integrity and monitoring the deep subsurface, including the storage complex. Coring activities are described separately in the Section 9.0 as-drilled wellbore diagrams for TB Leingang 1 and 2 and in the text in Section 2.0 for Milton Flemmer 1.

SCS1 will provide DMR-O&G with an opportunity to witness all well-logging and -testing activities as required under N.D.A.C. § 43-05-01-11.2(6).

**Table 5-5. Completed Logging and Testing Activities for Milton Flemmer 1**

	Logging/Testing	Justification
<b>Surface Section</b>	Open-hole logs: triple combo (resistivity and neutron and density porosity), dipole sonic, spontaneous potential (SP), GR, caliper, and temperature	Quantified variability in reservoir properties, such as resistivity and lithology, and measured hole conditions. Identified mechanical properties, including stress anisotropy. Provided compression and shear waves for seismic tie-in and quantitative analysis of the seismic data.
	Cased-hole logs: ultrasonic and array sonic tools (inclusive of CCL, VDL, and RCBL), GR, and temperature	Identified cement bond quality radially, evaluated the cement top and zonal isolation, and established external mechanical integrity. Established baseline temperature profile.
<b>Long-String Section</b>	Open-hole logs: triple combo and spectral GR	Quantified variability in reservoir properties, including resistivity, porosity, and lithology. Provided input for enhanced geomodeling and predictive simulation of CO <sub>2</sub> injection into the interest zones to improve interpretations. Identified mechanical properties, including stress anisotropy. Provided compression and shear waves for seismic tie-in and quantitative analysis of the seismic data.
	Open-hole log: dipole sonic	Identified mechanical properties, including stress anisotropy.
	Open-hole log: fracture finder log	Quantified fractures in the Broom Creek Formation and confining layers to ensure safe, long-term storage of CO <sub>2</sub> .
	Open-hole log: combinable magnetic resonance (CMR)	Interpreted reservoir properties (e.g., porosity and permeability) and determined the best location for pressure test depths, formation fluid sampling depths, and stress testing depths.
	Open-hole log: fluid sampling (modular formation dynamics tester)	Collected fluid samples from the Inyan Kara and Broom Creek Formation for analysis. Collected in situ microfracture stress tests in the Broom Creek and Opeche/Spearfish Formation for formation breakdown pressure, fracture propagation pressure, and fracture closure pressure.
	Cased-hole logs: ultrasonic and array sonic tools (inclusive of CCL, VDL, RCBL), GR, and temperature	Identified cement bond quality radially, evaluated the cement top and zonal isolation, confirmed mechanical integrity, and established baseline temperature profile.

**Table 5-6. Logging and Testing Plan for the TB Leingang 1 and TB Leingang 2 Wellbores**

	<b>Logging/Testing</b>	<b>Justification</b>	<b>N.D.A.C. § 43-05-01-11.2</b>
<b>Surface Section</b>	Open-hole logs: triple combo, SP, caliper, and temperature	Quantify variability in reservoir properties, such as resistivity and lithology, and measure hole conditions.	(1)(b)(1)
	Cased-hole logs: ultrasonic tool or other CIL and array sonic tools (inclusive of CCL, VDL, and RCBL), GR, and temperature	Identify cement bond quality radially, evaluate the cement top and zonal isolation, and establish external mechanical integrity. Establish baseline temperature profile for temperature-to-DTS calibration.	(1)(b)(2) and (1)(d)
<b>Long-String Section</b>	Open-hole logs: quad combo (triple combo plus dipole sonic*), SP**, GR, and caliper	Quantify variability in reservoir properties, including resistivity, porosity, and lithology, and measure hole conditions. Provide input for enhanced geomodeling and predictive simulation of CO <sub>2</sub> injection into the interest zones to improve interpretations. Identify mechanical properties, including stress anisotropy. Provide compression and shear waves for seismic tie-in and quantitative analysis of the seismic data.	(1)(c)(1)
	Open-hole log: fracture finder log	Quantify fractures in the Broom Creek Formation and confining layers to ensure safe, long-term storage of CO <sub>2</sub> .	(1)(c)(1)
	Open-hole log: magnetic resonance log	Aid in interpreting reservoir permeability and determine the best location for modular formation dynamics testing (MDT) fluid-sampling depths, packer-setting depths, and stress-testing depths.	(1)(c)(1)
	Open-hole log: MDT fluid sampling and testing	Collect fluid sample from the Broom Creek Formation for analysis.	(1), (2), and (3)
	Open-hole log: spectral GR	Identify clays and lithology that could affect injectivity. Also used for core to log depth correlation.	(4)(b)
	Injectivity test	Perform to define the fracture gradient and maximum allowable injection pressure of the storage reservoir.	(4)
	Pressure falloff test	Perform to verify hydrogeologic characteristics of the Broom Creek Formation.	(5)
	Cased-hole log: PNL	Confirm mechanical integrity from Opeche/Spearfish Formation to surface.	11.4(g)(1)
	Cased-hole logs: ultrasonic tool or other CIL and array sonic tools (inclusive of CCL, VDL, and RCBL), GR, and temperature	Confirm cement bond quality radially, evaluate cement top and zonal isolation and demonstrate mechanical integrity. Establish baseline for casing inspection logging and temperature profile for temperature-to-DTS calibration.	(1)(c)(2) and (d)

\* Dipole sonic logging may be excluded in TB Leingang 2 assuming that the dipole sonic log is successful in TB Leingang 1.

\*\* A sundry will be submitted requesting a waiver of the SP log and that an alternative method providing equivalent data will be utilized instead upon the DMR-O&G's approval pursuant to N.D.A.C. § 43-05-01-11.2(e).

Wellbore data collected from the reservoir-monitoring well (Milton Flemmer 1) have been integrated with the geologic model to inform the reservoir simulations that are used to characterize the initial state of the reservoir before injection operations (Section 3.0). The simulated CO<sub>2</sub> plume extents informed the timing and frequency of the application of the direct and indirect monitoring methods of the testing and monitoring plan.

#### **5.5.1 Baseline Wellbore Logging and Testing Plan (Site Characterization) QASP**

For all planned well-logging and -testing activities, SCS1 will ensure that third-party contractors follow industry standard or better QA/QC protocols for acquiring and processing the data and that reports of activities are prepared by a qualified geologist or engineer.

### **5.6 Wellbore Corrosion Prevention and Detection Plan**

The purpose of this corrosion prevention and detection plan is to monitor the well materials to ensure they meet the minimum standards for material strength and performance, pursuant to N.D.A.C. § 43-05-01-11.4(1)(c).

#### **5.6.1 Downhole Corrosion Prevention**

To prevent corrosion of the well materials in the TB Leingang 1 and 2 wellbores, the following preemptive measures will be implemented: 1) cement opposite of the injection interval and extending to the differential valve (DV) staging tool above the top of the Mowry Formation will be CO<sub>2</sub>-resistant; 2) the well casing will also be CO<sub>2</sub>-resistant from the bottomhole to just above the Opeche/Spearfish Formation and from below the top of the Swift Formation to just below the top of the Skull Creek Formation; 3) the well tubing will be CO<sub>2</sub>-resistant from the injection interval to surface; 4) the packer will be CO<sub>2</sub>-resistant; and 5) the packer fluid will be an industry-standard corrosion inhibitor. The tubing-casing annulus will be filled with the packer fluid system that is planned to be a brine-based fluid treated with antimicrobial biocide, corrosion inhibitor, and oxygen scavenger to minimize potential corrosive effects of soluble oxygen.

To prevent corrosion of the well materials in the Milton Flemmer 1 wellbore, the following preemptive measures are implemented: 1) cement opposite the injection interval and extending above the confining zones is CO<sub>2</sub>-resistant; 2) the well casing is CO<sub>2</sub>-resistant from the cast iron bridge plug set at 6550 feet in the well (to 137 feet above the Opeche/Spearfish Formation and from 214 feet below the top of the Swift Formation to 178 feet above the top of the Mowry Formation); and 3) the packer fluid is an industry-standard corrosion inhibitor. The tubing-casing annulus will be filled with a brine-based packer fluid treated with biocide, corrosion inhibitor, and oxygen scavenger. In addition, SCS1 plans to reevaluate replacement of packer and bottomhole assembly during the 5-year evaluation.

Figures 11-2, 11-4, and 11-5 in Section 11.0 illustrate the downhole corrosion prevention measures in each of the wellbores.

##### **5.6.1.1 Downhole Corrosion Prevention QASP**

Specification sheets for the antimicrobial biocide, corrosion inhibitor, and oxygen scavenger treatment are provided in Appendix D, Attachments D-14, D-15, and D-16, respectively.

SCS1 will ensure that third-party contractors follow industry standard or better QA/QC protocols when drilling and completing each of the wells and that the selected well materials at a minimum meet the standards selected and presented in Sections 9.0, 10.0, and 11.0 of this permit application.

### **5.6.2 Downhole Corrosion Detection**

PNLs will be run in the TB Leingang 1 and 2 and Milton Flemmer 1 wellbores to detect saturations of CO<sub>2</sub>. Further investigative methods of inspecting for corrosion in the wellbore could include ultrasonic logging or other equivalent CIL when required. Tables 5-1 and 5-2 specify the sampling frequency for acquiring data related to this downhole corrosion detection plan.

#### **5.6.2.1 Downhole Corrosion Detection QASP**

If the PNLs detect possible signs of out-of-zone vertical migration, SCS1 will work with DMR-O&G to take appropriate action, such as running an ultrasonic tool or other equivalent CIL to confirm downhole conditions in the wellbore. For any logging activities related to corrosion detection, SCS1 will ensure that third-party contractors follow industry standard or better QA/QC protocols and that reports of logging activities are prepared by a qualified geologist or engineer.

### **5.7 Environmental Monitoring Plan**

To verify the injected CO<sub>2</sub> is contained in the storage reservoir, protect all USDW, and demonstrate hydrogeologic properties of the storage reservoir, multiple environments will be monitored.

As required by N.D.A.C. § 43-05-01-11.4(1)(d) and (h), the near-surface environment, defined as the region from the surface down to the lowest USDW (Fox Hills Aquifer), will be monitored by sampling and analyzing vadose-zone soil gas at two soil gas profile stations, one new Fox Hills monitoring well, and up to four existing groundwater wells.

The deep subsurface environment, defined as the region from below the lowest USDW to the base of the storage reservoir, will be monitored with multiple methods, starting with the above-zone monitoring interval (AZMI) or the geologic interval from the confining zone above the storage reservoir to the confining zone above the next permeable zone above the storage reservoir (i.e., Opeche/Spearfish Formation to the Skull Creek Formation). The AZMI will be continuously monitored with DTS fiber optics in the TB Leingang 1 and 2 wellbores as well as PNLs.

Pursuant to N.D.A.C. § 43-05-01-11.4(1)(g), the storage reservoir will be monitored with both direct and indirect methods. Direct methods include continuous fiber optics (DTS) and downhole P/T measurements in the TB Leingang 1 and 2 and Milton Flemmer 1 and falloff tests and PNLs in the TB Leingang 1 and 2 wellbores. Falloff testing analysis will provide reservoir pressure data and the completion condition including transmissibility, skin factor, and well flowing and static pressure data for technical adequacy to demonstrate no migration from the reservoir. Indirect methods include time-lapse seismic surveys. These efforts will provide assurance that surface and near-surface environments are protected and that the injected CO<sub>2</sub> is safely and permanently contained in the storage reservoir. In addition, SCS1 will install multiple seismometer stations for passively detecting and locating seismic events.

### 5.7.1 Soil Gas Monitoring

Vadose-zone soil gas monitoring directly measures the characteristics of the air space between soil components and is an indirect indicator of both chemical and biological processes occurring in and below a sampling horizon. Two permanent soil gas profile stations installed adjacent to both the CO<sub>2</sub> injection and Milton Flemmer 1 well pads will be sampled, as shown in Figure 5-4. Figure 5-5 is a typical wellbore schematic of a soil gas profile station.

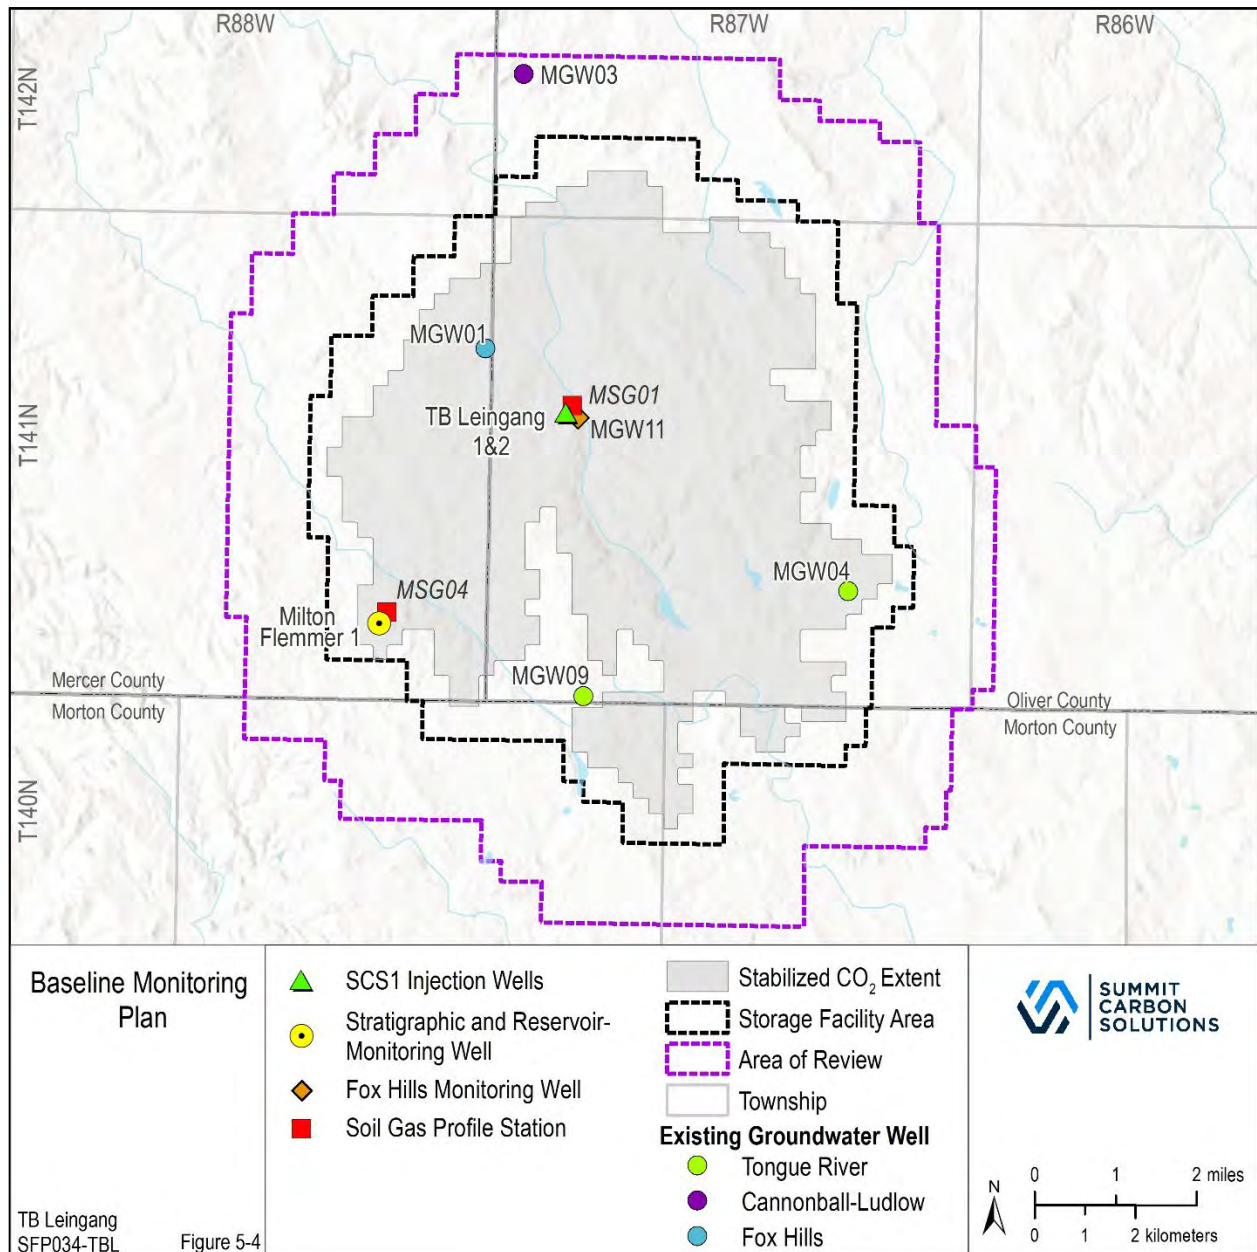

Figure 5-4. SCS1 baseline and operational near-surface sampling locations.

Figure 5-5. A typical wellbore schematic of a soil gas profile station.

The sampling frequency for soil gas is summarized in Tables 5-1 and 5-2. During injection, SCS1 may install additional replacement or alternative soil gas sampling sites based on monitoring data results. SCS1 will notify DMR-O&G if either replacement or alternative soil gas sampling sites are added pursuant to N.D.A.C. § 43-05-01-18(2). The results of the baseline soil gas sampling program will be provided to DMR-O&G prior to injection.

#### 5.7.1.1 Soil Gas Monitoring QASP

Tables 5-7 and 5-8 indicate a minimum set of analytes that will be included for the soil gas analysis.

**Table 5-7. Soil Gas Compositional Analysis – Primary Components**

Analyte	Units
N <sub>2</sub>	Volume %
O <sub>2</sub>	Volume %
CO <sub>2</sub>	Volume %
Ar	Volume %
CH <sub>4</sub>	Volume %

**Table 5-8. Stable and Radiocarbon Isotope Soil Gas Measurements**

Isotope	Units
δ <sup>13</sup> C of CO <sub>2</sub> and CH <sub>4</sub>	‰ (per mil)
δ <sup>14</sup> C of CO <sub>2</sub> and CH <sub>4</sub>	‰ (per mil)
δD of CH <sub>4</sub>	‰ (per mil)

At minimum, SCS1 will ensure that third-party service providers apply a standard procedure for sampling the wells, such as the one provided below. Figure 5-5 is a typical wellbore schematic of a soil gas profile station.

#### Example Soil Gas Profile Station Sampling Procedure

Prior to the collection of each sample, a minimum of three probe casing volumes will be removed, and the representativeness of the gas flow will be determined by analyzing the soil gas over time for CO<sub>2</sub>, total volatile organic compounds (VOCs), and O<sub>2</sub> using a handheld multigas meter. The handheld meter will be calibrated daily during sampling based on manufacturer instructions. After these measurements of the soil gas composition stabilize, two soil gas samples will be collected for characterization at each location using an air sampling bag and labeled with the appropriate sample number and site information. The samples will be sent to third-party laboratories for analysis.

#### Soil Gas Sampling QA/QC Procedures

SCS1 will ensure that third-party service providers selected for soil gas sampling and analysis follow industry standard sampling and analytical QA/QC protocols, including collection of field

blanks and duplicate (replicate) samples to identify environmental contamination and evaluate repeatability in sampling and analytical methods, respectively.

### 5.7.2 *Groundwater Monitoring*

Groundwater monitoring directly measures the chemical constituents of the water in the pore space between grains of subsurface geologic formations (aquifers) and is an indirect indicator of both chemical and biological processes occurring in and below a sampling horizon. Figure 5-4 identifies the sampling locations associated with the near-surface baseline and operational monitoring plan, which includes one new Fox Hills monitoring well, and up to four existing groundwater wells.

SCS1 will work with landowners of the four existing groundwater wells (MGW01, MGW03, MGW04, and MGW09) to attempt to collect samples as specified in Tables 5-1 and 5-2. The number of samples collected from each existing groundwater well may vary by location, since some of the groundwater wells may not be operated year-round or site accessibility may be limited (e.g., snow cover during winter months). If SCS1 is ever unable to access the wells due to operational status or access concerns, it will document the reason why it was unable to take samples. An attempt was made to identify alternative wells that operate year-round with reduced access concerns but produced no results.

SCS1 will install one Fox Hills monitoring well (MGW11) adjacent to the injection well pad (as shown in Figure 5-4). The Fox Hills monitoring well will be sampled according to the sampling frequency specified in Tables 5-1 and 5-2.

SCS1 reserves the right to evaluate and modify, if necessary, appropriate groundwater sampling locations and frequency based on conformance of the CO<sub>2</sub> plume extent in the subsurface. SCS1 will notify DMR-O&G if alternative or new water wells are added to the sampling program pursuant to N.D.A.C. § 43-05-01-18(2).

Appendix B includes a supplemental baseline dataset of historic geochemistry results for four groundwater wells within the area of review (AOR) boundary. The data were obtained from the Department of Water Resources (DWR) website. The wells are DWR 9433, 9053, 9055, and 9056, as shown in Figure B-1. These shallow groundwater wells were excluded from the baseline and operational monitoring plan primarily because they did not meet the depth criterion used to select wells for inclusion in the testing and monitoring plan.

#### 5.7.2.1 *Groundwater Monitoring QASP*

State-certified commercial laboratories will be identified by SCS1 to analyze the water samples for the analytes described in Tables 5-9 and 5-10.

**Table 5-9. General Analytes for Groundwater Samples**

<b>Analyte</b>	<b>Cation (total and dissolved)</b>	<b>Anion (total)</b>
pH	Aluminum	Bromide
Conductivity	Antimony	Chloride
Alkalinity	Arsenic	Fluoride
TDS	Barium	Nitrate
Total Organic Carbon (TOC)	Beryllium	Nitrite
Dissolved Organic Carbon (DOC)	Boron	Sulfate
	Cadmium	
	Calcium	
	Chromium	
	Cobalt	
	Copper	
	Iron	
	Lead	
	Lithium	
	Magnesium	
	Manganese	
	Mercury	
	Molybdenum	
	Nickel	
	Potassium	
	Selenium	
	Silicon	
	Silver	
	Sodium	
	Strontium	
	Thallium	
	Phosphorus	
	Vanadium	
	Zinc	

**Table 5-10. Stable and Radiocarbon Isotope Measurements in Groundwater**

<b>Isotope</b>	<b>Units</b>
$\delta D$ H <sub>2</sub> O	‰ (per mil)
$\delta^{18}O$ H <sub>2</sub> O	‰ (per mil)
$\delta^{13}C$ Dissolved Inorganic Carbon (DIC)	‰ (per mil)
$^3H$ H <sub>2</sub> O	‰ (per mil)
$\delta^{14}C$ DIC	‰ (per mil)

SCS1 will select third-party service providers to collect groundwater samples and ensure that standard industry QA/QC procedures are followed. At minimum, SCS1 will ensure that third-

party service providers apply a standard procedure for sampling the wells, such as the one provided below.

Example Groundwater Well Sampling Procedure

Groundwater samples will be collected by a third party from the dedicated Fox Hills monitoring well as well as other shallower groundwater wells, specified by SCS1 and with landowner approval, using a submersible pump. The standard procedure for sampling the wells is provided below:

1. Purge the well, removing a minimum of three casing volumes.
2. Wait for field measurements to stabilize and collect the sample.
  - a. Record the location of the sample point.
  - b. Collect field readings: temperature, conductivity, and pH.

Fill appropriate sample containers for analysis with minimum headspace and refrigeration/cooling (chill each sample to  $\leq 6^{\circ}\text{C}$ ) to reduce microbial activity.
3. Collect a duplicate sample from about 1 in every 10 samples for QA/QC purposes.

Groundwater Sampling QA/QC Procedures

SCS1 will ensure that third-party service providers selected for groundwater sampling and analysis follow industry standard sampling and analytical QA/QC protocols, including collection of field blanks and duplicate (replicate) samples to identify environmental contamination and evaluate repeatability in sampling and analytical methods, respectively.

**5.7.3 Deep Subsurface Monitoring**

Pursuant to N.D.A.C. § 43-05-01-11.4(1)(g), SCS1 will implement direct and indirect methods to monitor the location, thickness, and distribution of the free-phase CO<sub>2</sub> plume and associated pressure relative to the permitted storage reservoir. The direct and indirect storage reservoir monitoring methods described in this subsection of the permit application will be used to characterize the CO<sub>2</sub> plume's saturation and pressure within the AOR for the baseline and operational phases.

**5.7.3.1 Above-Zone Monitoring Interval**

Monitoring of the AZMI during injection operations includes monitoring of the temperature and saturation profiles from the Opeche/Spearfish Formation through the Skull Creek Formation. Temperature in the AZMI will be continuously monitored via DTS fiber-optic cable installed in the TB Leingang 1 and 2 and Milton Flemmer 1 wellbores. The plan for acquiring saturation data from PNLs is described in Tables 5-1 and 5-2.

**5.7.3.2 Above-Zone Monitoring Interval QASP**

SCS1 will ensure that all continuous monitoring devices (e.g., fiber optics) are inspected and maintained in accordance with the manufacturer's recommendations. For any logging activities, SCS1 will ensure that third-party contractors follow industry standard or better QA/QC protocols and that reports of logging activities are prepared by a qualified geologist or engineer.

Time-lapse data from the PNLs will be used to ensure CO<sub>2</sub> is not detected in the AZMI as an assurance-monitoring technique for evaluating the performance of the storage complex and protecting USDW.

#### 5.7.3.3 *Direct Reservoir Monitoring*

DTS fiber optics installed in the TB Leingang 1 and 2 and Milton Flemmer 1 wellbores will directly monitor the temperature of the storage reservoir. P/T readings from the casing-conveyed gauges in the CO<sub>2</sub> injection wells will also monitor conditions in the storage reservoir. To track the pressure front from CO<sub>2</sub> injection in the storage reservoir, pressure will be measured continuously from the downhole tubing-conveyed P/T gauge installed in the Milton Flemmer 1 well. To track the CO<sub>2</sub> plume in the storage reservoir, the DTS fiber-optic cable and temperature measurements from the downhole P/T gauge installed in the Milton Flemmer 1 well be used to estimate the timing of arrival of the CO<sub>2</sub> plume at the reservoir-monitoring well. The pressure and temperature data will be used to ensure the monitoring data from the Broom Creek Formation (from Amsden Formation through Opeche/Spearfish Formation) is conforming to the geologic model and numerical simulations. Pressure falloff tests will be performed in the CO<sub>2</sub> injection to demonstrate the performance of the storage reservoir.

#### 5.7.3.4 *Direct Reservoir Monitoring QASP*

SCS1 will ensure that all continuous monitoring devices (e.g., fiber optics and downhole P/T gauges) are inspected and maintained in accordance with the manufacturer's recommendations. Downhole P/T gauges will be calibrated within one year of initial installation; copies of calibration certificate will be submitted. Example specification sheets for the casing-conveyed downhole P/T gauges in the CO<sub>2</sub> injection wells and tubing-conveyed P/T gauge in the reservoir-monitoring well are provided in Appendix D, Attachments D-17 and D-18, respectively. For any logging activities, SCS1 will ensure that third-party contractors follow industry standard or better QA/QC protocols and that reports of logging activities are prepared by a qualified geologist or engineer.

#### 5.7.3.5 *Indirect Reservoir Monitoring*

SCS1 will acquire 3D time-lapse seismic surveys to track the extent of the CO<sub>2</sub> plume within the storage reservoir. The 200-mi<sup>2</sup> 3D Beulah seismic survey referenced in Section 2.0 will serve as the baseline survey. To demonstrate conformance between the reservoir model simulation and site performance, localized 3D seismic surveys will be collected to monitor the extent of the CO<sub>2</sub> plume, as shown in Figure 5-6 and detailed in Table 5-2.

SCS1 will reevaluate the testing and monitoring plan, inclusive of the design and frequency of the repeat 3D seismic surveys, at least once every 5 years, as required. If necessary, the time-lapse seismic monitoring strategy will be adapted based on updated simulations of the predicted extents of the CO<sub>2</sub> plume, including expanding the 3D survey area to capture additional data as the CO<sub>2</sub> plume expands in the storage reservoir.

SCS1 plans to install multiple seismometer stations to continuously monitor for seismic events with a magnitude of >1.5 within the AOR boundary during injection. The 3D seismic survey data (e.g., velocity modeling) collected within the AOR boundary will provide supporting evidence for confidently locating seismic events. A traffic light system for detecting larger magnitude events (e.g., >2.7) is presented with the Indirect Reservoir Monitoring QASP section of this application.

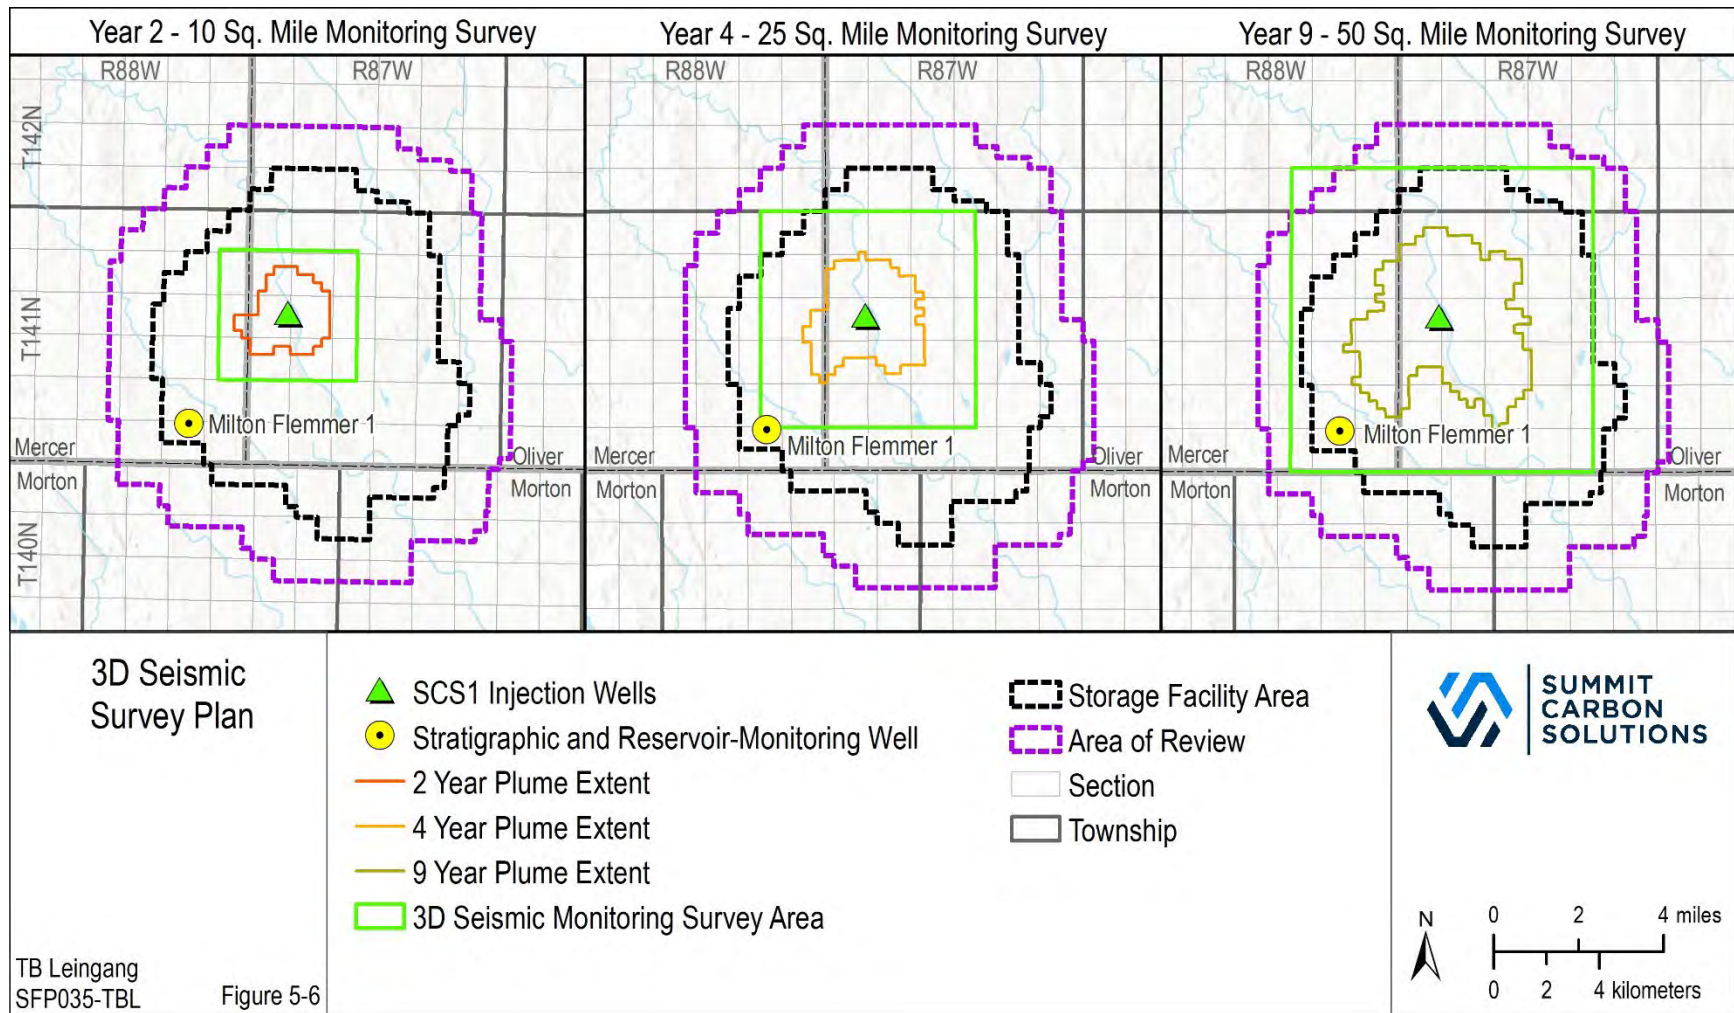

Figure 5-6. Simulated extent of the CO<sub>2</sub> plume at the end of Years 2, 4, and 9. The green boxes show the planned 3D seismic monitoring survey extents.

#### 5.7.3.5.1 Indirect Reservoir Monitoring QASP

The geophysical monitoring that is planned for the project includes 3D time-lapse seismic surveys. Time-lapse seismic surveys provide a measurement of the change in acoustic properties of the storage formation as injected CO<sub>2</sub> saturates the storage interval.

Application of time-lapse seismic surveys for monitoring changes in acoustic properties requires a quality preoperational seismic survey for baseline conditions. The monitor survey should be repeated as closely to the baseline conditions and parameters as possible. The seismic monitor data should be reprocessed simultaneously with the original baseline data or processed with the same steps and workflow to ensure repeatability. Repeatability is a measure of seismic quality (Lumley and others, 1997, 2000) that can be quantified once the processed data are analyzed by an experienced seismic interpreter.

For seismic survey acquisitions, SCS1 will follow the required permitting process pursuant to North Dakota Century Code (N.D.C.C.) § 38-08.1-04 and N.D.A.C. § 43-02-12-04. Seismic acquisition and processing are performed by highly specialized companies and crews that provide the equipment, procedures, and QA/QC protocols based on the technology selected for acquisition and parameters for processing the data. SCS1 will work with third-party contractors to select the appropriate equipment, procedures, QA/QC protocols, acquisition and processing parameters, and seismic interpreters for all repeat surveys.

#### 5.7.3.5.2 Seismicity Monitoring

The Williston Basin is a tectonically stable region of the North American Craton. A total of 13 events have been detected in North Dakota since 1870. While few seismic events have been recorded in the region, SCS1 plans to maintain a surface array during injection to ensure the safe operation of both the storage facility and associated infrastructure. This seismic monitoring will be conducted with a surface array of seismometer stations.

#### 5.7.3.5.3 Seismicity Monitoring QASP

SCS1 will work with third-party contractors and landowners to ensure proper design and installation of the passive seismicity monitoring array. The design and installation of the seismometer station array is performed by specialized contractors including the following activities:

- Project management support to design seismometer array, model network performance, coordinate permitting and equipment installation, testing and maintenance, and ensuring optimum execution of project.
- Field operation to deploy surface seismic station instrumentation, power and communication systems, data quality, and commissioning.
- Data acquisition, system configuration, and processing setup.
- Continuous support and monitoring for data verification and QA/QC.

- Continuous near-real-time reporting, including analyst review and alert notifications for events at or above predetermined magnitude thresholds over the seismic area.

SCS1 will follow a traffic light system if a seismic event is recorded by either the local or public national array during injection operations.

#### Traffic Light System

If an event is recorded by either the local private array or the public national array to have occurred within 3 miles of an injection well, SCS1 will implement its Emergency Remedial and Response Plan (Section 7.0) subject to detected earthquake magnitude limits defined below:

- For an event  $>2.7$  located within 3 miles of injection, SCS1 will closely monitor seismic activity and may implement a pause to operations or continue operations at a reduced rate, should analysis indicate a causal relationship between injection operations and detected seismicity. If the event is not related to the storage facility operation, the operator will resume normal injection rates.
- For an event  $>4.0$  located within 3 miles of injection, SCS1 will stop injection and perform an inspection in surface facilities and wells. If there is no damage, the operator will reduce the injection rate by not less than 50% and perform a detailed analysis to determine if a causal relationship exists. If the event is not related to the storage facility operation, the operator will resume normal injection rates. Should a causal relationship be determined, a revised injection plan would be developed to reduce or eliminate operationally related seismicity. Such plans are dependent on the pressures and seismicity observed and may include but not be limited to:
  - Pausing operations until reservoir pressures fall below a critical limit.
  - Continuing operations at a reduced rate and/or below a revised maximum operation pressure.
- For an event  $>4.5$  located within 3 miles of injection, the operator will stop injection. The operator will inform the regulator of seismic activity and inform them that operations have stopped pending a technical analysis. The operator will initiate an inspection of surface infrastructure for damage from the earthquake. A detailed analysis is conducted to determine if a causal relationship exists between injection operations and observed seismic activity. If the event is not related to the storage facility operation, and previously approved by the regulators, the operator will resume normal injection rates in steps, increasing the surveillance. Should a causal relationship be determined, a revised injection plan would be developed to reduce or eliminate operationally related seismicity before resuming injection operations. Such plans are dependent on the pressures and seismicity observed and may include but not be limited to:
  - Pausing operations until reservoir pressures fall below a critical limit.
  - Continuing operations at a reduced rate and/or below a revised maximum operation pressure.

## 5.8 Reporting Requirements

SCS1 shall retain the following records for a period of at least 10 years from the date of sample, measurement, or report:

- All data collected for the application of the storage facility permit, injection well permit, and operation of injection well permit.
- Data on the nature and composition of all injected fluids collected pursuant to N.D.A.C. § 43-05-01-11.4(1).
- All records from the closure period, including well plugging reports, postinjection site care data, and the final assessment.
- Upon project completion, SCS1 shall deliver any required records described in N.D.A.C. § 43-05-01-18(11).

SCS1 shall retain the following records for a period of at least 10 years from the date of sample, measurement, or report (N.D.A.C. § 43-05-01-18[12]):

- Monitoring data collected pursuant to N.D.A.C. § 43-05-01-11.4(b-i).
- Calibration and maintenance records.
- All original strip chart records for continuous monitoring instrumentation.
- Copies of all reports required by the storage facility permit.

### 5.8.1 Surface Facilities Leak Detection Reporting

Leak detection equipment at the wellhead of TB Leingang 1, TB Leingang 2, and Milton Flemmer 1 will be inspected and tested on a semiannual basis. If detection equipment is found to be defective, it will be repaired or replaced within 10 days of operator being aware of failure. An extension of time to repair or replacement of a leak detector may be granted by DMR-O&G upon SCS1 showing good cause. Semiannual inspection records will be maintained by SCS1 for at least 10 years and will be made available to DMR-O&G upon request pursuant to N.D.A.C. § 43-05-01-14(1).

## 5.9 Adaptive Management Approach

SCS1 will employ an adaptive management approach to implementing the testing and monitoring plan by completing periodic reviews of the testing and monitoring plan (Ayash and others, 2017) at least once every 5 years. During each review, monitoring and operational data will be analyzed, and the AOR will be reevaluated. Based on this reevaluation, it will either be demonstrated that 1) no amendment to the testing and monitoring program is needed or 2) modifications are necessary to ensure proper monitoring of storage performance is achieved moving forward. This determination will be submitted to DMR-O&G for approval. Should amendments to the testing and monitoring plan be necessary, they will be incorporated into the permit following approval by

DMR-O&G. Over time, monitoring methods and data collection may be supplemented or replaced as advanced techniques are developed.

Monitoring and operational data will be used to evaluate conformance between observations and history-matched simulation of the CO<sub>2</sub> plume and pressure distribution relative to the permitted geologic storage facility. If significant variance is observed, the monitoring and operational data will be used to calibrate the geologic model and associated simulations. The monitoring plan will be adapted to provide suitable characterization and calibration data as necessary to achieve such conformance. Subsequently, history-matched predictive simulation and model interpretations will, in turn, be used to inform adaptations to the monitoring program to demonstrate lateral and vertical containment of the injected CO<sub>2</sub> within the permitted geologic storage facility.

## **SECTION 6.0**

# **POSTINJECTION SITE CARE AND FACILITY CLOSURE PLAN**

## **6.0 POSTINJECTION SITE CARE AND FACILITY CLOSURE PLAN**

This postinjection site care (PISC) and facility closure plan describes the activities that Summit Carbon Storage #1, LLC (SCS1) will perform following the cessation of CO<sub>2</sub> injection to achieve final closure and issuance of a certificate of project completion. An overview of postinjection testing and monitoring activities is provided in Table 6-1. The postinjection testing and monitoring data will provide evidence that the injected CO<sub>2</sub> plume is stable (i.e., CO<sub>2</sub> migration will be unlikely to cross the storage facility area [SFA] boundary).

Pursuant to North Dakota Administrative Code (N.D.A.C.) § 43-05-01-19(1)(d), SCS1 proposes to submit the PISC monitoring results annually to the Department of Mineral Resources Oil and Gas Division (DMR-O&G).

**Table 6-1. Overview of Postinjection Testing and Monitoring Activities<sup>1</sup>**

Monitoring Type/SFP Reference	Parameter	Activity Description	Primary Purpose(s) of Activity	Equipment/Test	Location	Sampling Frequency (10 years minimum)
Wellbore Mechanical Integrity (external)/ Section 6.2.1	Material wall thickness	Ultrasonic or other equivalent casing inspection log (CIL) and sonic array logging	Mechanical integrity confirmation and operational safety assurance	Ultrasonic or other equivalent CIL and sonic array tools	Milton Flemmer 1	Repeat when required and when tubing is pulled during workovers.
	Radial cement bond					
	Temperature profile	Continuous data recording		Distributed temperature sensing (DTS) fiber		Continuous
		Temperature logging		Temperature log		Annually only if DTS fiber fails
	Saturation profile	Pulsed-neutron log (PNL)		PNL tool		Repeat PNL in Year 4 and Year 9 of postinjection. Run log from Opeche/Spearfish Formation to surface.
Wellbore Mechanical Integrity (internal)/ Section 6.2.1	Pressure/temperature	Continuous data recording via supervisory control and data acquisition (SCADA) system		Digital surface pressure gauge on the casing annulus (between surface and long-string sections)	Milton Flemmer 1	Continuous
		Tubing-casing annulus pressure testing	Surface pressure/temperature (P/T) gauge on tubing-casing annulus	Repeat during workover operations in cases where the tubing must be pulled and no less than every 5 years.		
		Continuous data recording via SCADA system	Digital surface P/T gauge on tubing-casing annulus	Continuous		
		Continuous data recording via SCADA system	Digital surface P/T gauge on tubing	Continuous		
	Saturation profile	PNL	PNL tool	Repeat PNL in Year 4 and Year 9 of postinjection. Run log from Opeche/Spearfish Formation to surface.		
	Downhole Corrosion Detection/ Section 6.2.1	Saturation profile	PNL	Corrosion detection of project materials in contact with CO <sub>2</sub>		PNL tool
Material wall thickness		Ultrasonic or other equivalent CIL	Ultrasonic or other approved CIL tools		Repeat when required and when tubing is pulled during workovers. <sup>2</sup>	

<sup>1</sup> Pursuant to N.D.A.C. § 43-05-01-19(1)(d), SCS1 proposes to submit monitoring results annually. The annual report is due 45 days after the end of the year.<sup>2</sup> If PNL indicates out-of-zone migration, the operator will work with DMR-O&G to take appropriate action.

Continued...

**Table 6-1. Overview of Postinjection Testing and Monitoring Activities (continued)**

Monitoring Type/SFP Reference	Parameter	Activity Description	Primary Purpose(s) of Activity	Equipment/Test	Location	Sampling Frequency (10 years minimum)
Near Surface/ Section 6.2.2	Soil gas composition (e.g., CO <sub>2</sub> , N <sub>2</sub> , and O <sub>2</sub> )	Soil gas sampling	Protection of near-surface environment	Field meter and sample bags	MSG01 and MSG04	Collect 3–4 seasonal samples at each station (MSG01 and MSG04) in Year 1 and Year 3 of postinjection and every 3 years thereafter (e.g., Years 6 and 9) and perform concentration analysis on all samples.
	Water composition (e.g., pH, total dissolved solids [TDS], and conductivity)	Groundwater sampling	Protection of underground sources of drinking water (USDWs)	Field meter and sample containers	MGW01	Collect 3–4 seasonal samples in Year 1 and Year 3 of postinjection and at least once every 3 years thereafter until facility closure (anticipated in Year 10 of postinjection).
					MGW04	Collect 3–4 seasonal samples in Year 4 of postinjection and prior to facility closure.
					MGW03 and MGW09	Collect 3–4 seasonal samples prior to facility closure (anticipated in Year 10 of postinjection).
					MGW11	Collect samples from MGW11 annually until facility closure (anticipated in Year 10 of postinjection).
Above-Zone Monitoring Interval/ Section 6.2.3	Temperature profile	Continuous data recording via SCADA system	Assurance of containment in storage reservoir	DTS casing-conveyed fiber-optic cable	Milton Flemmer 1	Continuous
		Temperature logging		Temperature log		Annually only if DTS fiber fails
	Saturation profile	PNL		PNL tool		Repeat PNL in Year 4 and Year 9 of postinjection. Run log from Opeche/Spearfish Formation to surface.
Storage Reservoir (direct)/ Section 6.2.3	Pressure/temperature	Continuous data recording via SCADA system	Pressure front tracking	Tubing-conveyed P/T gauge	Milton Flemmer 1	Continuous
	Temperature profile	Continuous data recording via SCADA system	CO <sub>2</sub> plume tracking	DTS casing-conveyed fiber-optic cable		Continuous
Storage Reservoir (indirect)/ Section 6.2.3	CO <sub>2</sub> saturation	Time-lapse seismic monitoring	CO <sub>2</sub> plume tracking	Time-lapse seismic surveys with source and receivers	Within area of review (AOR) boundary (CO <sub>2</sub> plume extents)	Actual design to be determined based on reevaluations of the testing and monitoring plan (Section 5.0) and migration of the CO <sub>2</sub> plume over time. Collect multiple repeat time-lapse seismic surveys during postinjection, with the first survey occurring by Year 4 of postinjection.

<sup>1</sup> Pursuant to N.D.A.C. § 43-05-01-19(1)(d), SCS1 proposes to submit monitoring results annually. The annual report is due 45 days after the end of the year.<sup>2</sup> If PNL indicates out-of-zone migration, the operator will work with DMR-O&G to take appropriate action.

Based on the current simulations of CO<sub>2</sub> plume movement following the cessation of CO<sub>2</sub> injection, it is projected that the CO<sub>2</sub> plume will stabilize within the storage facility area (SFA) boundary (Section 3.0), confirming nonendangerment of USDWs within the AOR. Based on these projections, a minimum 10-year postinjection monitoring period is planned to confirm CO<sub>2</sub> plume extent and postinjection stabilization pursuant to North Dakota Century Code (N.D.C.C.) § 38-22-17. Monitoring will be extended beyond 10 years if it is determined that additional data are required to demonstrate a stable CO<sub>2</sub> plume and nonendangerment of USDWs. The nature and duration of that extension will be determined based on an update of this plan and DMR-O&G approval.

In addition to the foregoing postinjection monitoring program, the CO<sub>2</sub> injection wells will be plugged as described in the plugging plan (Section 10.0). All surface equipment not associated with long-term monitoring will be removed, and all surface land associated with the project will be reclaimed as close as is practicable to its predisturbance condition. Following the plume stability demonstration, a final assessment will be prepared to document the status of the site and be submitted to DMR-O&G as part of a facility closure report. After application by the storage operator, NDIC shall consider issuing a certificate of project completion after notice and hearing pursuant to N.D.C.C. § 38-22-17.

## **6.1 Predicted Postinjection Subsurface Conditions**

### ***6.1.1 Pre- and Postinjection Pressure Differential***

Model simulations were performed to predict the change in pressure in the Broom Creek Formation during and after the cessation of CO<sub>2</sub> injection. The simulations were conducted for 20 years of CO<sub>2</sub> injection in the Broom Creek Formation at an average total rate of 6.22 MMt/yr, followed by a postinjection period of 10 years.

Figure 6-1 illustrates the predicted pressure differential at the cessation of CO<sub>2</sub> injection. At the time that CO<sub>2</sub> injection ceases, the models predict an increase in the pressure of the reservoir, with a maximum pressure differential of 938 psi at the TB Leingang well pad. There is insufficient pressure increase caused by CO<sub>2</sub> injection to move more than 1 m<sup>3</sup> of formation fluids from the storage reservoir to the lowest USDW. The details of the pressure evaluation are provided as part of the AOR delineation discussion within Section 3.0 of this application.

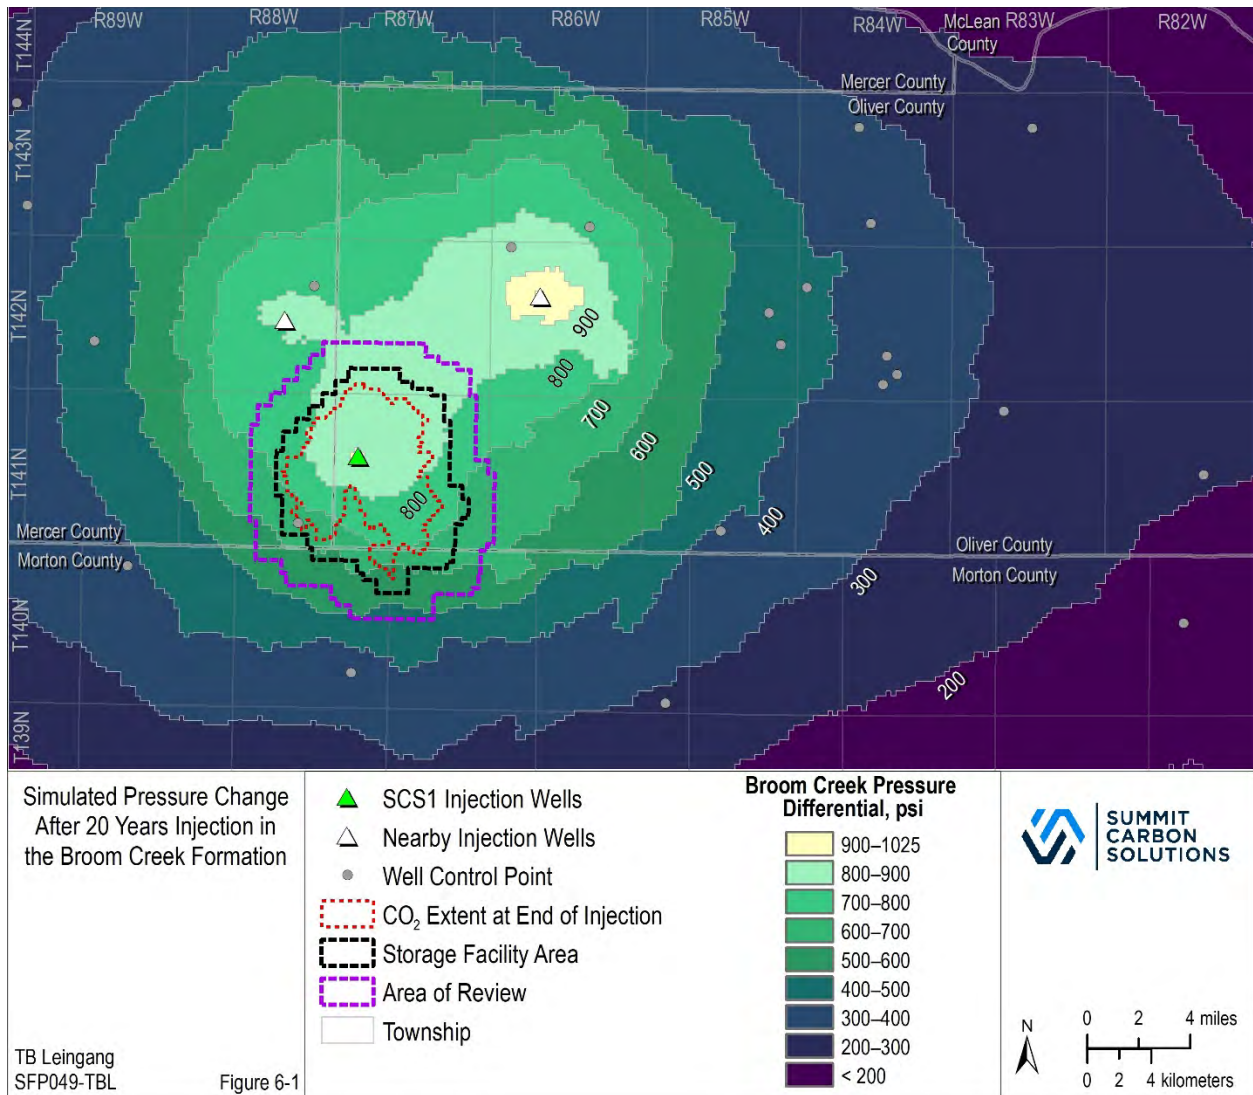

Figure 6-1. Predicted pressure increase in the storage reservoir following 20 years of injection of an average 6.22 MMt/yr of CO<sub>2</sub>.

Figure 6-2 illustrates the predicted gradual pressure decrease in the storage reservoir over a 10-year period following the cessation of CO<sub>2</sub> injection. The pressure at the TB Leingang CO<sub>2</sub> injection well pad at the end of the 10-year period is anticipated to decrease 600–650 psi as compared to the pressure in the storage reservoir at the time CO<sub>2</sub> injection ends. This trend of decreasing pressure is anticipated to continue over time until the pressure of the storage reservoir approaches the original reservoir pressure conditions.

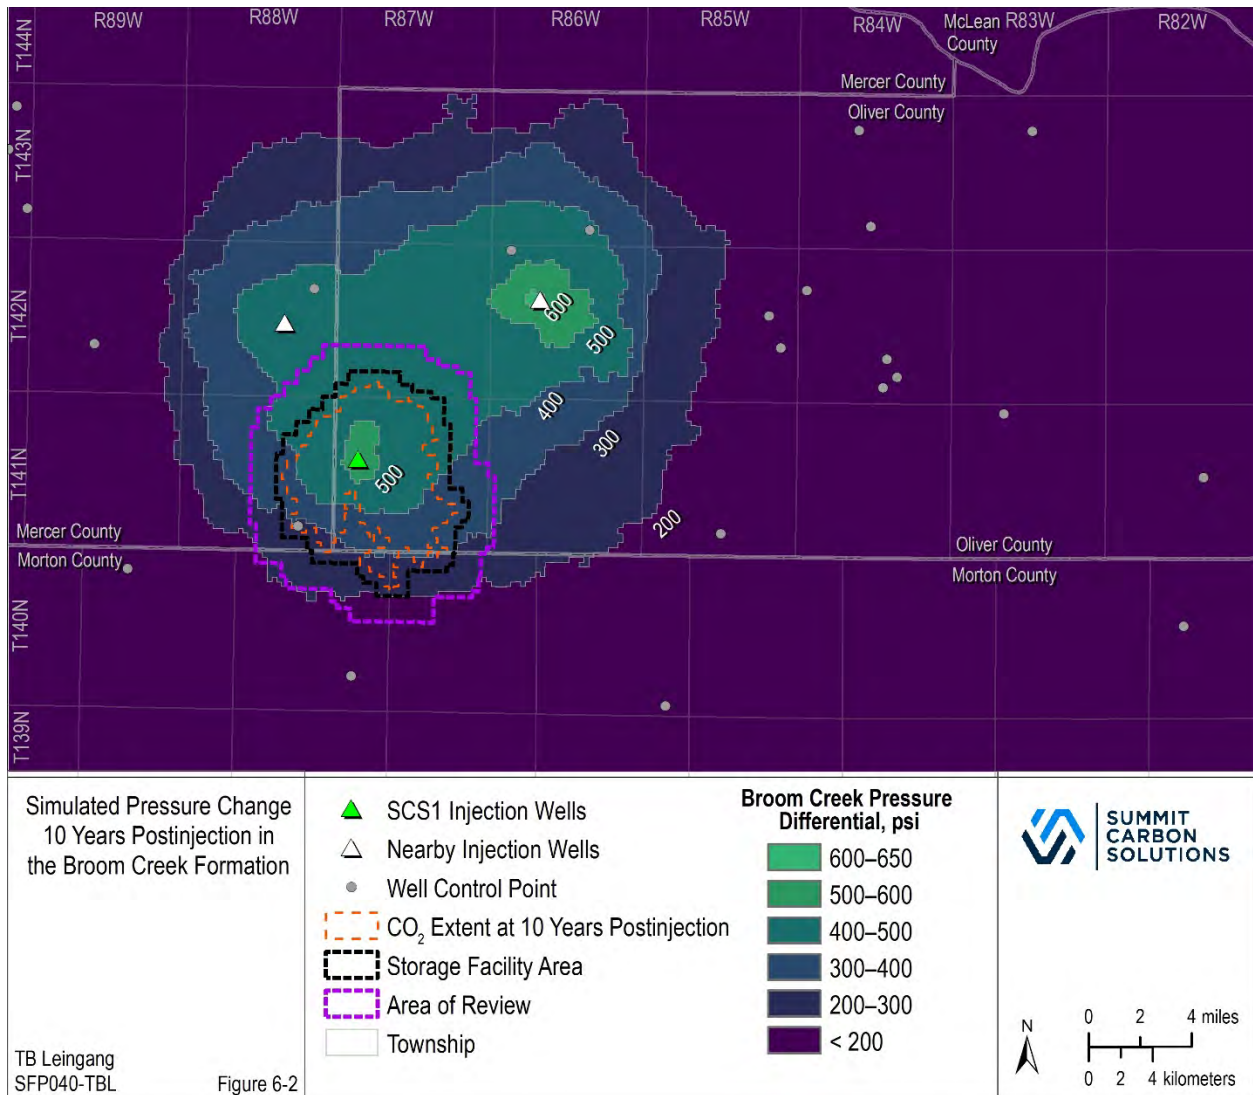

Figure 6-2. Predicted decrease in pressure in the storage reservoir over a 10-year period following the cessation of CO<sub>2</sub> injection.

### 6.1.2 Predicted Extent of CO<sub>2</sub> Plume

Figure 6-2 illustrates the extent of the CO<sub>2</sub> plume following the planned 10-year PISC period, which is based on numerical simulation predictions. The results of these simulations predict that the CO<sub>2</sub> plume extent will expand to an area of 30-mi<sup>2</sup> by the end of the 10-year PISC period.

If SCS1 demonstrates at the end of the 10-year PISC period that the CO<sub>2</sub> plume at the site is unlikely to extend beyond the SFA boundary, then the CO<sub>2</sub> plume will meet the definition of stabilization as presented in N.D.C.C. § 38-22-17(5)(d) as part of qualifying the storage site for receipt of a certificate of project completion.

## **6.2 Postinjection Testing and Monitoring Plan**

This postinjection testing and monitoring plan assumes that the CO<sub>2</sub> injection wells will be plugged at cessation of injection. Planned postinjection monitoring activities include 1) a mechanical integrity testing and corrosion detection plan for the reservoir-monitoring well (Milton Flemmer 1) and 2) an environmental monitoring plan for the near surface and deep subsurface for evidence that the injected CO<sub>2</sub> plume is essentially stationary within the storage reservoir and USDWs are nonendangered.

### **6.2.1 Mechanical Integrity Testing and Corrosion Detection**

The postinjection mechanical integrity testing and corrosion detection plan for the Milton Flemmer 1 is provided in Table 6-1. The supervisory control and acquisition (SCADA) system will be used to collect real-time and continuous measurements from the surface and downhole gauges in the Milton Flemmer 1.

SCS1 will follow the Wellbore Mechanical Integrity Testing Quality Assurance and Surveillance Plan (QASP) and Downhole Corrosion Detection QASP described within Section 5.0 of this application for the set of mechanical integrity and corrosion detection postinjection monitoring activities presented in Table 6-1.

### **6.2.2 Soil Gas and Groundwater Monitoring**

Figure 6-3 identifies the locations of the soil gas profile stations and groundwater wells that are included in this monitoring effort. The two stations (MSG01 and MSG04), the Fox Hills monitoring well drilled for this project (MGW11), and existing shallow groundwater wells (MGW01, MGW03, MGW04, and MGW09) will be sampled according to the plan outlined in Table 6-1. SCS1 may specify alternate groundwater sampling locations and sampling frequencies for the PISC period, if obtaining samples from MGW01, MGW03, MGW04, or MGW09 is not feasible.

Analytes and sampling procedures for all soil gas and groundwater monitoring activities conducted during the PISC period are anticipated to be the same as what is presented in the Soil Gas Monitoring QASP and Groundwater Monitoring QASP within Section 5.0 of this application. SCS1 anticipates that the final target list of analytical parameters will likely be reduced for the PISC period based on an evaluation of the monitoring results that are generated during the 20-year injection period of the storage operations.

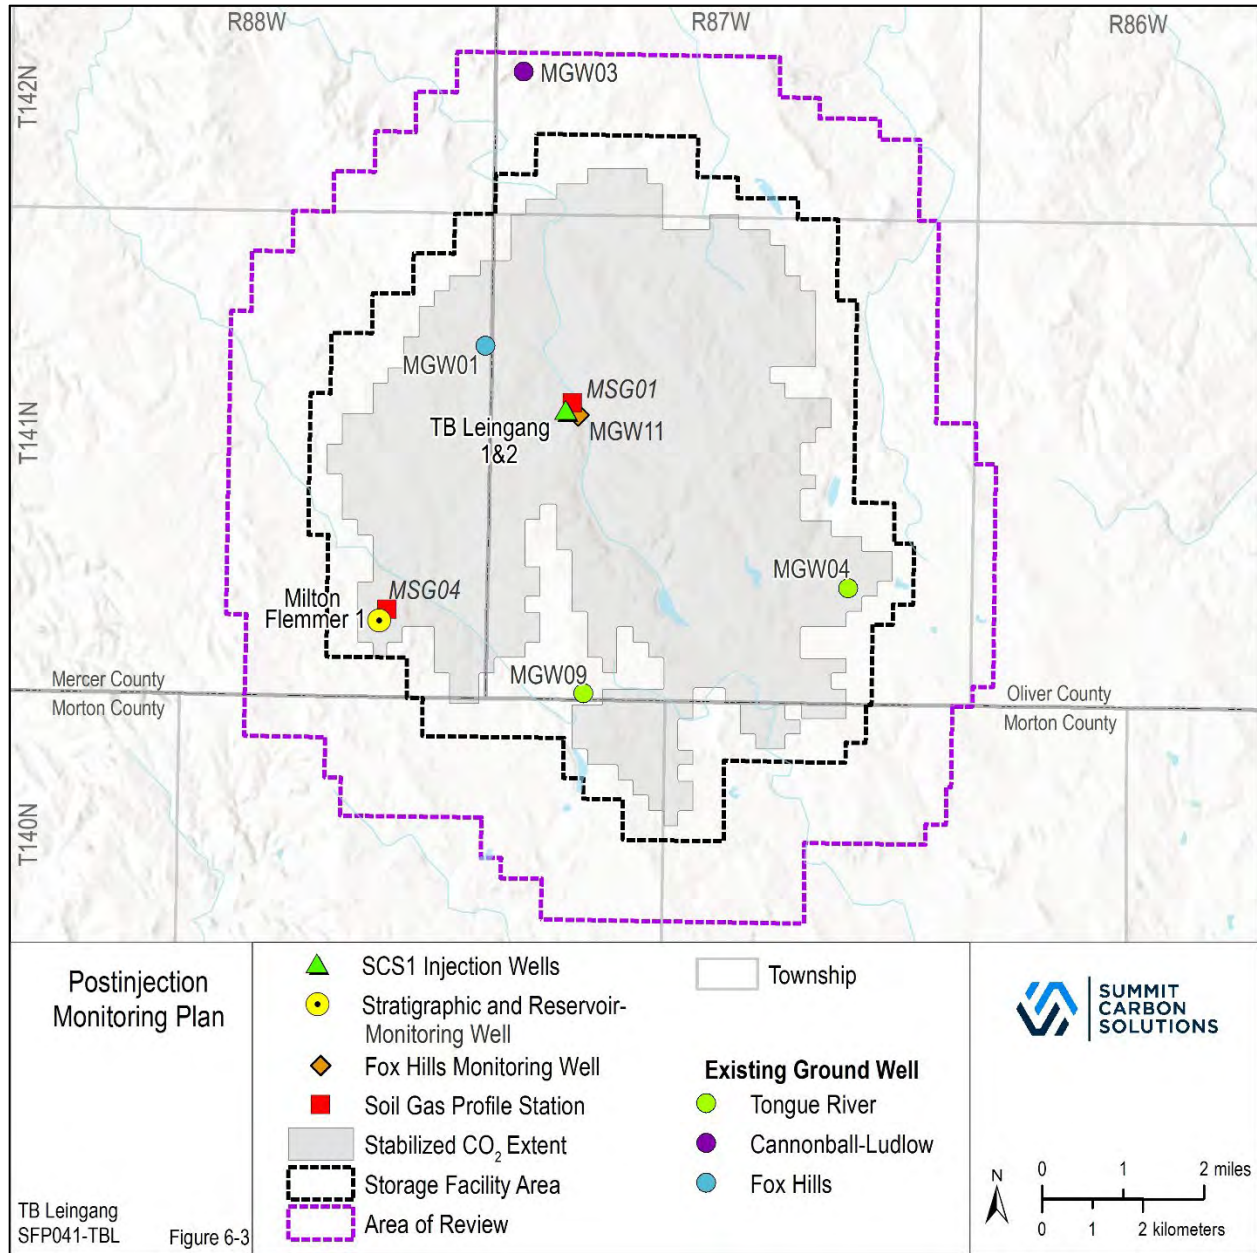

Figure 6-3. Soil gas station and groundwater well sampling locations included in the PISC period.

### 6.2.3 Deep Subsurface Monitoring

Table 6-1 describes the deep subsurface monitoring strategy during the PISC period. Monitoring methods include a combination of geophysical monitoring (e.g., time-lapse 3D/2D seismic) and formation monitoring (i.e., downhole P/T) for tracking CO<sub>2</sub> saturation and associated pressure, respectively, over the entire storage complex.

The design and frequency of the time-lapse seismic survey will depend on how the CO<sub>2</sub> plume is migrating during the operational phase of the project and the results of the adaptive

management approach discussion described in Section 5.0 of this application. The seismic survey design will be reevaluated and updated according to monitoring data results gathered in the operational phase.

SCS1 will follow the Above-Zone Monitoring Interval QASP, Direct Reservoir Monitoring QASP, and Indirect Reservoir Monitoring QASP described within Section 5.0 of this application for the set of deep subsurface postinjection monitoring activities presented in Table 6-1.

### **6.3 Postinjection Site Care Plan**

At the start of the PISC period, Flowline NDL-327, if not in use or projected use at this time, will be permanently disconnected, purged, and capped at both ends below grade, in accordance with the abandonment of flowlines pursuant to N.D.A.C. § 43-02-03-34.1. Main line valves (MLVs), launcher receivers, and other associated flowline infrastructure at grade or buried at a depth of 3 feet or less will be removed, whereas the NDL-327 flowlines themselves will be abandoned in place as the pipe bury depth will be 4 feet top of pipe and will be permanently disconnected, purged, and capped pursuant to N.D.A.C. § 43-02-03-34.1. The cost estimate for flowline segment NDL-327 abandonment can be found in Table 12-3b.

As required by N.D.A.C. § 43-05-01-19(5), PISC activities will include the P&A (plugging and abandonment) of the CO<sub>2</sub> injection wells (TB Leingang 1 and 2) and reclamation of the injection well pad. Storage facility equipment, appurtenances, and structures not associated with monitoring will be removed, and the surface will be reclaimed to the DMR-O&G's specifications to return the land as close as is practicable to its original condition. Injection well pad reclamation activities may occur contemporaneously with flowline removal and do not include the soil gas profile station (MSG01) and the Fox Hills monitoring well (MGW11).

SCS1 intends to use the Milton Flemmer 1 wellbore for deep subsurface monitoring during the PISC period. The postinjection testing and monitoring activities for the Milton Flemmer 1 and near-surface sampling are described earlier in Section 6.2. Section 12.0 includes cost estimates for performing these proposed testing and monitoring activities.

#### **6.3.1 Schedule for Submitting Postinjection Monitoring Results**

Where possible, PISC-monitoring data and results will be submitted to DMR-O&G within 45 days following the end of the calendar year in which CO<sub>2</sub> injection ceased. The annual reports will contain information and data generated during the reporting period, including seismic data acquisition, formation-monitoring data, soil gas and groundwater analytical results, and simulation results from updated geologic models and numerical simulations.

### **6.4 Facility Closure Plan**

SCS1 will notify DMR-O&G prior to its intent to close the site, and the facility closure plan will describe a set of activities that will be performed, following approval by DMR-O&G, at the end of the PISC period. Facility closure activities will include the plugging of all wells that are not planned for continued use in monitoring the closed site; the decommissioning and removal of aboveground storage facility equipment, appurtenances, and structures (e.g., buildings, gravel pads, access roads, etc.) not associated with monitoring or another deemed use; and the reclaiming of the surface land of the site as close as is practicable to its predisturbance condition.

As part of the final assessment, SCS1 will work with DMR-O&G to determine which wells and monitoring equipment will remain and transfer to the state for continued postinjection monitoring. P&A of the Milton Flemmer 1 and well pad reclamation costs are factored into Section 12.0, but DMR-O&G may choose to retain this reservoir-monitoring well into the postclosure period. The Fox Hills monitoring well drilled adjacent to the CO<sub>2</sub> injection wells (MGW11) and the soil gas profile stations (MSG01 and MSG04) may also transfer ownership to the state or a third party, pending DMR-O&G review and approval of the PISC plan and final assessment pursuant to N.D.A.C. § 43-05-01-19.11. Cost estimates for the PISC and closure periods can be found in Section 12.0 of this permit application in the scenario such that transfer to the state or a third-party entity does not occur.

***6.4.1 Submission of Facility Closure Report, Survey, and Deed***

A facility closure report will be prepared and submitted to DMR-O&G within 90 days following the execution of the PISC and facility closure plan. This report will provide DMR-O&G with a final assessment that documents the location of the stored CO<sub>2</sub> in the reservoir, describes its characteristics, and demonstrates the stability of the CO<sub>2</sub> plume in the reservoir over time. The facility closure report will also document the following:

- Plugging records of the CO<sub>2</sub> injection wells and reservoir-monitoring well.
- Location of the sealed CO<sub>2</sub> injection wells and reservoir-monitoring well on a plat survey that has been submitted to the county recorder's office.
- Notifications to state and local authorities as required by N.D.A.C. § 43-05-01-19.
- Records regarding the nature, composition, and volume of the injected CO<sub>2</sub>.
- Postinjection monitoring records.

At the same time, SCS1 will also provide DMR-O&G with a copy of an accurate plat certified by a registered surveyor that has been submitted to the county recorder's office designated by DMR-O&G. The plat will indicate the location of the injection well relative to permanently surveyed benchmarks pursuant to N.D.A.C. § 43-05-01-19.

Lastly, SCS1 will record a notation on the deed (or any other title search document) to the property on which the injection well was located pursuant to N.D.A.C. § 43-05-01-19.11.

## **SECTION 7.0**

# **EMERGENCY AND REMEDIAL RESPONSE PLAN**

## 7.0 EMERGENCY AND REMEDIAL RESPONSE PLAN

Summit Carbon Storage #1, LLC (SCS1) requires all employees, contractors, and agents to follow the company emergency and remedial response plan (ERRP) for TB Leingang. The purpose of the ERRP is to provide guidance for quick, safe, and effective response to an emergency to protect the public, all responders, company personnel, and the environment.

This ERRP for the geologic storage project 1) describes the local resources and infrastructure in proximity to the project site; 2) identifies events that have the potential to endanger underground sources of drinking water (USDW) during the construction, operation, and postinjection site care phases of the geologic storage project, building upon the screening-level risk assessment (SLRA); and 3) describes the response actions that are necessary to manage these risks to USDWs. In addition, this ERRP describes the emergency response team and command structure, injection facility evacuation plans, HazMat (hazardous materials) capabilities, and emergency communication plans. Lastly, procedures are presented for regularly conducting an evaluation of the adequacy of the ERRP and updating it, if warranted, over the lifetime of the geologic storage project. Copies of this ERRP are available at the company's nearest operational office and at the geologic storage facility.

### 7.1 Background

SCS1 is the owner and operator of TB Leingang, located in Oliver County, approximately 16 miles south of Beulah, North Dakota. SCS1 is requesting a commercial permit for the operation of the storage facility for the injection of a CO<sub>2</sub> stream that will range from 95% CO<sub>2</sub> to ≤99.9% CO<sub>2</sub>. This CO<sub>2</sub> stream range will provide flexibility to receive CO<sub>2</sub> from a variety of industrial sources (Table 7-1). This anticipated average CO<sub>2</sub> stream composition will ensure the safe and economical operation of the storage facility, including such factors as consistency with the design and materials of transport and storage equipment.

**Table 7-1. Anticipated Average CO<sub>2</sub> Stream Composition**

<b>Chemical Content</b>	<b>System Specification</b>
Carbon Dioxide, CO <sub>2</sub>	≥98.25%
Inert, N <sub>2</sub>	≤1.44%
Oxygen, O <sub>2</sub>	≤0.31%
Water, H <sub>2</sub> O*	≤20 lb/MMscf
Total Hydrocarbons*	≤1800 ppm by volume
Hydrogen Sulfide, H <sub>2</sub> S*	≤10 ppm by volume
Total Sulfur, S*	≤10 ppm by volume
Glycol	≤0.3 gallons/MMscf

\* Denotes trace constituents that do not make up notable percentages of stream composition.

Figure 7-1 identifies the planned pipeline, flowlines, injection wells (TB Leingang 1 and TB Leingang 2), and stratigraphic and reservoir-monitoring well (Milton Flemmer 1). The well locations, including latitudes and longitudes, are listed in Table 7-2. At the time SCS1 filed this application, it has not applied for any other permits from state, federal, or local agencies.

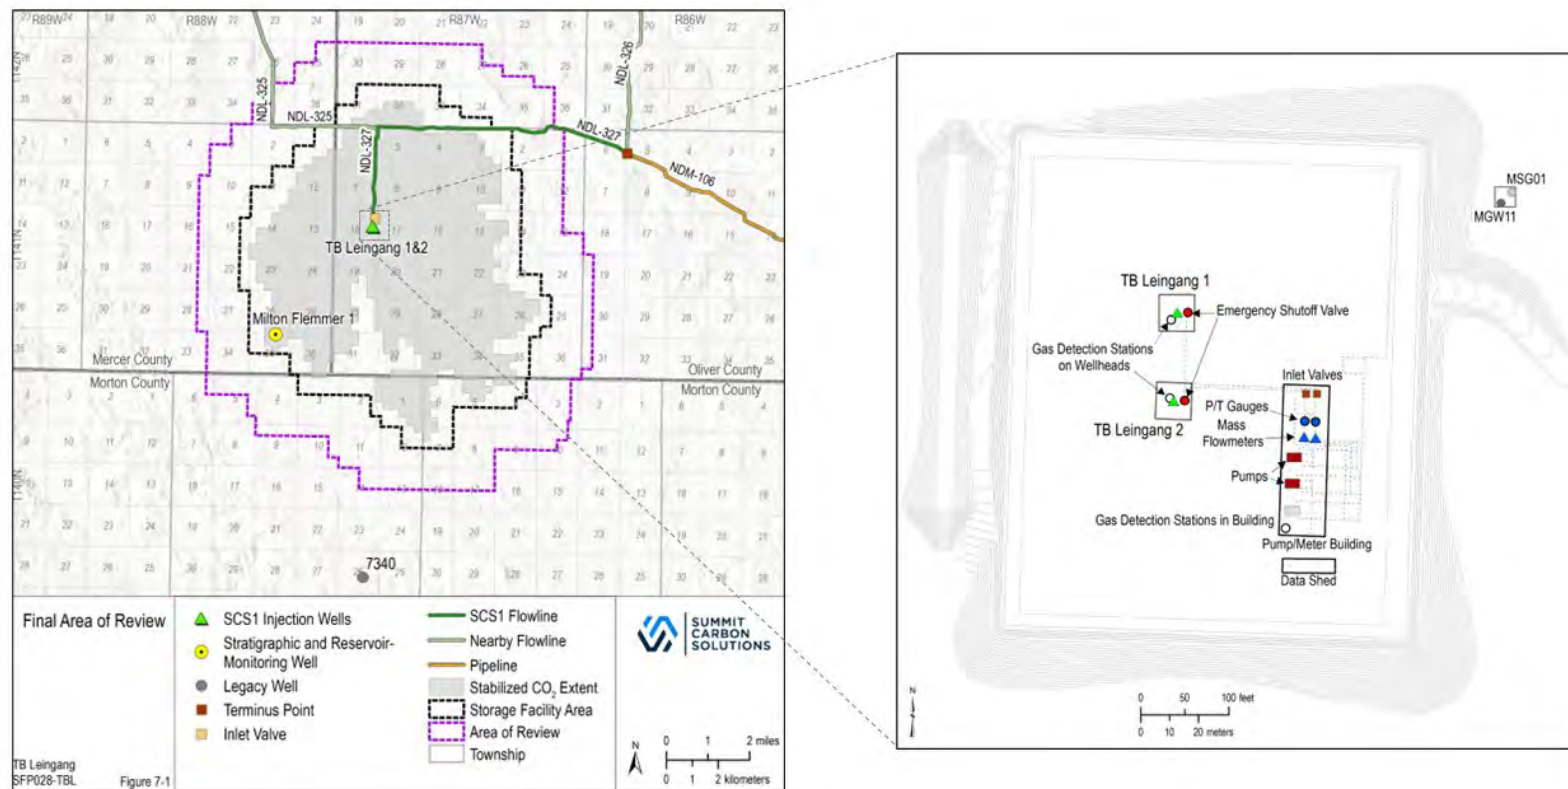

Figure 7-1. Site map detailing the on-pad CO<sub>2</sub> flowline(s) and the CO<sub>2</sub> injection wellsite. Also shown are the flowline(s) and pipeline associated with the Midwest Carbon Express (MCE) Project. Inset map illustrates a layout of surface facilities with key leak detection and monitoring equipment identified.

**Table 7-2. Well Names and Location Information for the Injection Wells and Reservoir-Monitoring Well of the Geologic Storage Operations**

<b>Well Name</b>	<b>Purpose</b>	<b>NDIC<sup>1</sup> File No.</b>	<b>Quarter/ Quarter</b>	<b>Section</b>	<b>Township</b>	<b>Range</b>	<b>Latitude<sup>2</sup></b>	<b>Longitude<sup>2</sup></b>
TB Leingang 1	CO <sub>2</sub> injection	40158	SE4/NE4	18	141N	87W	47.03321400	-101.74547500
TB Leingang 2	CO <sub>2</sub> injection	40178	SE4/NE4	18	141N	87W	47.032939	-101.745481

<sup>1</sup> North Dakota Industrial Commission.<sup>2</sup> North American Datum 83 (NAD 83) geographic coordinate system.

The primary SCS1 contacts for the geologic storage project and their contact information are listed in Table 7-3.

**Table 7-3. Primary SCS1 Contacts**

Individual	Title	Contact Information
		Office Phone Number
Wade Boeshans	Executive Vice President	515.531.2608
Jay Volk	Sequestration – Director of Health, Safety & Environmental	515.207.3563
Jeff Skaare	Director of Land & Legal Affairs	515.531.2615

Contact names and information for key local emergency organizations/agencies are provided in Figures 7-2 through 7-5 and Table 7-4.

## 7.2 Local Resources and Infrastructure

Land use near TB Leingang comprises primarily agricultural activities. Local resources in the vicinity of the geologic storage project that may be impacted as a result of an emergency event include existing groundwater wells, a spring (Figure 4-3), and five gravel pits (Figure 4-2).

The infrastructure in the area of review (AOR) that may be impacted as a result of an emergency event include 1) TB Leingang 1 and 2 (CO<sub>2</sub> injection wells), SCS1 flowline NDL-327, and Milton Flemmer 1 (stratigraphic and reservoir-monitoring well); 2) portions of the Bison Wind Farm (Figure 4-2); 3) surface features and occupied structures (Figure 4-2); and 3) public roads (Figures 7-3 through 7-5). Additional infrastructure nearby includes BK Fischer (SCS2), comprising two CO<sub>2</sub> injection wells and respective NDL-326 flowline; Archie Erickson 2 (stratigraphic and reservoir-monitoring well); KJ Hintz (SCS3), comprising two CO<sub>2</sub> injection wells and respective NDL-325 flowline, and Slash Lazy H 5 (stratigraphic and reservoir-monitoring well); and the MCE pipeline (Figures 7-3 through 7-5).

## 7.3 Identification of Potential Emergency Events

### 7.3.1 Definition of an Emergency Event

An emergency event is an event that poses an immediate or acute risk to human health, resources, or infrastructure and requires a rapid, immediate response. This ERRP focuses on emergency events that have the potential to move injection fluid or formation fluid in a manner that may endanger USDWs or lead to an accidental release of CO<sub>2</sub> to the atmosphere during the construction, operation, or postinjection site care project phases.

### **7.3.2 Potential Project Emergency Events and Their Detection**

The SLRA for the project developed a list of potential technical project risks (i.e., a risk register) which were placed into the following six technical risk categories:

1. Injection operations
2. Storage capacity
3. Containment – lateral migration of CO<sub>2</sub>
4. Containment – pressure propagation
5. Containment – vertical migration of CO<sub>2</sub> or formation water brine via injection wells, other wells, or inadequate confining zones
6. Natural disasters (induced seismicity)

Based on a review of these technical risk categories, SCS1 developed, to include in this ERRP, a list of the geologic storage project events that could potentially result in the movement of injection fluid or formation fluid in a manner that may endanger a USDW and, in turn, require an emergency response. These events and means for their detection are provided in Table 7-5.

In addition to the foregoing technical project risks, the occurrence of a natural disaster (e.g., naturally occurring earthquake, tornado, lightning strike, etc.) also represents an event for which an emergency response action may be warranted. For example, an earthquake or weather-related disaster (e.g., tornado or lightning strike) has the potential to result in injection well problems (integrity loss, leakage, or malfunction) and may also disrupt surface and subsurface storage operations. These events are also addressed in this ERRP.

## **7.4 Emergency Response Actions**

### **7.4.1 General Emergency Response Actions**

The response actions that will be taken to address the events listed in Table 7-5, as well as potential natural disasters, will follow the same protocol. This protocol consists of the following actions:

- The facility response plan qualified individual (QI), as found in Section 7.5, will be immediately notified and will make an initial assessment of the severity of the event (i.e., does it represent an emergency event?). The QI must make this assessment as soon as practical but must do so within 24 hours of the notification. This protocol will ensure SCS1 has taken all reasonable and necessary steps to identify and characterize any release pursuant to North Dakota Administrative Code (N.D.A.C.) § 43-05-01-13(2)(b).
- If an emergency event exists, the QI or designee shall notify, within 24 hours of the emergency event determination, the Department of Mineral Resources Oil and Gas Division (DMR-O&G) Director (see Sections 7.5 and 7.6, N.D.A.C. § 43-05-01-13[2][c]). The QI shall also implement the emergency communications plan (N.D.A.C. § 43-05-01-13[2][d]).

**Table 7-5. Potential Project Emergency Events and Their Detection**

Potential Emergency Events	Detection of Emergency Events
Failure of CO <sub>2</sub> Flowline NDL-327	<ul style="list-style-type: none"> <li>• Computational flowline continuous monitoring and leak detection system (LDS).               <ul style="list-style-type: none"> <li>– Instrumentation at the flowline for each injection well on the well pad collects pressure, temperature, and flow data.</li> <li>– Pressure, temperature, and flow measurements will be measured at the MCE terminus point.</li> <li>– The LDS software uses the pressure readings and flow rates in and out of the line to produce a real-time model and predictive model.</li> <li>– By monitoring deviations between the real-time model and the predictive model, the software detects flowline leaks.</li> </ul> </li> <li>• Frozen ground at the leak site may be observed.</li> <li>• CO<sub>2</sub> monitors located inside and outside of the process buildings detect a release of CO<sub>2</sub> from the flowline, connection, and/or wellhead.</li> </ul>
Integrity Failure of Injection or Monitoring Well	<ul style="list-style-type: none"> <li>• Pressure monitoring reveals wellhead pressure exceeds the shutdown pressure specified in the permit.</li> <li>• Annulus pressure indicates a loss of external or internal well containment.</li> <li>• Mechanical integrity test results identify a loss of mechanical integrity.</li> <li>• CO<sub>2</sub> monitors located inside and outside of the enclosed wellhead building detect a release of CO<sub>2</sub> from the wellhead.</li> </ul>
Monitoring Equipment Failure of Injection Well	<ul style="list-style-type: none"> <li>• Failure of monitoring equipment for wellhead pressure, temperature, and/or annulus pressure is detected.</li> </ul>
Storage Reservoir Unable to Contain the Formation Fluid or Stored CO <sub>2</sub>	<ul style="list-style-type: none"> <li>• Elevated concentrations of indicator parameter(s) in soil gas, groundwater, and/or surface water sample(s) are detected.</li> </ul>

Following these actions, the company will:

- Initiate a project shutdown plan and immediately cease CO<sub>2</sub> injection. However, in some circumstances, the company may determine whether gradual or temporary cessation of injection is more appropriate in consultation with the DMR-O&G Director.
- Shut in the CO<sub>2</sub> injection well (close the flow valve).
- Vent CO<sub>2</sub> from the surface facilities.
- Limit access to the wellhead to authorized personnel only, who will be equipped with appropriate personal protective equipment (PPE).
- If warranted, initiate the evacuation of the injection facilities, and communicate with local emergency authorities to initiate evacuation plans of nearby residents (Figure 7-2 and Table 7-4).
- Perform the necessary actions to determine the cause of the event; identify and implement the appropriate emergency response actions in consultation with the DMR-O&G Director. Table 7-6 provides details regarding the specific actions that will be taken to determine the cause and, if required, mitigation of each of the events listed in Table 7-5.

**Table 7-6. Actions Necessary to Determine Cause of Events and Appropriate Emergency Response Actions**

Failure of CO <sub>2</sub> Flowline NDL-327	<ul style="list-style-type: none"> <li>• The CO<sub>2</sub> release and its location will be detected by the LDS and/or CO<sub>2</sub> wellhead monitors, which will trigger a Pipeline Control* alarm, alerting system operators to take necessary action.</li> <li>• If warranted, initiate an evacuation plan in tandem with an appropriate workspace and/or ambient air-monitoring program, situated near the location of the failure, to monitor the presence of CO<sub>2</sub> and its natural dispersion following the shutdown of the flowline.</li> <li>• Inspect the flowline failure to determine the root cause.</li> <li>• Repair/replace the damaged flowline and, if warranted, put in place the measures necessary to eliminate such events in the future.</li> </ul>
Integrity Failure of Injection or Monitoring Well	<ul style="list-style-type: none"> <li>• Monitor well pressure, temperature, and annulus pressure to verify integrity loss and determine the cause and extent of failure.</li> <li>• Identify and implement appropriate remedial actions to repair damage to downhole equipment or wellhead (in consultation with the DMR-O&amp;G Director).</li> <li>• If subsurface impacts are detected, implement appropriate site investigation activities to determine the nature and extent of these impacts.</li> <li>• If warranted based on the site investigations, implement appropriate remedial actions (in consultation with the DMR-O&amp;G Director).</li> </ul>
Monitoring Equipment Failure of Injection Well	<ul style="list-style-type: none"> <li>• Monitor well pressure, temperature, and annulus pressure (manually, if necessary) to determine the cause and extent of failure.</li> <li>• Identify and, if necessary, implement appropriate remedial actions (in consultation with the DMR-O&amp;G Director).</li> </ul>

\* Pipeline Control refers to the controller monitoring MCE, SCS1, SCS2, and SCS3 flowline operations (see Section 7.5.8).

**Table 7-6. Actions Necessary to Determine Cause of Events and Appropriate Emergency Response Actions (continued)**

Storage Reservoir Unable to Contain the Formation Fluid or Stored CO <sub>2</sub>	<ul style="list-style-type: none"> <li>• Collect a confirmation sample(s) of groundwater from the Fox Hills monitoring well(s) and soil gas profile station(s), and analyze the samples for indicator parameters (Section 5.0).</li> <li>• If the presence of indicator parameters is confirmed, develop (in consultation with the DMR-O&amp;G Director) a case-specific work plan to:               <ol style="list-style-type: none"> <li>1. Install additional monitoring points near the impacted area to delineate the extent of impact:                   <ol style="list-style-type: none"> <li>a. If a USDW is impacted above drinking water standards, arrange for an alternate potable water supply for all users of that USDW.</li> <li>b. If a surface release of CO<sub>2</sub> to the atmosphere is confirmed and, if warranted, initiate an evacuation plan in tandem with an appropriate workspace and/or ambient air-monitoring program situated at the appropriate incident boundary to monitor the presence of CO<sub>2</sub> and its natural dispersion following the termination of CO<sub>2</sub> injection.</li> <li>c. If surface release of CO<sub>2</sub> to surface waters is confirmed, implement the appropriate surface water-monitoring program to determine if water quality standards are exceeded.</li> </ol> </li> <li>2. Proceed with efforts, if necessary, to:                   <ol style="list-style-type: none"> <li>a. Remediate the USDW to achieve compliance with drinking water standards (e.g., install a system to intercept/extract brine or CO<sub>2</sub> or “pump and treat” the impacted drinking water to mitigate CO<sub>2</sub>/brine impacts), and/or</li> <li>b. Manage surface waters using natural attenuation (i.e., natural processes, such as biological degradation, active in the environment that can reduce contaminant concentrations), or</li> <li>c. Activate treatment to achieve compliance with applicable water quality standards.</li> </ol> </li> </ol> </li> <li>• Continue all remediation and monitoring at an appropriate frequency (as determined by company management designee and the DMR-O&amp;G Director) until unacceptable adverse impacts have been fully addressed.</li> </ul>
---	--

Continued . . .

**Table 7-6. Actions Necessary to Determine Cause of Events and Appropriate Emergency Response Actions (continued)**

Natural Disasters (seismicity)	<ul style="list-style-type: none"> <li>• Identify when the event occurred and the epicenter and magnitude of the event.</li> <li>• If the magnitude is greater than 2.7 (Section 5.0), then:               <ol style="list-style-type: none"> <li>1. Determine whether there is a connection with injection activities.</li> <li>2. Demonstrate all project wells have maintained mechanical integrity.</li> <li>3. If a loss of CO<sub>2</sub> containment is determined, proceed as described above to evaluate and, if warranted, mitigate the loss of containment.</li> </ol> </li> </ul>
Natural Disasters	<ul style="list-style-type: none"> <li>• Monitor well pressure, temperature, and annulus pressure to verify well status and determine the cause and extent of any failure.</li> <li>• If warranted, perform additional monitoring of groundwater, surface water, and/or workspace/ambient air to delineate the extent of any impacts.</li> <li>• If impacts or endangerment are detected, identify and implement appropriate response actions in accordance with the facility response plan (in consultation with the DMR-O&amp;G Director).</li> </ul>

#### **7.4.2 Incident-Specific Response Actions**

If notification is received of a high-risk incident, the following procedures will be followed:

##### **1. Accidental/Uncontrolled Release of CO<sub>2</sub> from the Injection Facility or Associated Flowline(s)**

- On-scene personnel shall confirm that Pipeline Control is aware of the incident. If appropriate, Pipeline Control will effectuate the shutdown of the pipeline and the closure of mainline valves to isolate the release and to minimize the amount of released CO<sub>2</sub>.
- Consideration should be given to notifying and evacuating the public downwind of the release and closing roads. Coordinate with nearby fire departments and law enforcement to aid in any evacuation efforts.
- Pipeline Control will call the appropriate public safety answering point (PSAP) and nearby fire departments, law enforcement, and other appropriate agencies. Table 7-4 provides a listing of PSAPs. Personnel on-scene during an incident may call 911 directly.
- Pipeline Control dispatches the company response crew (CRC) to investigate the incident and notifies the QI.

- CRC arrives at the incident site and completes initial response actions. A designated CRC member will fill the initial incident commander (IC) position.
- The IC will conduct a risk assessment and coordinate with the QI to determine what National Incident Management System Incident Command System (ICS) positions need to be filled for the local response team (LRT).
- The QI or IC will establish liaison with the local emergency coordinating agencies, such as the 911 emergency call centers or county emergency managers, in lieu of communicating individually with each fire, police, or other public entities.
- If the response exceeds local capabilities, the IC will coordinate with the QI to determine the need for mobilization of a company support team (CST).

## **2. Fire or Explosion Occurring near or Directly Involving the Injection Facility or Associated Flowline(s)**

Note: CO<sub>2</sub> is not flammable, combustible, or explosive.

- Call for assistance from nearby fire departments and company personnel, as needed. Take all possible actions to keep fire from spreading.
- Shut down the pipeline for an explosion involving the injection facility.
- The IC will conduct a preliminary assessment of the situation upon arrival at the scene, evaluate the scene for potential hazards, and determine what product is involved.
- Assemble the LRT at the command post.
- Coordinate response efforts with on-scene fire department.

## **3. Operational Failure Causing a Hazardous Condition**

- On-scene personnel will confirm that Pipeline Control is aware of the incident, which will, if appropriate, effectuate the shutdown of the pipeline, injection well(s), and closure of mainline valves to isolate the release and minimize a hazardous condition.
- Consideration should be given to evacuating the public downwind of the release and closing roads. Coordinate with nearby fire departments and law enforcement to aid in any evacuation efforts.
- Pipeline Control will call the appropriate PSAP and nearby fire departments, law enforcement, and other appropriate agencies (Figure 7-2 and Table 7-4). Personnel on-scene during an incident may call 911 directly.

- Pipeline Control dispatches LRT to investigate the incident and notifies the QI.
- CRC arrives at the incident site and completes initial response actions. A designated CRC member will fill the initial IC position.
- The IC will conduct a risk assessment and coordinate with the QI to determine what ICS positions need to be filled for the LRT.
- The QI or IC will establish liaison with the local emergency coordinating agencies, such as the 911 emergency call centers or county emergency managers, in lieu of communicating individually with each fire, police, or other public entity.
- If the response exceeds local capabilities, the IC will coordinate with the QI to determine the need for mobilization of a CST.

## **7.5 Response Personnel/Equipment and Training**

### **7.5.1 Response Personnel and Equipment**

Designated company personnel will undergo hazardous waste operations and emergency response training (HAZWOPER) in accordance with guidelines produced and maintained by the Occupational Safety and Health Administration (OSHA) (OSHA 29 Code of Federal Regulations [CFR] § 1910.120). In addition, assistance has been secured from local emergency services to implement this ERRP, as shown in Figures 7-2 through 7-5.

Equipment (including appropriate PPE) needed in the event of an emergency and remedial response will vary, depending on the emergency event. Response actions (e.g., cessation of injection, well shut-in, and evacuation) will generally not require specialized equipment to implement. However, when specialized equipment is required (such as a drilling rig, logging equipment, or potable water hauling, etc.), one of the primary contacts listed in Table 7-3 is responsible for procurement of this equipment. One of the primary contacts listed in Table 7-3 is also responsible to maintain a list of contractors and equipment vendors (see Section 7.6).

The company will provide personnel, training, equipment, instruments, tools, and material as needed to respond to an emergency incident:

- All local company personnel are available for callout as needed for duty on a 24-hour basis to support public safety agencies.
- Additional personnel, if required, will be acquired from agency responders from public safety agencies and/or response contractors.
- If public authorities are involved, they will be given full cooperation and assistance. In no event shall such cooperation and assistance violate safety rules or consist of actions that would endanger the public or employees.

- Company employees, contractors, and agency responders will be equipped with tools, supplies, and equipment available to be used in cases of emergency conditions existing on or near the injection facility and associated flowline(s). CO<sub>2</sub>/O<sub>2</sub> monitoring devices should be used in the event of an accidental/uncontrolled release of CO<sub>2</sub>. Self-contained breathing apparatus may be required pending results from on-site-specific hazards and monitoring results.

### ***7.5.2 Staff Training and Exercise Procedures***

The company will integrate the training of the emergency response personnel of the geologic storage project into the standard operating procedures and facility operations training programs. Periodic training will be provided, at least annually, to protect all necessary facility- and project-personnel. The training efforts will be documented in accordance with the requirements of company plans which, at a minimum, will include a record of the trainee's name, date of training, type of training (e.g., initial or refresher), and instructor name. The company will also work with local emergency response personnel to perform coordinated training exercises associated with potential emergency events such as a significant release of CO<sub>2</sub> to the atmosphere.

### ***7.5.3 Emergency Response Procedures***

This section describes organization features and duties of the company's QI, LRT, and CST. The company's initial response to an incident will be provided by the LRT, once activated by the QI. The IC will activate a CST if an incident exceeds the local capabilities. In some cases, the initial responders to an incident may include local law enforcement, ambulance, and/or local fire department(s). The company will work with these agencies to manage a coordinated response effort.

The ICS will be used to manage emergency response activities. Because ICS is a management tool that is readily adaptable to incidents of varying magnitude, it will be used for all emergency incidents. Staffing levels will be adjusted to meet specific response team needs based on incident size, severity, and type of emergency. Local agencies are also trained to use ICS and may fill roles during a coordinated response effort. ICS principles include the following:

- Common terminology
- Manageable span of control
- Management by objectives
- Incident action planning
- Comprehensive resource management
- Established incident facilities
- Integrated communications

As a component of an ICS, the unified command (UC) is a structure that brings together the company and agencies at the command level. The UC links the organizations responding to the incident and provides a forum for the responsible party and responding agencies to make consensus decisions. Under the UC, the various responding agencies and company personnel may blend together throughout the organization to create an integrated response team. The ICS process requires the UC to set clear objectives to guide the on-scene response resources. The primary entities of a UC may be two or more of the following:

- Federal on-scene coordinator
- State on-scene coordinator
- Local on-scene coordinator
- Company IC (responsible party IC)

#### **7.5.4 *Qualified Individual (QI)***

The QI is defined by the U.S. Department of Transportation Pipeline and Hazardous Materials Safety Administration (PHMSA) as a company employee who has been given authority to fund response efforts without consulting company leadership for further authorization and knows how to commence the response procedures of this plan. The QI is responsible for activating the ICS response organization, including the LRT and CST.

The QI will be an English-speaking company employee who is available on a 24-hour basis with the full authority to activate and deploy the necessary emergency response contractors. The QI or alternate QI will activate personnel and equipment, act as a liaison with the UC, and obligate any funds required to carry out all the required or direct emergency response activities.

##### **7.5.4.1 *Communicating to Appropriate Operator Personnel***

If notification of an event relating to a potential emergency requires immediate response, the emergency notification flowchart in Figure 7-6 provides guidance regarding notification of appropriate operator personnel, contractors, and emergency and public officials.

#### **7.5.5 *Local Response Team (LRT)***

The first company person on scene will function as the IC and person in charge until relieved by an authorized person who will then assume the position of IC. The number of positions/personnel required to staff the LRT will depend on the size and complexity of the incident. The duties of each position may be performed by the IC directly or delegated as the situation demands. The IC is always responsible for directing response activities and will assume the duties of all the primary positions until the duties can be delegated to other qualified personnel.

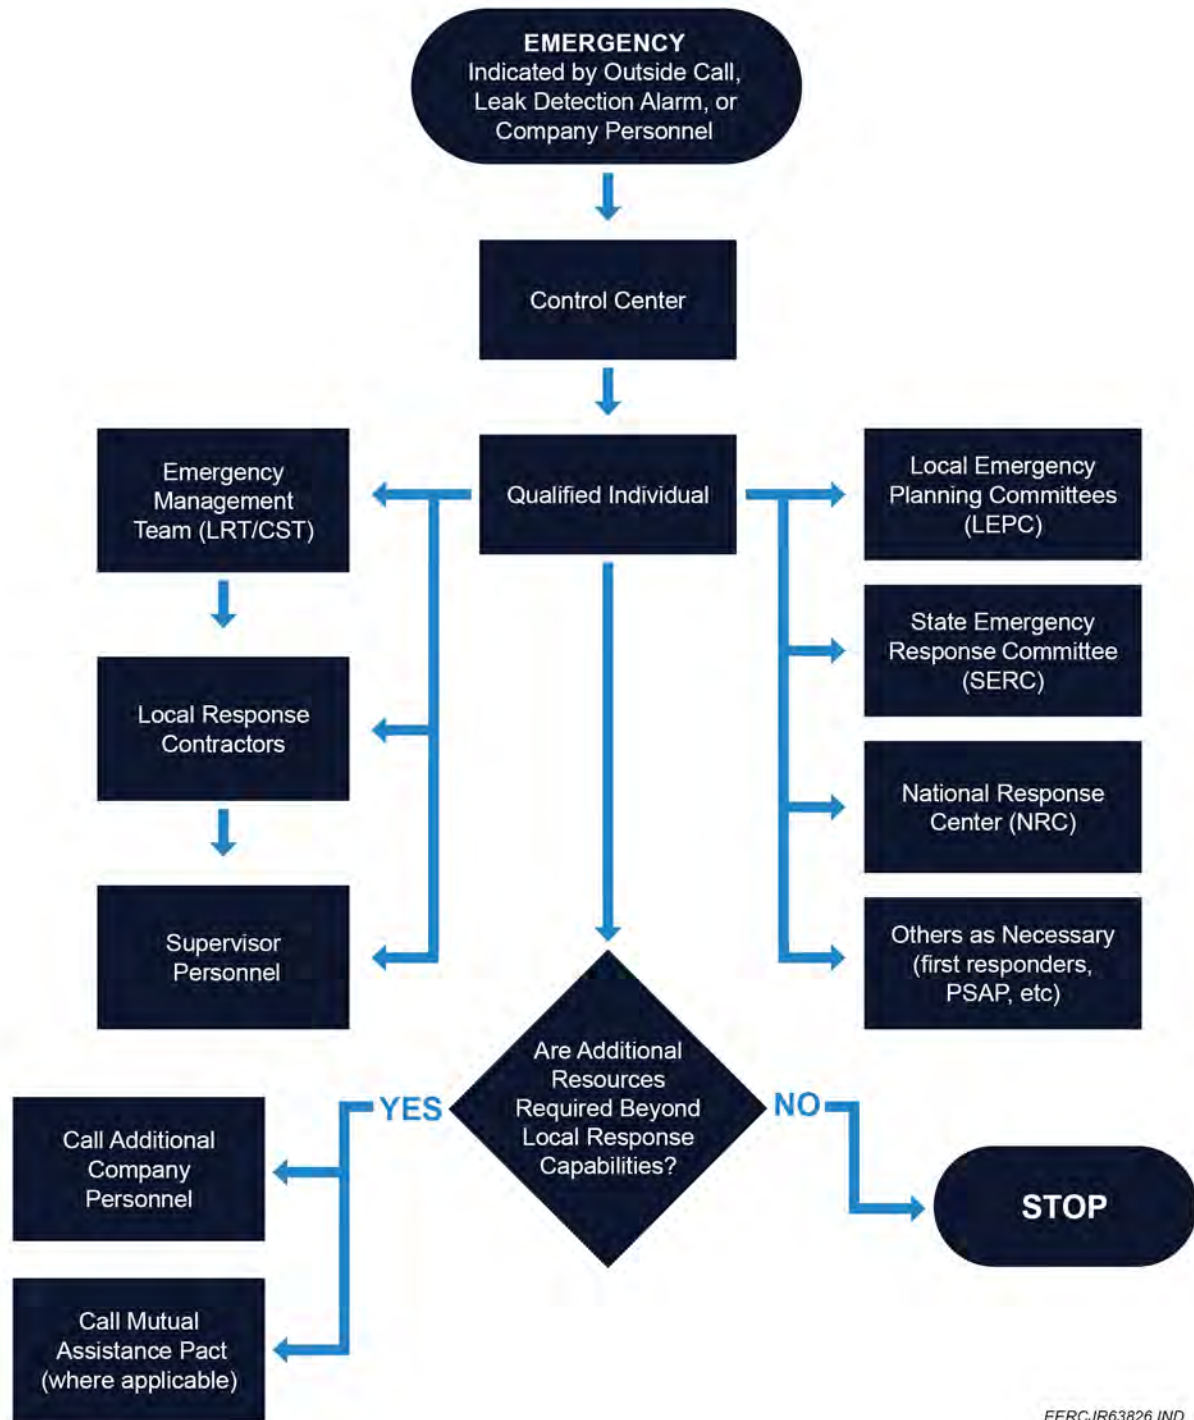

The LRT will fill the necessary positions and request additional support from the CST (defined below) to fill/back up any additional positions necessitated by the incident. Detailed job descriptions of the response team positions are provided within this plan.

#### **7.5.6 *Company Support Team (CST)***

The QI and IC may decide to mobilize a CST if there are any response operations outside the LRT's capabilities. The members of the LRT will typically become members of the CST.

The CST, once fully staffed, is designed to cover all aspects of a comprehensive and prolonged incident response. The number of positions/personnel required to staff the CST will depend on the size and complexity of the incident. During a prolonged response, additional personnel may be cascaded in to fill additional ICS positions or relieve responding personnel.

The CST is staffed by trained personnel from various company locations and by various contract resources as the situation requires.

EERC-JR63826.IND

Figure 7-6. Emergency notification flowchart.

### ***7.5.7 Preplanning Emergency Response Activities with Public Safety Answering Point, Fire, Police, and Other Public Officials***

To enhance cooperation during an incident response, the company will liaise with agency responders and public officials, including participating in emergency tabletop exercises, coordinating meetings to discuss hazards and emergency response, and conducting facility tours or open houses. These and other public outreach activities will be included in the Public Awareness Program that will be developed and implemented prior to commencing operation of the pipeline.

### ***7.5.8 Required Controller Actions***

Pipeline Control actions during emergency response actions will be detailed in the control room management plan that will be developed and implemented prior to commencing pipeline operations. Generally, the actions will include:

- Identifying abnormal operating conditions, including potential pipeline ruptures.
- Confirmation of abnormal conditions.
- Specific steps to take in response to certain abnormal conditions, including closing valves, notifications internal to the company, and notifications external to agency responders.
- Specific steps to take following pipeline shutdown to reestablish pipeline operations.

## **7.6 Emergency Communications Plan**

In the event of an emergency, the facility response plan contains an ICS which specifies the organization of a facility response team, team member roles, and team member responsibilities. The company organizational structure is still in development. The company will provide updated specific identification and contact information for each member of the facility response team. In the event of an emergency, as outlined in N.D.A.C. § 43-05-01-13(2), DMR-O&G will be notified within 24 hours (Table 7-7).

**Table 7-7. DMR-O&G UIC Program Management Contact**

<b>Company</b>	<b>Service</b>	<b>Location</b>	<b>Phone</b>
DMR-O&G	Class VI/CCUS	Bismarck, ND	701.328.8020

The QI or QI designee is responsible for establishing and maintaining communications with appropriate off-site persons and/or agencies as provided in Figure 7-2 and Table 7-4. Table 7-8 lists available contractors and service providers.

Lastly, the facility response plan contact list also includes addresses and contact information for the neighboring facilities and occupied residences located within a 1-mi radius of the geologic storage project. Because indicated local and regional emergency agencies (Figure 7-2 and Table 7-4) are provided a copy of the facility response plan, the QI or QI designee may rely upon emergency agency assistance when it is necessary and appropriate to alert the applicable neighboring facilities and residents in order to allow the company to focus time and resources on response measures.

## **7.7 ERRP Review and Updates**

This ERRP shall be reviewed:

- At least annually following its approval by DMR-O&G.
- Within 1 year of an AOR reevaluation.
- Within a prescribed period (to be determined by DMR-O&G) following any significant changes to the project, (e.g., injection process, the injection rate).
- As required by DMR-O&G.

If the review indicates that no amendments to the ERRP are necessary, the company will provide the documentation supporting the “no amendment necessary” determination to the DMR-O&G Director.

If the review indicates that amendments to the ERRP are necessary, SCS1 will make and submit amendments to DMR-O&G as soon as reasonably practicable. In no event, however, shall it do so more than 1 year following the commencement of a review.

## **SECTION 8.0**

### **WORKER SAFETY PLAN**

## 8.0 WORKER SAFETY PLAN

Summit Carbon Storage #1, LLC (SCS1) requires all employees and contractors to follow the SCS1 Worker Safety Plan (WSP) for TB Leingang. SCS1 maintains and implements a safety program that meets all state and federal requirements for worker safety protections, including the Occupational Safety and Health Administration (OSHA) and the National Fire Protection Association (NFPA). The safety program is described in this WSP. SCS1 will periodically review the WSP, and if substantive changes are warranted, the revised WSP will be provided to the Department of Mineral Resources, Oil and Gas Division (DMR-O&G). Controlled copies of the WSP are available at SCS1's nearest operational office and at the geologic storage facility (North Dakota Administrative Code [N.D.A.C.] § 43-05-01-13).

The WSP outlines steps to protect the health and safety of employees, contractors, and visitors while working near and around CO<sub>2</sub>. Specific topics included in the WSP are, but are not limited to, the following:

- A list of safety training programs, including annual CO<sub>2</sub> safety training, annual safe-working procedures training, and annual Emergency and Remedial Response Plan (ERRP) training, as well as the review frequency for the safety training programs and, if necessary, updates. A record of training completions, including the trainee's name, date and type of training, and the signatures (or other acceptable acknowledgment/documentation) of the trainee and trainer are maintained and available upon request.
- A site-specific list of potential hazards of working near and around CO<sub>2</sub>.
- Processes for determining causes of incidents and implementing appropriate emergency response actions.
- Requirements for employees to perform duties in ways that prevent the discharge of CO<sub>2</sub>.
- Personal protective equipment (PPE) policies for employees while performing their duties, including guidelines for selecting, using, and maintaining PPE.
- New-hire, contractor, and visitor protocols to ensure all on-site individuals are appropriately trained and are aware of the potential hazards of CO<sub>2</sub>.
- Drug, alcohol, and controlled substances policy complying with all governmental laws and regulations in the workplace and consequences for those who violate the policy.
- Reporting guidelines for all injuries; equipment or property damages; leaks, spills, or releases; or other health, safety, and environmental (HSE)-related incidents.

Only SCS1 employees and contractor personnel who have been properly trained can participate in the on-site activities of drilling, construction, operations, and equipment repair.

## **SECTION 9.0**

# **WELL CASING AND CEMENTING PROGRAM**

**9.0 WELL CASING AND CEMENTING PROGRAM**

Summit Carbon Storage #1, LLC (SCS1) plans to construct two CO<sub>2</sub> injection wells TB Leingang 1 (API 33-065-00026, North Dakota Industrial Commission [NDIC] File No. 40158) and TB Leingang 2 (API 33-065-00027, NDIC File No. 40178) and reenter and convert the Milton Flemmer 1 stratigraphic test well (API 33-057-00041, NDIC File No. 38594) into a reservoir-monitoring well. The following information represents the current proposed state for TB Leingang 1 (Figures 9-1 and 9-2, Tables 9-1 through 9-4) and TB Leingang 2 (Figures 9-3 and 9-4, Tables 9-5 through 9-8), the current, as-constructed state for Milton Flemmer 1 (Figure 9-5, Tables 9-9 through 9-12), and a radial cement bond log (RCBL) evaluation summary for Milton Flemmer 1 (Figure 9-6).

**9.1 TB Leingang 1: Proposed Injection Well Casing and Cementing Programs**

The proposed state of TB Leingang 1 is provided in Figure 9-1. TB Leingang 1 is a deviated well. The well surface location, well trajectory, and bottomhole target location are provided in Figure 9-2. This fieldwork information may change based on field conditions and operational challenges. The information below is the best knowledge available at the time of drafting this permit application.

Table 9-1 provides well information for TB Leingang 1. Tables 9-2 through 9-4 provide the casing and cement programs for TB Leingang 1 and have been updated according to the proposed drilling estimate for 2025. The tables demonstrate compliance with North Dakota Administrative Code (N.D.A.C.) § 43-05-01. In addition, the materials used for construction satisfy the requirements of N.D.A.C. § 43-05-01-11 for a CO<sub>2</sub> injection well.

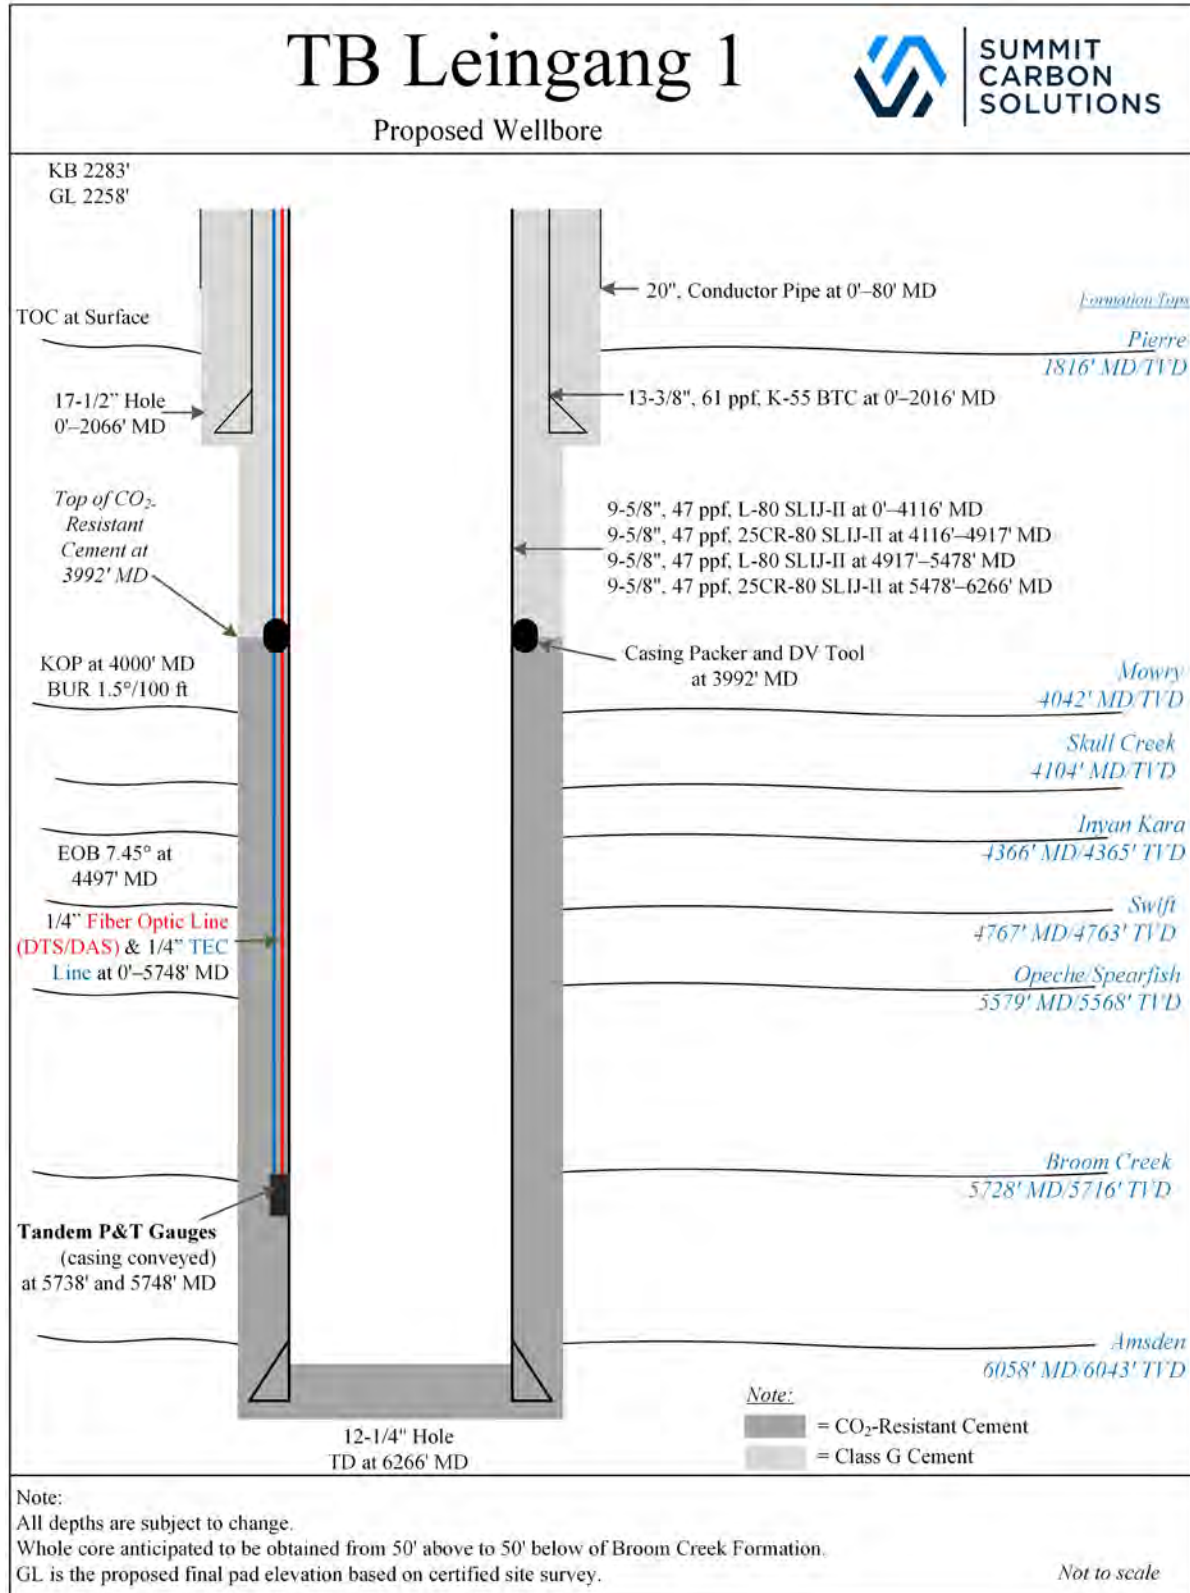

Figure 9-1. TB Leingang 1 proposed wellbore schematic.

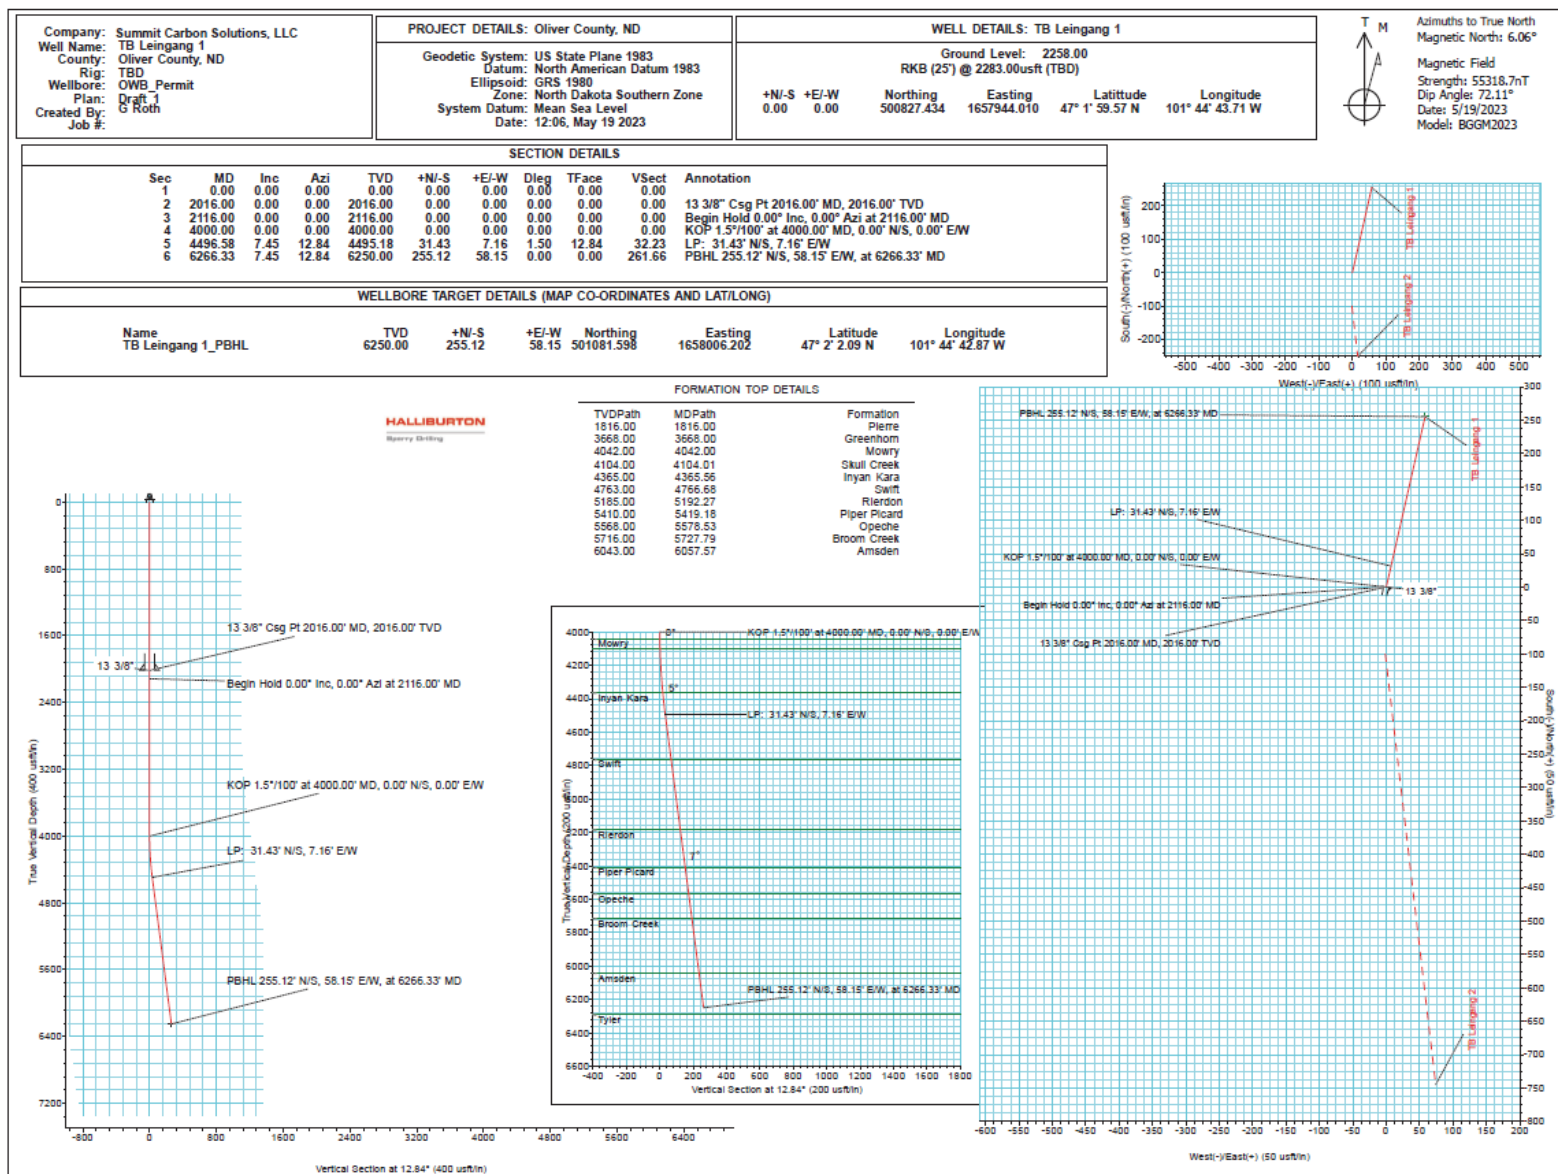

Figure 9-2. TB Leingang 1 proposed wellbore trajectory.

### 9.3 Milton Flemmer 1: As-Constructed CO<sub>2</sub> Monitoring Well Casing and Cementing Programs

The Milton Flemmer 1 well was permitted and drilled as a stratigraphic test well in November 2021 by the original operator, Summit Carbon Solutions, LLC (SCS). The Milton Flemmer 1 well was constructed and operated in compliance with N.D.A.C. § 43-05-01 requirements, bonded in accordance with N.D.A.C. § 43-02-03-15, and temporarily abandoned (TA) in accordance with N.D.A.C. § 43-02-03-55. As of December 2023, SCS has transferred ownership and operation of the Milton Flemmer 1 (API 33-057-00041, NDIC File No. 38594) well to SCS1 in accordance with N.D.A.C. § 43-02-03-15. Future plans for the Milton Flemmer 1 include utilizing the well as a reservoir-monitoring well. The as-constructed state of Milton Flemmer 1 is shown in Figure 9-5. The isolation scanner log, generally called an ultrasonic imaging tool (USIT), was deployed to determine the cement bond quality radially and provide a casing-inspection log. The isolation scanner log result is provided in Figure 9-6.

Table 9-9 provides well information for Milton Flemmer 1. Tables 9-10 through 9-12 provide the casing and cementing programs for Milton Flemmer 1 and have been updated according to the drilling performed in November 2021.

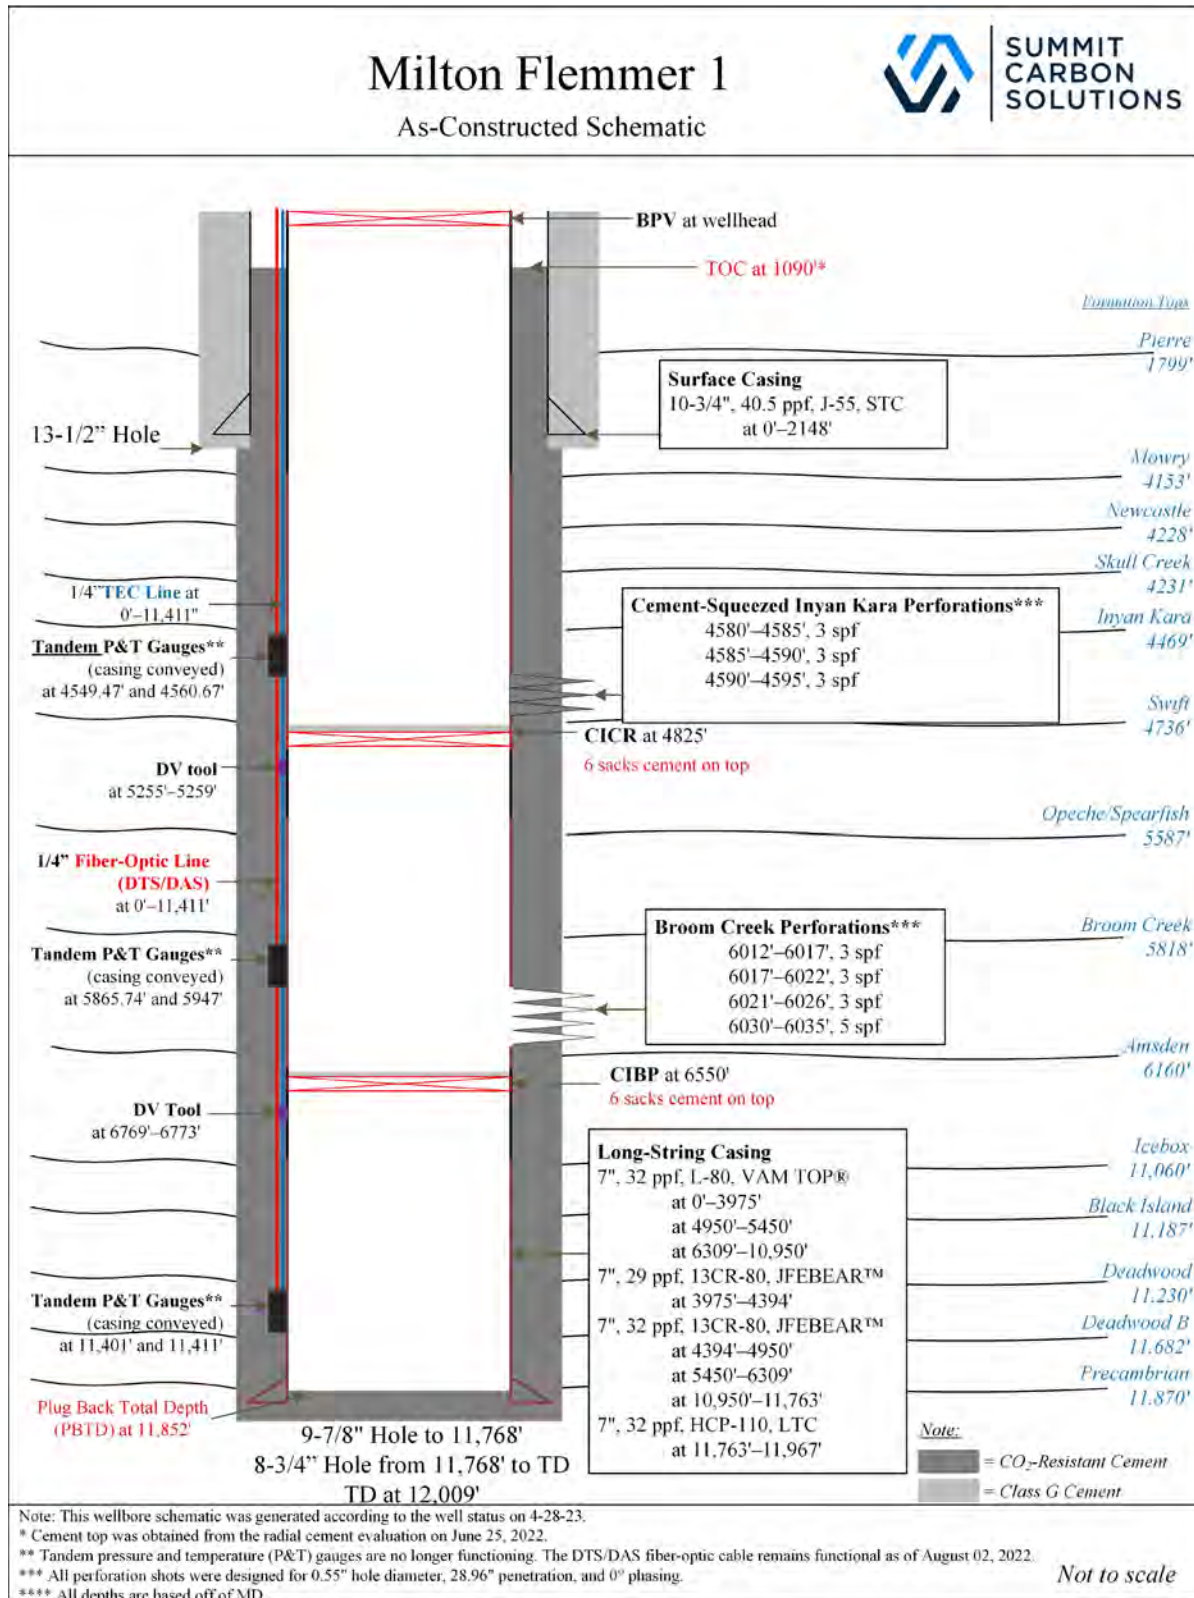

Figure 9-5. Milton Flemmer 1 as-constructed wellbore schematic.

	7.00	CorrosaCem	Tail	Stage 3	12.2		1000
	Stage 3 Through DV Tool at 5255–5259 ft, MD						
	7.00	CorrosaCem	Single	Stage 2	13.5	5255–6769	845
	Stage 2 Through DV Tool at 6769–6773 ft, MD						
	7.00	CorrosaCem	Single	Stage 1	13.0	6769–11,967	1440

\* The cement intervals are based on the designed volumes in the cementing post job report. According to Halliburton, it is not possible to distinguish where CorrosaCem ends and EconoCem GWS 1 begins, but the isolation scanner illustrates isolation in the CO<sub>2</sub> injection zone (Figure 9-6), confining zones, and USDWs.

\*\* On December 8, 2021, a top job was performed on the surface section. The job was a single-type Class G cement, with a slurry weight of 15.8 ppg. The interval for this job ranged from 0 to 110 feet.

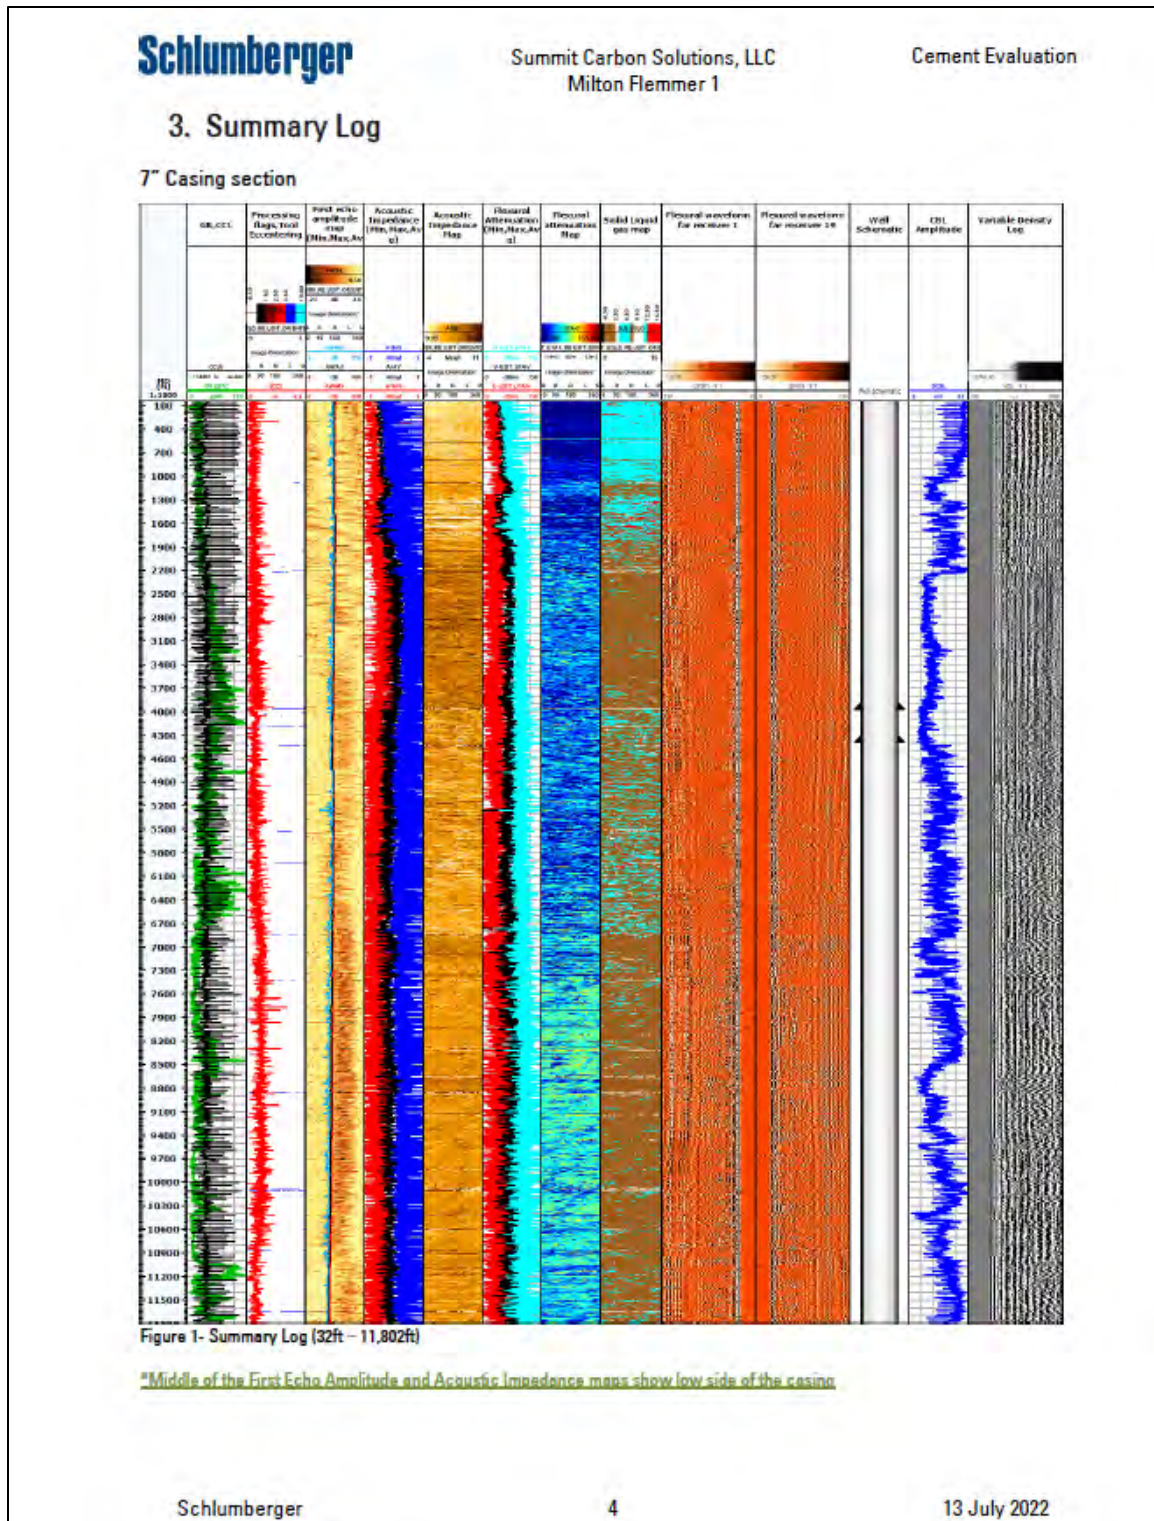

Figure 9-6. Milton Flemmer 1 cement evaluation—RCBL from Milton Flemmer 1 verifies the cement bond quality. Using a high-resolution image, the analyst can assess isolation in the CO<sub>2</sub> injection zone, confining zones, and USDWs.

**SECTION 10.0**  
**PLUGGING PLAN**

**10.0 PLUGGING PLAN**

The proposed plug and abandonment (P&A) procedures for the TB Leingang 1 and TB Leingang 2 wells are intended to be interpreted as proposed conditions and do not reflect the current as-proposed state for the wells. The proposed plugging procedure for the Milton Flemmer 1 does not reflect the current as-constructed state but the anticipated construction state at the time of abandonment during site closure. Plugging operations will likely occur at different times in the life cycle of the injector wells (TB Leingang 1 and TB Leingang 2) and the reservoir-monitoring well (Milton Flemmer 1). The injection wells (TB Leingang 1 and TB Leingang 2) are planned for P&A once the CO<sub>2</sub> injection operation ceases. The reservoir-monitoring well (Milton Flemmer 1) is planned for P&A after verification and the Department of Mineral Resources, Oil and Gas Division (DMR-O&G) has approved that the CO<sub>2</sub> plume has stabilized.

A proposed P&A procedure will be provided to DMR-O&G. Final procedures and requirements will be determined and approved at the time of abandonment. A CO<sub>2</sub>-resistant cement plug will be placed across the CO<sub>2</sub> storage reservoir in addition to cement across other zones, as deemed necessary for isolation of oil-bearing zones, nitrogen zones, etc. After approval, ample notification will be given to allow a DMR-O&G representative to be present during the plugging operations. The P&A events will be documented by a workover supervisor during P&A execution. The records of the P&A events shall demonstrate the utilization of CO<sub>2</sub>-compatible materials and complete isolation of the injection zone as per North Dakota underground injection control (UIC) Class VI requirements.

**10.1 TB Leingang 1: Proposed Injection Well P&A Program**

The TB Leingang 1 CO<sub>2</sub> injection well proposed completion schematic is provided in Figure 10-1. The proposed schematic is based on current information. The proposed P&A program may change based on the best knowledge available at the time of execution. The proposed P&A program may also change based on well response during the actual P&A procedures.

Figure 10-1. TB Leingang 1 proposed completion wellbore schematic.

DMR-O&G will be contacted, and an intent to P&A for TB Leingang 1 will be filed in NorthSTAR for approval. Final adjustments to the proposed P&A procedure will be made based on current wellbore conditions and DMR-O&G field inspector recommendations. Currently, the proposed P&A procedure for the well is as follows.

Proposed P&A Procedure

1. The procedures described below are subject to modification during execution as necessary to ensure a successful plugging operation. Any significant modifications, as per DMR-O&G approval, due to unforeseen circumstances will be described in the plugging report.
2. After injection operations have been terminated, the well will be flushed with kill fluid, which should be calculated from downhole gauges for proper fluid weight. A sufficient volume will be pumped to kill the well while remaining below the fracture pressure and ensuring control of the well.
3. Contact DMR-O&G supervisor and/or DMR-O&G field inspector 24 hours (hr) prior to moving onto location.
4. Dig out surface casing valve, and bleed off. Confirm most recent date of pull test. Pull test deadman anchors, if required. May require installing new deadman anchors depending on results.
5. Move in and rig up (MIRU) workover rig and surface equipment onto the TB Leingang 1 well. All CO<sub>2</sub> flowlines and valves will be marked and noted by the rig supervisor prior to MIRU.
6. Conduct and document a safety meeting. Check pressure at wellhead, and ensure pressure is off prior to starting work. Additional kill fluid may be needed.
7. Nipple-up (NU) lubricator, and install backpressure valve (BPV) in tubing hanger. Nipple-down (ND) Christmas tree, NU blowout preventer (BOP). Recover BPV, and install test plug. Test BOP for functionality. Pressure-test BOP to 80% of working pressure. Document BOP test.
8. Recover test plug. Connect a 7-in. work joint to the tubing hanger, and POOH (pull out of hole) until tubing hanger is unseated.
9. Release tubing from packer following the packer manufacturer instructions. Trip out of hole (TOOH) with 7-in. corrosion-resistant alloy (CRA) tubing string, and lay down.

Contingency: If unable to release tubing from packer, rig up (RU) electric line, and make a cut on the tubing string just above the packer. Pull the tubing string out of hole, and proceed to the next step. If problems are noted, update the cement remediation plan.

10. Pick up (PU) 2 $\frac{7}{8}$ -in. work string, and stand in derrick. PU bit and scraper, and trip in hole (TIH) to top of packer. Perform reverse circulation, pump down casing annulus and up the work string to clean hole. TOO H with work string, bit, and scraper.
11. PU cast iron cement retainer (CICR) and stinger, and TIH to depth. Set CICR 20 ft above packer.
12. Spot cement equipment and RU, preparing to squeeze across Broom Creek Formation perforations and balance plugs.
13. Conduct and document a safety meeting prior to pumping cement. Ensure all materials are on location and accounted for. Confirm volumes, tests, procedures, operating equipment, and setting times with cement provider. Ensure **CO<sub>2</sub>-resistant cement** is used for Broom Creek and Inyan Kara intervals. All other cement plugs should be of Class G grade or equivalent.
14. Pressure-test lines prior to pumping. Sting in and establish injection rate. Proceed with squeezing Broom Creek Formation perforations per cementer's planned procedures with 260 sacks (sx) of 15.2 pounds per gallon (ppg), 0.92 ft<sup>3</sup>/sx **CO<sub>2</sub>-resistant cement** and under displace 5 barrels of cement. Sting out of retainer, and finish displacing the last 5 barrels on top of the cement retainer. Check for flow. Pull work string above the plug.
15. Pressure-test casing to 1000 psi for 30 minutes or as approved by DMR-O&G. Record mechanical integrity test on casing. Circulate wellbore clean. TOO H with stinger and work string standing in derrick, and rig down (RD) stinger.

Contingency: If pressure test failed, a cast iron bridge plug (CIBP) will be set below each subsequent plug until casing test passes.

16. If needed, RU logging unit. Confirm external mechanical integrity by running one of the tests listed below as options, and RD logging truck:
  - Activated neutron log
  - Noise log
  - Production logging tool (PLT)
  - Tracers
  - Temperature log
  - DTS (distributed temperature sensing) survey (no required logging unit)

Note: If external failure in long-string casing is identified, the operator will adjust the P&A plan with DMR-O&G's approval.

17. If pressure test failed, set a CIBP prior to pumping balanced plug. TIH with work string and diffuser to depth of Plug 2. Pump 270 sx of 15.2 ppg, 0.92 ft<sup>3</sup>/sx **CO<sub>2</sub>-resistant cement** balanced plug as designed from cementer's proposed procedures across Inyan Kara interval.
18. Pull up work string above the top of the plug, and test casing. Circulate wellbore clean.

19. Set a CIBP prior to pumping Plug 3 if previous test failed. TOO H to depth of Plug 3. Pump 95 sx of 15.8 ppg, 1.15 ft<sup>3</sup>/sx Class G cement at 2116 ft. Pull up work string above the top of the plug, and circulate wellbore clean.
20. TOO H laying down work string to 90 ft. Pump 40 sx of 15.8 ppg, 1.15 ft<sup>3</sup>/sx Class G cement plug at 90 ft. Lay down all work string.

Contingency: Perform top job as necessary to ensure good cement on both sides.

21. RD all equipment, and move out.
22. Dig out wellhead and cut off casing 5-ft below ground level (GL). Weld ½-in. steel cap on casing with well name, date inscribed, and information that it was used for CO<sub>2</sub> injection.
23. Dig out deadman anchors. Report photos of steel cap to DMR-O&G.
24. Within 60 days, submit Form 7 plugging report after plugging operations are complete (N.D.A.C. § 43-05-01-11.5[4]).
25. Submit notice of intent to reclaim to DMR-O&G 30 days in advance prior to reclamation (N.D.A.C. § 43-05-01-18[10][d]).

The proposed P&A plan for TB Leingang 1 is summarized in Table 10-1 and provided in Figure 10-2. These values are estimated; final volume and thickness of plugs will be determined by design at time of plugging.

**Table 10-1. Summary of P&A Plan for TB Leingang 1**

<b>Cement Plug No.</b>	<b>Cement Type</b>	<b>Weight, ppg</b>	<b>Yield, ft<sup>3</sup>/sx</b>	<b>Interval, ft, MD</b>	<b>Thickness, ft</b>	<b>Volume, sx</b>	<b>Notes</b>
Plug 4	Class G	15.8	1.15	0–90	90	40	Surface plug
Plug 3	Class G	15.8	1.15	1866–2116	250	95	Isolate Fox Hills Formation at base of surface casing
Plug 2	CO <sub>2</sub> - resistant	15.2	0.92	4166–4766	600	270	Isolate Inyan Kara Formation from Fox Hills Formation
Plug 1	CO <sub>2</sub> - resistant	15.2	0.92	5698–6266	568	260	Squeeze perforations and mechanically isolate Broom Creek Formation

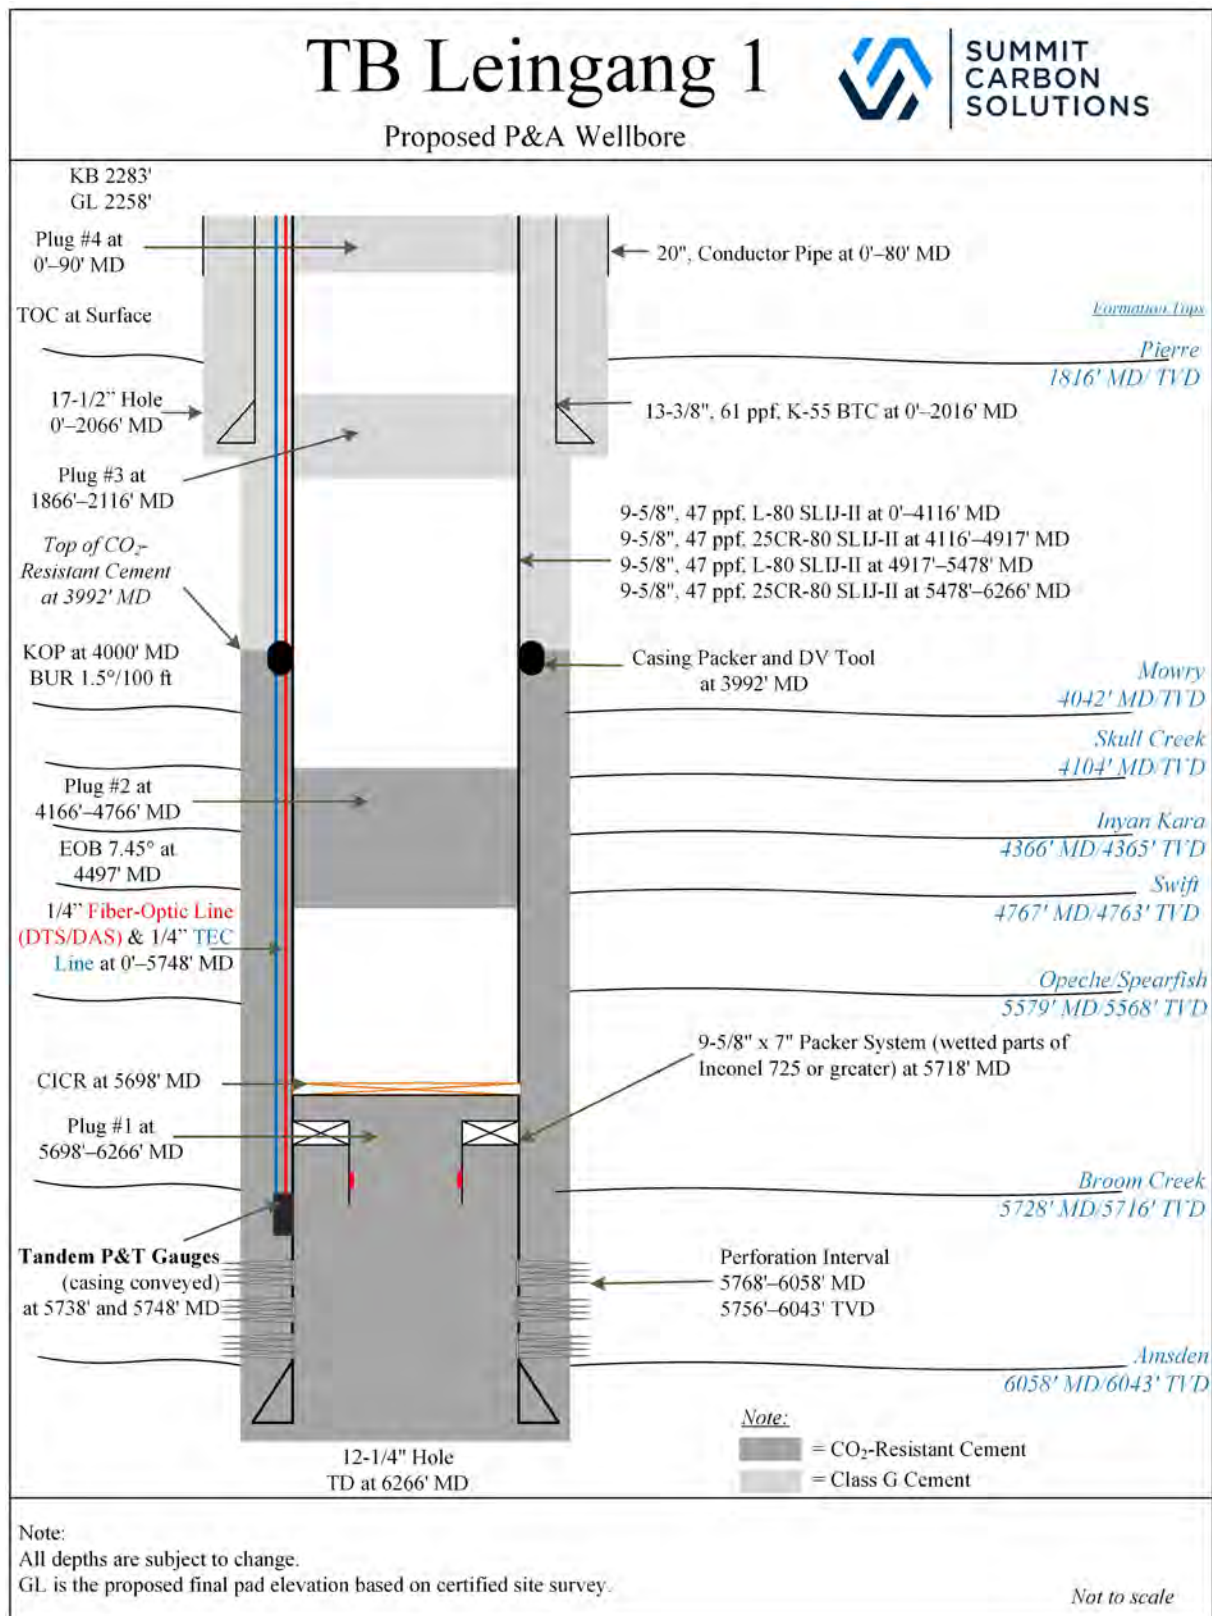

Figure 10-2. TB Leingang 1 proposed P&A wellbore schematic.

## **10.2 TB Leingang 2: Proposed Injection Well P&A Program**

The TB Leingang 2 CO<sub>2</sub> injection well proposed completion schematic is provided in Figure 10-3. The proposed schematic is based on current information. The proposed P&A program may change based on the best knowledge available at the time of execution. The proposed P&A program may also change based on well response during the actual P&A procedures.

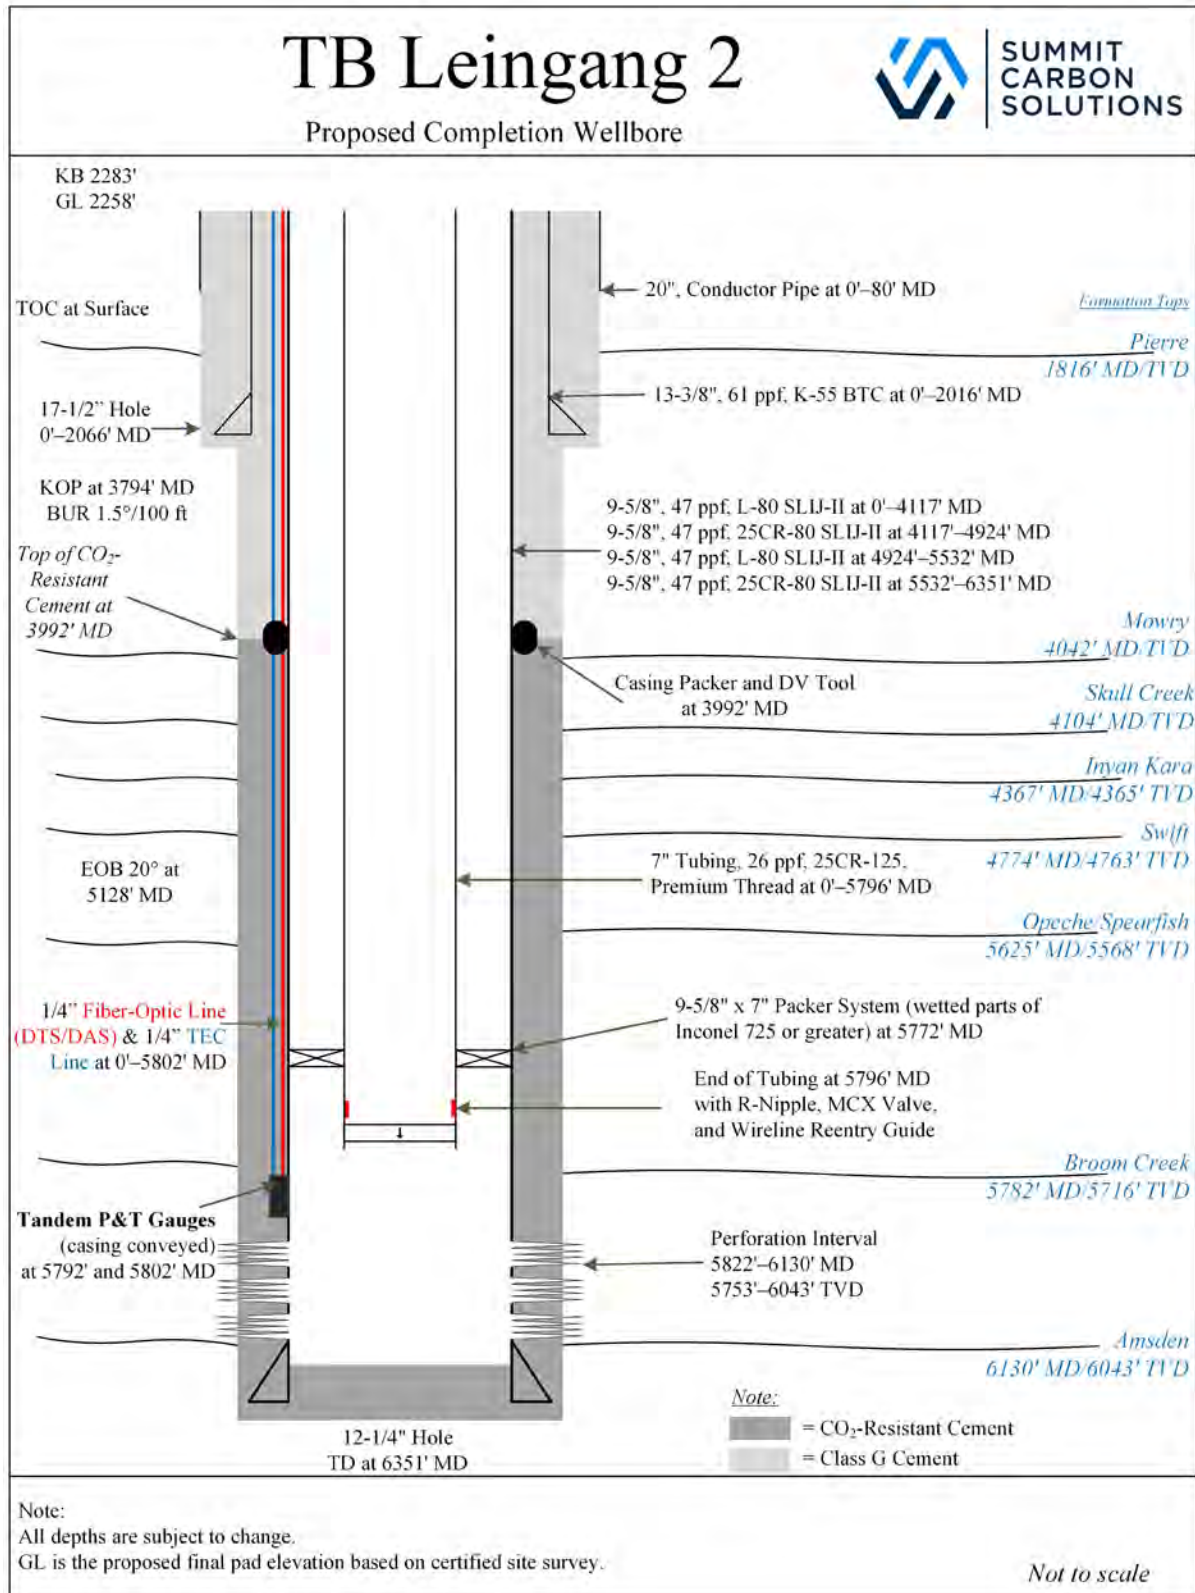

Figure 10-3. TB Leingang 2 proposed completion wellbore schematic.

DMR-O&G will be contacted, and an intent to P&A for TB Leingang 2 will be filed in NorthSTAR for approval. Final adjustments to the proposed P&A procedure will be made based on current wellbore conditions and DMR-O&G field inspector recommendations. Currently, the proposed P&A procedure for the well is as follows.

Proposed P&A Procedure:

1. The procedures described below are subject to modification during execution as necessary to ensure a successful plugging operation. Any significant modifications, as per DMR-O&G approval, due to unforeseen circumstances will be described in the plugging report.
2. After injection operations have been terminated, the well will be flushed with kill fluid, which should be calculated from downhole gauges for proper fluid weight. A sufficient volume will be pumped to kill the well while remaining below the fracture pressure and ensuring control of the well.
3. Contact DMR-O&G supervisor and/or DMR-O&G field inspector 24 hr prior to moving onto location.
4. Dig out surface casing valve, and bleed off. Confirm most recent date of pull test. Pull test deadman anchors if required. May require installing new deadman anchors depending on results.
5. MIRU workover rig and surface equipment onto the TB Leingang 2 well. All CO<sub>2</sub> flowlines and valves will be marked and noted by the rig supervisor prior to MIRU.
6. Conduct and document a safety meeting. Check pressure at wellhead, and ensure pressure is off prior to starting work. Additional kill fluid may be needed.
7. NU lubricator, and install BPV in tubing hanger. ND Christmas tree, NU BOP. Recover BPV, and install test plug. Test BOP for functionality. Pressure-test BOP to 80% of working pressure. Document BOP test.
8. Recover test plug. Connect a 7-in. work joint to the tubing hanger, and POOH until tubing hanger is unseated.
9. Release tubing from packer following the packer manufacturer instructions. TOO H with 7-in. CRA tubing string, and lay down.

Contingency: If unable to release tubing from packer, RU electric line, and make a cut on the tubing string just above the packer. Pull the tubing string out of hole, and proceed to the next step. If problems are noted, update the cement remediation plan.

10. PU 2 $\frac{7}{8}$ -in. work string, and stand in derrick. PU bit and scraper, and TIH to top of packer. Perform reverse circulation, pump down casing annulus and up the work string to clean hole. TOO H with work string, bit, and scraper.

11. PU CICR and stinger, and TIH to depth. Set CICR 20 ft above packer.
12. Spot cement equipment, and RU. Prepare to squeeze across Broom Creek Formation perforations and balance plugs.
13. Conduct and document a safety meeting prior to pumping cement. Ensure all materials are on location and accounted for. Confirm volumes, tests, procedures, operating equipment, and setting times with cement provider. Ensure **CO<sub>2</sub>-resistant cement** is used for Broom Creek and Inyan Kara intervals. All other cement plugs should be of Class G grade or equivalent.
14. Pressure-test lines prior to pumping. Sting in, and establish injection rate. Proceed with squeezing Broom Creek Formation perforations per cementer's planned procedures with 280 sx of 15.2 ppg, 0.92 ft<sup>3</sup>/sx **CO<sub>2</sub>-resistant cement** and under displace 5 barrels of cement. Sting out of retainer, and finish displacing the last 5 barrels on top of the cement retainer. Check for flow. Pull work string above the plug.
15. Pressure-test casing to 1000 psi for 30 minutes or as approved by DMR-O&G. Record mechanical integrity test on casing. Circulate wellbore clean. TOOH with stinger and work string standing in derrick, and RD stinger.

Contingency: If pressure test failed, a CIBP will be set below each subsequent plug until casing test passes.

16. If needed, RU logging unit. Confirm external mechanical integrity by running one of the tests listed below as options, and RD logging truck:
  - Activated neutron log
  - Noise log
  - PLT
  - Tracers
  - Temperature log
  - DTS survey (no required logging unit)

Note: If external failure in long-string casing is identified, the operator will adjust the P&A plan with DMR-O&G's approval.

17. If pressure test failed, set a CIBP prior to pumping balanced plug. TIH with work string and diffuser to depth of Plug 2. Pump 270 sx of 15.2 ppg, 0.92 ft<sup>3</sup>/sx **CO<sub>2</sub>-resistant cement** balanced plug as designed from cementer's proposed procedures across Inyan Kara interval.
18. Pull up work string above the top of the plug and test casing. Circulate wellbore clean.
19. Set a CIBP prior to pumping Plug 3 if previous test failed. TOOH to depth of Plug 3. Pump 95 sx of 15.8 ppg, 1.15 ft<sup>3</sup>/sx Class G cement at 2116 ft. Pull up work string above the top of the plug and circulate wellbore clean.

20. TOOH laying down work string to 90 ft. Pump 40 sx of 15.8 ppg, 1.15 ft<sup>3</sup>/sx Class G cement plug at 90 ft. Lay down all work string.

Contingency: Perform top job as necessary to ensure good cement on both sides.

21. RD all equipment and move out.
22. Dig out wellhead and cut off casing 5-ft below GL. Weld ½-in. steel cap on casing with well name, date inscribed, and information that it was used for CO<sub>2</sub> injection.
23. Dig out deadman anchors. Report photos of steel cap to DMR-O&G.
24. Within 60 days, submit Form 7 plugging report after plugging operations are complete (N.D.A.C. § 43-05-01-11.5[4]).
25. Submit notice of intent to reclaim to DMR-O&G 30 days in advance prior to reclamation (N.D.A.C. § 43-05-01-18[10][d]).

The proposed P&A plan for TB Leingang 2 is summarized in Table 10-2 and provided in Figure 10-4. These values are estimated; final volume and thickness of plugs will be determined by design at time of plugging.

**Table 10-2. Summary of P&A Plan for TB Leingang 2**

<b>Cement Plug No.</b>	<b>Cement Type</b>	<b>Weight, ppg</b>	<b>Yield, ft<sup>3</sup>/sx</b>	<b>Interval, ft, MD</b>	<b>Thickness, ft</b>	<b>Volume, sx</b>	<b>Notes</b>
Plug 4	Class G	15.8	1.15	0–90	90	40	Surface plug
Plug 3	Class G	15.8	1.15	1866–2116	250	95	Isolate Fox Hills Formation at base of surface casing
Plug 2	CO <sub>2</sub> - resistant	15.2	0.92	4168–4768	600	270	Isolate Inyan Kara Formation from Fox Hills Formation
Plug 1	CO <sub>2</sub> - resistant	15.2	0.92	5752–6351	599	280	Squeeze perforations and mechanically isolate Broom Creek Formation

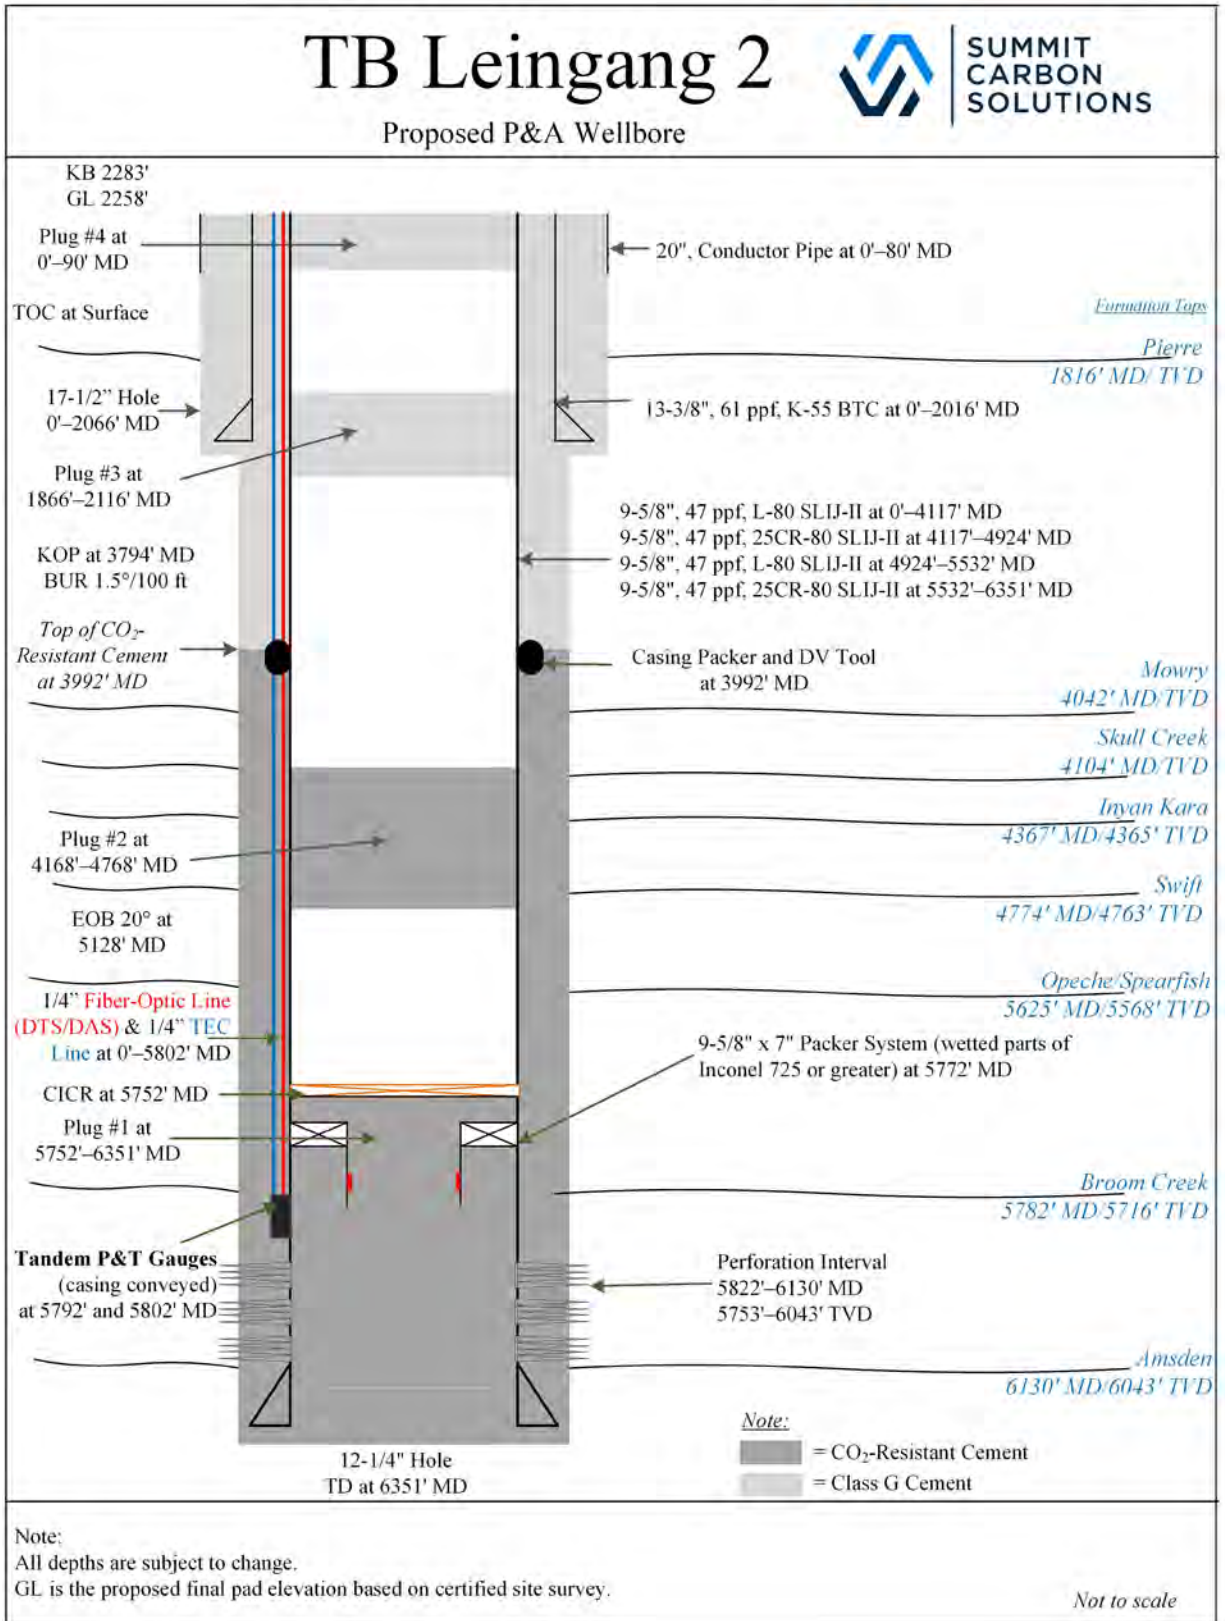

Figure 10-4. TB Leingang 2 proposed P&A wellbore schematic.

### **10.3 Milton Flemmer 1: Proposed Reservoir-Monitoring Well P&A Program**

The Milton Flemmer 1 wellbore will be P&A when the CO<sub>2</sub> plume has stabilized and monitoring of the plume extent is no longer necessary. A proposed reservoir-monitoring well completion schematic of Milton Flemmer 1 is provided in Figure 10-5. Described in Section 11.3, proposed completion procedure of Milton Flemmer 1, including plugback procedures, will be conducted prior to injection operations. The proposed P&A program may change based on the best knowledge available at the time of execution. The proposed P&A program may also change based on well response during the actual P&A procedures.

Figure 10-5. Milton Flemmer 1 proposed completion wellbore schematic.

DMR-O&G will be contacted, and an intent to P&A for Milton Flemmer 1 will be filed in NorthSTAR for approval. Final adjustments to the proposed P&A procedure will be made based on current wellbore conditions and DMR-O&G field inspector recommendations. Currently, the proposed P&A procedure for the well is as follows.

Proposed P&A Procedure:

1. The procedures described below are subject to modification during execution as necessary to ensure a successful plugging operation. Any significant modifications, as per DMR-O&G approval, due to unforeseen circumstances will be described in the plugging report.
2. After monitoring operations have been terminated, the well will be flushed with kill fluid, which should be calculated from downhole gauges for proper fluid weight. A sufficient volume will be pumped to kill the well while remaining below the fracture pressure and ensuring control of the well.
3. Contact DMR-O&G supervisor and/or DMR-O&G field inspector 24 hr prior to moving onto location.
4. Dig out surface casing valve, and bleed off. Confirm most recent date of pull test. Pull test deadman anchors, if required. May require installing new deadman anchors depending on results.
5. MIRU workover rig and surface equipment onto the Milton Flemmer 1 well.
6. Conduct and document a safety meeting. Check pressure at wellhead, and ensure pressure is off prior to starting work. Additional kill fluid may be needed.
7. Fill tubing with kill fluid. Bleeding off occasionally may be necessary to remove all air from the system. Monitor tubing and annulus pressure.
8. If both casing and tubing are dead, ND wellhead and NU BOP. Install test plug. Test BOP for functionality. Pressure-test BOP to 80% of working pressure. Document BOP test.

Contingency: If the well is not dead or the pressure cannot be bled off via tubing, RU wireline, and set plug in lower-profile nipple below packer. Unlatch the tubing from the packer and circulate tubing and annulus with kill fluid until the well is under control. After casing and tubing pressure are zero, ND Christmas tree, NU BOPs, and perform a function test. Prepare to recover packer with work string in case the packer needs to be unlatched.

9. Unseat tubing hanger. Release 3½-in. tubing, and POOH and lay down tubing, cable, and sensors.

Contingency: If unable to release tubing from the packer, RU electric line, and make a cut on the tubing string just above the packer. Pull the tubing string out of hole, and proceed to the next step. If problems are noted, update the cement remediation plan.

10. Make up (MU) bottomhole assembly (BHA) to include 6-in. bit, mud motor, drill collars, and jars. Tally and TIH BHA and 2<sup>7</sup>/<sub>8</sub>-in. work string and tag packer.
11. Drill out packer. Tally and continue to PU work string and tag CIBP at 6220 ft. Circulate hole clean with 9.8-ppg working fluid.
12. TOOH laying down BHA.
13. Spot and RU cementing equipment. Conduct and document a safety meeting prior to pumping cement. Confirm equipment and setting times with cement provider. Ensure **CO<sub>2</sub>-resistant cement** is used for Broom Creek and Inyan Kara intervals. All other cement plugs should be of Class G grade or equivalent.
14. RU Wireline. PU CICR. Run in hole (RIH) with CICR, and set at 5620 ft.
15. Prepare to perform cement squeeze Broom Creek Formation perforations with **CO<sub>2</sub>-resistant cement**. Tally, TIH, and sting into CICR. Establish injection rate. Mix and pump 145 sx of 15.2 ppg, 0.92 ft<sup>3</sup>/sx CO<sub>2</sub>-resistant cement, squeeze 135 sx into retainer, sting out and spot 10 sx on top.
16. TOOH with stinger and work string, standing in derrick, and RD stinger.
17. TIH open ended to 4870 ft. Prepare to pump Inyan Kara Formation balanced plug with CO<sub>2</sub>-resistant cement. Mix and pump 135 sx of 15.2 ppg, 0.92 ft<sup>3</sup>/sx **CO<sub>2</sub>-resistant cement** across Inyan Kara.
18. TOOH laying down work string to 2250 ft. Mix and pump 50 sx of 15.8-ppg, 1.15 ft<sup>3</sup>/sx Class G cement across surface casing shoe.
19. TOOH. As per cement bond log (CBL), top of cement (TOC) is picked at 1090 ft. Perforate 2-hole squeeze shot at 90 ft. Close BOP blind rams, and break circulation out of surface casing.
20. Pump 45 sx of 15.8 ppg, 1.15 ft<sup>3</sup>/sx Class G cement plug to perforations at 90 ft until cement returns observed at surface. Lay down all work string.  
  
Contingency: Perform top job as necessary to ensure good cement in both 7-in. casing and 7-in. × 10<sup>3</sup>/<sub>4</sub>-in. annulus.
21. ND BOP, RD all equipment, and move out.
22. Dig out wellhead and cut off casing 5-ft below GL. Weld ½-in. steel cap on casing with well name, date inscribed, and information that it was used for CO<sub>2</sub> monitoring.
23. Dig out deadman anchors. Report photos of steel cap to DMR-O&G.

24. Within 60 days, submit Form 7 plugging report after plugging operations are complete (N.D.A.C. § 43-05-01-11.5[4]).
25. Submit notice of intent to reclaim to DMR-O&G 30 days in advance prior to reclamation (N.D.A.C. § 43-05-01-18[10][d]).

The proposed P&A plan for Milton Flemmer 1 is summarized in Table 10-3 and provided in Figure 10-6. These values are estimated; final volume and thickness of plugs will be determined by design at time of plugging.

**Table 10-3. Summary of P&A Plan for Milton Flemmer 1**

<b>Cement Plug No.</b>	<b>Cement Type</b>	<b>Weight, ppg</b>	<b>Yield, ft<sup>3</sup>/sx</b>	<b>Interval, ft, MD</b>	<b>Thickness, ft</b>	<b>Volume, sx</b>	<b>Notes</b>
Plug 9	Class G	15.8	1.15	0–90	90	45	Surface plug
Plug 8	Class G	15.8	1.15	2000–2250	250	50	Isolate Fox Hills Formation at base of surface casing
Plug 7	CO <sub>2</sub> -resistant	15.2	0.92	4270–4870	600	135	Isolate Inyan Kara Formation from Fox Hills Formation
Plug 6	CO <sub>2</sub> -resistant	15.2	0.92	5620–6220	600	145	Squeeze perforations and mechanically isolate Broom Creek Formation
Plug 5*	Class G	15.8	1.15	6730–6980	250	50	Isolate the Madison Group
Plug 4*	Class G	15.8	1.15	8390–8840	450	85	Isolate the Duperow and Bakken
Plug 3*	Class G with 35% silica	15.6	1.50	9120–9570	450	65	Isolate the Interlake and Dawson Bay
Plug 2*	Class G with 35% silica	15.6	1.50	10,215–10,465	250	40	Isolate the Red River
Plug 1*	Class G with 35% silica	15.6	1.50	11,080–11,330	250	40	Isolate the Deadwood

\* Described in Section 11.3, plugs are set during plugback conversion of monitoring well prior to injection operations.

Figure 10-6. Milton Flemmer 1 proposed P&A wellbore schematic.

## **SECTION 11.0**

# **INJECTION WELL AND STORAGE OPERATIONS**

## 11.0 INJECTION WELL AND STORAGE OPERATIONS

This section of the storage facility permit (SFP) application presents the engineering criteria for completing and operating the injection wells in a manner that protects underground sources of drinking water (USDWs). The information presented in Table 11-1 meets the permit requirements for injection well and storage operations (North Dakota Administrative Code [N.D.A.C.] § 43-05-01-05 and § 43-05-01-11.3). Planned well logging, testing, and monitoring activities can be found in Sections 5.0 and 6.0.

**Table 11-1. TB Leingang 1 and TB Leingang 2: Proposed Injection Well Operating Parameters**

Item	Values		Description/Comments
Injected Volume			
Total Injected Mass/Volume	124.4 MMt 6.22 MMt/yr 2,351,294 MMcf	Based on a maximum wellhead pressure (WHP) constraint of 2100 psi and maximum bottomhole pressure (BHP) constraint	
Injection Rates	TB Leingang 1	TB Leingang 2	Description/Comments
Average Injection Rate	8616 tonnes/day (163 MMscf/day) 3.145 MMt/yr 1,188,878 MMcf 62.9 MMt	8425 tonnes/day (159.2 MMscf/day) 3.075 MMt/yr 1,162,416 MMcf 61.5 MMt	Based on a maximum WHP constraint of 2100 psi and maximum BHP constraint
Average Maximum Injection Rate*	25,315 tonnes/day (478.5 MMscf/day) 9.24 MMt/yr 3,492,920 MMcf 184.8 MMt	24,205 tonnes/day (457.5 MMscf/day) 8.835 MMt/yr 3,339,821 MMcf 176.7 MMt	Based on maximum BHP with only one well injecting at a time: TB Leingang 1: 3663 psi TB Leingang 2: 3669 psi
Depth	TB Leingang 1	TB Leingang 2	Description/Comments
Depth (true vertical depth [TVD]) of the top perforation used in the BHP calculation	5668 ft	5678 ft	Depths are for simulation modeling, taken prior to final site survey
Pressure	TB Leingang 1	TB Leingang 2	Description/Comments
Formation Fracture Pressure at Top Perforation	4070 psi	4077 psi	Based on geomechanical analysis of formation fracture gradient as 0.718 psi/ft
Average Surface Injection Pressure	2100 psi	2100 psi	Based on a maximum WHP constraint of 2100 psi and maximum BHP constraint
Maximum Surface Injection Pressure*	5500 psi	5120 psi	Based on maximum BHP with only one well injecting at a time (using the designed 7-inch tubing): TB Leingang 1: 3663 psi TB Leingang 2: 3669 psi

Continued . . .

**Table 11-1. TB Leingang 1 and TB Leingang 2: Proposed Injection Well Operating Parameters (continued)**

Pressure	TB Leingang 1	TB Leingang 2	Description/Comments
Average BHP	3621 psi	3633 psi	Based on a maximum WHP constraint of 2100 psi and maximum BHP constraint
Calculated Maximum BHP	3663 psi	3669 psi	Based on 90% of the formation fracture pressure: 4070 psi for TB Leingang 1 4077 psi for TB Leingang 2

\*Maximum injection pressure during operations will be limited to the surface equipment pressure ratings and maximum BHP constraint.

### **11.1 TB Leingang 1: Proposed Completion Procedure to Conduct Injection Operations**

As described in Section 9.1, the TB Leingang 1 well will be drilled and completed as a CO<sub>2</sub> injector (Figures 11-1 and 11-2 and Tables 11-2, 11-3, and 11-4). The following proposed completion procedure outlines the steps necessary to complete and test the well for injection purposes. The procedures described below are subject to change during execution as necessary to ensure successful completion and/or testing.

Figure 11-1. TB Leingang 1 proposed CO<sub>2</sub>-resistant wellhead schematic. Lowest manual valve of injection tree will be of Class HH material, and the tubing hanger mandrel will be of CRA (corrosion-resistant alloy) material, while the rest of the tree will consist of Class FF and equivalent.

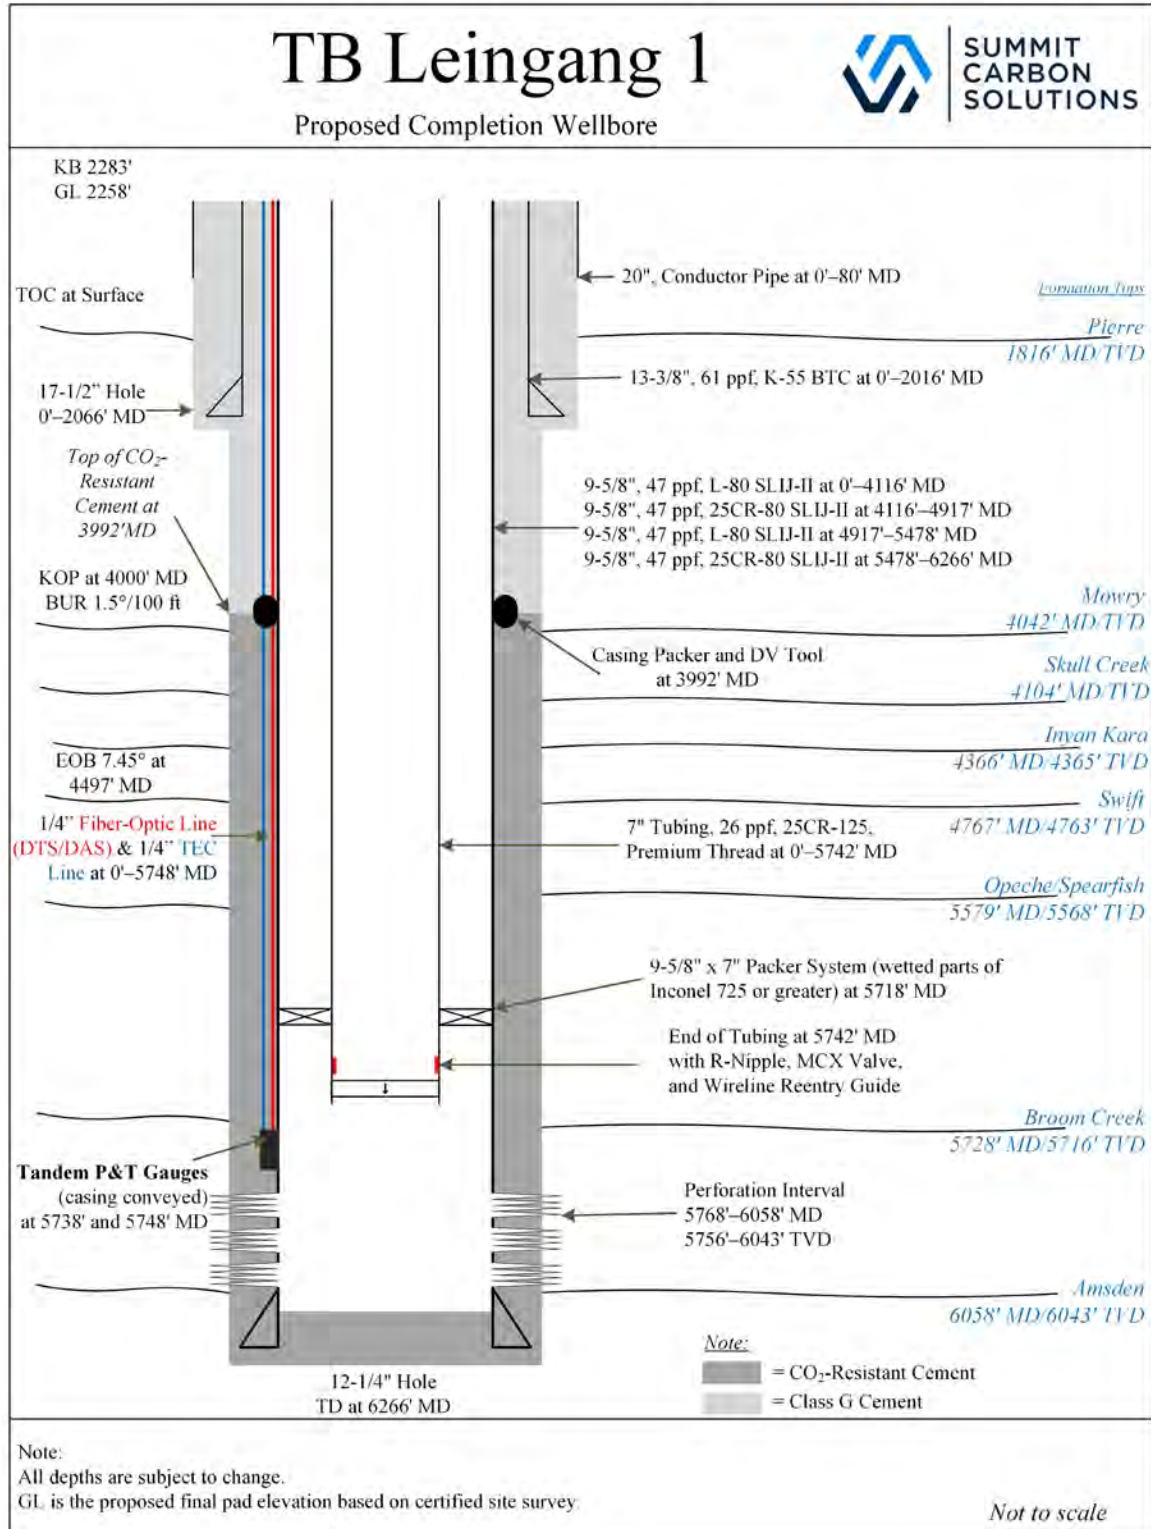

Figure 11-2. TB Leingang 1 proposed completion wellbore schematic.

**Table 11-4. Cased-Hole Logging Plan for the TB Leingang 1**

	<b>Logging</b>	<b>Justification</b>	<b>Frequency</b>	<b>N.D.A.C. § 43-05-01-</b>
<b>Long-String Section Without Tubing</b>	Sonic array logging (inclusive of radial cement bond log [RCBL], variable-density log [VDL], casing collar locator [CCL]), gamma ray (GR), and temperature log	Identify cement bond quality radially and evaluate cement top and zonal isolation. Establish baseline temperature profile for distributed temperature sensing (DTS) fiber-optic cable calibration.	Baseline and repeat when required and when tubing is pulled during workovers	11.2(1)(c)(2) and (d)
	Ultrasonic logging tool (or other approved casing inspection log [CIL])	Acquire baseline and demonstrate external mechanical integrity prior to injection.		11.2(1)(c)(2) and (d)
<b>Through-Tubing</b>	Pulsed-neutron log (PNL)	Confirm internal and external mechanical integrity from Opeche/Spearfish Formation to surface.	Baseline and Year 1, Year 3, and at least once every 3 years thereafter (e.g., Years 6, 9, 12, etc.)	11.4(g)(1)
	Temperature logging	Confirm external mechanical integrity and acquire baseline temperature profile.	Baseline and annually only if DTS fails	11.2(1)(c)(2) and (d)

Site Well Work Preparations

- Contact the Department of Mineral Resources, Oil and Gas Division (DMR-O&G), and provide a schedule to perform DMR-O&G-approved well work.
  - Work road and location as needed for safe operations.
  - Install rig anchors, and test to 20,000 lbf (pound-force), or as required by rig contractor. If installed, confirm recent anchor test date and that tension has been performed according to contractor policy.
  - Confirm actual casing depths and casing-conveyed gauges with the contractor representative and designated contractor field engineer.
  - Conduct safety meetings prior to shifts and treatments/operations.
  - Move in (MI) pipe racks, pipe wranglers, tanks, and portable toilet.
  - MI and unload 7-in., 25Cr-125 injection string and 2 $\frac{7}{8}$ -in. PH6 work string.
  - Fill tanks with compatible testing fluid for all well work.
1. Move in and rig up (MIRU) workover (WO) rig capable of 200,000 lb and equipment, check the casing pressure, and release pressure if any. Ensure no pressure buildup before proceeding to the next step.
  2. Remove nightcap and nipple up (NU) a blowout preventer (BOP) with variable rams capable of 2 $\frac{7}{8}$  to 7-in.
  3. Test BOP to maximum anticipated surface pressure (MASP).
  4. Tally and pick up 2 $\frac{7}{8}$ -in. PH6 work string and 8 $\frac{1}{2}$ -in. bit to drill out differential valve (DV) tool and clean out residual cement down to float collar. Pull out of hole (POOH).
  5. Run in the hole and work string with bit and scraper in front of the injection zone and at the depth where the packer will be set.
  6. Tag plug back total depth (PBSD).
  7. Circulate the wellbore with completion fluid, estimated at 9.8 ppg, compatible with the formation. Circulate until clean returns.
  8. Trip out of hole (TOOH) work string with bit and scraper.
  9. Close blind rams and test casing for 30 min to 1000 psi or as approved by DMR-O&G. If the pressure decreases more than 10% in 30 min, bleed pressure, check surface lines and surface connections, and repeat test. If the failure persists, the operator will be required to assess the root cause and correct it. Document all test results.
  10. MIRU logging truck.
  11. Conduct safety meeting to discuss logging and perforating operations.

12. Install and test lubricator.
13. Perform logs as per cased-hole logging plan shown in Table 11-4.

Note: Run radial cement bond log (RCBL) with 500-psi pressure. If the RCBL result shows poor cement bonding or a low top of cement, the results should be communicated to DMR-O&G, and an action plan will be prepared.

14. Perforate the Broom Creek Formation (ensure shots do not penetrate fiber-optic cable or downhole gauges. Perforations should be at least 10 ft away from gauge and fiber-optic cable). Actual perforation depths and design will be determined by designated geologists and engineers and will be based on the log analysis review and selected contractor.

Note: DTS/DAS (distributed temperature sensing/distributed acoustic sensing) fiber-optic cable and casing-conveyed gauges will be run along the exterior of the long-string casing. Special clamps, bands, and centralizers are installed to protect the fiber and provide a marker for wireline operations.

15. TOOH with perforating guns.
16. Tally and pick up retrievable testing packer with surface read-out downhole gauges, and run in the hole with work string to the top of the perforations.
17. Set packer above, at least 50 ft, top perforations to isolate and test the annulus to ensure seal and no communication with backside.
18. RU pump truck. Perform an injectivity test/step rate test (SRT) and pressure falloff test with fluid compatible with the formation. The SRT and pressure falloff test will be designed at a later time.

Note: If the well shows poor injectivity, perform a near-wellbore/perforation cleanout using a designed concentration of acid. Adjust acid formulation and volumes with water samples and compatibility test. Maximum injection pressure is not to exceed formation fracture pressure. Ensure correct acid and additives are used and the acid formula is determined based on not only acid/formation compatibility test result but also installed CRA material.

19. Release packer. TOOH, lay down (LD) retrievable packer, and LD work string.
20. Prepare rig floor to install injection string assembly (injection tubing and packer).
21. RU wireline. Pick up (PU) wireline-set permanent packer to desired depth.
22. Set injection packer within 50 ft above the top perforations, according to manufacturer recommendations and DMR-O&G requirements.

Note: Avoid setting packer within 10 ft of casing-conveyed gauges.

23. Tally, PU, and run completion assembly in accordance with program. Displace the well with inhibited packer fluid prior to latching 7-in., 25Cr-125 injection string into permanent packer.
24. Test packer to 1000 psi for 30 min. Ensure good seal.
25. Install tubing hanger.
26. Install backpressure valve (BPV), and nipple down (ND) BOP.
27. NU injection tree. Recover BPV.
28. Install test plug, and pressure-test injection tree to pressure rating. Recover test plug.
29. RDMO (rig down and move out) WO rig and equipment.
30. Schedule mechanical integrity test (MIT) with DMR-O&G inspector. Perform and record MIT with DMR-O&G representative present. Document MIT and submit to DMR-O&G.

**11.2 TB Leingang 2: Proposed Completion Procedure to Conduct Injection Operations**

As described in Section 9.1, the TB Leingang 2 well will be drilled and completed as a CO<sub>2</sub> injector (Figures 11-3 and 11-4 and Tables 11-5, 11-6, and 11-7). The following proposed completion procedure outlines the steps necessary to complete and test the well for injection purposes. The procedures described below are subject to change during execution as necessary to ensure successful completion and/or testing.

Figure 11-3. TB Leingang 2 proposed CO<sub>2</sub>-resistant wellhead schematic. Lowest manual valve of injection tree will be of Class HH material, and tubing hanger mandrel will be of corrosion-resistant material, while the rest of the tree will consist of Class FF and equivalent.

Table 11-7. Cased-Hole Logging Plan for the TB Leingang 2

	Logging	Justification	Frequency	N.D.A.C. § 43-05-01-
<b>Long-String Section Without Tubing</b>	Sonic array logging (inclusive of RCBL, VDL, CCL), GR, and temperature log	Identify cement bond quality radially and evaluate cement top and zonal isolation. Establish baseline temperature profile for DTS fiber-optic cable calibration.	Baseline and repeat when required and when tubing is pulled during workovers	11.2(1)(c)(2) and (d)
	Ultrasonic logging tool (or other approved CIL)	Acquire baseline and demonstrate external mechanical integrity prior to injection.		11.2(1)(c)(2) and (d)
<b>Through-Tubing</b>	PNL	Confirm internal and external mechanical integrity from Opeche/Spearfish Formation to surface.	Baseline and Year 1, Year 3, and at least once every 3 years thereafter (e.g., Years 6, 9, 12, etc.)	11.4(g)(1)
	Temperature logging	Confirm external mechanical integrity and acquire baseline temperature profile.	Baseline and annually only if DTS fails	11.2(1)(c)(2) and (d)

Site Well Work Preparations

- Contact DMR-O&G, and provide a schedule to perform DMR-O&G-approved well work.
  - Work road and location as needed for safe operations.
  - Install rig anchors, and test to 20,000 lbf, or as required by rig contractor. If installed, confirm recent anchor test date and that tension has been performed according to contractor policy.
  - Confirm actual casing depths and casing-conveyed gauges with the contractor representative and designated contractor field engineer.
  - Conduct safety meetings prior to shifts and treatments/operations.
  - MI pipe racks, pipe wranglers, tanks, and portable toilet.
  - MI and unload 7-in., 25Cr-125 injection string and 2 $\frac{7}{8}$ -in. PH6 work string.
  - Fill tanks with compatible testing fluid for all well work.
1. MIRU WO rig capable of 200,000 lb and equipment, check the casing pressure, and release pressure if any. Ensure no pressure buildup before proceeding to the next step.
  2. Remove nightcap, and NU a BOP with variable rams capable of 2 $\frac{7}{8}$  to 7-in.
  3. Test BOP to MASP.
  4. Tally and pick up 2 $\frac{7}{8}$ -in. PH6 work string and 8 $\frac{1}{2}$ -in. bit to drill out DV tool and clean out residual cement down to float collar. POOH.
  5. Run in the hole and work string with bit and scraper in front of the injection zone and at the depth where the packer will be set.
  6. Tag PBTD.
  7. Circulate the wellbore with completion fluid, estimated at 9.8 ppg, compatible with the formation. Circulate until clean returns.
  8. TOOH work string with bit and scraper.
  9. Close blind rams and test casing for 30 min to 1000 psi or as approved by DMR-O&G. If the pressure decreases more than 10% in 30 min, bleed pressure, check surface lines and surface connections, and repeat test. If the failure persists, the operator will be required to assess the root cause and correct it. Document all test results.
  10. MIRU logging truck.
  11. Conduct safety meeting to discuss logging and perforating operations.
  12. Install and test lubricator.
  13. Perform logs as per cased-hole logging plan shown in Table 11-7.

Note: Run RCBL with 500-psi pressure. If the RCBL result shows poor cement bonding or a low top of cement, the results should be communicated to DMR-O&G and an action plan will be prepared.

14. Perforate the Broom Creek Formation (ensure shots do not penetrate fiber-optic cable or downhole gauges. Perforations should be at least 10 ft away from gauge and fiber-optic cable). Actual perforation depths and design will be determined by designated geologists and engineers and will be based on the log analysis review and selected contractor.

Note: DTS/DAS fiber-optic cable and casing-conveyed gauges will be run along the exterior of the long-string casing. Special clamps, bands, and centralizers are installed to protect the fiber and provide a marker for wireline operations.

15. TOOH with perforating guns.
16. Tally and pick up retrievable testing packer with surface read-out downhole gauges, and run in the hole with work string to the top of the perforations.
17. Set packer above, at least 50 ft, top perforations to isolate and test the annulus to ensure seal and no communication with backside.
18. RU pump truck. Perform an injectivity test/SRT and pressure falloff test with fluid compatible with the formation. The SRT and pressure falloff test will be designed at a later time.

Note: If the well shows poor injectivity, perform a near-wellbore/perforation cleanout using a designed concentration of acid. Adjust acid formulation and volumes with water samples and compatibility test. Maximum injection pressure is not to exceed formation fracture pressure. Ensure correct acid and additives are used and the acid formula is determined based on not only acid/formation compatibility test result but also installed CRA material.

19. Release packer. TOOH, LD retrievable packer, and LD work string.
20. Prepare rig floor to install injection string assembly (injection tubing and packer).
21. RU wireline. PU wireline-set permanent packer to desired depth.
22. Set injection packer within 50 ft above the top perforations, according to manufacturer recommendations and DMR-O&G requirements.

Note: Avoid setting packer within 10 ft of casing-conveyed gauges.

23. Tally, PU, and run completion assembly in accordance with program. Displace the well with inhibited packer fluid prior to latching 7-in., 25Cr-125 injection string into permanent packer.
24. Test packer to 1000 psi for 30 min. Ensure good seal.
25. Install tubing hanger.
26. Install BPV and ND BOP.
27. NU injection tree. Recover BPV.
28. Install test plug, and pressure-test injection tree to pressure rating. Recover test plug.
29. RDMO WO rig and equipment.
30. Schedule MIT with DMR-O&G inspector. Perform and record MIT with DMR-O&G representative present. Document MIT and submit to DMR-O&G.

**11.3 Milton Flemmer 1: Proposed Completion Procedure for Monitoring-Well Operations**

Milton Flemmer 1 will be constructed as a reservoir-monitoring well (Figures 11-5 and 11-6 and Tables 11-8, 11-9, and 11-10) to support deep subsurface monitoring of TB Leingang 1 and TB Leingang 2, the CO<sub>2</sub> injection wells. Monitoring of the CO<sub>2</sub> plume extent and the storage reservoir pressure will be conducted continuously through casing-conveyed fiber-optic cable installed outside the long-string casing and pressure/temperature gauges deployed along the outside of the tubing. Monitoring will be conducted during injection operations as well as during the postinjection site care (PISC) period (see Section 6.0).

Figure 11-5. Milton Flemmer 1 proposed completion wellbore schematic.

**Table 11-10. Cased-Hole Logging Plan for the Milton Flemmer 1**

	<b>Logging</b>	<b>Justification</b>	<b>Frequency</b>	<b>N.D.A.C. § 43-05-01-</b>
<b>Long-String Section Without Tubing</b>	Sonic array logging (inclusive of RCBL, VDL, CCL), GR, and temperature	Baseline already acquired to identify cement bond quality radially and evaluate cement top and zonal isolation.	Repeat when required	11.2(1)(c)(2) and (d)
	Ultrasonic logging tool (or other approved CIL)	Baseline already acquired. Run log to demonstrate external mechanical integrity.	and when tubing is pulled during workovers	11.2(1)(c)(2) and (d)
<b>Through-Tubing</b>	PNL	Confirm internal and external mechanical integrity from Opeche/Spearfish Formation to surface.  Baseline and Year 1, Year 3, and at least once every 3 years thereafter (e.g., Years 6, 9, 12, etc.)		11.4(g)(1)
	Temperature logging	Confirm external mechanical integrity and acquire baseline temperature profile.  Baseline and annually only if the DTS fails		11.2(1)(c)(2) and (d)

The following proposed completion procedure outlines the steps necessary to complete and convert the well prior to injection operations.

Site Well Work Preparations

- Contact DMR-O&G, and provide a schedule to perform DMR-O&G-approved well work.
- Work road and location as needed for safe operations.
- Test deadman anchors.
- Confirm actual casing depths and perforation depths.
- Conduct safety meetings prior to shifts and treatments.
- MI mud pump, mud tank, power swivel, pipe racks, pipe wranglers, upright and catch tanks, and portable toilet.
- MI and unload 3½-in., J-55 EUE tubing string and 2⅞-in. PH6 work string.
- Fill tanks with 9.8-ppg water plus KCl (potassium chloride) working fluid for all well work.

Note: Broom Creek Formation perforations are open; ensure working fluid is compatible with formation, estimated at a pressure gradient of 0.466 psi/ft. The well will be plugged back to the Amsden Formation prior to running completions assembly.

1. MIRU WO rig and equipment, check the casing pressure, and release pressure if any. Ensure no pressure buildup before proceeding to the next step.
2. Fill casing with 9.8-ppg working fluid.
3. Remove nightcap, and NU a BOP with blind and correct pipe rams.
4. Test BOP to MASP.
5. PU power swivel. Tally and MU 6-in. bit, mud motor, drill collars, and jars.
6. Tally, PU 2⅞-in. PH6 work string and bottomhole assembly (BHA). Trip in hole (TIH) to cast iron cement retainer (CICR) with cement on top at 4825 ft.
7. Close blind rams and pressure test casing with working fluid to 1000 psi for 30 min to verify Inyan Kara Formation perforations are sealed off. If the pressure decreases more than 10% in 30 min, bleed pressure, check surface lines and surface connections, and repeat test. If the failure persists, the operator will be required to assess the root cause and correct it. Document all test results.
8. If the pressure test is successful, proceed to drill out CICR and cement at 4825 ft.

Note: Broom Creek Formation perforations below are open; ensure completion fluid is compatible with formation pressure.

9. Circulate the wellbore with completion fluid, compatible with the formation, estimated at a pressure gradient of 0.466 psi/ft.

10. Continue picking up work string. Tag cast iron bridge plug (CIBP) at 6550 ft. Circulate hole clean. Drill out CIBP and circulate hole clean. TOOH with work string.
11. Check bit and PU scraper. TIH with 6-in. bit and scraper, and perform scrape pass perforations at 6012–6035 ft and to PBTD.
12. Circulate wellbore clean. TOOH laying down BHA.
13. PU retrievable packer. TIH with retrievable packer and set at 6200 ft. Test casing below 6200 ft to 1000 psi for 15 min. TOOH with work string and retrievable packer.
14. Spot and RU cementing equipment. Confirm equipment and setting times with cement provider.
15. TIH to 11,330 ft. Conduct and document a safety meeting prior to testing lines and pumping cement. Pressure test lines prior to pumping.
16. Mix and pump 40 sacks (sx) Class G cement with 35% silica flour at 15.6 ppg, 1.50 ft<sup>3</sup>/sx balanced plug (Deadwood Isolation). Pull above and roll hole clean.
17. TOOH to 10,465 ft. Mix and pump 40 sx Class G cement with 35% silica flour at 15.6 ppg, 1.50 ft<sup>3</sup>/sx balanced plug (Red River Isolation). Pull above and roll hole clean.
18. TOOH to 9570 ft. Mix and pump 65 sx Class G cement with 35% silica flour at 15.6 ppg, 1.50 ft<sup>3</sup>/sx balanced plug (Interlake and Dawson Bay Isolation). Pull above and roll hole clean.
19. TOOH to 8840 ft. Mix and pump 85 sx Class G cement at 15.8 ppg, 1.15 ft<sup>3</sup>/sx balanced plug (Duperow and Bakken Isolation). Pull above and roll hole clean.
20. TOOH to 6980 ft. Mix and pump 50 sx Class G cement at 15.8 ppg, 1.15 ft<sup>3</sup>/sx balanced plug (Madison Group Isolation). Pull above and roll hole clean.
21. PU CIBP. TIH and set CIBP at 6220 ft. Dump 10 sx on top. PU permanent packer and set packer at 6000 ft, at least 10 ft above the top perforation.
22. Prepare rig floor to install tubing and monitoring assembly (3½-in. tubing and tubing-conveyed gauge(s). Gauges will be ported to the inside of the tubing, allowing readings of downhole pressure and temperature.
23. Tally and PU and run monitoring assembly in accordance with program.
24. Displace the well with inhibited packer fluid. Latch onto packer.
25. Test backside/annulus of tubing/casing to 1000 psi for 30 min. Document annular pressure test.

26. PU BOP. Install tubing hanger and double studded adapter with cable exit ports.
27. ND BOP.
28. Install cable exit unit and monitoring wellhead.
29. RDMO WO rig and equipment.
30. Schedule MIT with DMR-O&G inspector. Perform and record MIT with DMR-O&G representative present. Document MIT and submit to DMR-O&G.
31. Install pressure and temperature surface interrogator. Well is ready for monitoring operations.

# **FINANCIAL ASSURANCE DEMONSTRATION PLAN**

**12.0 FINANCIAL ASSURANCE DEMONSTRATION PLAN**

This financial assurance demonstration plan (FADP) is provided to meet the regulatory requirements for the geologic storage of CO<sub>2</sub> as prescribed by the state of North Dakota in North Dakota Administrative Code (N.D.A.C.) § 43-05-01-09.1. The storage facility permit (SFP) application must demonstrate that a financial instrument is in place that is sufficient to cover the costs associated with corrective actions and monitoring and reporting.

The FADP describes actions the operator of Summit Carbon Storage #1, LLC (SCS1) has taken and shall take to assure state and federal regulators that sufficient financial support is in place to cover the cost of any corrective action (N.D.A.C. § 43-05-01-05.1) that may be required at the geologic storage facility during any of its phases of operation, including: injection well plugging (N.D.A.C. § 43-05-01-11.5); postinjection site care (PISC) and facility closure (N.D.A.C. § 43-05-01-19); emergency and remedial response plan (ERRP) (N.D.A.C. § 43-05-01-13); and endangerment to underground sources of drinking water (USDW).

This FADP provides cost estimates for each of the above actions (Section 12.0) based on the information that is provided in the SFP application and describes the financial instruments that will be established (Section 12.3). The FADP was prepared to account for the entire operation of TB Leingang.

As the FADP was prepared, U.S. Environmental Protection Agency (EPA) guidance (2011) was also considered to assess the effectiveness of multiple qualifying financial instruments in the context of SCS1, e.g., key aspects of long-term public confidence, optimization of stakeholder interests, and practicality of implementation. Further, because of the structure of entity ownership, the FADP financial instruments were considered in evaluating the assurance approach during each of the operational periods.

SCS1 will establish a financial instrument(s) 30–60 days prior to inception of coverage, which is expected to be at or just prior to the commencement of injection operations. The applicant will provide a surety bond to ensure funds are available for PISC and facility closure activities in accordance with N.D.A.C. § 43-05-01-09.1(1)(a). It will also provide a third-party pollution liability insurance policy to cover emergency and remedial response costs, including endangerment to USDWs, in accordance with N.D.A.C. § 43-05-01-13, and a financial instrument to cover the costs of plugging the injection wells under N.D.A.C. § 43-05-01-11.5. No estimates have been provided for corrective action (N.D.A.C. § 43-05-01-05.1) because no action is required at this time.

The details contained in this FADP, along with supporting documentation, establish the approach the applicant proposes to use to meet the financial responsibility requirements and ensure that each of these instruments sufficiently addresses the activities and costs associated with the corrective action plan, injection well-plugging program, PISC and facility closure, ERRP, and endangerment of USDWs. The estimated total costs of these activities are presented in Table 12-1.

**Table 12-1. Potential Future Costs Covered by Financial Assurance**

Phase	Activity	Total Cost	Covered by Surety	Covered by Pollution Liability Policy	Details in Supporting Table
Preinjection, Active Injection, and PISC	Corrective Action on Wells in Area of Review (AOR)	\$0	\$0	\$0	N/A
Cessation of Injection	Plugging of Injection Wells	\$1,166,000	\$1,166,000	\$0	Table 12-2
PISC	PISC Storage Facility Monitoring and Injection Well Site Reclamation	\$4,225,000	\$4,225,000	\$0	Table 12-3a
PISC	Flowline Plugged and Abandoned (P&A)	\$243,000	\$243,000	\$0	Table 12-3b
PISC	Site Closure and Remediation	\$887,000	\$887,000	\$0	Table 12-4
Active Injection/PISC	ERRP	\$11,100,000	\$0	\$11,100,000	Table 12-6
Active Injection/PISC	Endangerment of USDWs	\$2,695,000	\$0	\$2,695,000	Table 12-7
<b>Total</b>		<b>\$20,316,000</b>	<b>\$6,521,000</b>	<b>\$13,795,000</b>	

If there are any changes, updated information related to the financial instruments will be provided on an annual basis to the Department of Mineral Resources Oil and Gas Division (DMR-O&G) for review and evaluation as required under N.D.A.C. § 43-05-01-09.1.

### 12.1 Facility Information

The facility name, facility contact, and injection well locations are provided below:

Facility Name:	Summit Carbon Storage #1, LLC
Facility Contact:	Wade Boeshans
Injection Well Locations:	TB Leingang 1 and 2; NE¼ of Section 18 T141N, R87W

### 12.2 Approach to Financial Responsibility Cost Estimates

In accordance with the requirements contained in N.D.A.C. § 43-05-01-09.1, the FADP provides financial assurance sufficient to cover the activities identified in the corrective action plan, injection well-plugging program, PISC and facility closure, ERRP, and endangerment of USDWs (Table 12-1). The following provides a summary description of the considerations and assessment approach for each activity.

#### 12.2.1 Corrective Action

According to N.D.A.C. § 43-05-01-05.1, corrective action involves inventorying and characterizing existing wells in the proposed AOR. The objective of a corrective action assessment is to describe the actions SCS1 will take, prior to and over the course of the project operation, on existing wells to proactively prevent the movement of fluid into or between USDWs. A detailed description of how the AOR was delineated can be found in Section 3.0 of this SFP application. SCS1 implemented the following workflow to estimate costs associated with corrective action

activities: 1) delineate the AOR and 2) identify and evaluate active and abandoned legacy wells within the AOR to ensure they meet the minimum completion standards for geologic storage of CO<sub>2</sub> and require no corrective action.

SCS1 has determined no wells in the proposed AOR require corrective action prior to or during the project operation, PISC, or postclosure period (Section 4.2). The only identified wellbore within the AOR boundary is the stratigraphic test and reservoir-monitoring wellbore, Milton Flemmer 1. SCS1 will employ a proactive monitoring approach to track the CO<sub>2</sub> plume extent and associated pressure front throughout the life of the project to ensure nonendangerment of USDWs, which includes acquiring time-lapse seismic and continuously monitoring reservoir pressure in the Broom Creek Formation at the CO<sub>2</sub> injection wells and reservoir-monitoring well (Section 5.7). For the avoidance of doubt, if injection or monitoring wells proposed as part of the SCS1 site operation require corrective action, such associated activities and costs relating thereto would be accounted for as part of the project's operating budget.

### ***12.2.2 Plugging of Injection Wells***

SCS1 will include the costs associated with plugging injection wells during site program closure within the project cost, the FADP, and the proposed instruments that SCS1 will use for plugging (N.D.A.C. § 43-05-01-11.5[2]). The injection wells will be plugged at cessation of the injection operation as discussed in Section 6.0 of this SFP application. The estimate covers the aggregated plugging and abandonment (P&A) cost of SCS1 injector wells TB Leingang 1 and 2, including rig mobilization, workover rig and rentals, labor, cementing, logging, trucking, supervision, and project management (Table 12-2). The specifics of the plugging program of the TB Leingang 1 and 2 wells can be found in Section 10.0. Reservoir-monitoring well plugging is separately accounted for as part of facility closure.

**Table 12-2. Injection Well Plugging**

<b>Activity</b>	<b>Total Cost</b>
Plugging TB Leingang 1	\$583,000
Plugging TB Leingang 2	\$583,000
<b>Total</b>	<b>\$1,166,000</b>

### ***12.2.3 Implementation of the PISC Plan and Facility Closure Activities***

PISC and facility closure cost estimates include site monitoring and periodic reevaluation of the AOR, facilities maintenance and power costs, and overhead and support costs during the 10-year PISC period. Details of the activities and actions contained in the PISC and Facility Closure Plan can be found in Section 6.0 of this SFP application.

The total combined cost for the implementation of the PISC and facility closure activities is estimated to be \$5,355,000, including \$4,225,000 for implementing the PISC (Table 12-3a), \$243,000 for flowline P&A (Table 12-3b), and \$887,000 for facility closure activities (Table 12-4). The PISC includes the following: a) formation monitoring (i.e., pulsed-neutron logs [PNL]),

b) near-surface monitoring (i.e., soil gas and Fox Hills Formation testing) and mechanical integrity well tests (i.e., injection well annulus pressure, ultrasonic logging), and c) coordinated repeat time-lapse seismic. The largest element of the PISC cost estimate relates to seismic studies, which are required to be carried out at 5-year intervals to validate models, which are expected to cover an area up to 65 mi<sup>2</sup>. Additionally, at the start of the PISC period, determined by cessation of injection

**Table 12-3a. Cost Estimate<sup>1</sup> for PISC Activities for TB Leingang Assuming a 10-year PISC Period**

Activity	Frequency	Unit Cost	Total
<b>Injection Pad Reclamation</b>			
Reclamation Costs of the Injection Well Pad and Aboveground Structure Removal	Perform prior to facility closure (anticipated in Year 10 of postinjection).	\$255,000	\$255,000
<b>Wellbore Monitoring (Milton Flemmer 1)</b>			
Overhead and Management	Overhead and management on monitoring activities for the whole duration of the PISC period.	\$60,000	\$600,000
PNL (saturation monitoring)	Repeat PNL in Year 4 and Year 9 during the PISC period.	\$45,000	\$90,000
Ultrasonic Logging (or other approved CIL [casing inspection log])	Repeat when required (assumes two occurrences).	\$43,000	\$86,000
Annulus Pressure Testing (internal mechanical integrity)	Repeat during workover operations in cases where the tubing must be pulled (assumes two occurrences).	\$8,000	\$16,000
Monitoring Surface Equipment Maintenance and Power	Quarterly inspections of wellhead and surface monitoring equipment.	\$5,000	\$50,000
<b>Near-Surface Monitoring</b>			
MSG01 and MSG04 – Sampling and Analysis	Collect three to four seasonal samples at each station (MSG01 and MSG04) in Years 1 and 3 of postinjection and every 3 years thereafter (e.g., Years 6 and 9), and perform concentration analyses on all samples.	\$2,150	\$34,000
Existing Groundwater Wells (MGW01) – Sampling and Analysis	Collect three to four seasonal samples in Years 1 and 3 of postinjection and at least once every 3 years thereafter until facility closure (anticipated in Year 10 of postinjection).	\$1,500	\$24,000
Existing Groundwater Wells (MGW04) – Sampling and Analysis	Collect three to four seasonal samples in Year 4 of postinjection and prior to facility closure (anticipated in Year 10 of postinjection).	\$1,500	\$12,000
Existing Groundwater Wells (MGW03 & MGW09) – Sampling and Analysis	Collect three to four seasonal samples prior to facility closure (anticipated in Year 10 of postinjection).	\$1,500	\$9,000
Dedicated Fox Hills Well (MGW11) – Sampling and Analysis	Collect annually until facility closure (anticipated in Year 10 of postinjection).	\$1,500	\$15,000
<b>Storage Complex Monitoring</b>			
Time-Lapse Seismic Survey Acquisition and Processing	Collect multiple repeat time-lapse seismic surveys during postinjection, with the first survey occurring by Year 4 of postinjection (two occurrences).	\$1,517,000	\$3,034,000
Total for PISC Activities			4,225,000

<sup>1</sup> Does not include interpretation and reporting. Costs are based on 2023 pricing and do not account for inflation.

operations, SCS1 will plug and abandon the TB Leingang 1 and 2 injection wells (Table 12-2) and conduct reclamation of injection well pad and aboveground structures, if no other beneficial use is determined at that time. SCS1 would leave intact for the period of the PISC the reservoir-monitoring well and the dedicated Fox Hills monitoring well (MGW11). These costs for plugging and surface facility reclamation are included in Table 12-4.

*12.2.3.1 Plugging and Abandonment of Flowlines*

The application must demonstrate that a financial instrument is in place sufficient to cover the costs associated with abandonment of \$100,000 or an amount determined by the Director of the DMR-O&G. This document describes the abandonment cost of the flowline and associated structures to be \$243,000 (Table 12-3b).

The FADP describes actions the operator has taken and shall take to assure state and federal regulators that sufficient financial support is in place to cover the cost of abandonment which includes:

- a) Disconnect and physically isolate the pipeline from any operating facility or other pipeline.
- b) Cut off the pipeline or the part of the pipeline to be abandoned below surface at pipeline level.
- c) Purge the pipeline with fresh water, air, or inert gas in a manner that effectively removes all fluid.
- d) Remove cathodic protection from the pipeline.
- e) Permanently plug or cap all open ends by mechanical means or welded means.

**Table 12-3b. Cost Estimate for Flowline Segment NDL-327 Abandonment**

<b>Activity</b>	<b>Timing</b>	<b>Description</b>	<b>Total</b>
<b>Closure and Reclamation Costs</b>			
Isolation of Flowline from Operating Facility or Other Pipeline	Prior to facility closure	Disconnect and physically isolate the pipeline from any operating facility or other pipeline.	\$20,000
Cut of Flowline to Be Abandoned	Prior to facility closure	Cut off the pipeline or the part of the pipeline to be abandoned below surface at pipeline level.	\$50,000
Purge Flowline	Prior to facility closure	Purge the pipeline with fresh water, air, or inert gas in a manner that effectively removes all fluid.	\$10,000
Cathodic Protection Removal	Prior to facility closure	Remove cathodic protection from the flowline.	\$10,000
Remove Launcher/Receivers	Prior to facility closure	Remove three launcher and/or receiver (three sites) associated with NDL-327.	\$150,000
Site Reclamation	Prior to facility closure	Main line valves (MLVs)/launcher receiver sites based on 0.06 ac/Site 3 sites (seed, seeding, soil prep, and mobilization).	\$3,000
<b>Total for Flowline P&amp;A Activities</b>			<b>\$243,000</b>

### 12.2.3.2 Facility Closure

SCS1 will prepare and apply for facility closure to the DMR-O&G and, upon authorization from the DMR-O&G, will proceed with plugging the reservoir-monitoring wells and well pad reclamation as discussed in Section 6.0 of this SFP application. The specifics of the plugging program of the reservoir-monitoring well can be found in Section 10.0. The estimate covers the aggregated P&A and reclamation cost of SCS1 reservoir-monitoring well, Milton Flemmer 1, including rig mobilization, Fox Hills monitoring well P&A, soil gas profile station P&A, workover rig and rentals, equipment and labor, cementing, logging, trucking, dirt work, supervision, and project management (Table 12-4). SCS1 is planning that the Fox Hills monitoring well (MGW11) will remain in place because the groundwater monitoring locations may be wanted by DMR-O&G or SCS1 for future use; however, SCS1 has set aside funds in case P&A is required.

**Table 12-4. Cost Estimate<sup>1</sup> for Site Closure and Remediation Activities for TB Leingang CO<sub>2</sub> Storage Project**

Activity	Timing	Description	Total
<b>Closure and Reclamation Costs</b>			
Plugging of Milton Flemmer 1	During facility closure	Plugging activities described in Section 10 plugging plan	\$613,500
Reclamation Costs of Milton Flemmer 1 Well Pad	During facility closure	Wellhead removal, sump removal, pad reclamation (rock removal and soil coverage), fencing removal, reseeding, general labor	\$255,000
Fox Hills Monitoring Well P&A <sup>2</sup>	During facility closure	Pipe removal, pad reclamation (rock removal and soil coverage), reseeding, general labor of MGW11	\$16,000
MSG Station(s) P&A <sup>2</sup>	During facility closure	P&A of MSG01 and MSG04	\$2,500 (\$1,250 per well)
Total for Closure Activities			\$887,000

<sup>1</sup> Does not include interpretation and reporting. Costs are based on 2023 pricing and do not account for inflation.

<sup>2</sup> P&A assumed unless DMR-O&G requests transfer of ownership.

## 12.2.4 Implementation of Emergency and Remedial Response Actions

### 12.2.4.1 Emergency Response Actions

The ERRP and associated detailed assessment can be found in Section 7.0 of this SFP application. The ERRP assessment supports a determination that the likelihood of release of significant volumes of CO<sub>2</sub> from underground storage into the soil or the atmosphere or significant volumes of saltwater into the environment are considered remote. Multiple factors were considered in the development of the ERRP, including:

- a) Extensive and independently verified analysis of the integrity of the storage mechanism.
- b) Selection of qualified and experienced storage facility operator.
- c) Selection of qualified and experienced drilling contractor.

Risk mitigation measures include:

- a) Continuous monitoring of transportation and injection systems.
- b) Routine measurement and reporting of CO<sub>2</sub> volumes.
- c) Physical security, barriers, and signage around injection facilities.
- d) Primary and secondary containment for leaked fluids at injection well pads.

A review of the ERRP technical risk categories for SCS1 identified a list of events that could potentially result in the movement of injected CO<sub>2</sub> or formation fluids in a manner that may endanger a USDW and require an emergency response. These events are as follows:

- a) Loss of injectivity
- b) Lower storage capacity than modeled
- c) Containment loss – lateral migration of CO<sub>2</sub>
- d) Containment loss – pressure propagation
- e) Containment loss – vertical migration of CO<sub>2</sub> or formation water brine via injection wells, other wells, or inadequate confining zones
- f) Natural disasters

If it is determined that one or more of these events has occurred, the emergency response actions that will be implemented are described in the ERRP (Section 7.0) of this SFP application. SCS1 planned response actions are summarized in Table 7-6.

#### *12.2.4.2 Estimation of Costs of Emergency Response Actions*

Estimating the costs of implementing the emergency response actions in Table 7-6 is challenging since remediation measures specifically dedicated to CO<sub>2</sub> storage impacts are poorly documented, with one of the more important data gaps being the lack of precise knowledge of the leakage mechanisms and associated impacts (Manceau and others, 2014). Furthermore, to date, no remediation action following CO<sub>2</sub> leakage after geologic storage has ever been implemented mainly because of the absence of established impacts (Manceau and others, 2014). Consequently, the degree of maturity of remediation measures in the carbon capture and storage (CCS) field is low, making it necessary to rely on literature that is primarily based on modeling or hypotheticals with other release and loss containment events, e.g., the analogy between CO<sub>2</sub> and volatile organic compounds, the latter having been addressed extensively in the literature. Additionally, for the remedial measures, costs and time for adequate removal are generally site-dependent, and no information is specifically available in this area in the CCS field.

##### *12.2.4.2.1 Identification of Remediation Technologies*

Manceau and others (2014) identified several remediation technologies/strategies that are available to address the potential impacted media that may result from an emergency event. These impacted media and remediation measures are listed in Table 12-5. The impacted media in Table 12-5 include surface and groundwater/USDW, vadose zone, indoor settings, and atmosphere; the remedial measures include a combination of active (e.g., air sparging) and passive (e.g., dispersion, natural attenuation) systems.

**Table 12-5. Proposed Technologies/Strategies for Remediation of Potential Impacted Media**

<b>Impacted Media</b>	<b>Potential Remedial Measures</b>
Groundwater/USDW	Monitored natural attenuation Pump-and-treat Air sparging Permeable reactive barrier Extraction/injection Biological remediation
Vadose Zone (soil gas)	Monitored natural attenuation Soil vapor extraction pH adjustment (via spreading of alkaline supplements, irrigation, and drainage)
Surface Water	Passive systems, e.g., natural attenuation Active treatment systems
Atmosphere	Passive systems, e.g., natural mixing, dispersion
Indoor/Workplace Settings	Sealing of leak points Depressurization Ventilation

However, it is important to note that, at this time, no methodology is widely accepted for designing intervention and remediation plans for CO<sub>2</sub> geologic storage projects. In an effort to establish SCS1's site-specific financial assurance obligation, three areas were evaluated, as follows:

- 1) Cost estimates specific to remediation within SCS1's AOR,
- 2) Methodologies and estimates from permitted North Dakota storage facilities, and
- 3) Existing literature (Manceau and others, 2014; Bielicki and others, 2014).

#### 12.2.4.2.2 Estimation of Costs for Implementing Emergency Event Responses

SCS1 has compiled cost estimates regarding a conservative hypothetical emergency event scenario to provide for future financial assurance. This conservative outer-limit cost estimate was calculated and used as a basis for this FADP.

#### Emergency Remedial Response Scenarios

The applicant formed a team to evaluate and quantify project risks based upon the scenarios described in the ERRP. The team consisted of members with relevant professional qualifications and experience in subsurface analysis, drilling engineering, facilities engineering, operations, well control events, and finance. The team evaluated and considered hypothetical scenarios for costs estimates in this document and identified site-specific financial risks.

Following the identification of financial risks, the applicant compiled cost estimates associated with a conservative hypothetical scenario wherein a failure of well integrity in an injection well causes a loss of containment in which a significant volume of CO<sub>2</sub> and briny water

migrates to the surface during injection operations through one of the injection wells. The conservative hypothetical scenario response action includes potential responses including but not limited to securing the location, diagnostics, well control and containment activities, remediation of injection well integrity, evaluation of environmental impacts, installation of monitoring equipment, and execution of surface remediation. The remediation plan would be discussed with DMR-O&G. The scenario contemplates a reactive response approach, e.g., mobilization of response personnel and equipment upon discovery of such an event to diagnose and develop a remediation plan. This approach is considered appropriate because of the remoteness of the residual risk. Specific postoccurrence action is not determinable until occurrence; thus actual response to such an event would be based on its severity. Because of the remote likelihood, this single conservative scenario was compiled to account for the outer-limit cost estimate to satisfy event response. The scenario used for cost estimating assumed the optimal operating conditions (10 years of operation) requiring outer-limit response and remediation costs. This conservative outer-limit cost estimate was calculated and used as a basis for this FADP.

#### Endangerment of Drinking Water Sources

As discussed in the ERRP section, the risk of endangerment to USDWs is considered remote. However, as part of the reactive response scenario contemplated in the ERRP cost estimate, the applicant assessed the specific response actions and cost data to represent the likely impact of such an event on sources of drinking water. Because of precautions taken in the design for spill control and pollution prevention, the well pad design incorporates a berm that, in combination with the response strategy, would minimize this portion of environmental repair. Thus, the applicant assessed the second reactive scenario, which contemplates a subsurface leak scenario. This subsurface leak scenario has primary costs related to groundwater delineation, and an extended period (10 years) of quarterly monitoring and reporting after emergency remedial actions are taken.

#### Selected Elements of Analysis of Inherent Risks

From the surface to the lowermost USDW—the Fox Hills Aquifer—the groundwater is considered a protected aquifer with <10,000 ppm TDS (total dissolved solids). The Fox Hills base is estimated at a depth of approximately 1000 ft and is followed by a thick section of clays with a thickness of approximately 2600 ft. These clays act as a seal until the next major permeable zone, the Inyan Kara. The Inyan Kara is an underpressured formation that is classified as an exempt aquifer under N.D.A.C. § 43-02-05-03. It is west of the 83W range line, and this formation is mostly targeted for water disposal wells in its surrounding areas. Approximately 1083 ft of cap rock acts as a main seal between the Inyan Kara zone and the Broom Creek.

Inside the AOR, 18 domestic wells, 30 stock wells, one test hole, and 3 Department of Water Resources wells are located in shallow aquifers, providing water for the associated farms' livestock, irrigation, and localized consumption (Figure 4-3). One existing well that penetrates the Fox Hills Formation (MGW01) and one new Fox Hills monitoring well (MGW11) will monitor the lowest USDW within the AOR, as shown in Figure 5-4 and discussed in the testing and monitoring strategy (Section 5.7).

No producible minerals, oil, natural gas, or other reserves are reported in the AOR for the Broom Creek Formation or overlying formations. As described in the AOR and corrective action section (Section 4.0) for the SCS1 storage reservoir, one deep well penetrates the storage complex

(the Milton Flemmer 1) within or in proximity to the plume boundaries and the identified pressure front. These wells are identified in Section 4.2.

#### 12.2.4.2.3 Cost Estimates

The tables in Section 12 provide a detailed estimate, in current dollars (2023), of the cost for performing corrective actions on wells in the AOR, plugging the injection wells, PISC and facility closure, endangerment to USDWs, flowline abandonment, and ERRP. Table 12-1 is a summary of the cost estimates underlying the FADP, and it identifies proposed financial instrument(s) that will provide the appropriate assurance to regulatory agencies of the applicant's intent and ability to fulfill its responsibilities.

The values included in the FADP are based on cost estimates provided during the permit application development process and are based on the hiring of a third party to perform the services or procurement of goods associated with performance. For that reason, the estimate includes costs such as project management and oversight, general and administrative costs, and overhead during the postinjection period. These values are subject to change during the course of the project to account for inflation of costs and any changes to the project that affect the cost of the covered activities. SCS1 will adjust the value of the financial instruments if the cost estimates change, and it will submit any adjustment to DMR-O&G for approval (N.D.A.C. § 43-05-01-09.1[3]) and N.D.A.C. § 43-05-01-19).

Tables 12-6 and 12-7 provide additional information for the future cost estimates that were provided in Table 12-1.

**Table 12-6. Cost Estimate for Emergency and Remedial Response Plan\***

<b>Activity/Item</b>	<b>Cost</b>
General Incident Response and Diagnostics	\$600,000
Well Control and Containment Activities	\$8,100,000
Well Integrity and Site Remediation Activities	\$2,400,000
<b>Total</b>	<b>\$11,100,000</b>

\* These costs are based on activities in response to a hypothetical scenario with remote risk of occurrence.

**Table 12-7. Cost Estimate for Endangerment of USDWs\***

<b>Description</b>	<b>Total Estimated Amount</b>
General Response, Delineation, and Water Replacement	\$1,890,000
Quarterly Groundwater Monitoring (10 years) and Reporting	\$750,000
P&A of Groundwater-Monitoring Wells	\$55,000
<b>Total</b>	<b>\$2,695,000</b>

\* These costs are based on activities in response to a hypothetical scenario with remote risk of occurrence. Costs are based on estimates of current (2023) contract rates.

### 12.3 Financial Instruments

The applicant will establish a financial instrument(s) 30–60 days prior to inception of coverage, which is expected to be at or just prior to the commencement of injection operations (N.D.A.C. § 43-05-01-09.1). The applicant will provide financial assurance in the form of a surety bond to ensure funds are available for PISC and facility closure activities (N.D.A.C. § 43-05-01-09.1[1][a] and N.D.A.C. § 43-05-01-19). The applicant will also obtain a pollution liability policy(s) to cover emergency and remedial response costs and endangerment of USDWs under N.D.A.C. § 43-05-01-13 and a financial instrument (surety bond) to cover the costs of plugging the injection wells (N.D.A.C. § 43-05-01-11.5). No estimates have been provided for corrective action (N.D.A.C. § 43-05-01-05.1) because no action is required at this time.

This application presents the estimated total costs (\$20,316,000) of these activities and a breakdown apportionment across proposed financial instruments in Table 12-1. Section 12.2 of this FADP provides additional details of the financial responsibility cost estimates for each activity.

The company providing insurance will meet all the following criteria:

1. The company is authorized to transact business in North Dakota.
2. The company has either passed the specified financial strength requirements on the basis of credit ratings or has met a minimum rating, minimum capitalization, and ability to pass the rating, when applicable.
3. The third-party insurance can be maintained until such a time that DMR-O&G determines that the storage operator has fulfilled its financial obligations.

The third-party insurance, which identifies SCS1 as the covered party, will be provided by one or a combination of the companies meeting the creditworthiness and other requirements of N.D.A.C. § 43-05-01-09.1. However, the greatest hypothetical exposure evaluated would be an acute upward migration through an CO<sub>2</sub> injection well, which has an estimated cost of \$13,795,000 for emergency and remedial response actions, as well as coverage identified in the endangerment of USDWs.

Coverage terms are of an indicative/estimated nature only at this time, as firm and bindable terms are not possible this far in advance of commencement of injection operations; however, final coverage terms and costs will be determined upon full underwriting and firm/bindable quotations to be issued by insurers 30–60 days prior to inception of coverage, which is expected to be at or just prior to the commencement of injection operations. The actual third-party insurance companies will be determined closer to the proposed injection start date and will meet both of the following criteria, as specified in N.D.A.C. §43-05-01-09.1(1)(g):

1. The companies satisfy financial strength requirements based on credit ratings in the top four categories of either Standard & Poor's (AAA, AA, A, or BBB) or Moody's (Aaa, Aa, A, Baa).

2. The companies meet a minimum rating (minimum rating based on an issuer, credit, securities, or financial strength rating as a demonstration of financial stability) and minimum capitalization (i.e., demonstration that minimum thresholds are met for the following financial ratios: debt–equity, assets–liabilities, cash return on liabilities, liquidity, and net profit) and are able to pass bond rating in the top four categories of either Standard & Poor’s (AAA, AA, A, or BBB) or Moody’s (Aaa, Aa, A, Baa), when applicable.

## **APPENDIX B**

### **FRESHWATER WELL FLUID SAMPLING**

**B-1. FRESHWATER WELL FLUID SAMPLING**

Table B-1 summarizes the results from existing groundwater wells for ranges of pH, electrical conductivity (EC), total dissolved solids (TDS), and total alkalinity measured from 4 monitoring sites within TB Leingang area of review (AOR). Monitoring sites were selected to supplement forthcoming groundwater sampling to establish baseline conditions. Figure B-1 is a map showing the locations of the selected monitoring sites. Water chemistry results are included below.

**Table B-1. Summary of Water Chemistries<sup>1</sup> at Four Sampling Locations Within the Area of Review (AOR) at TB Leingang**

Number of Wells	Water Samples	Data Vintage	Sampling Horizon	pH	EC, mS/cm	TDS, mg/L	Total Alkalinity, mg/L CaCO <sub>3</sub>
1	1	1968	Tongue River	8.4	2460	1680	1370
3	3	1967–68	Unknown	7.2–9.3	2850–4330	1960–4260	NA

Figure B-1. Locations of the four sampled fresh water wells within the AOR.

**APPENDIX C**

**GEOCHEMICAL INTERACTIONS**

## C.1 GEOCHEMICAL INTERACTIONS

### C.1.1 Geochemical Interaction of Injection Zone (Broom Creek Formation)

Geochemical simulation was performed to calculate the effects of introducing the CO<sub>2</sub> stream to the injection zone. The injection zone, the Broom Creek Formation, was investigated using the geochemical analysis option available in GEM, the compositional simulation software package from Computer Modelling Group Ltd. (CMG). GEM is also the primary simulation software used for evaluation of the reservoir's dynamic behavior resulting from the expected CO<sub>2</sub> injection. For this geochemical modeling study, the injection scenario consisted of a single injection well injecting for a 20-year period with maximum bottomhole pressure (BHP) and maximum wellhead pressure (WHP) constraints of 3663 and 2100 psi, respectively. A postinjection period of 25 years was run in the model to evaluate any dynamic behavior and/or geochemical reaction after the CO<sub>2</sub> injection is stopped.

The anticipated average CO<sub>2</sub> stream composition is 98.25% CO<sub>2</sub>, 1.44% N<sub>2</sub>, and 0.31% O<sub>2</sub>, with a trace amount of H<sub>2</sub>S. The CO<sub>2</sub> stream, shown in Table C-1 that was used for geochemical modeling, contains a higher amount of O<sub>2</sub> (2%). The modeled stream containing ~95% CO<sub>2</sub> and 2% O<sub>2</sub> was used to represent a conservative scenario where the oxygen concentration is highest, potentially triggering more geochemical reactions in the formation. This simulation scenario was run with and without the geochemical model analysis option included, and results from the two cases were compared (Figures C-1 and C-2).

The case with geochemical analysis (geochemistry case) was constructed using the average mineralogical composition of the Broom Creek Formation rock materials (78% of bulk reservoir volume) and average formation brine composition (22% of bulk reservoir volume). X-ray diffraction (XRD) data from the Milton Flemmer 1 well core samples were used to inform the mineralogical composition of the Broom Creek Formation (Table C-2). Illite was chosen to represent clay for geochemical modeling as it was the most prominent type of clay identified in the XRD data. Ionic composition of the Broom Creek Formation water, derived from the state-certified analysis reported in Appendix A, is listed in Table C-3.

**Table C-1. CO<sub>2</sub> Stream Composition Used for Geochemical Modeling**

Component	mol%
CO <sub>2</sub>	94.999
N <sub>2</sub>	3
O <sub>2</sub>	2
H <sub>2</sub> S	1.0E-3

Figure C-1. Top graph shows cumulative injection vs. time; bottom graph shows gas injection rate vs. time. There is no observable difference in injection volume and gas rate due to geochemical reactions.

Figure C-2. Top graph shows WHP vs. time; bottom graph shows BHP vs. time. There is no observable difference in pressures due to geochemical reactions.

**Table C-2. Averaged XRD data for  
(Milton Flemmer 1) Broom Creek  
Core Sample**

Mineral Data	wt%
Illite	3.07
K-Feldspar	4.35
Albite	1.32
Quartz	53.17
Dolomite	21.16
Anhydrite	16.79
Siderite	0.12
Hematite	0.02

**Table C-3. Milton Flemmer 1 Broom Creek  
Formation Water Ionic Composition**

<b>Component</b>	<b>mg/L</b>	<b>Molality</b>
Na <sup>+</sup>	39,500	1.787216
K <sup>+</sup>	680	0.018091
Ca <sup>2+</sup>	3060	0.079421
Mg <sup>2+</sup>	505	0.021613
Fe <sup>2+</sup>	5	9.31E-05
SO <sub>4</sub> <sup>2-</sup>	2400	2.60E-02
Cl <sup>-</sup>	42,400	1.244033
HCO <sub>3</sub> <sup>-</sup>	101	1.72E-03
H <sup>+</sup>	0.00015976	1.65E-07
Al <sup>3+</sup>	1E-10	3.86E-15
OH <sup>-</sup>	0.00852419	5.21E-07
SiO <sub>2</sub> (aq)	1.00E-10	1.73E-15
CO <sub>3</sub> <sup>2-</sup>	0.00001	1.73E-10
Fe <sup>3+</sup>	1.00E-10	1.86E-15

The results do not show an evident difference in the CO<sub>2</sub> gas molality fraction between both cases as seen in Figures C-1 and C-2 for volume injected and injection pressure simulation results. As a result of geochemical reactions in the reservoir, cumulative volume and injection rate have no observable difference between the geochemical and nongeochemical cases. The resulting BHP and WHP from the two cases are nearly identical, with no appreciable differences.

Figure C-3 shows the location of the cross sections and Layer 30 used in Figures C-4a and C-4b to depict the geochemical modeling results. Figures C-4a and C-4b show the concentration of CO<sub>2</sub>, in molality, in the reservoir after 20 years of injection plus 25 years of postinjection for the geochemistry model and nongeochemistry model, respectively.

The pH of the reservoir brine changes in the vicinity of the CO<sub>2</sub> accumulation, as shown in Figure C-5a. The pH of the Broom Creek Formation native brine sample is 6.8, whereas the fluid pH declines to approximately 4.3 in the CO<sub>2</sub>-flooded areas near the well as a result of CO<sub>2</sub> dissolution in the native formation brine (Figure C-5b).

Figure C-3. Index map of west–east and south–north cross sections and simulation Layer 30 at 3469 ft (SSTVD, subsea true vertical depth).

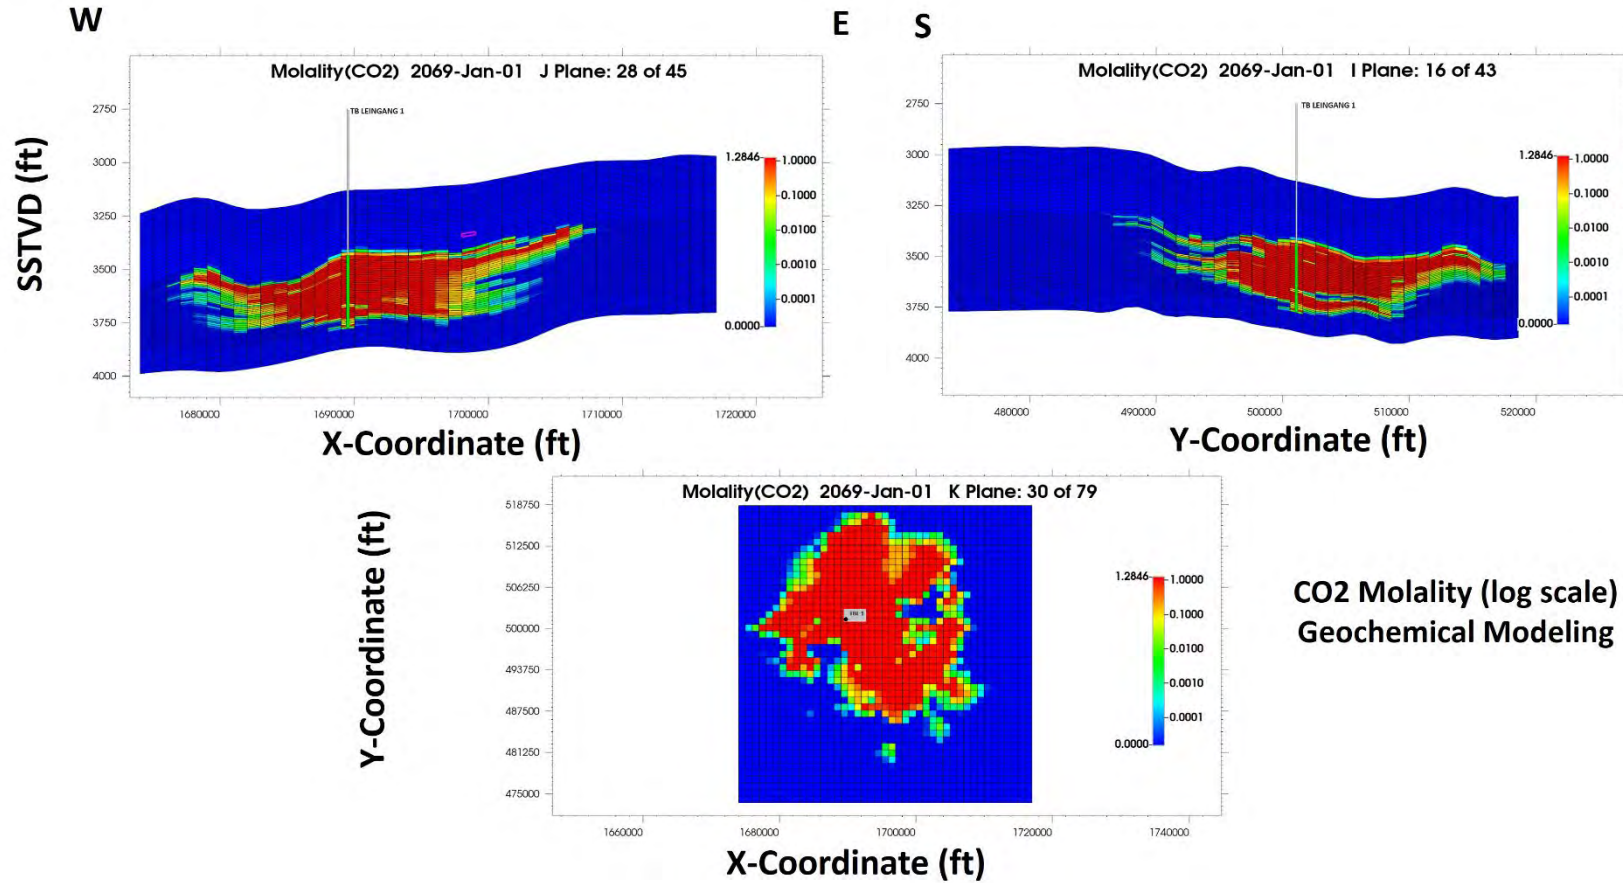

Figure C-4a. CO<sub>2</sub> molality for the geochemistry case simulation results after 20 years of injection plus 25 years postinjection showing the distribution of CO<sub>2</sub> molality in log scale. The top-left image is west–east, and the top-right image is a south–north cross section. The bottom image is a planar view of simulation Layer 30 at 3469 ft (SSTVD).

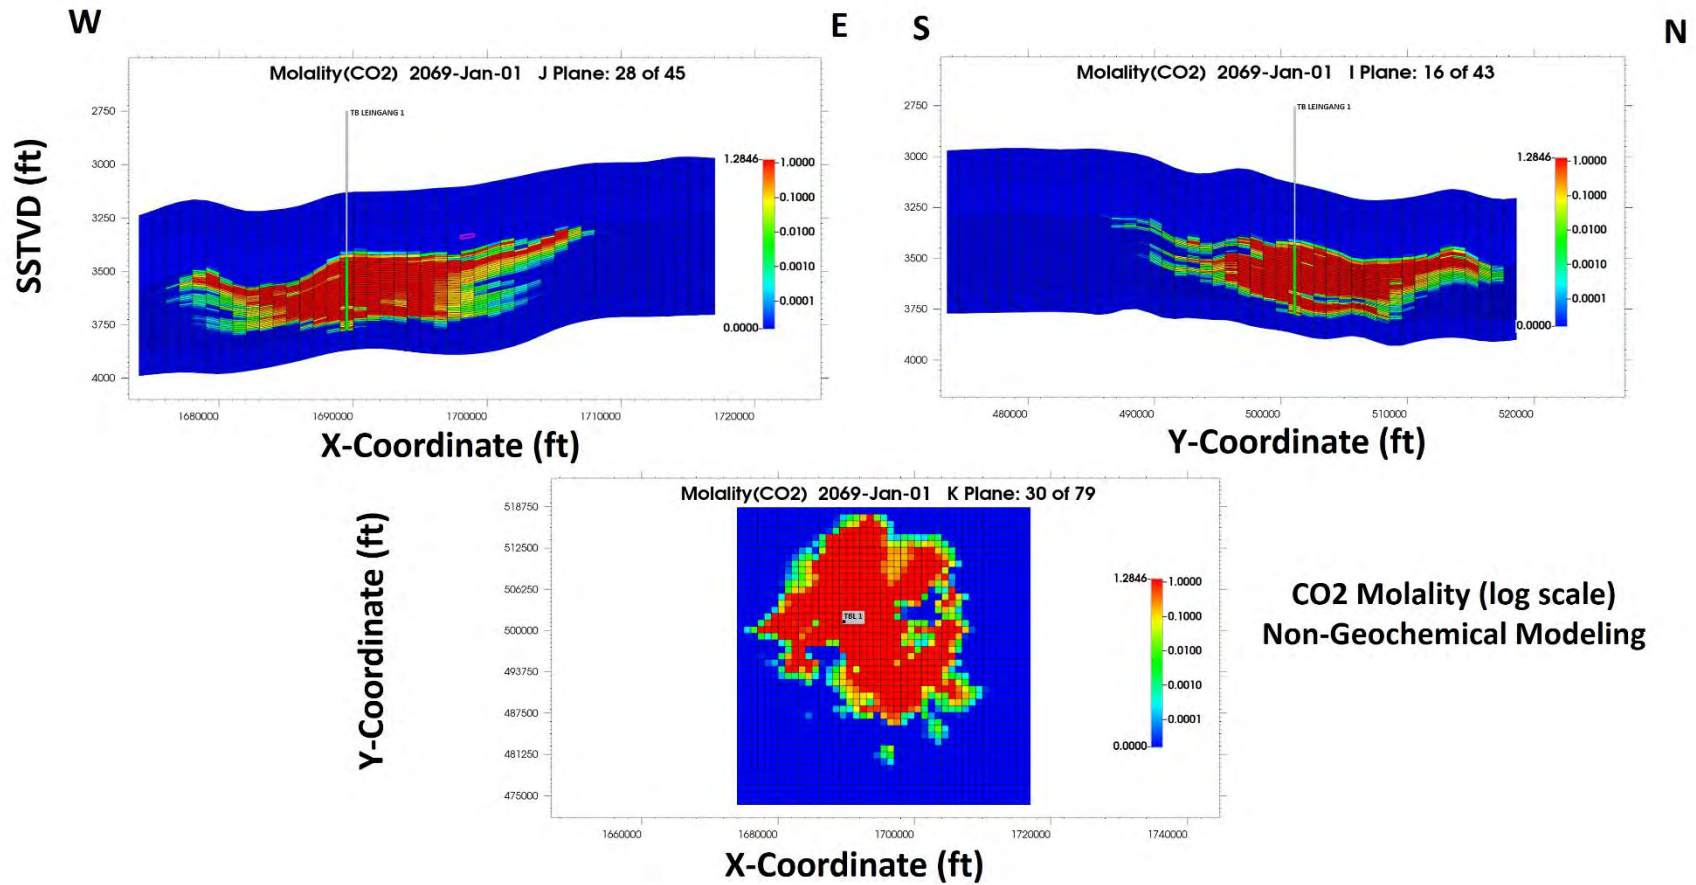

Figure C-4b. CO<sub>2</sub> molality for the nongeochemistry case simulation results after 20 years of injection plus 25 years postinjection showing the distribution of CO<sub>2</sub> molality in log scale. The top-left image is west-east, and the top-right image is a south-north cross section. The bottom image is a planar view of simulation Layer 30 at 3469 ft (SSTVD).

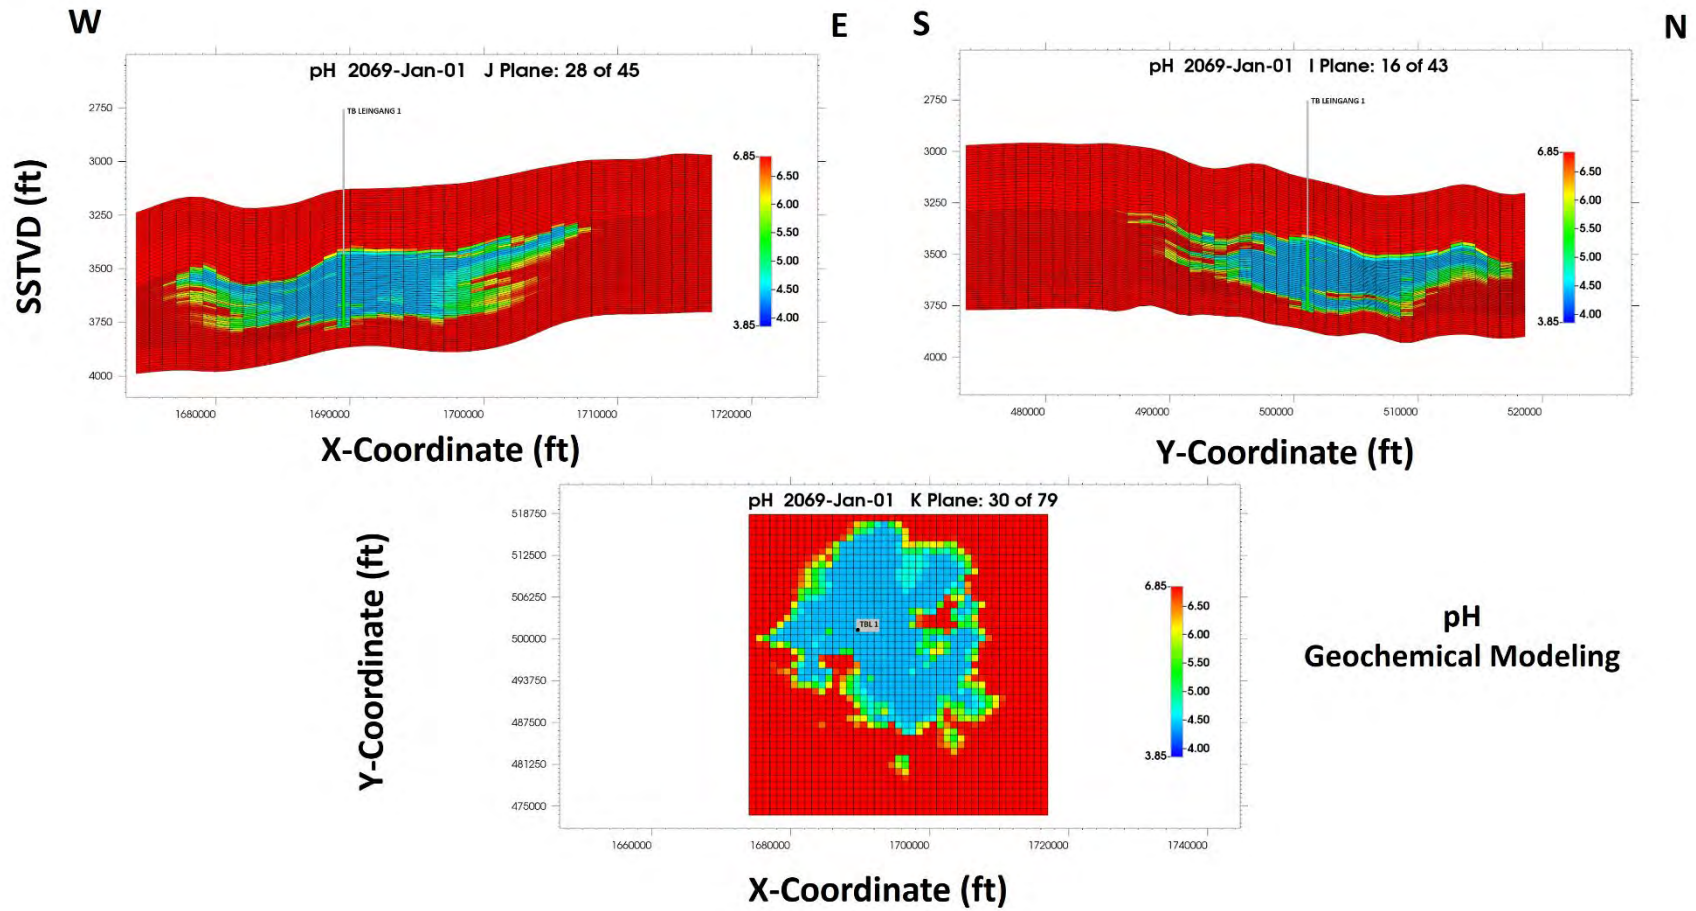

Figure C-5a. Geochemistry case simulation results after 20 years of injection plus 25 years postinjection showing the pH of formation brine in log scale. The top-left image is west-east, and the top-right image is a south-north cross section. The bottom image is a planar view of simulation Layer 30 at 3469 ft (SSTVD).

Figure C-5b. Geochemistry case simulation results through 20 years of injection plus 25 years postinjection showing the pH of the Broom Creek Formation brine at the wellbore vs. time for Layer 30 at 3469 ft (SSTVD), Layer 44 at 3574.4 ft (SSTVD), and Layer 62 at 3710 ft (SSTVD).

Figures C-6a and C-6b show the cross section for  $O_2$  molality in the Broom Creek Formation. Figure C-6a shows the cross section for the concentration of  $O_2$ , in molality, in the reservoir after 20 years of injection plus 25 years postinjection for the geochemistry model scenario, and Figure C-6b shows the same information for the nongeochemistry simulation case for comparison. The results do not show an evident difference in the  $O_2$  gas molality fraction between both cases. After being injected, the 2% molar oxygen content in the injection stream is dissolved in the brine and likely to cause oxidative reactions of the minerals, which may induce dissolution/precipitation of reactive minerals and formation of secondary minerals in the reservoir. The simulation results showed no significant precipitation caused by the high concentration of  $O_2$  that would affect the  $CO_2$  injection volume, as demonstrated by the comparison in injection rates between the case with and without geochemical modeling shown in Figure C-2.

Figure C-6a. Cross section for O<sub>2</sub> molality for the geochemistry case simulation results after 20 years of injection plus 25 years postinjection showing the distribution of O<sub>2</sub> in the gas phase in log scale. The top-left image is west-east, and the top-right image is a south-north cross section. The bottom image is a planar view of simulation Layer 30 at 3469 ft (SSTVD).

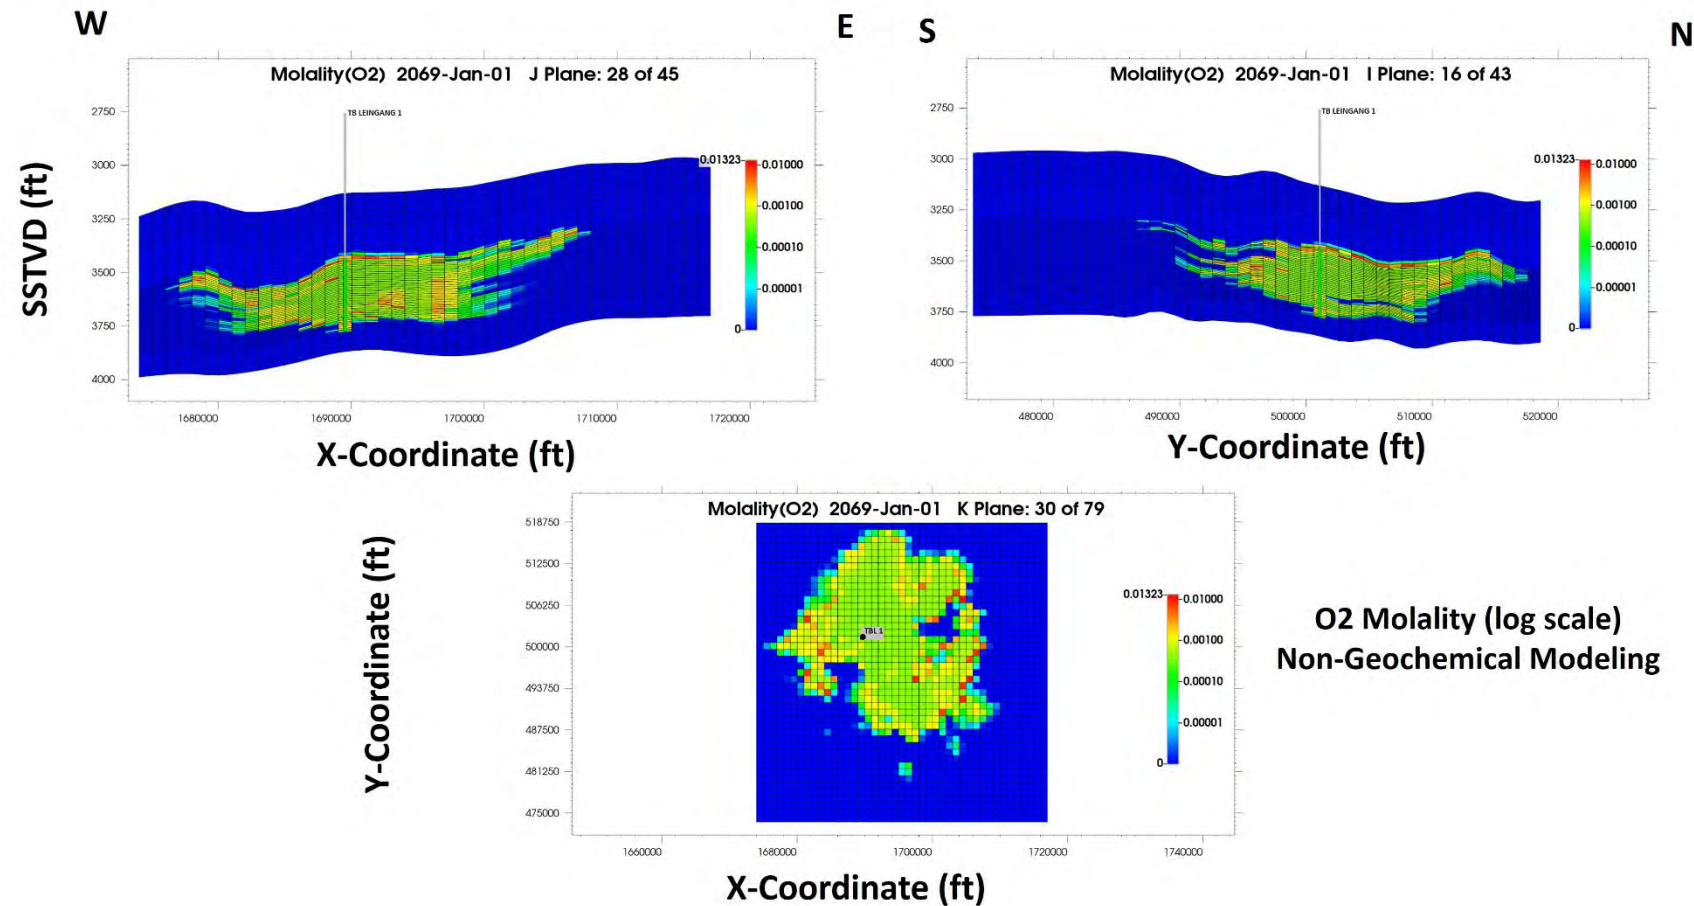

Figure C-6b. Cross section for O<sub>2</sub> molality for the nongeochemistry case simulation results after 20 years of injection plus 25 years postinjection showing the distribution of O<sub>2</sub> in the gas phase in log scale. The top-left image is west-east, and the top-right image is a south-north cross section. The bottom image is a planar view of simulation Layer 30 at 3469 ft (SSTVD).

Figure C-7 shows the mass of mineral dissolution and precipitation due to CO<sub>2</sub> injection in the Broom Creek Formation. Dolomite is the most prominent dissolved mineral, while anhydrite is the most prominent precipitated mineral. All other minerals showed very limited variations.

Simulation results show that, during CO<sub>2</sub> injection, the supercritical CO<sub>2</sub> (free-phase CO<sub>2</sub> gas) remains dominant. CO<sub>2</sub> dissolution in the formation water and residual trapping of CO<sub>2</sub> slowly increased over time, while CO<sub>2</sub> mineralization is negligible at the plot scale in Figure C-7 it can be observed at the plot scale in Figure C-8. Once CO<sub>2</sub> injection ceases in 2044, injected concentrated CO<sub>2</sub> begins to expand, resulting in more CO<sub>2</sub> that is capillary-trapped or dissolved into fresh brine, as evidenced by the crossover in Figure C-8. Figures C-9 and C-10, respectively, provide an indication of the change in distribution of the mineral that experienced the most dissolution, dolomite, and the mineral that experienced the most precipitation, anhydrite. Considering the apparent net dissolution of minerals in the system, as indicated in Figure C-7, there is an associated net increase in porosity in the affected areas, as shown in Figure C-11. Del Porosity Mineral (DPORMNR) output calculates the porosity change due to mineral dissolution/precipitation. It is calculated as Initial Porosity – Porosity at Time “t.” Negative values of this output indicate net mineral dissolution (porosity increase), while positive values indicate net mineral precipitation (porosity decrease). However, the porosity change is small, less than 0.01% porosity units, equating to a maximum increase in average porosity from 22.00% to 22.01% after the 20-year injection period plus 25 years postinjection.

Figure C-7. Modeled change in the mineral masses (minus values show dissolution and positive values show precipitation) due to CO<sub>2</sub> injection (top: all minerals; bottom: zoomed in after removing anhydrite and dolomite). Dissolution of dolomite with precipitation of anhydrite was observed. All of the other minerals showed very small values and account as net zero in this figure.

Figure C-8. Top image: mineral mass changes, in metric tons (tonnes), for the different CO<sub>2</sub>-trapping mechanisms present during CO<sub>2</sub> injection with geochemical modeling in the injection zone for the Broom Creek Formation; bottom image: CO<sub>2</sub> mineral trapping.

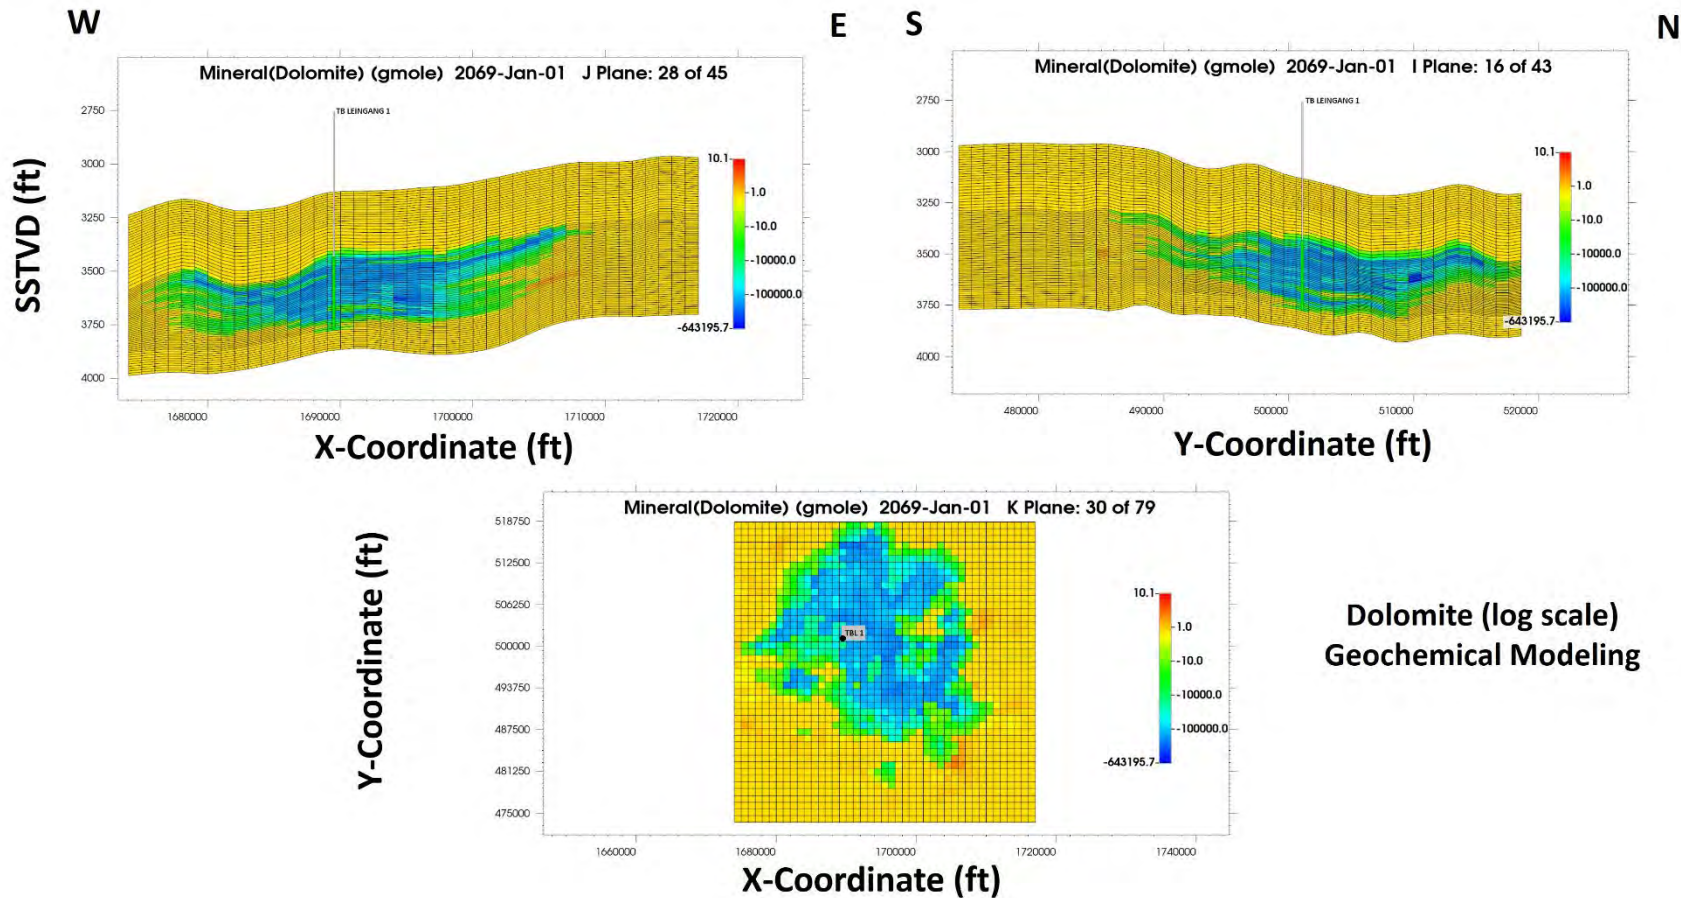

Figure C-9. Modeled change in molar distribution of dolomite, the most prominent dissolved mineral after 20 years of injection plus a 25-year postinjection period. The top-left image is west-east, and the top-right image is a south-north cross section. The bottom image is a planar view of simulation Layer 30 at 3469 ft (SSTVD).

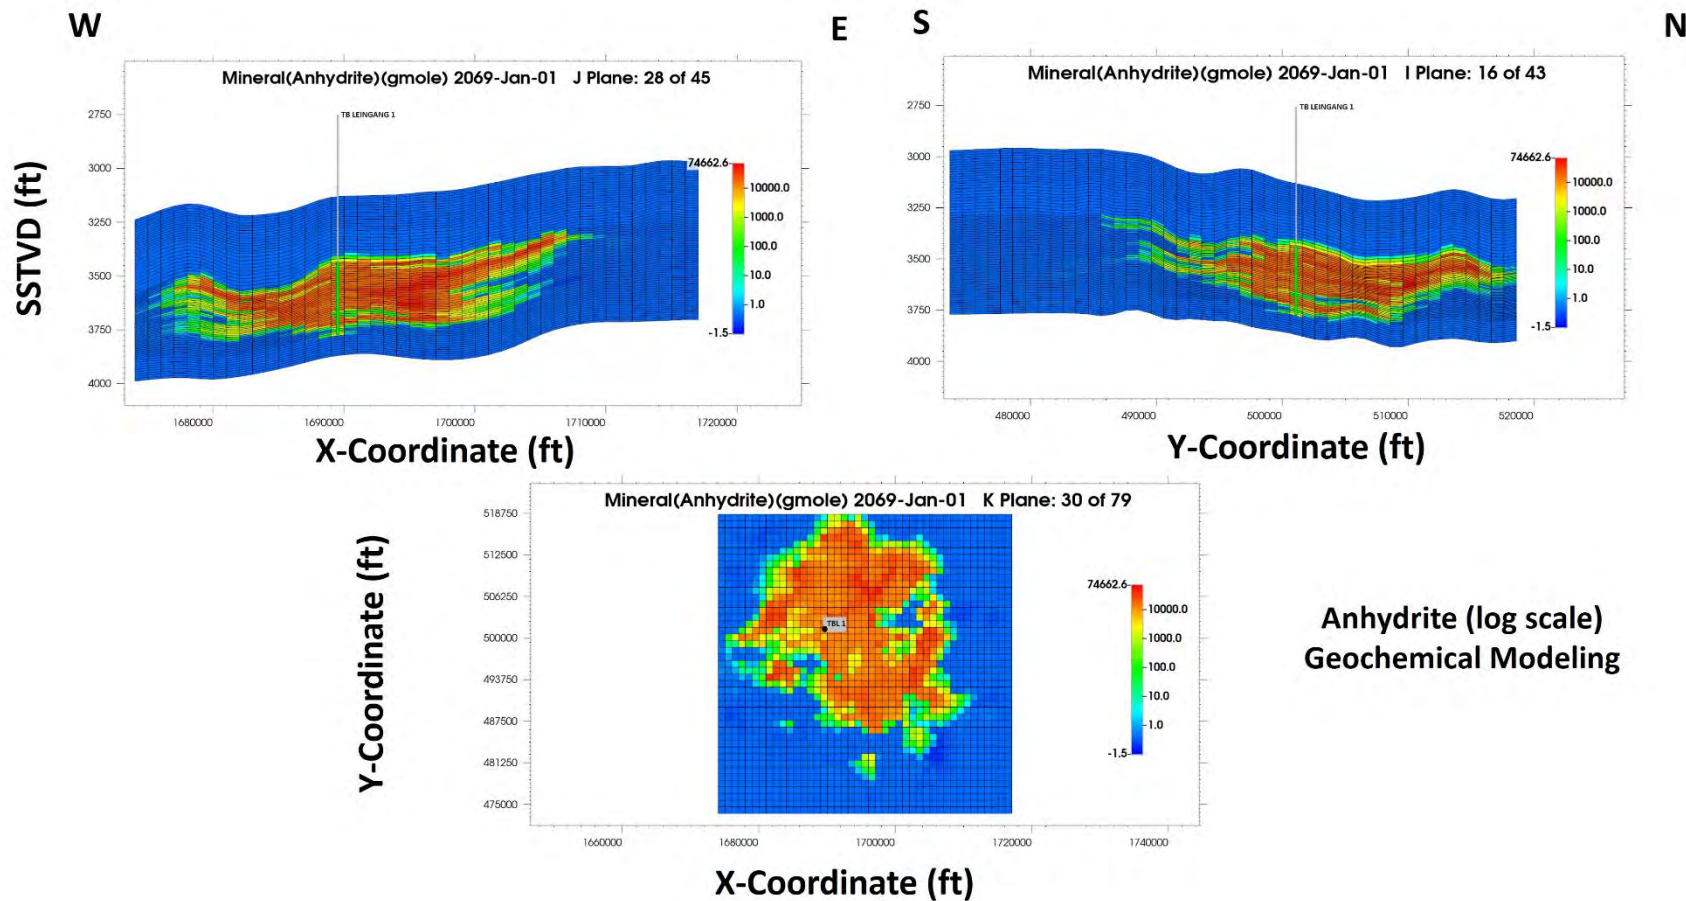

Figure C-10. Modeled change in molar distribution of anhydrite, the most prominent precipitated mineral after 20 years of injection plus a 25-year postinjection period. The top-left image is west-east, and the top-right image is a south-north cross section. The bottom image is a planar view of simulation Layer 30 at 3469 ft (SSTVD).

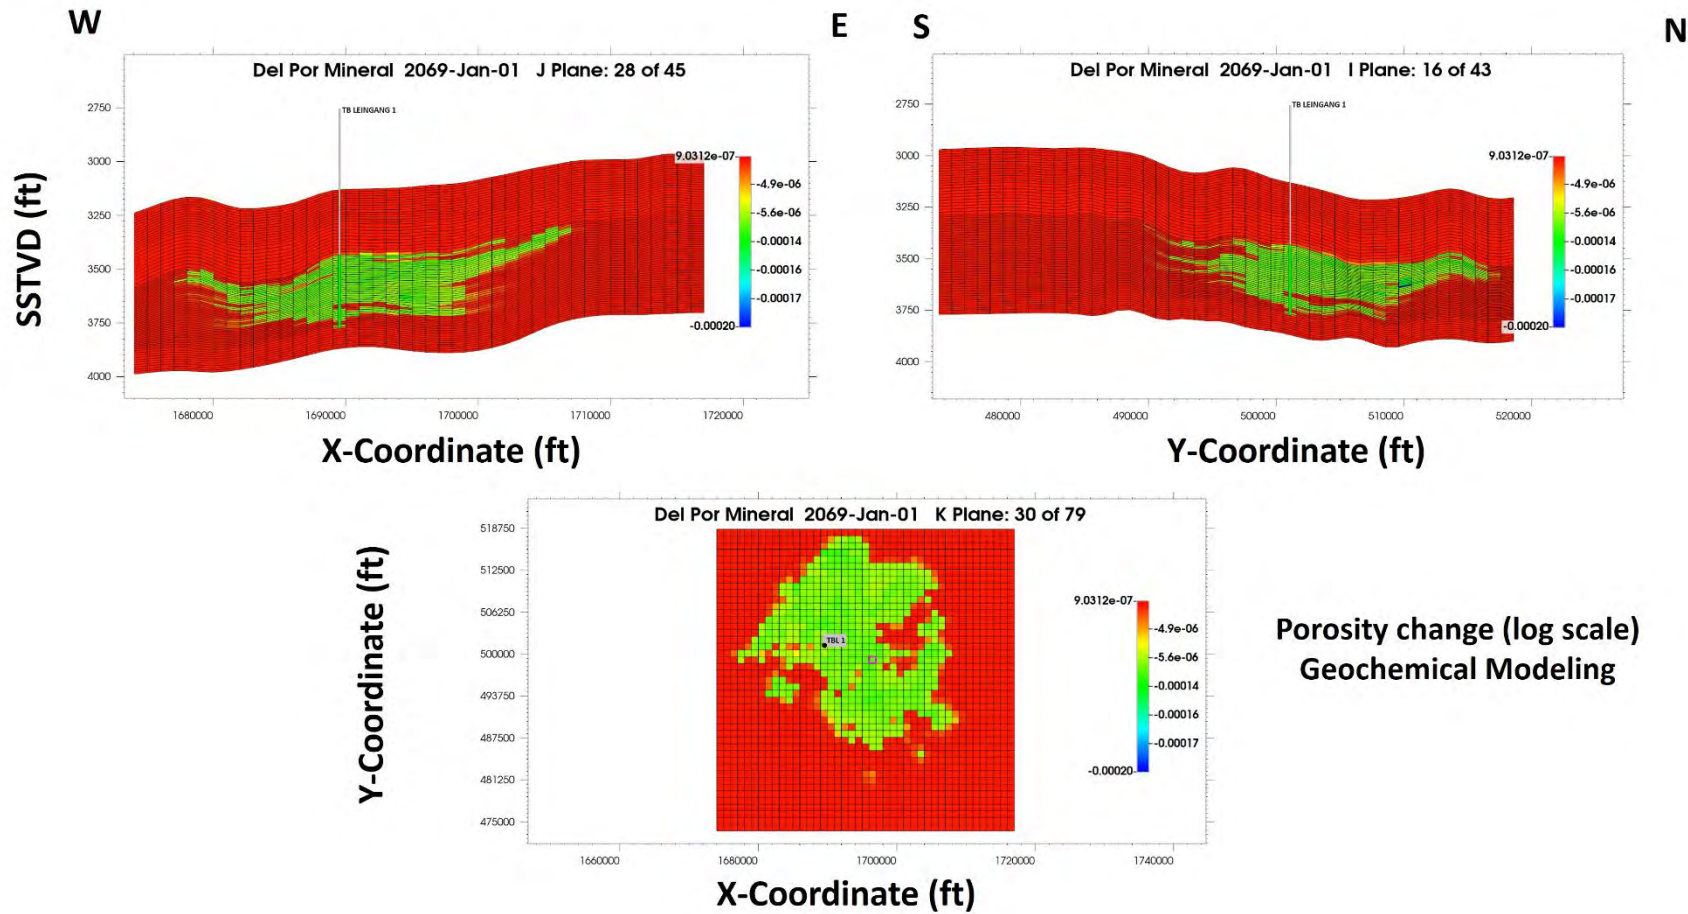

Figure C-11. Modeled change in porosity due to net geochemical dissolution after 20 years of injection plus a 25-year postinjection period. The top-left image is west-east, and the top-right image is a south-north cross section. The bottom image is a planar view of simulation Layer 30 at 3469 ft (SSTVD).

### C.1.2 Geochemical Interaction of the Upper Confining Zone (Cap Rock, Opeche/Spearfish Formation)

Geochemical simulation using the PHREEQC geochemical software was performed to calculate the potential effects of an injected multicomponent CO<sub>2</sub> stream on the Opeche/Spearfish Formation. Note: PHREEQC's unit of measure is metric. A vertically oriented 1D simulation was created using a stack of 1-meter grid cells where the formation was exposed to the injection stream mixture at the bottom boundary of the simulation and allowed to enter the system by molecular diffusion processes. Direct fluid flow into the Opeche/Spearfish Formation by free-phase saturation from the injection stream is not expected to occur because of the low permeability of the confining zone. Results were calculated at the grid cell centers: 0.5, 1.5, and 2.5 meters above the cap rock–CO<sub>2</sub> exposure boundary. The average mineralogical composition calculated from the XRD results of the two deepest samples from the Opeche/Spearfish Formation was honored (Table C-4). Formation brine composition was assumed to be the same as the known composition from the Broom Creek Formation injection zone below (Table C-5).

The anticipated average CO<sub>2</sub> stream composition is 98.25% CO<sub>2</sub>, 1.44% N<sub>2</sub>, and 0.31% O<sub>2</sub>, with a trace amount of H<sub>2</sub>S. The CO<sub>2</sub> stream, shown in Table C-1 that was used for geochemical modeling, contains a higher amount of O<sub>2</sub> (2%). The modeled stream containing ~95% CO<sub>2</sub> and 2% O<sub>2</sub>, Table C-1, was used to represent a conservative scenario where the higher oxygen concentration may trigger more geochemical reactions in the formation. The exposure level, expressed in moles per year, of the CO<sub>2</sub> stream to the confining layer was 4.5 moles/yr. This value is considerably higher than the expected actual exposure level of 2.3 moles/year (Espinoza and Santamarina, 2017). Again, this conservative overestimation was done to ensure that the degree and pace of geochemical change would not be underestimated. This geochemical simulation was run for 45 years to represent 20 years of injection plus 25 years postinjection. The simulation was performed at elevated reservoir pressure and temperature conditions obtained from the dynamic reservoir simulation.

**Table C-4. Averaged Mineral Composition of the Opeche/Spearfish Derived from XRD Analysis of Milton Flemmer 1 Core Samples at Depths\* of 5824.8 and 5819.5 ft MD**

Minerals, wt%	
Anhydrite	59.56
Quartz	25.20
Dolomite	9.14
K-Feldspar	4.82
Illite	1.29

\*Core Depths. Please reference Table 2-2a for the core to log depth shifts in the Milton Flemmer 1.

**Table C-5. Formation Water Chemistry from Broom Creek Formation Fluid Sample from Milton Flemmer 1**

pH	6.47	TDS	105,000 mg/L
Total Alkalinity	101 mg/L CaCO <sub>3</sub>	Calcium	3060 mg/L
Bicarbonate	101 mg/L CaCO <sub>3</sub>	Magnesium	505 mg/L
Sulfate	2400 mg/L	Iron	5 mg/L
Chloride	42,400 mg/L	Lead	0.01 mg/L
Sodium	39,500 mg/L	Strontium	86.5 mg/L
Potassium	680 mg/L	Barium	5 mg/L

Results showed geochemical processes at work. Figures C-12 through C-16 show results from geochemical modeling. Figure C-12 shows a change in fluid pH over time as CO<sub>2</sub> diffuses into the system. For the cell at the CO<sub>2</sub> interface, Cell 1 (C1), the pH starts declining from an initial pH of 6.47, decreasing to a level of 5.05 after 10 years of injection, and slowly stabilizes at 5.03 by the end of 25 years postinjection. For the cell occupying the space 1 to 2 meters into the cap rock, C2, the pH begins to change after Year 8 and goes down to 5.45 by the end of simulation. For the cell occupying the space 2 to 3 meters into the cap rock, C3, the pH begins to change after Year 43.

Figure C-13 shows the modeled change in mineral dissolution and precipitation in grams per cubic meter of rock for C1 and C2. In C1 and C2, K-feldspar starts to dissolve from the beginning of the simulation period, while illite and quartz start to precipitate at the same time. The net change due to precipitation or dissolution in C2 is less than 5 kg per cubic meter, with little dissolution or precipitation taking place during the later years of simulation. Any effects in C3 are too small to represent at this scale.

Figure C-14 represents the initial fractions of potentially reactive minerals in the Opeche/Spearfish Formation based on XRD data shown in Table C-4. The expected dissolution of these minerals in weight percentage is also shown for C1 and C2 of the model. In C1 and C2, K-feldspar is the primary mineral that dissolves. Dissolution (%) in C2 is minimal (<0.2%) and not significant to represent at the scale in Figure C-14.

Figure C-15 represents minerals expected to be precipitated in weight (%) shown for C1 and C2 of the model. In C1 and C2, illite, quartz, and calcite are the minerals to be precipitated.

Figure C-16 shows the modeled change in porosity of the cap rock for C1–C3. The overall net porosity changes from dissolution and precipitation are minimal, less than 0.1% change during the life of the simulation. Initially, C1 experiences up to a 0.14% increase in porosity upon first CO<sub>2</sub> exposure because of dissolution and initial model equilibration, but the change is temporary. No significant porosity changes were observed for C2 and C3. These results suggest that geochemical change from exposure to CO<sub>2</sub> is minor; therefore, the ability of the Opeche/Spearfish Formation to maintain its sealing integrity will not be compromised by geochemical processes.

Figure C-12. Modeled change in fluid pH vs. time. Red line shows pH for the center of C1, 0.5 meters above the Opeche/Spearfish Formation cap rock base. Yellow line shows C2, 1.5 meters above the cap rock base. Green line shows C3, 2.5 meters above the cap rock base.

Figure C-13. Modeled dissolution and precipitation of minerals in the Opeche/Spearfish Formation cap rock. Dashed lines show results calculated for C1, 0.5 meters above the cap rock base. Solid lines show results for C2, 1.5 meters above the cap rock base, and these changes are smaller compared to the changes observed for C1. Results from C3, 2.5 meters above the cap rock base, are not shown because they are less than the dissolution and precipitation occurring in C2.

Figure C-14. Weight percentage (wt%) of potentially reactive minerals present in the Opeche/Spearfish Formation geochemistry model before simulation (blue) and expected dissolution of minerals in C1 (orange) and C2 (gray, too small to see in the figure) after 20 years of injection plus 25 years postinjection. Negative values represent total wt% associated with dissolution.

Figure C-15. Weight percentage (wt%) of initial (blue) and precipitated (orange) minerals of the Opeche/Spearfish Formation in C1 and C2 normalized based on total solids (initial – dissolution + precipitation) present in C1 and C2 after 20 years of injection and 25 years postinjection. Secondary minerals, barite and hematite, precipitated in C1 and C2, are too small ( $<10^{-4}\%$ ) to be seen in the figure.

Figure C-16. Modeled change in percent porosity of the Opeche/Spearfish Formation cap rock. Red line shows porosity change calculated for C1, 0.5 meters above the cap rock base. Yellow line shows C2, 1.5 meters above the cap rock base. Green line shows C3, 2.5 meters above the cap rock base. Long-term change in porosity is minimal and stabilized. Positive change in porosity is related to dissolution of minerals, and negative change is due to mineral precipitation.

### C1.3 Geochemical Interaction of the Lower Confining Zone (Amsden Formation)

The Broom Creek Formation's underlying confining layer, the Amsden Formation, was investigated using PHREEQC geochemical software. A vertically oriented 1D simulation was created using a stack of seven cells, each cell 1 meter in thickness. The formation was exposed to CO<sub>2</sub> stream components at the top boundary of the simulation, and CO<sub>2</sub> was allowed to enter the system by advection and dispersion processes. Direct fluid flow into the Amsden Formation by free-phase saturation from the injection stream is not expected to occur because of the low permeability of the confining zone. Results were calculated at the center of each cell below the confining layer–CO<sub>2</sub> exposure boundary. The average mineralogical composition calculated from the results of two samples from the Amsden Formation was honored (Table C-6). The formation brine composition was assumed to be the same as the known composition from the overlying Broom Creek Formation injection zone (Table C-5). A CO<sub>2</sub> stream containing ~95% CO<sub>2</sub> and 2% O<sub>2</sub>, described in Table C-1, was used in the geochemical modeling to represent a conservative scenario, where higher oxygen concentration may trigger more geochemical reactions in the formation. The maximum formation temperature and pressure, projected from CMG simulation results, described in Section 3.0, were used to represent the potential maximum pore pressure and temperature level.

**Table C-6. Averaged Mineral Composition of the Amsden Formation Derived from XRD Analysis of Milton Flemmer 1 Core Samples at Depths\* of 6169 and 6177 ft MD**

Minerals, wt%	
Illite	10.0
K-Feldspar	9.05
Albite	5.03
Quartz	24.2
Dolomite	50.9
Others	0.82

\*Core Depths. Please reference Table 2-2a for the core to log depth shifts in the Milton Flemmer 1.

The higher-pressure results are shown here to represent a potentially more rapid pace of geochemical change. This simulation was run for 45 years to represent 20 years of injection plus 25 years postinjection.

Modeling results show geochemical processes at work. Figures C-17 through C-22 show results from the geochemical modeling. Figure C-17 shows change in fluid pH over 45 years (representing 20 years of injection and 25 years postinjection) as CO<sub>2</sub> enters the system. Initial change in pH in all of the cells, for C1 to C7, is related to initial equilibration of the model. For the cell at the CO<sub>2</sub> interface, C1, the pH declines to a level of 5.7 after 7 years of injection, further declining to 4.8 by the end of the modeled injection period, and hits 4.5 by the end of simulation period. Progressively lower or slower pH changes occur for each cell that is more distant from the CO<sub>2</sub> interface. The pH for C7 did not decline over the 45 years of simulation time. Figure C-18 shows that CO<sub>2</sub> does not penetrate more than 6 meters (represented by C7) over the 20 years of injection and 25 years postinjection.

Figure C-19 shows the modeled changes in mineral dissolution and precipitation in grams per cubic meter over 45 years of simulation time. For C1, albite and K-feldspar start to dissolve from the beginning of the simulation period while quartz and illite start to precipitate. Anhydrite and hematite, the secondary minerals, precipitate in minor amounts. C2 shows the same trends, but the process begins approximately 6 years after Cell C1.

Figure C-20 represents the initial fractions of potentially reactive minerals in the Amsden Formation based on the XRD data in Table C-6. The expected dissolution of the minerals in weight percentage is also shown for C1 and C2 of the model. In C1 and C2, albite and K-feldspar are the primary minerals that dissolve, and their initial fractions have almost completely dissolved. No dissolution is observed for illite and quartz. The minerals that experience dissolution in the model are almost completely replaced by the precipitation of other minerals.

Figure C-17. Modeled change in fluid pH for C1–C7 in the Amsden Formation underlying confining layer.

Figure C-18. Modeled CO<sub>2</sub> concentration (molality) for C1–C7 in the Amsden Formation underlying confining layer.

Figure C-19. Modeled dissolution and precipitation of minerals in the Amsden Formation underlying confining layer. Dashed lines show results for C1, 0 to 1 meter below the Amsden Formation top. Solid lines show results for C2, 1 to 2 meters below the Amsden Formation top. Dotted lines show results for C6, 5 to 6 meters below the Amsden Formation top. C6 shows minimal dissolution and precipitation at the end of 25 years postinjection because of the smaller amount of CO<sub>2</sub> penetration in C6 by the end of 45 years of simulation.

Figure C-20. Weight percentage (wt%) of potentially reactive minerals present in the Amsden Formation geochemistry model before simulation (blue) and expected dissolution of minerals in C1 (orange) and C2 (gray) after 20 years of injection plus 25 years postinjection. Negative values represent total wt% associated with dissolution.

Figure C-21 represents this replacement, with the minerals expected to be precipitated in weight percentage (wt%) shown for C1 and C2 of the model. In C1 and C2, illite and quartz are the key primary minerals expected to be precipitated. Anhydrite and hematite precipitate as secondary minerals in C1 and calcite in C2.

The modeled change in porosity (% units) of the Amsden Formation underlying confining layer is displayed in Figure C-22 for C1–C3. The overall net porosity changes from dissolution and precipitation are minimal, less than 2% change during the life of the simulation. C1 shows an initial porosity increase, but this change is temporary, and the cell returns to its near-initial porosity after Year 18. For C2 and C3, a cyclic pattern of porosity increase and subsequent decrease with low amplitude is observed. No significant porosity changes were observed in C2–C3 after 20 years of modeled injection. Cells C4–C7 showed similar results, with porosity change being less than 0.1% at each time step (not shown in Figure C-22).

Figure C-21. Weight percentage (wt%) of initial (blue) and precipitated (orange) minerals of the Amsden Formation in C1 and C2, normalized based on total solids (initial – dissolution + precipitation) present in C1 and C2 after 20 years of injection and 25 years postinjection. Very little hematite and anhydrite precipitation is observed in C1. Hematite precipitation in C2 is too small to be seen in the figure.

Figure C-22. Modeled change in percent porosity in the Amsden Formation underlying confining layer. Red line shows porosity change for C1, 0 to 1 meter below the Amsden Formation top. Orange line shows C2, 1 to 2 meters below the Amsden Formation top. Green line shows C3, 2 to 3 meters below the Amsden Formation top. Long-term change in porosity is minimal and stabilized. Positive change in porosity is related to dissolution of minerals, and negative change is due to mineral precipitation.

## **APPENDIX D**

### **MONITORING EQUIPMENT SPECIFICATION INFORMATION**

## Attachment D-1 – Gas Chromatograph Specification Sheet

### Envent Model 132S Process Gas Chromatograph

The Model 132S Process Gas Chromatograph (GC) is a simple approach to energy measurement, created and designed for many different applications. Envent provides a Process Gas Chromatograph platform that is efficiently manufactured to ensure industry leading delivery, while providing a GC that allows for ease of serviceability.

#### Features

- High performance GC columns packed in our Envent GC Lab
- Reduced carrier usage due to efficient column design
- Environmental chamber tested prior to shipment

#### Field-Serviceability

- Easy access Electronics Enclosure with single board technology
- Easy access GC Detector/Column Oven for easy GC valve diaphragm replacement and column change
- Typical downtime for diaphragm and column change: approx. 30 minutes
- No modules to maintain or un-planned downtime due to non-serviceability and high cost of competitor's module technology
- Returns ownership to the measurement technician rather than the GC manufacturer

#### Natural Gas Applications

- Energy Measurement
- Pipeline Monitoring
- Custody Transfer
- Biogas/Landfill
- Power Generation
- Turbine Control

#### Gas Processing Applications

- Cryogenic gas plant
- NGL/LPG (methanol ethanol)
- LNG
- Fractionation/ Hydrocarbon Purity
- Gas Sweetening
- Methanol in NGL
- Methanol in Natural Gas

#### Electronics

- Non-incendive electronic circuit design approved for Class I Division 2 electrical areas
- Eliminates the need for explosion proof enclosures or purge-air
- Includes all CPU, Memory, and I/O functions on a single board that operates together with the Envent Gas Chromatograph software
- Low-cost, simplified electronic troubleshooting approach

#### Software

- Archived custody stream chromatogram/chart storage
- Auto-storage of most recent calibration chromatogram/chart
- 18 months of archived analysis reports
- 6 months of archived calibration reports

Easily Accessible GC Oven

1. Thermal Conductivity Detector (Max 2)
2. GC Valve (Max 6)
3. Column Dish
4. Sample Pre-Heat Coil (Max 4)

High performance micro-packed GC columns manufactured at our Envent GC lab in Houston, TX

### Specifications

Environmental Temperature	-18° to 54°C (0° to 130°F) Quoted per application
Dimensions	Standard Configuration: 72" H x 24" W x 16" D (183cm H x 61cm W x 41cm D)
Mounting	Wall mount or floor mount
Enclosure	NEMA 4X
Electrical Classification	Class I, Division 2, Groups B, C, D
Power	120 +/- 10% VAC 50/60 Hz Standard 240 +/- 10% VAC 50/60 Hz Available
Power Consumption	Start up: 150 watts Steady State: 60 - 80 watts nominal
Oven	Airless Heat Sink
GC Valves	Six-port and ten-port diaphragm chromatograph valves Thermal Conductivity Detector (TCD) Single or Dual TCD Capabilities (2-min application)
Stream Valves	Double Block and Bleed
Carrier Gas	UHP Helium (99.999%) or UHP Hydrogen (99.999%)
Actuation Gas	Helium, Nitrogen, Instrument Air (GC Valves/Stream Valves Regulated to 65 psig)
Detector	Thermal Conductivity Detector: Single or Dual TCD capabilities Advanced TCD allows for low ppm measurement
Peak Gating	Auto-Slope detection
Streams	Up to 4 Custody streams (plus auto-calibration stream)
Input/Output	2 analog outputs 4 dry contact relay outputs 4 digital inputs 4 solenoid outputs SIM 2251 Modbus mapping User Modbus mapping
Communications	1 RS-232 serial communication ports (Modbus capable) 2 RS-485 serial communication ports (Modbus capable) 1 Ethernet communication port RJ-45 (Modbus capable)
Measurement Calculations	Latest GPA 2145, GPA 2172, AGA 8, and ISO 6976 calculations

# ULTIMA® X5000 Gas Monitor

The future looks bright.

Simple retrofits have identical footprint and wiring to ULTIMA X Gas Monitor series.

Bluetooth® wireless technology allows mobile device to act as HMI screen and controller.

Intuitive display features new design equipped with organic LED (OLED) display, with full word text in 9 languages. Bright green, yellow, and red status LEDs for extreme visibility.

Industry-first, touch-button interface provides intuitive, tool-free user experience.

Instrument status indicators illuminate power, fault, and alarm conditions.

**X/S Connect App**  
Reduce setup time by at least 50% with the X/S Connect App.

## Advanced Sensor Technology

POWERED BY  
**XCell**  
SENSORS

WITH  
**TruCal**  
TECHNOLOGY

- Patented XCell H<sub>2</sub>S and CO Sensors with TruCal technology extend calibration cycles for as long as 2 years, actively monitor sensor integrity, and compensate for environmental factors and electrochemical sensor drift.
  - **Diffusion Supervision** sends acoustic signal every 6 hours to check that sensor inlet isn't obstructed so gas can reach the sensor.
  - Worry-free operation—automatically self-checks four times per day.
- 3-year warranty and 5-year expected life for XCell Sensors.
- **Dual sensor capability** doubles sensing power with half the footprint of a single gas sensor transmitter.
- **SafeSwap** enables safe and quick XCell Sensor replacement without powering off gas detector.

**Attachment D-3 – SCADA System and Leak Detection Software**

**Supervisory Control and Data Acquisition (SCADA) System**

The SCADA system is a computer-based system or systems used by personnel in a control room that aims to collect and display information about the CO<sub>2</sub> geologic storage project injection operations in real time. This supervisory system collects data at an assigned time interval and stores the data in the historian server. Using Summit Carbon Storage #1, LLC (SCS1) process control selections, the SCADA system will have the ability to send commands and control the storage injection network (i.e., start or stop pumps, open or close valves, control process equipment remotely, etc.).

In addition to monitoring and control ability, the SCADA system will include warnings, both audible and visual, to alert the SCS1 control room, which is staffed 24/7, of near or excessive violations of set parameters within the system.

**Leak Detection Software**

The leak detection system (LDS) will monitor the CO<sub>2</sub> flowline from the point of transfer to each of the injection wellheads. Instrumentation at both ends of the CO<sub>2</sub> flowline and each injection well collects pressure, temperature, and flow data. The LDS software uses the pressure readings and flow rates in and out of the line to produce a real-time model and predictive model. By monitoring deviations between the real-time model and the predictive model, the software is able to detect leaks along the CO<sub>2</sub> flowline.

## Attachment D-4 – Personnel Multigas Detector Specifications

## IBRID MX6

An easy and flexible way to do gas detection

Get ready to see hazardous levels of oxygen, toxic and combustible gas, and volatile organic compounds (VOCs) like never before.

The MX6 iBrid™ is more than an intelligent hybrid of Industrial Scientific's best monitoring technologies. It's the first gas monitor to feature a full-color LCD display screen.

The display improves safety with clear readings in low-light, bright-light or anywhere in between. Whether the work is outside, inside or underground, it's easy to see what gas hazards lurk in the immediate work environment.

And a color display is more than eye-catching. It allows the user to step through instrument settings and functions with an intuitive menu and the instrument's five-way navigation button. It even supports the option of on-board graphing for easily interpreted direct readings and recorded data.

Plus, the MX6 iBrid is our most rugged instrument ever. It is compatible with our DSX™ Docking Station and iNet

## MX6 IBRID COLOUR SCREEN

The MX6 clearly shows real-time readings in PPM or % by volume.

An intuitive menu provides easy access to features and setup.

Datalog trends and direct readings can be viewed graphically.

Calibration progress and results are shown for each sensor.

A "calibration due" warning appears for each relevant sensor.

Bright red numerals and a flashing backlight show alarm conditions.

Alarms shown with "Go/No Go" text and flashing backlight.

Color-coded text shows test or calibration results at a glance.

## KEY FEATURES

- 24 "Plug-and-Play" fieldreplaceable sensors including PID and Infrared options
- Up to 6 gases monitored simultaneously
- Simple, user-friendly, customizable menu-driven navigation
- Five-way navigation button
- Durable, concussionproof over-mold
- Optional integral sampling pump with strong 30.5 meter (100 feet) sample draw
- Full-color graphic LCD is highly visible in a variety of lighting conditions
- Powerful, 95 dB audible alarm

**iNet**

<b>ELECTROCHEMICAL</b>		
Ammonia	0-500 ppm	1
Carbon Monoxide	0-1,500 ppm	1
Carbon Monoxide (High Range)	0-9,999 ppm	1
Carbon Monoxide/ Hydrogen low	0-1,000 ppm	1
Chlorine	0-50 ppm	0.1
Chlorine Dioxide	0-1 ppm	0.01
Carbon Monoxide/ Hydrogen Sulfide (COSH)	CO: 0-1,500 ppm H <sub>2</sub> S: 0-500 ppm	1 0.1
Hydrogen	0-2,000 ppm	1
Hydrogen Chloride	0-30 ppm	0.1
Hydrogen Cyanide	0-30 ppm	0.1
Hydrogen Sulfide	0-500 ppm	0.1
Nitric Oxide	0-1,000 ppm	1
Nitrogen Dioxide	0-150 ppm	0.1
Oxygen	0-30% vol	0.1%
Phosphine	0-5 ppm	0.01
Phosphine (High Range)	0-1,000 ppm	1
Sulfur Dioxide	0-150 ppm	0.1
<b>INFRARED</b>		
Hydrocarbons	0-100% LEL	1%
Methane (% vol)	0-100% vol	1%
Methane (% LEL)	0-100% LEL	1%
Carbon Dioxide	0-5% vol	0.01%
<b>PHOTOIONIZATION</b>		
VOC	0-2,000 ppm	0.1

## SPECIFICATIONS

Specifications subject to change without notice

<b>INSTRUMENT WARRANTY:</b>	Warranted for as long as the instrument is supported by Industrial Scientific Corporation
<b>CASE MATERIAL:</b>	Lexan/ABS/Stainless Steel w/ protective rubber overmold
<b>DIMENSIONS:</b>	135 mm x 77 mm x 43 mm (5.3" x 3.05" x 1.7") – without pump 167 mm x 77 mm x 56 mm (6.6" x 3.1" x 2.2") – with pump
<b>WEIGHT:</b>	409 g (14.4 oz) typical – without pump 511 g (18.0 oz) typical – with pump
<b>DISPLAY/READOUT:</b>	Color Graphic Liquid Crystal Display
<b>POWER SOURCE/ RUN TIMES:</b>	Rechargeable Lithium-ion (Li-ion) Battery Pack (24 hours) – without pump Rechargeable, Extended-Range Lithium-ion (Li-ion) Battery Pack (36 hours) – without pump Replaceable AA Alkaline Battery Pack (10.5 hours) – without pump
<b>OPERATING TEMPERATURE RANGE:</b>	-20°C to 55°C (-4°F to 131°F)
<b>OPERATING HUMIDITY RANGE:</b>	15% to 95% non-condensing (continuous)

## Attachment D-5 – Electrical Resistance (ER) Probe Specification Sheet

**Roxar Retrievable ER Probes**  
FA-T218-A

**Product Data Sheet**  
06.07.2015

## Roxar Electrical Resistance (ER) Probes

### 2" Retrievable System

#### High Accuracy ER Probes

Corrosion is a serious industrial problem, and corrosion control is important in order to avoid damage and loss of integrity in a plant or production site. Efficient corrosion mitigation requires fast and reliable tools for control and verification of protection programs, such as the use of corrosion inhibitors.

Electrical Resistance (ER) Probes are probably the most commonly used technology used for internal corrosion monitoring. ER Probes provide a high resolution and sensitivity compared to other technologies available, and changes in corrosion rates can be identified within hours or days <sup>1)</sup>.

ER Probes measure corrosion and corrosion rates as an increase in electrical resistance over time for a steel element in the probe face. The increase in electrical resistance is proportional to the accumulated corrosion of the probe element over the exposure period. Since resistance is also dependent on temperature, a reference element (not exposed to corrosion) is buried inside the probe body for temperature correction.

ER Probes can generally be used in most common environments, like oil, gas and water. The ER Probes described in this data sheet are of the 2" high pressure retrievable type, typically used in upstream, high pressure applications.

Quality of information and measurement accuracy depend on measurement frequency and instruments used. For best results, it is recommended that Roxar ER Probes are used with Roxar CorrLog or Roxar CorrLog Wireless high accuracy instruments, covering a wide range of configuration options.

Operating conditions vary from case to case, and it is important to choose the right probe for the specific application. For this reason, a range of ER Probes is available with flush or projecting design.

The useful life of an ER Probe is normally defined as half the measurement element thickness.

<sup>1)</sup> Depending on probe type, measurement frequency and corrosion rates.

Attachment D-5 – ER Probe Specification Sheet (continued)

Roxar Retrievable ER Probes

06.07.2015

Drawing shows flush probe outline and basis for probe length calculations.

Drawing shows tubular probe outline and basis for probe length calculations.

A special reinforced probe design is available for conditions where velocities are high, sometimes in combination with a need for long probes. Need for reinforced design probes is normally evaluated based on wake frequency calculations. Picture shows reinforced probe body with reinforced hollow plug.

## Attachment D-5 – ER Probe Specification Sheet (continued)

06.07.2015

### Roxar Retrievable ER Probes

#### Repro D Probe

*Repro D Probe front*

The design of the Repro D Probe ensures a high resistance, and thus, highly accurate measurements, even if probe has a thick element. This design is therefore suitable for corrosion monitoring where corrosion rates are assumed to be from moderate to high, maintaining a high measurement resolution and accuracy. Repro D Probe is available with element thicknesses 1, 2 and 4 mm (40, 80 and 160 mil).

#### Repro E Probe

*Repro E Probe front*

The simple design of the probe makes it suitable in conditions where conductive deposits could cause short circuits between sections of the probe element for more sophisticated probe element designs (e.g. in sour production environments).

#### Repro F Probe

*Repro F Probe front*

The Repro F Probe has an element with an optimized shape, and is available with a 0,1 mm (4 mil) measurement element. The design gives the probe a very high sensitivity, however, a limited life for many field applications. The probe is mostly recommended for conditions where corrosion is expected to be low, or for test/research applications where fast response is required.

#### Tubular T10 and T20 Probes

*Roxar Tubular Probe front*

Roxar tubular element probes are designed with a tubular shaped element protruding into the flow. The probes are available with 0.25 and 0.5 mm (10 and 20 mil) elements.

*Protective shields for the tubular elements are available (T10 probe left, T20 probe right)*

**Specifications - Roxar Retrievable ER Probes**

Item	Description
Mounting:	2" high pressure access fitting (mechanical or hydraulic system)
Probe body material:	316 SS (other materials available upon request)
Pressure rating:	Standard: 6,000 psi (420 bar) Optional: 10,000 psi (690 bar)
Connector:	6 pin Amphenol male
Temperature rating:	Operating Temperature up to 145 °C (293 °F) (Welded element tubular probes are option at higher temperature rating, please ask Roxar for details).

## Attachment D-6 – ER Probe Data Transmitter Specification Sheet

### Rosemount™ 4390 Series of Corrosion and Erosion Wireless Transmitters

Maximize your process performance with continuous online corrosion and erosion monitoring

Rosemount 4390 Series of Corrosion and Erosion Wireless Transmitters provide continuous, accurate and highly sensitive real time corrosion and erosion monitoring data, enabling maximum performance through process optimization and eliminate the need of costly walk-downs. The transmitter delivers superior corrosion management data by using top of the range instruments thus providing improved data processing, flexible data management solutions and friendly user interface.

- Best-in-class inline corrosion and erosion data monitoring by providing continuous, accurate and highly sensitive monitoring data
- Increase safety at your plant by reducing exposure to personnel in hazardous areas and eliminating walk-downs to gather data
- WirelessHART® – seamless compatibility with existing Emerson™ devices
- Self-organizing, self-healing, adaptive mesh network – no wireless expertise is required
- Better cost control by enabling maximum performance through process optimization

### Easy to Deploy and Easy to Maintain

Corrosion monitoring system

- The transmitter is compatible with Electrical Resistance Probes (ER probes), Linear Polarization Probes (LPR probes) and Multi Element Sand probes from Emerson and other major vendors
- Various data formats (calculated metal loss data, corrosion and erosion rates or probe raw data) can be selected from the HART® terminal, or from the Emerson Asset Management System (AMS)
- The corrosion wireless transmitter can be seamlessly integrated with Plantweb™ Insight Inline Corrosion Application and provides actionable data right to your desk
- High resolution (24 bit) ensuring reliable and fast corrosion and erosion monitoring
- Optimized power consumption up-to 4 times more compared to previous generation
- 15 times better sampling rate compared to previous generation
- Delivers high reliability in challenging radio environments using Direct Sequence Spread Spectrum (DSSS) technology

Attachment D-6 – ER Probe Data Transmitter Specification Sheet (continued)

Rosemount 4390 Series of Corrosion and Erosion Wireless Transmitters

Product Specifications	
General	For connection with intrusive corrosion and erosion probes
Connection	Connected to probe via a probe cable - maximum 65 feet (20 m)
Humidity Limits	5 - 95% relative humidity
Instrument Resolution	24 bit
Measurement Intervals	Multiple Element probes and Electrical Resistance (ER) probes can be measured as fast as 1-minute interval Linear Polarization Resistance (LPR) probes can be measured as fast as 4-minutes intervals
Communication	WirelessHART 2.4 GHz DSSS (Discrete Sequential Spread Spectrum)
ER Probe	Actual accuracy 10-100 ppm of probe element thickness, depending on probe type and environmental conditions
LPR Probe	Accuracy of 100ppm for the resistance measured on the LPR port
Sand Probe	Actual accuracy 10-100 ppm of probe element thickness, depending on probe type and environmental conditions
Operating Temperature	-40 to 158 °F (-40 to +70 °C)
Power Module	Black power module, type 701PBKKF. Replaceable, non-rechargeable. Intrinsically safe Lithium-Thionyl Chloride power module pack with PBT/PC enclosure. 7.2 V
Housing & Weight	Painted aluminum, IP 66, NEMA® 4x, 5kg
Hazardous Location Protection Type	Intrinsically Safe (Ex ia) device

\* See product data sheet for full specifications.

## Attachment D-7 – Example Ultrasonic Tool Specification Sheet

Summit Carbon Solutions LLC  
Cased-Hole Wireline Services RFP 7.6.2023

Flexural wave imaging is used by Isolation Scanner service as a significant complement to pulse-echo acoustic impedance measurement. It relies on the pulsed excitation and propagation of a casing flexural mode, which leaks deep-penetrating acoustic bulk waves into the annulus. Attenuation of the first casing arrival, estimated at two receivers, is used to unambiguously determine the state of the material coupled to the casing as solid, liquid, or gas (SLG). Third-interface reflection echoes arising from the annulus/formation interface yield additional characterization of the cased hole environment:

- acoustic velocity ( $P$  or  $S$ ) of the annulus material
- position of the casing within the borehole or a second casing string
- geometrical shape of the wellbore.

Vertical sampling is selectable to as low as 0.6 in [1.52 cm], and the azimuthal resolution has a maximum of  $10^\circ$ . Because acoustic impedance and flexural attenuation are independent measurements, their combined analysis provides borehole fluid properties, not requiring a separate fluid property measurement.

#### Applications

- Differentiate high-performance lightweight cements (foam, LiteCRETE\*, and Ultra LiteCRETE\* systems) from liquids
- Map annulus material as SLG
- Confirm hydraulic isolation
- Image channels and defects in annular isolating material
- Visualize position of casing in the borehole
- Image wellbore shape
- Determine casing internal diameter and thickness
- Determine depth for sidetracking and casing milling.

**Attachment D-7 – Example Ultrasonic Tool Specification Sheet (continued)**

Summit Carbon Solutions LLC  
Cased-Hole Wireline Services RFP 7.6.2023

**Isolation Scanner Service Measurement Specifications**

Output <sup>†</sup>	Solid-liquid-gas map of annulus material, hydraulic communication map, acoustic impedance, flexural attenuation, rugosity image, casing thickness image, internal radius image
Logging speed	Standard resolution (6 in, 10° sampling): 2,700 ft/h [823 m/h] High resolution (0.6 in, 5° sampling): 563 ft/h [172 m/h] Up to 13,000 ft/h [3,972 m/h] using SLB Power Transducers
Range of measurement	Min. casing thickness: 0.15 in [0.38 cm] Max. casing thickness: 0.79 in [2.01 cm]
Vertical resolution	High resolution: 0.6 in [1.52 cm] High speed: 6 in [15.24 cm]
Accuracy <sup>‡</sup>	Acoustic impedance: <sup>§</sup> 0 to 1.0 Mrayl (range); 0.2 Mrayl (resolution); 0 to 3.3 Mrayl = ±0.5 Mrayl, >3.3 Mrayl = ±15% (accuracy) Flexural attenuation: <sup>††</sup> 0 to 2 dB/cm (range), 0.05 dB/cm (resolution), ±0.01 dB/cm (accuracy)
Depth of investigation	Casing and annulus up to 3 in [7.62 cm]
Mud type or weight limitations <sup>‡‡</sup>	Conditions simulated before logging
Combinability	Bottom only, combinable with most wireline tools Telemetry: fast transfer bus (FTB) or enhanced FTB (EFTB)
Special applications	H <sub>2</sub> S service

- <sup>†</sup> Investigation of annulus width depends on the presence of third-interface echoes. Analysis and processing beyond cement evaluation can yield additional answers through additional outputs, including the Variable Density log of the annulus waveform and polar movies in AVI format
- <sup>‡</sup> 8-mm calibration target
- <sup>§</sup> Differentiation of materials by acoustic impedance alone requires a minimum gap of 0.5 Mrayl between the fluid behind the casing and a solid
- <sup>††</sup> For 0.3-in [8-mm] casing thickness
- <sup>‡‡</sup> Max. mud weight depends on the mud formulation, sub used, and casing size and weight, which are simulated before logging

**Isolation Scanner Service Mechanical Specifications**

Temperature rating	350 degF [177 degC]
Pressure rating	20,000 psi [138 MPa]
Casing size—min. <sup>†</sup>	4 ½ in (min. pass-through restriction: 4 in [10.16 cm])
Casing size—max. <sup>†</sup>	13 ¾ in
Outside diameter	IBCS-A: 3.375 in [8.57 cm] IBCS-B: 4.472 in [11.36 cm] IBCS-C: 6.657 in [16.91 cm] IBCS-D: 8.736 in [22.19 cm]
Length	Without sub: 19.73 ft [6.01 m] IBCS-A sub: 2.01 ft [0.61 m] IBCS-B sub: 1.98 ft [0.60 m] IBCS-C sub: 1.98 ft [0.60 m] IBCS-D sub: 1.98 ft [0.60 m]
Weight	Without sub: 333 lbm [151 kg] IBCS-A sub: 16.75 lbm [7.59 kg] IBCS-B sub: 20.64 lbm [9.36 kg] IBCS-C sub: 23.66 lbm [10.73 kg] IBCS-D sub: 24.55 lbm [11.13 kg]
Sub max. tension	2,250 lbf [10,000 N]
Sub max. compression	12,250 lbf [50,000 N]

- <sup>†</sup> Limits for casing size depend on the sub used. Data can be acquired in casing larger than 9% in with low-attenuation mud (e.g., water, brine). If the chrome content of the tubing or casing is higher than 13%, contact your local SLB representative.

## Attachment D-8 – Example Array Sonic Tool Specification Sheet

Summit Carbon Solutions LLC  
Cased-Hole Wireline Services RFP 7.6.2023

## Array Sonic Tool (ASLT)

Acoustic, or sonic, tools provide a measurement of the formation integral travel time ( $\Delta t$ ) in a variety of environments. Acoustic logs recognize secondary, or vugular, porosity in hard rock sediments. Acoustic tools can be run in conjunction with density and compensated neutron tools in bad borehole conditions to measure porosity, and this third porosity is also used to identify complex lithology.

The Array Sonic Tool (ASLT) is made up with a Sonic Array Logging Sonde (ASLT), which uses the Digital Telemetry System, to provide either compressional  $\Delta t$  measurements or Cement Bond Log (CBL) and Variable Density log (VDL) measurements and digital waveform recording and display. The conventional sonic measurements are borehole-compensated (BHC) (3- to 5-ft [0.91- to 1.52-m]) transit time and long-spacing depth-derived BHC (DDBHC) (5- to 7-ft [2.43- to 3.65-m]) and STC.

## Applications

- 2 ft span BHC (3ft to 5ft) delta-T
- 2 ft span BHC (5ft to 7ft) delta-T (Compensated measurement for tool tilt and wash out)
- 6 in span BHC Compressional  $\Delta t$
- Compressional and Shear slowness from multi receiver STC analysis
  - Gas detection
  - Seismic ties & Synthetics
  - Sonic Porosity
- ASLT has capability to obtain Shear Slowness in fast formation through STC Processing

ASLT Measurement Specifications	
Output	OH: BHC (3-5ft), DDBHC (5-7ft), STC CH: 1ft and 3ft CBL, VDL, Attenuation
Logging speed	3,600 ft/h [1,097 m/h]
Range of measurement	40 to 200 us/ft [131 to 656 us/m]
Maximum compressional slowness	155 (us/ft) with DT mud at 180 (us/ft)
Maximum shear slowness	DT mud – 50 (us/ft)
Tx – Rx Configuration	Upper and Lower Transmitter – 6 Receivers Array
Mud type or weight limitations	None
Combinability	Combinable with most services

**Attachment D-8 – Example Array Sonic Tool Specification Sheet (continued)**

Summit Carbon Solutions LLC

Compression	3,000 lbs

## Attachment D-9 – Example Pulsed-Neutron Logging Tool Specification Sheet

## Spectral Pulsed Neutron service

### Formation evaluation and reservoir monitoring

The **Spectral Pulsed Neutron (SPN)** service can undertake a broad scope of reservoir evaluation and management applications, including reservoir saturation and produced fluids monitoring, formation evaluation, production profiling, workover and well abandonment evaluation, borehole diagnostics, location of bypassed oil, gas detection and quantification, and identification of water production.

The service uses an advanced, slim-hole, multifunction, pulsed neutron reservoir monitoring tool and is ideally suited for acquiring data through tubing. The tool is flexible with multiple operating modes that are selectable by surface commands. The tool is also very efficient with multiple sensors that enable faster tool movement while performing data acquisition. The SPN service combines multiple acquisition modes, reducing multiple passes down to one pass, without compromising data quality, resulting in logging times reduced by up to 66%.

The Spectral Pulsed Neutron tool employs three high-density high-resolution gamma ray detectors and an advanced digital downhole acquisition system. The reliable high output neutron generator produces gamma ray counts

up to 3 times higher than conventional instrumentation providing the most accurate and efficient measurements in the industry. The enhanced detectors and electronics measure both the arrival time and energy of detected gamma rays. The generator is pulsed at distinct frequencies, and the data acquisition system operates in various timing modes to obtain the different gamma ray measurements.

Data acquisition through casing is enabled by the high energy neutrons emitted from the non-chemical pulsed neutron source, even in complicated well completions utilizing multiple tubing and casing strings and sizes. The instrumentation combines multiple nuclear measurements in one system with industry-leading accuracy and precision. Carbon/Oxygen (C/O) and Pulsed Neutron Capture (PNC) measurements acquired with the SPN tool provide formation fluid saturations, porosity, three-phase holdup determination, and oxygen activation measurements for the detection of water flow in annuli and channels.

Extensive physical characterization of the SPN tool is conducted at our Houston Technology Center. The characterization provides forward-

#### Applications

- Formation evaluation
- Reservoir monitoring and management
- Borehole diagnostics
- Workover applications

#### Features and benefits

- Higher count rates and improved signal-to-noise ratio significantly reduces logging times
- Innovative mixed acquisition mode provides a complete pulsed neutron data set all in the same pass
- Multiple modes for operating versatility
- Flexible deployment on e-line
- Pre-job MCNP modelling to provide accurate quantitative fluid saturation

[sondex.com](http://sondex.com)

Continued...

## Attachment D-9 – Example Pulsed-Neutron Logging Tool Specification Sheet (continued)

looking pulsed neutron measurement response predictions for well candidate evaluation and data analysis. The tool's measurements are interpreted using Monte Carlo N-Particle (MCNP) transport mode modelling to provide accurate saturation profiles in a wide range of borehole, casing, formation, and fluid conditions.

The Spectral Pulsed Neutron service includes modelling of unique downhole conditions to ensure that the analysis of

the reservoir is as accurate as possible. Extensive pre-job planning tools are available for the design of a data acquisition program that optimizes the answers provided by the service.

Spectral Pulsed Neutron Service data can be matched with previous-generation **RPM™ reservoir performance monitor service** measurements for easy comparison in mature fields. For remedial work and time-lapse monitoring, the data

can be overlaid with existing log measurements in real time, allowing rapid workover planning.

The SPN hardware is combinable with other production logging instruments. It is constructed in short, modular sections to facilitate shipping and handling.

### Applications description

#### Formation evaluation

- Salinity-independent quantitative measurement with the **GasView™ gas saturation service**
- Salinity-independent quantitative measurement with the **OmniView™ three-phase fluid saturation service**
- Salinity-independent quantitative measurement in light oil reservoirs with the **OilView™ two-phase fluid saturation service**
- Quantitative measurement in light oil or high salinity reservoirs with the **FluidView™ multiphase saturation service**
- Formation resistivity, neutron porosity, and density data with **NEO™ openhole log emulation**
- Porosity evaluation

#### Reservoir monitoring and management

- Reservoir management base logs
- Monitoring fluid contacts
- Time-lapse fluid saturation monitoring
- Production and reservoir depletion
- Identification of pressure-depleted sands
- Monitoring wells with air or gas filled boreholes
- Gas flood monitoring for steam, CO<sub>2</sub> sequestration and EOR projects
- Steam envelope build up in steam-assisted gravity drainage (SAGD) wells

#### Borehole diagnostics

- Production and hold-up monitoring in horizontal wellbores
- Identification of water channeling
- Annular injection profiling in multiple-string completions

#### Workover applications

- Location of bypassed and irreducible hydrocarbons, residual oil saturation independent of water salinities
- Re-evaluation of marginal fields
- Gravel pack evaluation and monitoring

Tool specification	
Description	Specification
Tool diameter	1.80 in. (w/ Boron coating) 19 ft
Tool length	29.75 ft (w/ telemetry, GR and CCL)
Temperature	350°F
Pressure	20,000 psi
Minimum restriction	1.90 in.

HALLIBURTON

**Attachment D-12 – Example Annulus Pressure Test Procedure**

The following is a checklist SCS1 will use as a guide for conducting an initial annulus pressure test. Annulus pressure tests are required prior to commencing injection and are requisite in reestablishing mechanical integrity following a workover that involves tubing removal. If necessary, a detailed annulus pressure test procedure can be provided with the written notification prior to conducting the test.

**Pretest Protocol:**

- Notify the Department of Mineral Resources (DMR-O&G) in writing at least 30 days prior to annulus pressure testing and again at least 48 hours in advance to witness the test.
- Prepare a well schematic that includes sufficient information to confirm the packer is set opposite a cemented interval of the long-string casing and no more than 50 feet above the uppermost perforation or at a location otherwise approved by DMR-O&G. If the test well was worked over and the tubing or tubing/packer retrieved from the well, provide a workover record to the DMR-O&G inspector for review and verification of packer depth.
- Provide the on-site DMR-O&G inspector with a well schematic confirming the test well packer is in an approved location.
- Provide the on-site DMR-O&G inspector with a calibration certificate for the mechanical or digital device used to record the annulus pressure test verifying calibration within 1 year of the test date.

**Test Protocol:**

- Install or select the wellhead pressure gauge and continuous recording device to measure pressure and serve as a record of the pressure data witnessed on the wellhead pressure gauge. Select a pressure gauge with an appropriate scale so that the anticipated testing pressure falls within 25% and 75% of the full gauge scale, and that the gauge range is at a minimum twice the testing pressure. The pressure gauge and continuous recording device shall have sufficient accuracy and precision to identify a 10% pressure change.
- Fill the tubing-casing annulus with an approved liquid and confirm the annulus will remain full. Measure and record the liquid type and volume required to fill the annulus. Allow time for the temperature of the well and annulus liquid to equilibrate.
- Confirm that the annulus is liquid-filled.
- Build and maintain the annulus pressure at 1000 psig or a value previously approved by DMR-O&G
- Isolate the well from the pressure source and confirm no leaks occur at shut-off valves. If present, consider disconnecting the seal pot or surge tank to also prevent leaks at their shut-off valves.

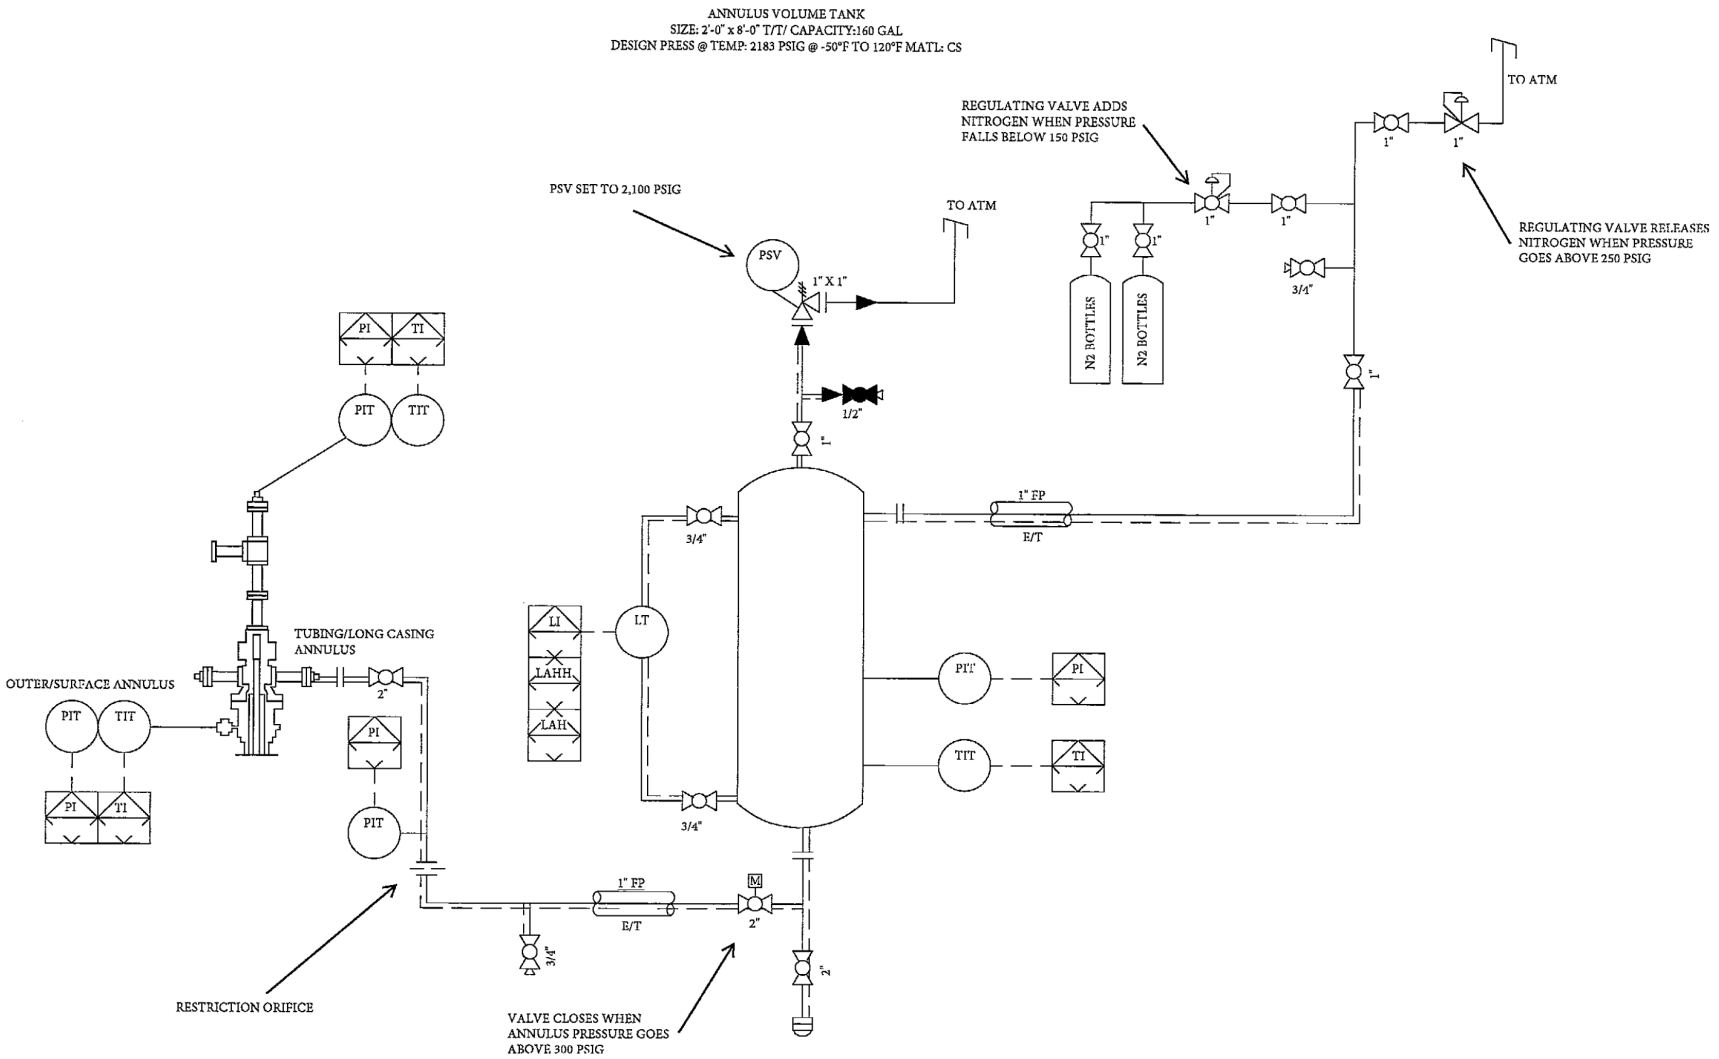

- Maintain a minimum pressure differential of 200 psi between the tubing pressure and annulus pressure. If a lower pressure differential is needed, the storage facility operator must obtain prior DMR-O&G approval.
- Record the annulus pressure for at least 30 minutes.
  - Note the time, the annulus pressure, and the tubing pressure at the start of the test and at least every 5 minutes thereafter to the end of the test.
  - The continuous recording device shall serve as a backup. A copy of the continuous pressure recording shall be submitted with the written reports to DMR-O&G.
  - A net pressure change of more than 10% constitutes a failed test.

**Posttesting Protocol:**

- Report to DMR-O&G within 30 days the results of any annulus pressure test.
- Publish the annulus pressure test results in the quarterly report in which the test was performed.

# Attachment D-13 – Diagram of the Seal Pot System

## Attachment D-14 – Antimicrobial Biocide Specification Sheet

## PRODUCT DATA SHEET

**ALDACIDE® G**  
**BIOCIDE****Product Description**

ALDACIDE® G biocide is suitable for use in water-based drilling fluids and packer fluids. ALDACIDE G biocide is effective against aerobic and anaerobic bacteria and is compatible with all brine types. Use of ALDACIDE G biocide in conjunction with sulphite oxygen scavengers is not recommended.

**Applications/Functions**

- » Water-based drilling fluids
- » Completion and packer fluids
- » Aqueous waste treatment
- » Used as part of corrosion control systems

**Advantages**

- » Effective against a broad range of microbes, bacteria and fungi
- » Effective in small concentrations
- » Compatible with most water-based drilling fluids

**Typical Properties**

- » Appearance: Transparent liquid
- » Specific gravity: 1.06
- » pH: 3.1 - 4.5

**Recommended Treatment**

Initial additions around 0.4 lb/bbl (1.1 kg/m<sup>3</sup>) will achieve effective antimicrobial action. Packer fluids should be treated with ALDACIDE G along with other corrosion control additives. Circulating fluids require regular additions of ALDACIDE G in order to maintain protection.

Caution: ALDACIDE G biocide is incompatible with BARASCAV™ D and BARASCAV L oxygen scavengers.

**Packaging**

ALDACIDE G biocide is packaged in 5-gal (18.9-l) pails and 55-gal (208-l) drums.

ALDACIDE is a registered trademark of Halliburton. BARASCAV is a trademark of Halliburton. © 2016 Halliburton. All rights reserved. Because the conditions of use of this product are beyond the seller's control, the product is sold without warranty either express or implied and upon condition that purchaser make its own test to determine the suitability for purchaser's application. Purchaser assumes all risk of use and handling of this product. This product will be replaced if defective in manufacture or packaging or if damaged. Except for such replacement, seller is not liable for any damages caused by this product or its use. The statements and recommendations made herein are believed to be accurate. No guarantee of their accuracy is made, however.

## Attachment D-15 – Corrosion Inhibitor Specification Sheet

## Baroid Fluid Services

## BARACOR® 100

## Corrosion Inhibitor

## Product Data Sheet

## Product Description

BARACOR 100 inhibitor is a highly active, film forming, water-dispersible corrosion inhibitor for use in solids-free brines.

## Applications / Functions

- BARACOR 100 inhibitor is an effective corrosion inhibitor in solids-free packer fluids and other oil and gas industry applications. BARACOR 100 inhibitor is effective at temperatures up to 400°F (204°C) in monovalent (sodium and potassium) brines and up to 300°F (148°C) in divalent (calcium and zinc) brines. Typical results show over ninety percent corrosion inhibition.

## Advantages

- Effective at low concentrations
- Convenient and easy to use
- Economical

## Typical Properties

- |                             |             |
|-----------------------------|-------------|
| • Appearance                | Dark liquid |
| • Flash point, TCC          | 92 °F       |
| • Flash point, TCC          | 33 °C       |
| • pH, (1% aqueous solution) | 10.5        |
| • Pour point                | -10 °F      |
| • Pour point                | -23 °C      |
| • Specific gravity          | 1           |

## Recommended Treatment

Treatment recommendations should be based on area histories which indicate a need for an inhibited packer fluid and compatibility test of BARACOR 100 inhibitor with the packer fluid. Many producing companies require the use of inhibited packer fluids in areas known to have corrosion problems. This is low-cost insurance for production strings.

The suggested treatment for solids-free freshwater or brine packer fluids is 0.5%-1% by volume. BARACOR 100 inhibitor should be mixed with the packer brine after filtration, then spotted in the hole.

## Packaging

BARACOR 100 inhibitor is packaged in 55-gal (208-l) drums containing 462-lb (210-kg) net weight.

## Attachment D-16 – Scaling Inhibitor (Oxygen Scavenger) Specification Sheet

**OXYGON™ Scavenger**

PRODUCT DATA SHEET

Fluid Additive

**Product Description**

OXYGON™ is a non-sulfite oxygen scavenger used to minimize the corrosive effects of soluble oxygen. Dissolved oxygen can be removed from drilling, completion and packer fluids. OXYGON works in conjunction with inhibitors, other scavengers and biocides to minimize corrosion and avoid damage to drilling and completion equipment.

**Applications/Functions**

- Removes soluble oxygen from drilling, completion and packer fluids
- Compatible with fresh water, mono- and divalent brines
- Used as part of corrosion control systems

**Advantages**

- Effective at low concentrations
- Rapid removal of dissolved oxygen
- Stable in solution to 250°F (121°C)
- Stability can be extended up to 500°F (260°C)

**Typical Properties**

- |                     |                       |
|---------------------|-----------------------|
| • Appearance:       | White granular powder |
| • Solubility:       | Water Soluble         |
| • Specific Gravity: | 1.2                   |

**Recommended Treatment**

Packer fluids should be treated with 0.1 lb/bbl (0.29 kg/m<sup>3</sup>) OXYGON, along with other corrosion control additives. Circulating fluids require regular additions of OXYGON. Service at temperatures above 250°F (121°C) requires treatment with 0.5 lb/bbl (1.45 kg/m<sup>3</sup>) CFS-635 OXYGON stabilizer.

**Packaging**

OXYGON is packed in 50lb and 25kg pails.

## Attachment D-17 – Example Casing-Conveyed P/T Gauge Specifications

INTELLIGENT COMPLETIONS | Permanent Monitoring

## DataSphere® Array System

## RELIABLE MULTI-POINT RESERVOIR MONITORING

## OVERVIEW

The DataSphere® Array system is the next step in the evolution of DataSphere permanent monitoring suite. The technology is built upon the reliability of ROC™ gauge hybrid technology and provides greater system customization by deploying multiple discrete sensors across challenging wellbore regions.

A system comprised of conventional gauges can communicate with multiple Array sensor systems distributed across different wellbore intervals. Each Array system provides discrete real-time annular downhole distributed multi-point temperature and pressure monitoring data. The Array system incorporates no cable terminations, which reduces installation time and eliminates risks associated with multiple terminations. Furthermore, the Array system uses internal short circuit protection circuitry that minimizes system line takedowns.

Based on an industry-standard, field-proven resonating quartz crystal sensor, the Array system can be used for distributed, single zone, or multi-zone monitoring applications.

In distributed monitoring, the use of Halliburton conventional downhole gauges can be enhanced by the Array system, allowing operators greater visibility into their operations efficiency in a cost-effective manner.

## APPLICATIONS

- » ICD efficiency monitoring
- » Production monitoring
- » Injection monitoring
- » Field reservoir monitoring
- » SmartWell® completion system optimization
- » Artificial lift/gas lift optimization
- » Pressure gradient monitoring

## FMJ CABLE TERMINATION

When connected to a conventional gauge, the DataSphere Array system uses a high-performance cable termination with a sealing arrangement based on our highly reliable intelligent completion FMJ connector. This cable termination incorporates a pressure-testable dual metal-to-metal ferrule seal arrangement for isolating the downhole cable outer metal sheath from the well fluid.

## FEATURES

- » Can be deployed standalone
- » Up to 50 sensors per array
- » ROC-MODBUS communication protocol
- » Designed for harsh environments up to 16,000 psi and 175°C
- » AWES qualified
- » Reduced OD design
- » Multi-drop capability on single core tubing encased conductor (TEC)
- » Hermetically sealed electron beam-welded design
- » Application Specific Integrated Chip (ASIC) technology
- » Increased capabilities such as fault protection per sensor
- » Designed for a 10 year life at 185°C

## BENEFITS

- » Quartz-sensors provide high accuracy and resolution and low drift
- » Can be deployed across the sandface for greater reservoir inflow/outflow understanding
- » Reduces rig time through faster installation times (up to eight hours saved per gauge)
- » Reduces need for cable terminations
- » Eliminates requirement for gauge mandrels in annular sensing applications
- » Validates/disproves reservoir models
- » Tool head voltage and gauge current measurement for diagnostics
- » Reduces potential leak points by minimizing system connections

## Attachment D-17 – Example Casing-Conveyed P/T Gauge Specifications (continued)

## INTELLIGENT COMPLETIONS | Permanent Monitoring

## TESTING

The individual sensor design has gone through the Design for Reliability process, which includes a Highly Accelerated Lifetime Test (HALT) program. This program is a series of controlled environmental stresses designed to ensure that stringent criteria are met for thermal shock, mechanical shock, vibration and thermal aging. During manufacture, all gauges are also subjected to Environmental Stress Screening (ESS) to highlight any defect in functionality prior to installation at the well site. This method of screening has proven to be far more effective than "burn-in" techniques.

All of the individual sensors that make up the DataSphere Array system are independently calibration-checked in our manufacturing facility. During Factory Acceptance Testing (FAT), the DataSphere Array sensor welds are pressure tested for integrity as the array is being built and spooled onto the final drum.

## DataSphere® Array System - Temperature Performance

Accuracy (°C)	0.5
Typical Accuracy (°C)	0.15
Achievable Resolution (°C/sec)	< 0.005
Repeatability (°C)	< 0.01
Drift at 177°C (°C/year)	< 0.1

## DATASPHERE ARRAY SYSTEM DESIGNS

- » Quartz transducer and hybrid technology
- » ASIC technology
- » Maximum 175°C operating temperature
- » Can be used in conjunction with existing gauges
- » Improved shock and vibration performance
- » 0.625-in. OD ultra slim design
- » Less than 7-in. length per sensor
- » Does not need a gauge mandrel to be deployed
- » Short-circuit protection per sensor, prevents line takedowns

*Temperature and Pressure Sensor > The DataSphere® Array system is comprised of multiple ultra slim, highly accurate quartz-based temperature and pressure sensors.*

## DataSphere® Array System - Pressure Performance

Pressure Range (psi / bar)	0 to 10,000 / 0 to 690	0 to 16,000 / 0 to 1,100
Accuracy (% FS)	0.015	0.02
Typical Accuracy (% FS)	0.012	0.015
Achievable Resolution (psi/sec)	< 0.006	< 0.008
Repeatability (% FS)	< 0.01	< 0.01
Response Time to FS Step (for 99.5% FS)	< 1 sec	< 1 sec
Acceleration Sensitivity (psi/g – any axis)	< 0.02	< 0.02
Drift at 14 psi and 25°C (%FS/year)	Negligible	Negligible
Drift at Max. Pressure and Temperature (%FS/year)	0.02	0.02

## Attachment D-18 – Tubing-Conveyed P/T Gauge Specifications

# DataSphere® Opsis™ Permanent Downhole Gauges

## RELIABLE, REAL-TIME MONITORING OF DOWNHOLE CONDITIONS

### OVERVIEW

In today's challenging environments, there is an increasing need for reliable and accurate reservoir data, driving the need for continuous improvement of monitoring technology. Opsis™ permanent downhole gauges are the latest addition to the DataSphere® permanent monitoring suite, providing real-time downhole data for increased productivity throughout the life of the well.

Opsis gauges feature ASIC (Application Specific Integrated Circuit) technology in combination with field-proven resonating quartz crystal sensors. The result is highly accurate pressure and temperature measurements, even under extreme temperature conditions.

Opsis gauges can be used for single or multi-zone monitoring applications. These gauges may be ported to tubing, annulus, or control line. The addition of feed-through or splitter block assemblies enables the monitoring of multiple zones.

### APPLICATIONS

- » Life of the well production monitoring
- » Life of the field reservoir monitoring
- » SmartWell® completion system optimization
- » Artificial lift optimization

### GAUGE DESIGNS

- » Quartz transducer
- » ASIC technology
- » Maximum 200°C operating temperature
- » 0.75-in OD slim line design
- » Improved shock and vibration performance

### FMJ CABLE TERMINATION

Opsis gauges use a high performance cable termination with a sealing arrangement based on our highly reliable intelligent completion FMJ connector. This cable termination incorporates a pressure-testable dual metal-to-metal ferrule seal arrangement for isolating the downhole cable outer metal sheath from the well fluid.

### FEATURES

- » ASIC hybrid electronics qualified to 200°C
- » Demonstrated downhole gauge reliability 10 years @185°C
- » Onboard intelligent gauge diagnostics
- » Bellows to isolate quartz crystal from well fluids
- » Designed for harsh environments up to 30,000 psi and 200°C
- » Extensive qualification testing performed
- » Simplified system with multiple sensor options
- » Field-testable dual metal-to-metal seal
- » Fault-tolerance features for maximum reliability

### BENEFITS

- » Continuous pressure and temperature data without the need for well intervention
- » Enhanced reservoir management
- » Increased system reliability using stable pressure/temperature measurements
- » Quartz-based sensor for high accuracy, low drift

Continued...

Single Sensor					
Single Sensor + Feedthrough					
Dual Sensor					
Dual Sensor + Feedthrough					

Special calibration available upon request

Single sensor non feedthrough variants for 150°C and 175°C have 0.75-in. OD

All feedthrough and dual sensor variants have 1.125-in. OD

## **APPENDIX E**

# **STORAGE FACILITY PERMIT REGULATORY COMPLIANCE TABLE**

Subject	N.D.C.C./N.D.A.C. Reference	Requirement	Regulatory Summary	Storage Facility Permit Application (Section and Page Number; see main body for reference cited)	Figure/Table Number and Description (Page Number)
Pore Space Amalgamation	N.D.C.C. §§ 38-22-06(3) and (4)  N.D.A.C. §§ 43-05-01-08(1) and (2)	N.D.C.C. § 38-22-06 3. Notice of the hearing must be given to each mineral lessee, mineral owner, and pore space owner within the storage reservoir and within one-half mile of the storage reservoir's boundaries.	a. An affidavit of mailing certifying that all pore space owners and lessees within the storage reservoir boundary and within one-half mile outside of its boundary have been notified of the proposed carbon dioxide storage project;	<b>1.0 PORE SPACE ACCESS</b> Summit Carbon Storage #1, LLC (SCS1) will notify in accordance with N.D.A.C. § 43-05-01-08 of the SFP hearing at least 45 days prior to the scheduled hearing. An affidavit of mailing will be provided to NDIC to certify that these notifications were made.	The affidavit has not yet been prepared.
		4. Notice of the hearing must be given to each surface owner of land overlying the storage reservoir and within one-half mile of the reservoir's boundaries.	b. A map showing the extent of the pore space that will be occupied by carbon dioxide over the life of the project;	<b>1.0 PORE SPACE ACCESS</b> (p. 1-1) North Dakota law explicitly grants title to pore space in all strata underlying the surface of lands and waters to the owner of the overlying surface estate; i.e., the surface owner owns the pore space (North Dakota Century Code [N.D.C.C.] § 47-31-03). Prior to issuance of the storage facility permit (SFP), North Dakota law mandates the storage operator obtain the consent of landowners who own at least 60% of the pore space of the storage reservoir for geologic storage of CO <sub>2</sub> (N.D.C.C. § 38-22-08[5]). The statute also mandates that a good faith effort be made to obtain consent from all pore space owners and that all nonconsenting pore space owners are, or will be, equitably compensated (N.D.C.C. §§ 38-22-08[4], [14]). North Dakota law grants the North Dakota Industrial Commission (NDIC) the authority to require pore space owned by nonconsenting owners to be included in a storage facility and subject to geologic storage through pore space amalgamation (N.D.C.C. § 38-22-10). Amalgamation of pore space will be considered at an administrative hearing as part of the regulatory process required for consideration of the SFP application. Surface access for any potential aboveground activities is not included in pore space amalgamation.	<b>Figure 1-1.</b> Map illustrating the pore space CO <sub>2</sub> extent at the cessation of injection (20 years), alongside the stabilized CO <sub>2</sub> extent over the life of the project. Map also depicts the storage facility area boundary, and 0.5 miles outside of the storage facility area boundary is the hearing notification area. Additionally, 0.5 miles outside the hearing notification area, the area of review boundary is depicted. (p. 1-2)
		N.D.A.C. § 43-05-01-08 1. The commission shall hold a public hearing before issuing a storage facility permit. At least forty-five days prior to the hearing, the applicant shall give notice of the hearing to the following:  a. Each operator of mineral extraction activities within the facility area and within one-half mile [.80 kilometer] of its outside boundary;  b. Each mineral lessee of record within the facility area and within one-half mile [.80 kilometer] of its outside boundary;	c. A map showing the storage reservoir boundary and one-half mile outside of the storage reservoir boundary with a description of pore space ownership;	Summit Carbon Storage #1, LLC (SCS1) has identified the owners (surface and mineral) (N.D.C.C. §§ 38-22-06[3], [4]; North Dakota Administrative Code [N.D.A.C.] § 43-05-01-08[1]). No mineral lessees or operators of mineral extraction activities are within the facility area or within 0.5 miles of its outside boundary. SCS1 will notify all owners of a pore space amalgamation hearing at least 45 days prior to the scheduled hearing and will provide information about the proposed CO <sub>2</sub> storage project and the details of the scheduled hearing. An affidavit of mailing will be provided to NDIC to certify that these notifications were made (N.D.C.C. §§ 38-22-06[3], [4]; N.D.A.C. §§ 43-05-01-08[1], [2]).  All owners, lessees, and operators that require notification have been identified in accordance with North Dakota law, which vests the title to the pore space in all strata underlying the surface of lands and water to the owner of the overlying surface estate (N.D.C.C. § 47-31-03). The review of pertinent county recorder records identified no severance of pore space from the surface estate or leasing of pore space to a third party prior to April 9, 2009. All surface owners and pore space owners and lessees are the same owner of record.	<b>Figure 1-1.</b> Map illustrating the pore space CO <sub>2</sub> extent at the cessation of injection (20 years), alongside the stabilized CO <sub>2</sub> extent over the life of the project. Map also depicts the storage facility area boundary, and 0.5 miles outside of the storage facility area boundary is the hearing notification area. Additionally, 0.5 miles outside the hearing notification area, the area of review boundary is depicted. (p. 1-2)
		c. Each owner of record of the surface within the facility area and one-half mile [.80 kilometer] of its outside boundary;	d. A map showing the storage reservoir boundary and one-half mile outside of its boundary with a description of each operator of mineral extraction activities;	The map in Figure 1-1 shows the extent of the pore space that will be occupied by CO <sub>2</sub> at the cessation of injection (20 years) and over the life of the project (the stabilized CO <sub>2</sub> extent) as well as the storage facility area boundary and 0.5 miles outside of the storage facility area boundary (the hearing notification area).	<b>Figure 1-1.</b> Map illustrating the pore space CO <sub>2</sub> extent at the cessation of injection (20 years), alongside the stabilized CO <sub>2</sub> extent

	(1)(b)(1)	(1) The name, description, and average depth of the storage reservoirs;	Name Lithology Average thickness Average depth	<p>TB Leingang is situated approximately 16 miles south of Beulah, North Dakota (Figure 2-1). This project site is on the eastern flank of the Williston Basin.</p> <p>Overall, the stratigraphy of the Williston Basin has been well studied, particularly the numerous oil-bearing formations. Through research conducted by the Energy &amp; Environmental Research Center (EERC) via the Plains CO<sub>2</sub> Reduction (PCOR) Partnership, the Williston Basin has been identified as an excellent candidate for long-term CO<sub>2</sub> storage due, in part, to the thick sequence of clastic and carbonate sedimentary rocks and subtle structural character and tectonic stability of the basin (Peck and others, 2014; Glazewski and others, 2015).</p> <p>The CO<sub>2</sub> storage reservoir for this project is the Broom Creek Formation, a predominantly sandstone formation 5818 ft below kelly bushing (KB) elevation at the stratigraphic and reservoir-monitoring well (Milton Flemmer 1, NDIC File No. 38594) (Figure 2-2). Unconformably overlying the Broom Creek Formation is 231 ft of predominantly siltstone with interbedded dolostone and anhydrite of the Spearfish, Minnekahta, and Opeche Formations, hereinafter referred to as the Opeche/Spearfish Formation. The Minnekahta Formation (limestone) is used to distinguish between the Spearfish Formation (above) and Opeche Formation (below). The Minnekahta Formation is interpreted to pinch out within the storage facility area. Where the Minnekahta does not exist, because of the similarity in lithology between the two formations, the Opeche and Spearfish are undifferentiated. The Opeche/Spearfish Formation serves as the primary upper confining zone (Figure 2-2). The Amsden Formation (dolostone, anhydrite, sandstone) unconformably underlies the Broom Creek Formation and serves as the lower confining zone (Figure 2-2). Together, the Opeche/Spearfish, Broom Creek, and Amsden Formations comprise the storage complex for TB Leingang (Table 2-1).</p> <p>Including the Opeche/Spearfish Formation, there are 1082 ft (thickness in Milton Flemmer 1) of impermeable rock formations between the Broom Creek Formation and the next overlying permeable zone, the Inyan Kara Formation. An additional 2670 ft (thickness at Milton Flemmer 1) of impermeable intervals separates the Inyan Kara Formation and the lowest underground source of drinking water (USDW), the Fox Hills Formation (Figure 2-2).</p> <p><b>Table 2-1. 	N.D.A.C. § 43-05-01-05(1)(b)(2)(k)	(k) Data on the depth, areal extent, thickness, mineralogy, porosity, permeability, and capillary pressure of the injection and confining zone, including facies changes based on field data, which may include geologic cores, outcrop data, seismic surveys, well logs, and names and lithologic descriptions;	b. Data on the injection zone and source of the data which may include geologic cores, outcrop data, seismic surveys, and well logs: Depth Areal extent Thickness Mineralogy Porosity Permeability Capillary pressure Facies changes	<p><b>SOURCE OF DATA</b></p> <p><b>2.2 Data and Information Sources (p. 2-4)</b> Several sets of data were used to characterize the injection and confining zones to establish their suitability for the storage and containment of injected CO<sub>2</sub>. Data sets used for characterization included both existing data (e.g., from published literature, publicly available databases, purchased/leased digital well logs, existing 3D and 2D seismic) and site-specific data acquired specifically to characterize the storage complex.</p> <p><b>2.2.1 Existing Data (p. 2-4)</b> Well log data and interpreted formation top depths from 115 wellbores within the 4070-mi<sup>2</sup> (74-mi × 55-mi) area covered by the geologic model were used to characterize the depth, thickness, and extent of the subsurface geologic formations (Figure 2-3). Seismic interpretation products (seismic horizons and acoustic impedance volumes) from legacy 3D seismic data and 2D seismic data shown in Figure 2-3 were used to support generation of the 3D geologic model.</p> <p>In addition to data from Milton Flemmer 1, existing laboratory measurements for core samples from the Broom Creek Formation and its confining zones were available from nine additional wells: ANG 1 (ND-UIC-101), Flemmer 1 (NDIC File No. 34243), BNI 1 (NDIC File No. 34244), J-LOC 1 (NDIC File 37380), Liberty 1 (NDIC File No. 37672), MAG 1 (NDIC File No. 37833), Coteau 1 (NDIC File No. 38379), Archie Erickson 2 (NDIC File No. 38622), and Slash Lazy H 5 (NDIC File No. 38701) (Figure 2-4). These measurements were compiled and used to establish relationships between measured petrophysical characteristics and estimates from well log data and were integrated with newly acquired site-specific data.</p> <p><b>2.2.2 Site-Specific Data (p. 2-6)</b> Site-specific efforts to characterize the storage complex generated multiple data sets, including geophysical well logs, petrophysical data, fluid analyses, whole core, and 3D seismic data. Milton Flemmer 1 was drilled to a depth of 12,009 ft in 2022, specifically to gather subsurface geologic data to support the development of this CO<sub>2</sub> storage facility permit (SFP) application and serve as a future CO<sub>2</sub> reservoir-monitoring well. Downhole logs were acquired, and cores were collected from the associated storage complex (Opeche/Spearfish, Broom Creek, and Amsden Formations). Broom Creek Formation stress tests, a fluid sample, and temperature and pressure measurements were collected in the Milton Flemmer 1 (Figure 2-5).</p> <p>Site-specific and existing data were used to assess the suitability of the storage complex for safe and permanent storage of CO<sub>2</sub>. Site-specific data were also used as inputs for geologic model construction (Section 3.0), numerical simulations of CO<sub>2</sub> injection (Section 3.0), geochemical simulation (Appendix C), and geomechanical information (Section 2.4). The site-specific data improved the understanding of the subsurface and directly informed the selection of monitoring technologies, development of the timing and frequency for monitoring data collection, and interpretation of monitoring data with respect to potential subsurface risks. Furthermore, these data guided and influenced the design and operation of site equipment and infrastructure.</p> <p><b>DATA ON THE INJECTION ZONE:</b></p> <p><b>2.3 Storage Reservoir (injection zone) (p. 2-16)</b> The Broom Creek Formation is laterally extensive across the simulation model area and surrounding region (Figure 2-9). The Broom Creek Formation comprises interbedded eolian/nearshore marine sandstone (permeable storage intervals) and dolostone layers (impermeable layers) with minor amounts of siltstone and anhydrite layers. The Broom Creek Formation unconformably overlies the Amsden Formation and is unconformably overlain by the Opeche/Spearfish Formation (Figure 2-2) (Murphy and others, 2009).</p> <p>The top of the Broom Creek Formation is located at a depth of 5818 ft below KB elevation at Milton Flemmer 1, and the cored interval is made up of 240 ft of sandstone, 81 ft of dolostone, and 21 ft of anhydrite. The thickness of the Broom Creek Formation at Milton Flemmer 1 is 342 ft. Cored wells within the extent of the simulation model show minor anhydrite and siltstone intervals are also present in the Broom Creek Formation. Across the simulation model area, the Broom Creek Formation ranges in thickness from 139 to 492 ft (Figure 2-10a, 2-10b), with an average thickness of 280 ft based on offset-well data and geologic model characteristics. The net sandstone thickness within the simulation model area ranges from 6 to 397 ft, with an average thickness of 140 ft.</p> <p>The top of the Broom Creek Formation was picked based on the stratigraphic transition from a relatively low GR signature of sandstone and dolostone lithologies within the Broom Creek Formation to a relatively high GR signature representing the siltstones of the Opeche/Spearfish Formation (Figure 2-11). This transition is also noted with a drop in bulk density (RHOB) and dipole sonic compressional slowness values (DTC) and an increase in NEUT and resistivity (RES_D, RES_S). The bottom of the Broom Creek Formation was placed at the base of a relatively low GR package representing a 10-ft package of anhydrite that can be correlated across much of the study area. This rock package</p>	<p><b>Figure 2-3.</b> Map showing the extent of the regional geologic model, distribution of well control points, 2D and 3D seismic, and extent of the simulation model. The wells shown penetrate the storage reservoir and the upper and lower confining zones. (p. 2-5)</p> <p><b>Figure 2-4.</b> Map showing the spatial relationship between the TB Leingang and ten wells where core samples were collected from the formations comprising the storage complex. (p. 2-6)</p> <p><b>Figure 2-9.</b> Broom Creek Formation in North Dakota. The area within the green dashed line shows the extent originally proposed by Rygh (1990), and the area outside of the green dashed line has been modified based on new well control. (p. 2-16)</p> <p><b>Figure 2-10a.</b> Isopach map of the Broom Creek Formation in the simulation model area. A convergent interpolation gridding algorithm was used with well formation tops, 3D seismic, and 2D seismic in the creation of this map (thickness of the Broom Creek Formation at Milton Flemmer 1 is 342 ft, see Table 2-6). (p. 2-17)</p>

Subject	N.D.C.C./N.D.A.C. Reference	Requirement	Regulatory Summary	Storage Facility Permit Application (Section and Page Number; see main body for reference cited)	Figure/Table Number and Description (Page Number)														
				<p>divides the clean sandstones and dolostone lithologies of the Broom Creek Formation from the dolostone and anhydrite of the Amsden Formation. Seismic data collected as part of site characterization efforts (Figure 2-8) were used to reinforce structural correlation and thickness estimations of the storage reservoir. The combined structural correlation and seismic interpretation indicate that the formation is continuous across the area near Milton Flemmer 1 (Figures 2-12 and 2-13). A structure map of the Broom Creek Formation shows no detectable features with associated spill points in the simulation model area (Figures 2-14 and 2-15).</p> <p>Thirty-two (32) 1-in.-diameter core plugs collected from the Broom Creek Formation were sampled and used to determine the distribution of porosity and permeability values throughout the formation (Table 2-6, Figure 2-16). The range in porosity and permeability predominantly captured the sandstone variability as this rock type was prominent in the sampling program over the dolostone.</p> <p>Core-derived measurements from Milton Flemmer 1 were used as the foundation for the generation of porosity and permeability properties within the 3D geologic model. The 1-in.-diameter core plug sample measurements showed good agreement with the geologic model property distribution at the location of Milton Flemmer 1. This agreement gave confidence to the geologic model, which is a spatially and computationally larger data set created with the extrapolation of porosity and permeability from offset well logs. The geologic model property distribution statistics shown in Table 2-6 are derived from a combination of the core plug analysis and the larger data set derived from offset well logs.</p> <p>Sandstone intervals in the Broom Creek Formation are associated with low GR, low density, high porosity (neutron, density, and sonic), low resistivity because of brine salinity, and high sonic slowness measurements (Figure 2-11). The dolostone intervals in the formation are associated with an increase in GR measurements compared to the sandstone intervals, in addition to high density, low porosity (neutron, density, and sonic), high resistivity, and low sonic slowness measurements. The dolomitic sandstone intervals in the formation are the transitions between sandstone and dolostone, where the porosity begins to decrease, and density begins to increase in a transition from predominantly sandstone to dolostone (Figure 2-16).</p> <p><b>2.3.1 Mineralogy</b> (p. 2-26)</p> <p>Powder XRD for average bulk composition analysis of 36 finely ground, homogenized samples from the Broom Creek Formation shows quartz as the most common mineral (~52%) followed by carbonates (~22%, primarily dolomite with minor contributions from ankerite and siderite), sulfates (~16%, mostly anhydrite with a minor amount of gypsum), feldspar (~6%, mostly K-feldspar), and clay minerals (~3%, mostly illite) (Figure 2-17a). Minor amounts of oxide/hydroxide (~0.3%), halide (~0.1%), and sulfide (~0.1%) make up the rest of the mineralogy. The major constituents of the Broom Creek Formation are shown in Table 2-7a. These results align with the average elemental composition obtained by XRF which shows silica (Si) as the dominant element followed by calcium (Ca), sulfur (S), magnesium (Mg), aluminum (Al), potassium (K), and other trace elements (Figure 2-17b).</p> <p>XRF analysis of the Broom Creek Formation (Figure 2-17b) shows a high percentage of SiO<sub>2</sub> (0.4%–97%), CaO (0.1%–40%), and MgO (0%–21%) that confirms the presence of sandstone and dolomite intervals in the Broom Creek Formation. A high percentage of CaO and SO<sub>3</sub> at the top and the base of the formation indicates the presence of anhydrite layers that isolate the Broom Creek Formation from the Opeche/Spearfish Formation from the top and Amsden Formation from the bottom. The Broom Creek Formation consists of a clay content ranging from 0% to 24%, with illite being the dominant clay type.</p> <table><tr><th colspan="2">Table 2-6. Values are measured at 2400 psi.</p> <p><b>Appendix C</b></p> <p><b>C.1.1 Geochemical Information of Injection Zone (Broom Creek Formation )(p. C-1)</b></p> <p>Geochemical simulation was performed to calculate the effects of introducing the CO<sub>2</sub> stream to the injection zone. The injection zone, the Broom Creek Formation, was investigated using the geochemical analysis option available in GEM, the compositional simulation software package from Computer Modelling Group Ltd. (CMG). GEM is also the primary simulation software used for evaluation of the reservoir’s dynamic behavior resulting from the expected CO<sub>2</sub> injection. For this geochemical modeling study, the injection scenario consisted of a single injection well injecting for a 20-year period with maximum bottomhole pressure (BHP) and maximum wellhead pressure (WHP) constraints of 3663 and 2100 psi, respectively. A postinjection period of 25 years was run in the model to evaluate any dynamic behavior and/or geochemical reaction after the CO<sub>2</sub> injection is stopped.</p> <p>The anticipated average CO<sub>2</sub> stream composition is 98.25% CO<sub>2</sub>, 1.44% N<sub>2</sub>, and 0.31% O<sub>2</sub>, with a trace amount of H<sub>2</sub>S. The CO<sub>2</sub> stream, used for geochemical modeling, described in Table C-1, contains a higher amount of O<sub>2</sub> (2%). The modeled stream containing ~95% CO<sub>2</sub> and 2% O<sub>2</sub> was used to represent a conservative scenario where the oxygen concentration is highest, potentially triggering more geochemical reactions in the formation. This simulation scenario was run with and without the geochemical model analysis option included, and results from the two cases were compared (Figures C-1 and C-2).</p> <p>The case with geochemical analysis (geochemistry case) was constructed using the average mineralogical composition of the Broom Creek Formation rock materials (78% of bulk reservoir volume) and average formation brine composition (22% of bulk reservoir volume). X-ray diffraction (XRD) data from the Milton Flemmer 1 well core samples were used to inform the mineralogical composition of the Broom Creek Formation (Table C-2). Illite was chosen to represent clay for geochemical modeling as it was the most prominent type of clay identified in the XRD data. Ionic composition of the Broom Creek Formation water, derived from the state-certified analysis reported in Appendix A, is listed in Table C-3.</p> <p>As seen in Figures C-1 and C-2, the results do not show an evident difference in the CO<sub>2</sub> gas molality fraction between both cases for volume injected and injection pressure simulation results. As a result of geochemical reactions in the reservoir, cumulative volume and injection</p>	Capillary Entry Pressure (brine/CO <sub>2</sub> ), psi		1.12		Geologic Properties				Formation	Property	Laboratory Analysis	Simulation Model Property Distribution	Broom Creek (sandstone)	Porosity, % *	15.5	22.0	(0.3–26.1)	(0.0–35.3)	Permeability, mD**	674.71, 13.55	458.79, 136.96			(0.00103–2700)	(0.0–3401.2)	Broom Creek (dolostone)	Porosity, %*	6.1	4.4	(1.4–14.6)	(0.0–34.9)	Permeability, mD**	0.4107, 0.0147	2.07, 0.0221			(0.0005–3.34)	(0.0–919.6)	<p><b>Figure 2-13.</b> Regional well log cross sections showing the structure of the Opeche/Spearfish and Broom Creek Formation logs. 				<p>rate have no observable difference between the geochemical and nongeochemical cases. The resulting BHP and WHP from the two cases are nearly identical, with no appreciable differences.</p> <p>Figure C-3 shows the location of the cross sections and Layer 30 used in Figures C-4a and C-4b to depict the geochemical modeling results. Figures C-4a and C-4b show the concentration of CO<sub>2</sub>, in molality, in the reservoir after 20 years of injection plus 25 years of postinjection for the geochemistry model and nongeochemistry model, respectively.</p> <p>The pH of the reservoir brine changes in the vicinity of the CO<sub>2</sub> accumulation, as shown in Figure C-5a. The pH of the Broom Creek Formation native brine sample is 6.8, whereas the fluid pH declines to approximately 4.3 in the CO<sub>2</sub>-flooded areas near the well as a result of CO<sub>2</sub> dissolution in the native formation brine (Figure C-5b).</p> <p>Figures C-6a and C-6b show the cross section for O<sub>2</sub> molality in the Broom Creek Formation. Figure C-6a shows the cross section for the concentration of O<sub>2</sub>, in molality, in the reservoir after 20 years of injection plus 25 years postinjection for the geochemistry model scenario, and Figure C-6b shows the same information for the nongeochemistry simulation case for comparison. The results do not show an evident difference in the O<sub>2</sub> gas molality fraction between both cases. After being injected, the 2% molar oxygen content in the injection stream is dissolved in the brine and likely to cause oxidative reactions of the minerals, which may induce dissolution/precipitation of reactive minerals and formation of secondary minerals in the reservoir. The simulation results showed no significant precipitation caused by the high concentration of O<sub>2</sub> that would affect the CO<sub>2</sub> injection volume, as demonstrated by the comparison in injection rates between the case with and without geochemical modeling shown in Figure C-2.</p> <p>Figure C-7 shows the mass of mineral dissolution and precipitation due to CO<sub>2</sub> injection in the Broom Creek Formation. Dolomite is the most prominent dissolved mineral, while anhydrite is the most prominent precipitated mineral. All other minerals showed very limited variations.</p> <p>Simulation results show that, during CO<sub>2</sub> injection, the supercritical CO<sub>2</sub> (free-phase CO<sub>2</sub> gas) remains dominant. CO<sub>2</sub> dissolution in the formation water and residual trapping of CO<sub>2</sub> slowly increased over time, while CO<sub>2</sub> mineralization is negligible at the plot scale in Figure C-7 but can be observed at the plot scale in Figure C-8. Once CO<sub>2</sub> injection ceases in 2044, injected concentrated CO<sub>2</sub> begins to expand, resulting in more CO<sub>2</sub> that is capillary-trapped or dissolved into fresh brine, as evidenced by the crossover in Figure C-8. Figures C-9 and C-10, respectively, provide an indication of the change in distribution of the mineral that experienced the most dissolution, dolomite, and the mineral that experienced the most precipitation, anhydrite. Considering the apparent net dissolution of minerals in the system, as indicated in Figure C-7, there is an associated net increase in porosity in the affected areas, as shown in Figure C-11. Del Porosity Mineral (DPORMNR) output calculates the porosity change due to mineral dissolution/precipitation. It is calculated as Initial porosity – Porosity at time “t.” Negative values of this output indicate net mineral dissolution (porosity increase), while positive values indicate net mineral precipitation (porosity decrease). However, the porosity change is small, less than 0.01% porosity units, equating to a maximum increase in average porosity from 22.00% to 22.01% after the 20-year injection period plus 25 years postinjection.</p>	<p><b>Table 2-6.</b> Description of CO<sub>2</sub> Storage Reservoir (injection zone) at the Milton Flemmer 1 (p. 2-24)</p> <p><b>Figure 2-16.</b> Vertical distribution of core-derived porosity and permeability values in the TB Leingang storage complex from the Milton Flemmer 1. 	* Porosity values recorded at 2400-psi confining pressure. Porosity values from the model are reported as the arithmetic mean followed by the range of values in parentheses.																																						
	** Permeability values recorded at 2400-psi confining pressure. Permeability values are reported as the arithmetic mean and geometric mean, respectively, followed by the range of values in parentheses and do not have the 2.5 permeability calibration factor applied during simulation.																																						
			<p><b>2.4.1 Upper Confining Zone (p. 2-32)</b></p> <p>In TB Leingang, the upper confining zone, the Opeche/Spearfish Formation, consists of predominantly siltstone with interbedded dolostone and anhydrite (Table 2-7a). The upper confining zone is laterally extensive across the simulation model area (Figure 2-20) and is 5587 ft below KB elevation and 231 ft thick as observed in Milton Flemmer 1 (Figures 2-20 and 2-21). The contact between the underlying Broom Creek Formation and the upper confining zone is an unconformity that can be correlated across the Broom Creek Formation extent where the resistivity and GR logs show a significant change across the contact. A relatively low GR signature of sandstone and dolostone lithologies within the Broom Creek Formation changes to a relatively high GR signature representing the siltstones of the Opeche/Spearfish Formation (Figure 2-11).</p>			<p><b>Figure 2-22a.</b> Bar charts showing a) average mineralogy (wt%) and b) average elemental composition (wt%) of the Opeche/Spearfish Formation at Milton Flemmer 1 (note: elemental data by XRF were determined as oxides of the respective elements). (p. 2-35)</p>																																	
			<p><b>2.4.1.1 Mineralogy of the Upper Confining Zone (p.2-35)</b></p> <p>Powder XRD for average bulk composition analysis of eight finely ground, homogenized samples from the Opeche/Spearfish Formation shows quartz as the most common mineral (~29%) followed by carbonates (~25%, mostly dolomite with a minor contribution from ankerite), sulfates (~17%, mostly anhydrite), potassium- and sodium-feldspar (~7% each), and clay minerals (~15%, mostly illite and chlorite) (Figure 2-22a). Minor amounts of sulfide (~0.1%) and oxide/hydroxide (~0.1%) minerals make up the rest of the mineralogy. The major constituents of the Opeche/Spearfish Formation are also shown in Table 2-7c. XRD data align with the average elemental composition obtained by XRF which show silica (Si) as the dominant element followed by calcium (Ca), sulfur (S), aluminum (Al), magnesium (Mg), potassium (K), iron (Fe), and other trace elements (Figure 2-22b).</p>			<p><b>Table 2-7c.</b> XRD Analysis of the Opeche/Spearfish Formation at Milton Flemmer 1. Only major constituents are shown. (p. 2-36)</p>																																	
			<p><b>Appendix C</b></p> <p><b>C.1.2 Geochemical Interaction of the Upper Confining Zone (Cap Rock, Opeche/Spearfish Formation) (p.C-18)</b></p> <p>Geochemical simulation using the PHREEQC geochemical software was performed to calculate the potential effects of an injected multicomponent CO<sub>2</sub> stream on the Opeche/Spearfish Formation. It should be noted that PHREEQC’s unit of measure is metric. A vertically oriented 1D simulation was created using a stack of 1-meter grid cells where the formation was exposed to the injection stream mixture at the bottom boundary of the simulation and allowed to enter the system by molecular diffusion processes. Direct fluid flow into the Opeche/Spearfish Formation by free-phase saturation from the injection stream is not expected to occur because of the low permeability of the confining zone. Results were calculated at the grid cell centers: 0.5, 1.5, and 2.5 meters above the cap rock–CO<sub>2</sub> exposure boundary. The average mineralogical composition calculated from the XRD results of the two deepest samples from the Opeche/Spearfish Formation was honored (Table C-4). Formation brine composition was assumed to be the same as the known composition from the Broom Creek Formation injection zone below (Table C-5).</p>			<p><b>Figure 2-22b.</b> Elemental composition by XRF as a function of depth in the Opeche/Spearfish Formation at Milton Flemmer 1. (p. 2-36)</p>																																	
			<p>The anticipated average CO<sub>2</sub> stream composition is 98.25% CO<sub>2</sub>, 1.44% N<sub>2</sub>, and 0.31% O<sub>2</sub>, with a trace amount of H<sub>2</sub>S. The CO<sub>2</sub> stream used for geochemical modeling, described in Table C-1, contains a higher amount of O<sub>2</sub> (2%). The modeled stream containing ~95% CO<sub>2</sub> and 2% O<sub>2</sub>, Table C-1, was used to represent a conservative scenario where the higher oxygen concentration may trigger more geochemical reactions in the formation. The exposure level, expressed in moles per year, of the CO<sub>2</sub> stream to the confining layer was 4.5 moles/yr. This value is considerably higher than the expected actual exposure level of 2.3 moles/year (Espinoza and Santamarina, 2017). Again, this conservative overestimation was done to ensure that the degree and pace of geochemical change would not be underestimated. This</p>			<p><b>Figure 2-23.</b> Thin section (a, b) and SEM (c, d) micrographs of the most porous (a, c) and the least porous (b, d) samples from the Opeche/Spearfish Formation at Milton Flemmer 1. The most porous sample has a total porosity and permeability of 11% and 0.0359 mD, respectively, which is notably reduced to 0.33% and 0.178 mD in the least porous sample.</p>																																	

Subject	N.D.C.C./N.D.A.C. Reference	Requirement	Regulatory Summary	Storage Facility Permit Application (Section and Page Number; see main body for reference cited)	Figure/Table Number and Description (Page Number)
				<p>geochemical simulation was run for 45 years to represent 20 years of injection plus 25 years postinjection. The simulation was performed at elevated reservoir pressure and temperature conditions obtained from the dynamic reservoir simulation.</p> <p>Results showed geochemical processes at work. Figures C-12 through C-16 show results from geochemical modeling. Figure C-12 shows a change in fluid pH over time as CO<sub>2</sub> diffuses into the system. For the cell at the CO<sub>2</sub> interface, Cell 1 (C1), the pH starts declining from an initial pH of 6.47, decreasing to a level of 5.05 after 10 years of injection, and slowly stabilizes at 5.03 by the end of 25 years postinjection. For the cell occupying the space 1 to 2 meters into the cap rock, C2, the pH begins to change after Year 8 and goes down to 5.45 by the end of simulation. For the cell occupying the space 2 to 3 meters into the cap rock, C3, the pH begins to change after Year 43.</p> <p>Figure C-13 shows the modeled change in mineral dissolution and precipitation in grams per cubic meter of rock for C1 and C2. In C1 and C2, K-feldspar starts to dissolve from the beginning of the simulation period, while illite and quartz start to precipitate at the same time. The net change due to precipitation or dissolution in C2 is less than 5 kg per cubic meter, with little dissolution or precipitation taking place during the later years of simulation. Any effects in C3 are too small to represent at this scale.</p> <p>Figure C-14 represents the initial fractions of potentially reactive minerals in the Opeche/Spearfish Formation based on XRD data shown in Table C-4. The expected dissolution of these minerals in weight percentage is also shown for C1 and C2 of the model. In C1 and C2, K-feldspar is the primary mineral that dissolves. Dissolution (%) in C2 is minimal (&lt;0.2%) and not significant to represent at the scale in Figure C-14.</p> <p>Figure C-15 represents minerals expected to be precipitated in weight (%) shown for C1 and C2 of the model. In C1 and C2, illite, quartz, and calcite are the minerals to be precipitated.</p> <p>Figure C-16 shows the modeled change in porosity of the cap rock for C1–C3. The overall net porosity changes from dissolution and precipitation are minimal, less than 0.1% change during the life of the simulation. Initially, C1 experiences up to a 0.14% increase in porosity upon first CO<sub>2</sub> exposure because of dissolution and initial model equilibration, but the change is temporary. No significant porosity changes were observed for C2 and C3. These results suggest that geochemical change from exposure to CO<sub>2</sub> is minor; therefore, the ability of the Opeche/Spearfish Formation to maintain its sealing integrity will not be compromised by geochemical processes.</p> <p><b>C1.3 Geochemical Interaction of the Lower Confining Zone (Amsden Formation) (p. C-24)</b> The Broom Creek Formation’s underlying confining layer, the Amsden Formation, was investigated using PHREEQC geochemical software. A vertically oriented 1D simulation was created using a stack of seven cells, each cell 1 meter in thickness. The formation was exposed to CO<sub>2</sub> stream components at the top boundary of the simulation, and CO<sub>2</sub> was allowed to enter the system by advection and dispersion processes. Direct fluid flow into the Amsden Formation by free-phase saturation from the injection stream is not expected to occur because of the low permeability of the confining zone. Results were calculated at the center of each cell below the confining layer–CO<sub>2</sub> exposure boundary. The average mineralogical composition calculated from the results of two samples from the Amsden Formation was honored (Table C-6). The formation brine composition was assumed to be the same as the known composition from the overlying Broom Creek Formation injection zone (Table C-5). A CO<sub>2</sub> stream containing ~95% CO<sub>2</sub> and 2% O<sub>2</sub>, described in Table C-1, was used in the geochemical modeling to represent a conservative scenario, where higher oxygen concentration may trigger more geochemical reactions in the formation. The maximum formation temperature and pressure, projected from CMG simulation results, described in Section 3.0, were used to represent the potential maximum pore pressure and temperature level.</p> <p>The higher-pressure results are shown here to represent a potentially more rapid pace of geochemical change. This simulation was run for 45 years to represent 20 years of injection plus 25 years postinjection.</p> <p>Modeling results show geochemical processes at work. Figures C-17 through C-22 show results from the geochemical modeling. Figure C-17 shows change in fluid pH over 45 years (representing 20 years of injection and 25 years postinjection) as CO<sub>2</sub> enters the system. Initial change in pH in all of the cells, for C1 to C7, is related to initial equilibration of the model. For the cell at the CO<sub>2</sub> interface, C1, the pH declines to a level of 5.7 after 7 years of injection, further declining to 4.8 by the end of the modeled injection period, and hits 4.5 by the end of simulation period. Progressively lower or slower pH changes occur for each cell that is more distant from the CO<sub>2</sub> interface. The pH for C7 did not decline over the 45 years of simulation time.</p> <p>Figure C-18 shows that CO<sub>2</sub> does not penetrate more than 6 meters (represented by C7) over the 20 years of injection and 25 years postinjection.</p>	<p>The blue color in the thin sections (a and b) represents porosity. (p. 2-37)</p> <p><b>Figure 2-24.</b> A figure showing a change in the mineralogy of the upper-confining Opeche/Spearfish Formation (highlighted in gray) at Milton Flemmer 1 as a function of depth based on XRD in comparison to core sample total porosity (%) and permeability (mD). Very low total porosity and permeability with a high clay content make the Opeche/Spearfish Formation an ultralow permeable formation. Data gaps in the porosity and permeability plots are due to the inability to obtain testable samples as solid plugs (i.e., samples too soft/brittle). (p. 2-38)</p> <p><b>Table C-4</b> Averaged Mineral Composition of the Opeche/Spearfish Formation Derived from XRD Analysis of Milton Flemmer 1 Core Samples at Depths of 5824.8 and 5819.5 ft MD (p. C-18)</p> <p><b>Table C-5</b> Formation Water Chemistry from Broom Creek Formation Fluid Sample from Milton Flemmer 1 (p. C-19)</p> <p><b>Figure C-12</b> Modeled change in fluid pH vs. time. Subject	N.D.C.C./N.D.A.C. Reference	Requirement	Regulatory Summary			Storage Facility Permit Application (Section and Page Number; see main body for reference cited)	Figure/Table Number and Description (Page Number)																														
				<p>Figure C-19 shows the modeled changes in mineral dissolution and precipitation in grams per cubic meter over 45 years of simulation time. For C1, albite and K-feldspar start to dissolve from the beginning of the simulation period, while quartz and illite start to precipitate. Anhydrite and hematite, the secondary minerals, precipitate in minor amounts. C2 shows the same trends, but the process begins approximately 6 years after Cell C1.</p> <p>Figure C-20 represents the initial fractions of potentially reactive minerals in the Amsden Formation based on the XRD data in Table C-6. The expected dissolution of the minerals in weight percentage is also shown for C1 and C2 of the model. In C1 and C2, albite and K-feldspar are the primary minerals that dissolve, and their initial fractions have almost completely dissolved. No dissolution is observed for illite and quartz. The minerals that experience dissolution in the model are almost completely replaced by the precipitation of other minerals.</p> <p>Figure C-21 represents this replacement, with the minerals expected to be precipitated in weight percentage (wt%) shown for C1 and C2 of the model. In C1 and C2, illite and quartz are the key primary minerals expected to be precipitated. Anhydrite and hematite precipitate as secondary minerals in C1 and calcite in C2.</p> <p>The modeled change in porosity (% units) of the Amsden Formation underlying confining layer is displayed in Figure C-22 for C1–C3. The overall net porosity changes from dissolution and precipitation are minimal, less than 2% change during the life of the simulation. C1 shows an initial porosity increase, but this change is temporary, and the cell returns to its near-initial porosity after Year 18. For C2 and C3, a cyclic pattern of porosity increase and subsequent decrease with low amplitude is observed. No significant porosity changes were observed in C2–C3 after 20 years of modeled injection. Cells C4–C7 showed similar results, with porosity change being less than 0.1% at each time step (not shown in Figure C-22).</p> <p><b>2.4.2 Additional Overlying Confining Zones</b> (p. 2-39)</p> <p>Several other formations provide additional confinement above the Opeche/Spearfish Formation. Impermeable rocks above the primary seal include the Piper, Rierdon, and Swift Formations, which make up the first additional group of confining formations (Table 2-8a). At Milton Flemmer 1, together with the Opeche/Spearfish Formation, these intervals are 1082 ft thick and will isolate Broom Creek Formation fluids from migrating upward to the next permeable interval, the Inyan Kara Formation (Figure 2-25). Above the Inyan Kara Formation, 2670 ft of impermeable rocks acts as an additional seal between the Inyan Kara sandstone interval and the lowermost USDW, the Fox Hills Formation (Figure 2-26). Confining layers above the Inyan Kara sandstone interval include the Skull Creek, Mowry, Belle Fourche, Greenhorn, Carlile, Niobrara, and Pierre Formations (Table 2-8a).</p> <p>The formations between the Broom Creek and Inyan Kara Formations and between the Inyan Kara Formation and lowest USDW have demonstrated the ability to prevent the vertical migration of fluids throughout geologic time and are recognized as impermeable flow barriers in the Williston Basin (Downey, 1986; Downey and Dinwiddie, 1988).</p> <p>Sandstones of the Inyan Kara Formation comprise the first unit with relatively high porosity and permeability stratigraphically above the injection zone and the primary sealing formation. The Inyan Kara represents the most likely candidate to act as an overlying pressure dissipation zone. Monitoring distributed temperature sensor data for the Inyan Kara Formation using the downhole fiber-optic cable provides an additional opportunity for mitigation and remediation (Section 5.0). In the unlikely event of out-of-zone migration through the primary and secondary sealing formations, CO<sub>2</sub> would become trapped in the Inyan Kara Formation. The depth to the Inyan Kara Formation at the Milton Flemmer 1 location is approximately 4469 ft below KB elevation, and the interval itself is 267 ft thick.</p> <table><tr><th colspan="5">Table 2-8. 			<p><b>2.4.3 Lower Confining Zones</b> (p. 2-42)</p> <p>The lower confining zone of the storage complex is the Amsden Formation, which comprises primarily dolostone and anhydrite. The Amsden Formation does include some thin sandstone intervals on the order of 1 to 8 in. thick. The sandstone intervals in the Amsden Formation are isolated from the sandstones of the Broom Creek Formation by thick impermeable dolostone and anhydrite intervals. The top of the Amsden Formation was placed at the top of an argillaceous dolostone, which has relatively high GR character that can be correlated across the simulation model area (Figure 2-11). The Amsden Formation is 6160 ft below KB elevation and 261 ft thick at TB Leingang as determined at Milton Flemmer 1 (Figures 2-27 and 2-28).</p> <p>The contact between the underlying Amsden Formation and the overlying Broom Creek Formation is evident on wireline logs as there is a lithological change from the dolostone and anhydrite beds of the Amsden Formation to the porous sandstones of the Broom Creek Formation (Figure 2-11). The top of the Amsden in Milton Flemmer 1 is picked at the base of a 10-ft anhydrite bed which can be correlated across much of the study area. This lithologic change is also recognized in the core from Milton Flemmer 1. The lithology of the cored section of the Amsden Formation from Milton Flemmer 1 is predominantly dolostone and anhydrite, with lesser predominant lithologies of sandstone.</p> <p><b>2.4.3.1 Mineralogy of the Lower Confining Zone</b> (p. 2-44)</p> <p>Powder XRD for average bulk composition analysis of six finely ground, homogenized samples from the Amsden Formation shows equal proportions of quartz (~34%) and carbonates (~33%, mostly dolomite with minor contributions from calcite and ankerite) followed by sulfate (~17%, mostly anhydrite) (Figure 2-29a[a]). Feldspar (mostly K-feldspar) and clay minerals (mostly illite) each account for about 7% of the composition of the Amsden Formation with minor amounts of halide (~0.1%), oxide/hydroxide (~0.1%), and sulfide (~0.2%). The major constituents of the Amsden Formation are also shown in Table 2-8b. These data align with the average elemental composition obtained by XRF which show Si as the dominant element followed by calcium (Ca), sulfur (S), magnesium, (Mg), aluminum (Al), potassium (K), iron (Fe), and other trace elements (Figure 2-29a[b]).</p> <p>XRF analysis of the Amsden Formation (Figure 2-29b) shows that the contact between the Amsden and Broom Creek Formations is dominated by CaO and MgO, indicating the presence of dolomite. As the formation gets deeper, the chemistry changes to more anhydrite-rich, fine to medium-grained sandstones, as shown by the high percentage of SiO<sub>2</sub>, CaO, and SO<sub>3</sub>. The Amsden Formation contains clay up to 20% with illite being the dominant clay type.</p> <p>Similar to the Opeche/Spearfish Formation, the higher content of anhydrite (~17%) and clay minerals (~7%) makes the Amsden Formation less porous and more impermeable compared to the target Broom Creek Formation. The thin-section and SEM–EDS micrographs of the most porous sample at the cored depth of 6215.2 ft (6208.2 ft KB elevation) show moderately sorted, fine-grained subangular quartz and feldspar grains with anhydrite cement (Figures 2-30a and c).</p> <p>The least porous sample, located at the bottom of the section at the core depth of 6219.9 ft (6212.9 ft KB elevation), predominantly consists of anhydrite (~97%) with microfractures (Figures 2-30b and d). Figure 2-31 shows changes in the mineralogy at the Milton Flemmer 1 well as a function of depth next to the core sample porosity and permeability data. The Amsden Formation is highlighted in gray. Although a total porosity of 22% with a permeability of 419 mD was observed at the core depth of 6215.2 ft (6208.2 ft KB elevation), it must be noted that this layer is isolated and confined between ultralow permeable layers (a clay-rich quartz dolomite layer above and an anhydrite-rich layer below).</p>

		(2) A geologic and hydrogeologic evaluation of the facility area, including an evaluation of all existing information on all geologic strata overlying the storage reservoir, including the immediate caprock containment characteristics and all subsurface zones to be used for monitoring. The evaluation must include any available geophysical data and assessments of any regional tectonic activity, local seismicity and regional or local fault zones, and a comprehensive description of local and regional structural or stratigraphic features. The evaluation must describe the storage reservoir’s mechanisms of geologic confinement, including rock properties, regional pressure gradients, structural features, and adsorption characteristics with regard to the ability of that confinement to prevent migration of carbon dioxide beyond the proposed storage reservoir. The evaluation must also identify any productive existing or potential mineral zones occurring within the facility area and any underground sources of drinking water in the facility area and within one mile [1.61 kilometers] of its outside boundary. The evaluation must include exhibits and plan view	geologic confinement characteristics with regard to preventing migration of carbon dioxide beyond the proposed storage reservoir, including: Rock properties Regional pressure gradients Adsorption processes	<p>Temperature measurements from Milton Flemmer 1 were used to derive a temperature gradient for the proposed injection site (Table 2-2b). In combination with depth, the temperature property was used primarily to inform predictive simulation inputs and assumptions. Temperature data were also used as inputs for geochemical modeling.</p> <p>Formation pressure testing at Milton Flemmer 1 was performed with the SLB (formerly Schlumberger) MDT (modular formation dynamics tester) tool. The MDT tool’s formation pressure measurements from the Broom Creek Formation are included in Table 2-3. The calculated pressure gradients were used to model formation pressure profiles for use in the numerical simulations of CO<sub>2</sub> injection.</p> <p><b>Table 2-2b. 		maps showing the following:		<p>* Dry test. No fluid was withdrawn because of low permeability.</p> <p>** The pressure gradient is an average of the sensor-measured pressures minus standard atmospheric pressure at 14.7 psi, divided by the associated test depth.</p> <p><b>2.3.2 Mechanism of Geologic Confinement</b> (p. 2-31)</p> <p>For TB Leingang, the initial mechanism for geologic confinement of CO<sub>2</sub> injected into the Broom Creek Formation will be the upper confining formation (Opeche/Spearfish Formation), which will contain the initially buoyant CO<sub>2</sub> in the reservoir under the effects of relative permeability and capillary pressure. Lateral movement of the injected CO<sub>2</sub> will be restricted by residual gas trapping (relative permeability) and solubility trapping (dissolution of the CO<sub>2</sub> into the native formation brine), confining the CO<sub>2</sub> within the proposed storage reservoir. After injected CO<sub>2</sub> becomes dissolved in the formation brine, the brine density will increase. This higher-density brine will ultimately sink in the storage formation (convective mixing). Over a much longer period (&gt;100 years), mineralization of the injected CO<sub>2</sub> will ensure long-term, permanent geologic confinement. Injected CO<sub>2</sub> is not expected to adsorb to any of the mineral constituents of the target formation; therefore, this process is not considered to be a viable trapping mechanism in this project.</p>	
	N.D.A.C. § 43-05-01-05(1)(b)(2)(g)	<p><b>N.D.A.C. § 43-05-01-05(1)(b)(2)</b></p> <p>(g) Identification of all structural spill points or stratigraphic discontinuities controlling the isolation of stored carbon dioxide and associated fluids within the storage reservoir;</p>	<p>e. Identification of all characteristics controlling the isolation of stored carbon dioxide and associated fluids within the storage reservoir, including:</p> <ul style="list-style-type: none"><li>Structural spill points</li><li>Stratigraphic discontinuities</li></ul>	<p><b>2.2.2.6 Seismic Survey</b> (p. 2-14)</p> <p>A 208-square-mile 3D seismic survey was conducted from November 2021 to February 2022 south of Beulah, North Dakota (Figure 2-8). The Beulah 3D seismic data provided visualization of deep geologic formations at lateral-spatial intervals as short as 82.5 ft. Additionally, seismic data from nearby 3D surveys to the east, namely, the Center 3D and Minnkota 3D, and a connecting 2D line were used to interpret and evaluate the subsurface (Figure 2-8). The seismic data were used for assessment of the geologic structure and reservoir properties.</p> <p>Data products generated from the interpretation of the Beulah 3D were used as inputs for the geologic model that was used to simulate migration of the CO<sub>2</sub> plume. The Beulah 3D seismic data and the Milton Flemmer 1 well logs were used to interpret surfaces for the formations of interest within the survey area. These surfaces were converted to depth using the time-to-depth relationship derived from Archie Erickson 2, Milton Flemmer 1, and Slash Lazy H 5 dipole sonic logs. The depth-converted surfaces for the storage reservoir and upper and lower confining zones were used as inputs for the geologic model. Detailed information about the structure and varying thickness of the formations away from well control was derived from these surfaces. A prestack seismic inversion was generated from the 3D seismic data and well logs from the Milton Flemmer 1, Archie Erickson 2, and Slash Lazy H 5 stratigraphic test wells. Depth-converted surfaces and poststack seismic inversion results from the Center 3D and Minnkota 3D were also used as inputs for the geologic model.</p> <p>Interpretation of the 3D seismic data suggests there are no major stratigraphic pinch-outs or structural features with associated spill points (e.g., folds, domes, or fault traps) in TB Leingang. No structural features, faults, or discontinuities that would cause a concern about seal integrity in the strata above the Broom Creek Formation extending to the deepest USDW, the Fox Hills Formation, were observed in the 3D seismic data in the TB Leingang.</p> <p><b>2.3.2 Mechanism of Geologic Confinement</b> (p. 2-31)</p> <p><i>See discussion above under 2.3.2 Mechanism of Geologic Confinement</i></p>	<p><b>Figure 2-8.</b> Map showing the 2D and 3D seismic surveys used to characterize the TB Leingang and inform the construction of the geologic model. The evaluation must include any available geophysical data and assessments of any regional tectonic activity, local seismicity and regional or local fault zones, and a comprehensive description of local and regional structural or stratigraphic features. The evaluation must describe the storage reservoir’s mechanisms of geologic confinement, including rock properties, regional pressure gradients,	h. Information on any regional tectonic activity, and the seismic history, including: The presence and depth of seismic sources; Determination of the probability that seismicity would interfere with containment;	<b>2.5.4 Seismic Activity</b> (p. 2-67) The Williston Basin is a tectonically stable region of the North American Craton. Zhou and others (2008) summarize that “the Williston Basin as a whole is in an overburden compressive stress regime,” which could be attributed to the general stability of the North American Craton. Interpreted structural features associated with tectonic activity in the Williston Basin in North Dakota include anticlinal and synclinal structures in the western half of the state, lineaments associated with Precambrian basement block boundaries, and faults (North Dakota Industrial Commission, 2022).  Between 1870 and 2015, 13 earthquakes were detected within the North Dakota portion of the Williston Basin (Table 2-12) (Anderson, 2016). Of these 13 earthquakes, only three occurred along one of the eight Precambrian basement faults interpreted by Anderson (2016) in the North Dakota portion of the Williston Basin (Figure 2-44). The earthquake recorded closest to the project area occurred in 1927, located 19.15 miles southwest of the TB Leingang 1 injection well, near Hebron, North Dakota (Table 2-12). The magnitude of this earthquake is estimated to have been 3.2.  <b>Table 2-12. The evaluation must include any available geophysical data and assessments of any regional tectonic activity, local seismicity</p>	<p>i. Illustration of the regional geology, hydrogeology, and the geologic structure of the storage reservoir area:  Geologic maps  Topographic maps  Cross sections</p>	<p><b>2.1 Overview of Project Area Geology</b> (p. 2-1)  <i>See discussion above under 2.1 Overview of Project Area Geology</i></p> <p><b>4.4.3 Hydrology of USDW Formations</b> (p. 4-13)  The aquifers of the Fox Hills and Hell Creek Formations are hydraulically connected and function as a single confined aquifer system (Fischer, 2013). The Bacon Creek Member of the Hell Creek Formation forms a regional aquitard for the Fox Hills–Hell Creek aquifer system, isolating it from the overlying aquifer layers. Recharge for the Fox Hills–Hell Creek aquifer system occurs in southwestern North Dakota along the Cedar Creek Anticline and discharges into overlying strata under central and eastern North Dakota (Fischer, 2013). Flow through the AOR is to the east (Figure 4-8).</p> <p>Water sampled from the Fox Hills Formation is a sodium bicarbonate type with a total dissolved solids (TDS) content of approximately 1500–1600 ppm. Previous analysis of Fox Hills Formation water has also noted high levels of fluoride in excess of 5 mg/L (Trapp and Croft, 1975). As such, the Fox Hills–Hell Creek system is typically not used as a primary source of drinking water. However, it is occasionally produced for irrigation and/or livestock watering.</p> <p>Multiple other freshwater-bearing units, primarily of Tertiary age, overlie the Fox Hills–Hell Creek aquifer system in the AOR. A cross section of these formations is presented in Figure 4-9. The upper formations are generally used for domestic and agricultural purposes. The Cannonball and Tongue River Formations comprise the major aquifer units of the Fort Union Group, which overlies the Hell Creek Formation. The Cannonball Formation consists of interbedded sandstone, siltstone, claystone, and thin lignite beds of marine origin. The Tongue River Formation is predominantly sandstone interbedded with siltstone, claystone, lignite, and occasional carbonaceous shales. The basal sandstone</p>	<p><b>Figure 2-1.</b> Topographic map showing well locations and the TB Leingang in relation to the city of Beulah, North Dakota. (p. 2-2)</p> <p><b>Figure 2-9.</b> Broom Creek Formation in North Dakota. The area within the green dashed line shows the extent originally proposed by Rygh (1990), and the area outside of the green dashed line has been modified based on new well control. (p. 2-16)</p>

		<p>and regional or local fault zones, and a comprehensive description of local and regional structural or stratigraphic features. The evaluation must describe the storage reservoir's mechanisms of geologic confinement, including rock properties, regional pressure gradients, structural features, and adsorption characteristics with regard to the ability of that confinement to prevent migration of carbon dioxide beyond the proposed storage reservoir. The evaluation must also identify any productive existing or potential mineral zones occurring within the facility area and any underground sources of drinking water in the facility area and within one mile [1.61 kilometers] of its outside boundary. The evaluation must include exhibits and plan view maps showing the following:</p> <p><b>N.D.A.C. § 43-05-01-05(1)(b)(2)</b> (n) Geologic and topographic maps and cross sections illustrating regional geology, hydrogeology, and the geologic structure of the facility area; and</p>		<p>member of the Tongue River is persistent and a reliable source of groundwater in the region. The thickness of this basal sand ranges from approximately 200 to 500 ft, and it directly underlies surficial glacial deposits in the AOR. Tongue River groundwaters are generally a sodium bicarbonate type with a TDS of approximately 1000 ppm (Croft, 1973).</p> <p>The Sentinel Butte Formation, a silty fine-to-medium-grained sandstone with claystone and lignite interbeds, overlies the Tongue River Formation in western portions of the AOR. The Sentinel Butte Formation is predominantly sandstone with lignite interbeds. While the Sentinel Butte Formation is another important source of groundwater in the region, primarily to the west of the AOR, the Sentinel Butte Formation is not a source of groundwater within the AOR. TDS in the Sentinel Butte Formation range from approximately 400 to 1000 ppm (Croft, 1973). Above these are undifferentiated alluvial and glacial drift Quaternary aquifer layers.</p>	<p><b>Figure 2-12.</b> Regional well log stratigraphic cross sections of the Opeche/Spearfish and Broom Creek Formations flattened on the top of the Amsden Formation. 	N.D.A.C. § 43-05-01-05(1)(b)(2)(h)	N.D.A.C. § 43-05-01-05(1)(b)(2) (h) Evaluation of the pressure front and the potential impact on underground sources of drinking water, if any;	q. Evaluation of the pressure front and the potential impact on underground sources of drinking water, if any;	<b>3.4 Simulation Results</b> (p. 3-16) The maximum WHP constraint of 2100 psi was one of the constraints on the injection wells for the entire 20 years of simulated injection. The maximum BHP constraint of 3663 psi for TB Leingang 1 and 3669 psi for TB Leingang 2 (equal to 90% of the product when multiplying the fracture gradient by top perforation depth) was approached near Year 20 of injection but was never reached (Figure 3-10), translating to a cumulative combined 124.4 MMt of CO <sub>2</sub> injected into the Broom Creek Formation by TB Leingang 1 and 2 (Figure 3-11). Simulations of CO <sub>2</sub> injection with the given well constraints, listed in Table 3-4, predicted the injection rate would decline from a maximum initial injection rate of approximately 3.65 MMt/yr per well to a final rate of approximately 2.85 MMt/yr per well (with a 20-year combined average of approximately 3.11 MMt/yr per injection well) (Figure 3-12).  WHP and BHP responses depend on several factors, including predicted injection rate, injection tubing parameters (tubing internal radius and relative roughness), and surface injection temperature. For the designed tubing size of 7 in., the wells are operated at the maximum WHP of 2100 psi during the 20-year injection period (Figure 3-10).  During and after injection, supercritical CO <sub>2</sub> (free-phase CO <sub>2</sub> ) accounts for the majority of CO <sub>2</sub> observed in the modeled pore space. Throughout the injection operation, a portion of the free-phase CO <sub>2</sub> is trapped in the pore space through a process known as residual trapping. Residual trapping can occur as a function of low CO <sub>2</sub> saturation and inability to flow under the effects of relative permeability. CO <sub>2</sub> also dissolves into the formation brine throughout injection operations (and continues afterward), although the rate of dissolution slows over time. The free-	<b>Figure 3-14a.</b> Average pressure increase within the Broom Creek Formation after 5 years of simulated CO <sub>2</sub> injection operation. 				<p>phase CO<sub>2</sub> transitions to either residually trapped or dissolved CO<sub>2</sub> during the postinjection period, resulting in a decline in the mass of free-phase CO<sub>2</sub>. The relative portions of supercritical, trapped, and dissolved CO<sub>2</sub> can be tracked throughout the duration of the simulation (Figure 3-13).</p> <p>The pressure fronts (Figures 3-14a–d) show the distribution of average pressure increase throughout the Broom Creek Formation after 5, 10, and 20 years of injection as well as 10 years postinjection. A maximum increase of approximately 1024 psi was estimated in the near-wellbore area at the end of the 20-year injection period (Figure 3-14c).</p> <p>Long-term CO<sub>2</sub> migration potential was also investigated through numerical simulation efforts. The slow lateral migration of the plume is caused by the effects of buoyancy where the free-phase CO<sub>2</sub> injected into the formation rises to the bottom of the upper confining zone or lower-permeability layers present in the Broom Creek Formation and then outward. This process results in a higher concentration of CO<sub>2</sub> at the center which gradually spreads out toward the model edges where the CO<sub>2</sub> saturation is lower. Trapped CO<sub>2</sub> saturations, employed in the model to represent fractions of CO<sub>2</sub> trapped in small pores as immobile supercritical fluids, ultimately immobilize the CO<sub>2</sub> plume and limit the plume’s lateral migration and spreading. Figures 3-15a–c show the CO<sub>2</sub> saturation at the end of injection in west-to-east and north-to-south cross-sectional views and the areal map showing the stabilized plume at the site.</p> <p><b>6.1.1 Pre- and Postinjection Pressure Differential</b> (p. 6-4) Model simulations were performed to predict the change in pressure in the Broom Creek Formation during and after the cessation of CO<sub>2</sub> injection. The simulations were conducted for 20 years of CO<sub>2</sub> injection in the Broom Creek Formation at an average total rate of 6.22 MMt/yr, followed by a postinjection period of 10 years.</p> <p>Figure 6-1 illustrates the predicted pressure differential at the cessation of CO<sub>2</sub> injection. At the time that CO<sub>2</sub> injection ceases, the models predict an increase in the pressure of the reservoir, with a maximum pressure differential of 897 psi at the TB Leingang well pad. There is insufficient pressure increase caused by CO<sub>2</sub> injection to move more than 1 m<sup>3</sup> of formation fluids from the storage reservoir to the lowest USDW. The details of the pressure evaluation are provided as part of the AOR delineation discussion within Section 3.0 of this application.</p>	<p><b>Figure 3-14c.</b> Average pressure increase within the Broom Creek Formation after 20 years of simulated CO<sub>2</sub> injection operation. (p. 3-22)</p> <p><b>Figure 6-1.</b> Predicted pressure increase in the storage reservoir following 20 years of injection of an average 6.465 MMt/yr of CO<sub>2</sub>. (p. 6-5)</p> <p><b>Figure 6-2.</b> Predicted decrease in pressure in the storage reservoir over a 10-year period following the cessation of CO<sub>2</sub> injection. (p. 6-6)</p>
	N.D.A.C. § 43-05-01-05(1)(b)(2)(l)	<p><b>N.D.A.C. § 43-05-01-05(1)(b)(2)</b> (l) Geomechanical information on fractures, stress, ductility, rock strength, and in situ fluid pressures within the confining zone. The confining zone must be free of transmissive faults or fractures and of sufficient areal extent and integrity to contain the injected carbon dioxide stream;</p>	<p>r. Geomechanical information on the confining zone. The confining zone must be free of transmissive faults or fractures and of sufficient areal extent and integrity to contain the injected carbon dioxide:</p> <ul style="list-style-type: none"> <li>Fractures</li> <li>Stress</li> <li>Ductility</li> <li>Rock strength</li> <li>In situ fluid pressure</li> </ul>	<p><b>2.4.4 Geomechanical Information of Confining Zone</b> (p. 2-48) <b>2.4.4.1 Fracture Analysis</b> Fractures within the overlying confining zone (the Opeche/Spearfish Formation) and the underlying confining zone (Amsden Formation) were assessed during the description of the Milton Flemmer 1 well core. Observable fractures were categorized by attributes including morphology, orientation, aperture, and origin. Secondly, natural fractures and in situ stress were assessed through the interpretation of the image log acquired during the drilling of the Milton Flemmer 1 well.</p> <p><b>2.4.4.2 Core-Fracture Analysis</b> The fractures observed in the Opeche Formation were tectonic, vertical to subvertical, closed, and cemented with anhydrite. The Amsden Formation was determined to be a nonfractured interval. A few discontinuous closed fractures were noted. The presence of stylolites was also noted in the dolomitic intervals of the Amsden Formation.</p> <p><b>2.4.4.3 Borehole Image Fracture Analysis</b> Natural fractures and in situ stresses were assessed through the interpretation of borehole image log, dipole shear sonic slowness (DTS), and DTC logs acquired during the drilling of the Milton Flemmer 1 well. Borehole image logs provide a 360-degree image of the formation of interest and are oriented to provide an understanding of the general orientation of the observed features. The fractures within the upper confining zone formations, specifically Spearfish, Minnekahta, and Opeche, exhibit unique characteristics and are classified individually.</p> <p>Fractures within Opeche Formation were primarily litho-bound resistive fractures, mainly oriented NNW-SSE with the presence of other fracture sets oriented N-S, NW-SE, and NE-SW. They were commonly filled with anhydrite. Some litho-bound conductive fractures were identified and determined to have a N-S and NW-SE orientation. The litho-bound conductive fractures are filled with clay and are interpreted as closed fractures (Figure 2-32a). In the Spearfish formation, one resistive litho-bound fracture and one resistive continuous fracture, oriented N-S and NNE-SSW, were highlighted (Figure 2-32b). In the Minnekahta Formation, one conductive litho-bound fracture, oriented NE-SW was highlighted (Figure 2-32C). The fractures vary in orientation and exhibit horizontal, oblique, and vertical trends. They are closed, and the aperture varies from close to centimeter-scale (Figures 2-33 and 2-34). No microfaults were found in the Spearfish, Minnekahta, and Opeche intervals.</p> <p>The Amsden Formation is considered to be a nonfractured interval; however, a few litho-bound conductive and resistive fractures are highlighted with the presence of horizontal compaction features (stylolites). The fractures are oriented E-W, NNE-SSW, and NNW-SSE (Figure</p>	<p><b>Figure 2-32a.</b> Strike orientation per type of fracture that characterizes the Opeche Formation: resistive litho-bound fractures (pink), resistive continuous fractures (brown), and conductive litho-bound fractures (blue). The colored dots represent the dip value for the corresponding type of fracture and the dip azimuth of the fracture. (p. 2-49)</p> <p><b>Figure 2-32b.</b> Strike orientation per type of fracture that characterizes the Spearfish Formation: resistive litho-bound fracture (pink) and resistive continuous fracture (brown). The colored dots represent</p>

				<p>2-35). The fractures vary in orientation and exhibit oblique and vertical trends. The fractures are filled, and the aperture varies from closed to millimeter-scale (Figures 2-36 and 2-37). No microfaults were found in the Amsden interval.</p> <p>Breakout and tensile fractures induced by drilling were identified in several formations such as Precambrian and Ordovician units and Amsden, Broom Creek, and Opeche Formations. Breakouts and tensile fractures have NW-SE and NE-SW orientations, respectively (Figure 2-38). In the confining and injection zones, the tensile fractures were identified at different depths 5804, 5826, 6195, and 6307 ft MD. The tensile fractures are oriented NE-SW, indicating that the maximum horizontal stress (SHmax) has an orientation of N050°.</p> <p><i>2.4.4.4 Stress, Ductility and Rock Strength</i></p> <p>The dynamic elastic properties (dynamic Young’s modulus and Poisson’s ratio) for the Opeche/Spearfish, Broom Creek, and Amsden Formations were calculated by using DTC, DTS, and density log collected from Milton Flemmer 1. These dynamic elastic properties were converted to static elastic properties with calibrations of geomechanical lab core measurements.</p> <p>A 1D MEM in the Broom Creek section was built for Milton Flemmer 1 using the available wireline data such as GR logs, caliper logs, density logs (RHOB), dipole sonic logs (DTC, DTS), and image logs. The 1D MEM consists of pore pressure, the vertical in situ stress (Sv, overburden), minimum and maximum horizontal in situ stresses (Shmin, SHmax), static and dynamic Young’s moduli (E), static and dynamic Poisson’s ratio (ν), Bulk modulus (K), shear modulus (G), unconfined compressive strength (UCS), tensile strength (To), and friction angle (FA or FANG) (Tables 2-9 and 2-10).</p> <p>Sv is one of the three principal stresses that act upon a rock. It is defined as the stress applied by the overlaying lithostatic column, at the depth (z), and is estimated using the Plumb and others (1991) equation. Sv is calculated using the RHOB log as an input. For the pore pressure, porosity proxy logging data based on a normal compaction trendline concept were used (for hydraulic static pressure, 1.03 g/cm³ = 0.44675 psi/ft = 8.6 ppg). For the Broom Creek Formation, the MDT data taken in sand bodies show pore pressure equivalent to 9 ppg equivalent to 0.466 psi/ft, which is slightly overpressured. The pore pressure estimation honored the MDT measurement. Dynamic to static Young’s modulus function used a linear conversion where a dynamic Young’s modulus log was calculated from the available sonic (DTC, DTS) and density logs. For Poisson’s ratio, dynamic and static parameters are assumed to be equal. The Biot factor was estimated using the formula Biot’s factor =1 – (K0/Kmineral), where K0 is the bulk modulus of the porous medium and Kmineral is the bulk modulus of solid parts of the porous medium. It is a function of mineral volumes and minerals’ bulk modulus. For rock properties, Young’s modulus and Poisson’s ratio were estimated from well logs and were calibrated with the triaxial core laboratory measurements (Figure 2-39).</p> <p>Unconfined compressive strength (UCS) was calculated using empirical correlations between UCS and DTC for shale, sandstone, and dolostone: the Chang (2006) method was used for shale formation, the McNally (1987) method was used for sandstone formation, and the Golubev and Rabinovich (1976) method was used for dolostone formation. The tensile strength was assumed to be 10% of the calculated UCS. The friction angle (FA or FANG) was estimated using an empirical correlation between the internal angle of friction and DTC: Lal’s approach (1999) was used to calculate the FA in the Opeche/Spearfish and Amsden Formations, and Weingarten and Perkins (1995) in Broom Creek Formation. Horizontal stresses (Shmin and SHmax) were estimated using the poroelastic equations (Plumb and others, 2000). The orientations of Shmin and SHmax were estimated with the help of image logs (Figure 2-38). The magnitude of Shmin was calibrated by the closure pressures which were measured with a mini-frac stress test. In addition, the 1D MEM shows that the stress regime observed in the Opeche/Spearfish, Broom Creek, and Amsden Formations is normal (Sv &gt; SHmax &gt; Shmin).</p> <p>The analysis of the pore pressure measured in the Broom Creek Formation attests that it could be considered an overpressured reservoir with a gradient equal to 0.466 psi/ft.</p> <p>Triaxial test (static elastic properties), ultrasonic velocity (dynamic elastic properties), destructive test (compressive strength) at reservoir conditions, and pore volume compressibility (PVC) for reservoir samples were conducted on nine core samples acquired from the Opeche/Spearfish, Broom Creek, and Amsden Formations in the Milton Flemmer 1 well. These values were used to calibrate the static and dynamic Young’s modulus and Poisson’s ratio generated from well logs (Table 2-11).</p>	<p>the dip value for the corresponding type of fracture and the dip azimuth of the fracture. <b>Area of Review Delineation</b>	N.D.A.C. §§ 43-05-01-05(1)(j) and (1)(b)(3)	<b>N.D.A.C. § 43-05-01-05(1)</b> j. An area of review and corrective action plan that meets the requirements pursuant to section 43-05-01-05.1;	The carbon dioxide storage reservoir area of review includes the areal extent of the storage reservoir and one mile outside of the storage reservoir boundary, plus the maximum extent of the pressure front caused by injection activities.	<b>4.1 Area of Review (AOR) Delineation</b> (p. 4-1) North Dakota regulations for geologic storage of CO <sub>2</sub> require that each storage facility permit (SFP) delineate an AOR, which is defined as “the region surrounding the geologic storage project where underground sources of drinking water (USDWs) <sup>1</sup> may be endangered by the injection activity” (North Dakota Administrative Code [N.D.A.C.] § 43-05-01-01[4]). Concern regarding the endangerment of USDWs is related to the potential vertical migration of CO <sub>2</sub> and/or brine from the injection zone to the USDW. Therefore, the AOR encompasses the region overlying the injected free-phase CO <sub>2</sub> plume and the region overlying the extent of formation fluid pressure increase that is sufficient to drive formation fluids (e.g., brine) into USDWs, assuming pathways for this migration (e.g., abandoned wells or transmissive faults) are present.	<b>Figure 4-2.</b> Final AOR map showing the TB Leingang storage facility area (dashed black boundary) and AOR (dashed purple boundary). 		<p><b>N.D.A.C. § 43-05-01-05(1)(b)</b>            (3) A review of the data of public record, conducted by a geologist or engineer, for all wells within the facility area, which penetrate the storage reservoir or primary or secondary seals overlying the reservoir, and all wells within the facility area and within one mile [1.61 kilometers], or any other distance as deemed necessary by the commission, of the facility area boundary. The review must include the following:</p>	<p>The area of review delineation must include the following:</p>	<p>The minimum fluid pressure increase in the reservoir that results in a sustained flow of brine upward into an overlying drinking water aquifer is referred to as the “critical threshold pressure increase” and resultant pressure as the “critical threshold pressure.” Calculation of the allowable increase in pressure using site-specific data from Milton Flemmer 1 (North Dakota Industrial Commission [NDIC] File No. 38594) shows that the storage reservoir in the project area is overpressured with respect to the lowest USDW (i.e., the allowable increase in pressure is less than zero). The storage reservoir is calculated to be overpressured, with a value of –271 psi calculated using data from the Milton Flemmer 1 well. The maximum vertically averaged storage reservoir change in pressure at the end of the simulated injection period was 1004 psi in the raster cell intersected by the injection well, which corresponds to less than 0.017 m<sup>3</sup> of flow over 20 years (Section 3.5). Based on the computational methods used to simulate CO<sub>2</sub> injection activities and the associated pressure front (Figure 4-1), the resulting AOR for TB Leingang is delineated as being 1 mi beyond the storage facility area boundary. This extent ensures compliance with existing state regulations.</p> <p>In accordance with N.D.A.C. § 43-05-01-05(1)(b)(3), a geologist or engineer reviewed the data of public record for all wells within the storage facility area, including those which penetrate the storage reservoir or primary or secondary seals overlying the reservoir, and all wells within 1 mi of the facility area boundary (Table 4-1).</p> <p>This section of the SFP application is accompanied by maps and tables that include information required and in accordance with N.D.A.C. § 43-05-01-05(1)(a) and (b) and § 43-05-01-05.1(2), such as the storage facility area; location of any proposed injection wells; presence of occupied structures, gravel pits, and wind turbines (Figure 4-2); and location of water wells, springs, and any other wells within the AOR (Figure 4-3). Table 4-1 lists all the surface and subsurface features that were investigated as part of the AOR evaluation. Surface features that were investigated but not found within the AOR boundary are also identified in Table 4-1.</p> <p>An extensive geologic and hydrogeologic characterization performed by a team of geologists from the Energy &amp; Environmental Research Center (EERC) resulted in no evidence of transmissive faults or fractures in the upper confining zone within the AOR (Section 2.5) and revealed that the upper confining zone has sufficient geologic integrity to prevent vertical fluid movement. All geologic data and investigations indicate the storage reservoir within the AOR has sufficient containment and geologic integrity, including geologic confinement above and below the injection zone, to prevent vertical fluid movement.</p>	<p>represent occupied structures, brown crosses represent wind turbines, and brown circles represent gravel pits (note: gravel pits were identified using the North Dakota Geographic Information System [GIS] Hub landmarks data layer from the North Dakota Department of Transportation [2002]). 					and gas producing well (NDIC File No. 7616). (p. 2-73)
	N.D.A.C. § 43-05-01-05(1)(c) and N.D.A.C. § 43-05-01-05.1(1)(a)	<p><b>N.D.A.C. § 43-05-01-05(1)</b></p> <p>c. The extent of the pore space that will be occupied by carbon dioxide as determined by utilizing all appropriate geologic and reservoir engineering information and reservoir analysis, which must include various computational models for reservoir characterization, and the projected response of the carbon dioxide plume and storage capacity of the storage reservoir. The computational model must be based on detailed geologic data collected to characterize the injection zones, confining zones, and any additional zones;</p> <p><b>N.D.A.C. § 43-05-01-05.1(1)</b></p> <p>a. The method for delineating the area of review, including the model to be used, assumptions that will be made, and the site characterization data on which the model will be based;</p>	<p>c. A description of the method used for delineating the area of review, including:</p> <ul style="list-style-type: none"><li>i. The computational model to be used</li><li>ii. The assumptions that will be made</li><li>iii. The site characterization data on which the model will be based;</li></ul>	<p><b>3.5.4 Risk-Based AOR Calculations (p. 3-35)</b></p> <p>Complete details of the risk-based AOR model are found in Burton-Kelly and others (2021). The inputs, assumptions, and results discussed here provide the necessary details for reproducing and verifying the results. A macro-enabled Microsoft Excel file was used to define the inputs and calculations that were employed in the method (hereafter “ASLMA Workbook”).</p> <p><b>3.5.4.1 Initial Hydraulic Heads</b></p> <p>The original ASLMA Model (Cihan and others, 2011) initially assumed hydrostatic pressure distributions in the entire system. The current work uses a modified version of the ASLMA Model to simulate pressure perturbations and leakage rates when there are initial head differences in the aquifers (Oldenburg and others, 2014). The initial hydraulic heads are calculated assuming a total head based on the unit-specific elevations and pressures. The total heads are entered into the ASLMA Model and establish the initial pressure conditions for the storage complex prior to CO<sub>2</sub> injection.</p> <p>For example, the initial reference case total heads for the storage reservoir (Aquifer 1), potential thief zone (Aquifer 2), and USDW (Aquifer 3) are shown in Table 3-6. They illustrate the state of overpressure in the storage complex because Aquifer 1 has a greater initial hydraulic head than Aquifer 2 and Aquifer 3. Therefore, the storage complex requires different treatment than the default AOR calculations described by EPA (2013). Details on the calculations of initial hydraulic head are provided in Burton-Kelly and others (2021).</p> <p><b>3.5.4.2 CO<sub>2</sub> Injection Parameters</b></p> <p>The ASLMA Model for the project used a Broom Creek CO<sub>2</sub> injection rate that matched the simulation scenario. A single injector is placed at the center of the ASLMA Model grid at an x,y location of (0,0) in the coordinate reference system. The ASLMA Model requires the CO<sub>2</sub> injection rate to be converted into an equivalent-volume injection of formation fluid in units of cubic meters per day. Microsoft Excel Visual Basic for Applications (VBA) functions were used to estimate the CO<sub>2</sub> density from the storage reservoir pressure and temperature, which resulted in an estimated density, shown in Table 3-7. The CO<sub>2</sub> mass injection rate and CO<sub>2</sub> density are then used to derive the daily equivalent-volume injection rate, shown in Table 3-7.</p> <p><b>3.5.4.3 Hypothetical Leaky Wellbore</b></p> <p>In the simulation model area, few wellbores are known to exist that penetrate the primary seal of the Broom Creek storage reservoir. However, for heuristic, “what-if” scenario modeling, which is needed to generate the data for delineating a risk-based AOR, a single hypothetical leaky wellbore is inserted into the ASLMA Model at 1, 2, ..., 100 km from the CO<sub>2</sub> injection well. The pressure buildup in the storage reservoir at each distance, along with the recorded cumulative volume of formation fluid vertically migrating through the leaky wellbore from the storage reservoir to the USDW (i.e., from Aquifer 1 to Aquifer 2) throughout the 20-year injection period, provides the data set needed to derive the risk-based AOR.</p> <p>Published ranges for the effective permeability of a leaky wellbore (Figure 3-18) have included an “open wellbore” with an effective permeability as high as 10<sup>-5</sup> m<sup>2</sup> (10<sup>10</sup> mD) to values more representative of leakage through a wellbore annulus of 10<sup>-12</sup> to 10<sup>-10</sup> m<sup>2</sup> (10<sup>3</sup> to 10<sup>5</sup> mD) (Watson and Bachu, 2008, 2009; Celia and others, 2011). Carey (2017) provides probability distributions for the effective permeability of potentially leaking wells at CO<sub>2</sub> storage sites and estimated a wide range from 10<sup>-20</sup> to 10<sup>-10</sup> m<sup>2</sup> (10<sup>-5</sup> to 10<sup>5</sup> mD). For the project Broom Creek ASLMA Model, the effective permeability of the leaky wellbore is set to 10<sup>-16</sup> m<sup>2</sup> (0.1 mD), which is a conservative (highly permeable) value near the top of the published range for the effective permeability of potentially leaking wells at CO<sub>2</sub> storage sites (Figure 3-18).</p> <p>The current work uses the ASLMA Model Type 1 feature (focused leakage only) for the nominal model response, which makes the conservative assumption that the aquitards are impermeable. This assumption prevents the pressure from diffusing into the overlying aquitards, resulting in a greater pressure buildup in the storage reservoir and a commensurately greater amount of formation fluid vertically migrating from the storage reservoir through the leaky wellbore. The conservative assumption of Model Type 1 rather than Model Type 3 (coupled focused and diffuse leakage) provides an added level of protection to the delineation of a risk-based AOR by projecting a larger pressure buildup in the storage reservoir than a scenario in which pressure is allowed to dissipate through the upper seal and, therefore, a greater leakage of formation fluid up the leaky wellbore.</p> <p><b>3.5.4.4 Saline Aquifer Potential Thief Zone</b></p>	<p><b>Table 3-6.</b> Simplified Stratigraphy and Average Properties Used to Represent the Storage Complex (p. 3-36)</p> <p><b>Table 3-7.</b> CO<sub>2</sub> Density and Injection Parameters Used for the ASLMA Model (p. 3-37)</p> <p><b>Figure 3-19.</b> Relationship between pressure buildup (x-axis, psi) in the storage reservoir (Aquifer 1, Broom Creek) and incremental total cumulative leakage (y-axis, m<sup>3</sup>) into Aquifer 2 (thief zone, Inyan Kara, red solid line) and Aquifer 3 (USDW, Fox Hills, dashed blue line). In the left-hand scenario, the leaky wellbore is closed to Aquifer 2, so all flow is from the storage reservoir to the USDW. In the right-hand scenario, the leaky wellbore is open to Aquifer 2, so the vast majority of flow is from the storage reservoir to the Aquifer 2 thief zone, and the curve showing flow into the Aquifer 3 USDW is not visible on this plot. (p. 3-40)</p> <p><b>Figure 3-18.</b> Histograms describing the expected frequency of leaky wellbore effective permeabilities under different scenarios. The ASLMA Model used for</p>

Subject	N.D.C.C./N.D.A.C. Reference	Requirement	Regulatory Summary	Storage Facility Permit Application (Section and Page Number; see main body for reference cited)	Figure/Table Number and Description (Page Number)
				<p>As shown in Table 3-6, a saline aquifer (Aquifer 2, Inyan Kara Formation) exists between the storage reservoir primary seal and the USDW (Aquifer 3, Fox Hills Formation). Formation fluid migrating up a leaky wellbore that is open to Aquifer 2 will preferentially flow into Aquifer 2, and the continued flow up the wellbore and into the USDW will be reduced. Therefore, Aquifer 2 may act as a thief zone and reduce the potential for formation fluid impacts to the groundwater.</p> <p>The thief zone phenomenon was described by Nordbotten and others (2004) as an “elevator model” by analogy to an elevator full of people on the main floor, who then get off at various floors as the elevator moves up, such that only very few people ride all the way to the top floor. The term “thief zone” is also used in the oil and gas industry to describe a high-permeability zone encountered during drilling into which circulating fluids can be lost. Models with and without opening the leaky wellbore to Aquifer 2 were run and the results evaluated to quantify the effect of a thief zone on the risk-based AOR.</p> <p><i>3.5.4.5 Aquifer- and Aquitard-Derived Properties</i> The ASLMA Model assumes homogeneous properties within each hydrostratigraphic unit (Table 3-6). For each unit shown in Table 3-6, pressure, temperature, porosity, permeability, and salinity are used to derive two key inputs for the ASLMA Model: HCON and specific storage (SS). Average porosity and permeability values were derived as follows: Broom Creek, from distributed properties in the geologic model; Fox Hills, from regional well log data. Porosity is represented as an arithmetic mean and permeability as a geometric mean value within each hydrostratigraphic unit (excluding nonsandstone rock types).</p> <p>VBA functions included in the ASLMA Workbook are used to estimate the formation fluid density and viscosity from the aquifer or aquitard pressure, temperature, and salinity inputs, which are then used to estimate HCON and SS. The estimated reference case HCON for the storage reservoir (Aquifer 1) potential thief zone (Aquifer 2) and USDW (Aquifer 3) are shown in Table 3-6. Details about the HCON and SS derivations are provided in supporting information for Burton-Kelly and others (2021).</p> <p><b>3.5.5 Risk-Based AOR Results (p. 3-39)</b> <i>3.5.5.1 Relating Pressure Buildup to Incremental Leakage with ASLMA Model and Compositional Simulation</i> Figure 3-19 shows the relationship between the maximum pressure buildup in the storage reservoir and incremental leakage to Aquifer 3 (USDW) for scenarios with and without the leaky wellbore open to Aquifer 2 (thief zone). The curvilinear relationship between pressure buildup in the storage reservoir and incremental leakage to Aquifer 3 is used to predict the incremental leakage from the pressure buildup map produced by the compositional simulation of the geocellular model. The average simulated pressure buildup in the reservoir is represented by a raster (grid) map of pressure buildup values. For each raster value (grid cell map location), the relationship between pressure buildup and incremental leakage (Figure 3-19) is used to predict incremental leakage using a linear interpolation between the points making up the curve. The estimated cumulative leakage potential from Aquifer 1 to Aquifer 3 along a hypothetical leaky wellbore without injection occurring (i.e., leakage due to natural overpressure) and no thief zone is shown in Table 3-7.</p> <p><i>3.5.5.2 Incremental Leakage Maps and AOR Delineation</i> The pressure buildup–incremental flow relationship, shown in Figure 3-19, results in the incremental flow map, shown in Figure 3-20, which shows the estimated total cumulative incremental flow potential from a hypothetical leaky well into Aquifer 3 (USDW) over the entire injection period if the modeled leaky wellbore is not open to the thief zone.</p>	<p>AOR delineation used a value of approximately 0.1 mD (constructed from data presented by Carey [2017]). (p. 3-38)</p> <p><b>Table 3-20.</b> Map of potential incremental flow into the USDW at the end of 20 years of CO<sub>2</sub> injection. (p. 3-41)</p> <p><b>Figure 3-21.</b> Final AOR estimations of the TB Leingang storage facility area in relation to nearby legacy wells. Shown is the storage facility area (black dashed line) and AOR (purple dashed line). The gray circle represents legacy oil and gas wells near the storage facility area. (p. 3-43)</p>

Required Plans	N.D.A.C. § 43-05-01-05(1)(k)	N.D.A.C. § 43-05-01-05(1) k. The storage operator shall comply with the financial responsibility requirements pursuant to section 43-05-01-9.1;	a. Financial Assurance Demonstration	<p><b>12.3 Financial Instruments (p.12-11)</b></p> <p>The applicant will establish a financial instrument(s) 30–60 days prior to inception of coverage, which is expected to be at or just prior to the commencement of injection operations (N.D.A.C. § 43-05-01-09.1). The applicant will provide financial assurance in the form of a surety bond to ensure funds are available for PISC and facility closure activities (N.D.A.C. § 43-05-01-09.1[1][a] and N.D.A.C. § 43-05-01-19). The applicant will also obtain a pollution liability policy(s) to cover emergency and remedial response costs and endangerment of USDWs under N.D.A.C. § 43-05-01-13 and a financial instrument (surety bond) to cover the costs of plugging the injection wells (N.D.A.C. § 43-05-01-11.5). No estimates have been provided for corrective action (N.D.A.C. § 43-05-01-05.1) because no action is required at this time.</p> <p>This application presents the estimated total costs (\$20,316,000) of these activities and a breakdown apportionment across proposed financial instruments in Table 12-1. Section 12.2 of this FADP provides additional details of the financial responsibility cost estimates for each activity.</p> <p>The company providing insurance will meet all the following criteria:</p> <ol style="list-style-type: none"><li>The company is authorized to transact business in North Dakota.</li><li>The company has either passed the specified financial strength requirements on the basis of credit ratings or has met a minimum rating, minimum capitalization, and ability to pass the rating, when applicable.</li><li>The third-party insurance can be maintained until such a time that DMR-O&amp;G determines that the storage operator has fulfilled its financial obligations.</li></ol> <p>The third-party insurance, which identifies SCS1 as the covered party, will be provided by one or a combination of the companies meeting the creditworthiness and other requirements of N.D.A.C. § 43-05-01-09.1. However, the greatest hypothetical exposure evaluated would be an acute upward migration through an CO<sub>2</sub> injection well, which has an estimated cost of \$13,795,000 for emergency and remedial response actions, as well as coverage identified in the endangerment of USDWs.</p> <p>Coverage terms are of an indicative/estimated nature only at this time, as firm and bindable terms are not possible this far in advance of commencement of injection operations; however, final coverage terms and costs will be determined upon full underwriting and firm/bindable quotations to be issued by insurers 30–60 days prior to inception of coverage, which is expected to be at or just prior to the commencement of injection operations. The actual third-party insurance companies will be determined closer to the proposed injection start date and will meet both of the following criteria, as specified in N.D.A.C. §43-05-01-09.1(1)(g):</p> <ol style="list-style-type: none"><li>The companies satisfy financial strength requirements based on credit ratings in the top four categories of either Standard &amp; Poor’s (AAA, AA, A, or BBB) or Moody’s (Aaa, Aa, A, Baa).</li><li>The companies meet a minimum rating (minimum rating based on an issuer, credit, securities, or financial strength rating as a demonstration of financial stability) and minimum capitalization (i.e., demonstration that minimum thresholds are met for the following financial ratios: debt–equity, assets–liabilities, cash return on liabilities, liquidity, and net profit) and are able to pass bond rating in the top four categories of either Standard &amp; Poor’s (AAA, AA, A, or BBB) or Moody’s (Aaa, Aa, A, Baa), when applicable.</li></ol>	<p><b>Table 12-1.</b> Potential Future Costs Covered by Financial Assurance (p. 12-2)</p> <p><b>Table 12-2.</b> Injection Well Plugging (p. 12-3)</p> <p><b>Table 12-3a.</b> Cost Estimate1 for PISC Activities for TB Leingang Assuming a 10-year PISC Period (p. 12-4)</p> <p><b>Table 12-3b.</b> Cost Estimate for Flowline Segment NDL-327 Abandonment (p. 12-5)</p> <p><b>Table 12-4.</b> Cost Estimate1 for Site Closure and Remediation Activities for TB Leingang CO<sub>2</sub> Storage Project (p. 12-6).</p> <p><b>Table 12-6.</b> Cost Estimate for Emergency and Remedial Response Plan (p. 12-10).</p> <p><b>Table 12-7.</b> Cost Estimate Endangerment of USDWs* (p. 12-10).</p>

				<ul style="list-style-type: none"><li>Drug, alcohol, and controlled substances policy complying with all governmental laws and regulations in the workplace and consequences for those who violate the policy.</li><li>Reporting guidelines for all injuries; equipment or property damages; leaks, spills, or releases; or other health, safety, and environmental (HSE)-related incidents.</li></ul> <p>Only SCS1 employees and contractor personnel who have been properly trained can participate in the on-site activities of drilling, construction, operations, and equipment repair.</p>	
	N.D.A.C. § 43-05-01-05(1)(f)	N.D.A.C. § 43-05-01-05(1) f. A corrosion monitoring and prevention plan for all wells and surface facilities pursuant to section 43-05-01-15;	d. A corrosion monitoring and prevention plan for all wells and surface facilities;	<p><b>5.3 CO<sub>2</sub> Flowline Corrosion Prevention and Detection Plan (p. 5-14)</b> The purpose of this plan is to prevent and detect any signs of corrosion in the flowline.</p> <p><b>5.3.1 Corrosion Prevention</b> To protect against corrosion, an external fusion-bonded epoxy coating will be applied to the NDL-327 flowline. Flowline installed by trenchless methods, such as road crossings, will also have an abrasion-resistant overcoat installed as a secondary coating, over the fusion-bonded epoxy, prior to installation.</p> <p>SCS1 will install an impressed current cathodic protection (ICCP) system along the buried flowline to mitigate the threat of external soil corrosion on the line. The ICCP system, which will be continuously monitored, involves the installation of deep anode beds along the flowline that are connected to external power through a rectifier. The power provides the current needed to drive an electrochemical reaction whereby the anodes corrode instead of the flowline. Except for a rectifier, junction box, and small diameter vent pipe posted above the anode beds, the ICCP system will be buried.</p> <p>Because the CO<sub>2</sub> stream will contain only trace amounts of water (Table 5-2), SCS1 will operate the surface facilities above the saturation point of water to prevent corrosive conditions from forming.</p> <p><b>5.3.2 Corrosion Detection</b> Real-time, continuous monitoring of the CO<sub>2</sub> flowline with P/T gauges and Coriolis mass flowmeter measurements from the pump/metering building to the terminus of the pipeline combined with continuous analysis of the CO<sub>2</sub> stream with the gas chromatograph will provide strong evidence that noncorrosive conditions are maintained in the flowline during injection operations. The equipment will be spliced to the SCADA system and have automated triggers and alarms for alerting SCS1 of any anomalous readings.</p> <p>The flowline segment from the terminus of the pipeline to the pipeline inspection gauge (PIG) receiver (shown in Figure 5-3) will allow the passage of internal inspection devices (commonly referred to as “smart PIGs”), which are designed to detect certain internal and external anomalies in the line, such as loss of mass/wall thickness, dents, pitting, cracking, and scratches. The launchers and receiver facilities are designed to launch and receive these internal inspection devices along with other types of PIGs (e.g., maintenance pigs). The launchers and receivers will be located at standalone sites in Oliver and Mercer Counties. The frequency for running PIGs in the flowline during operations is described in Table 5-2.</p> <p>In addition to the activities described above, SCS1 will install at least one electrical resistance (ER) probe along the CO<sub>2</sub> flowline upstream of the gas chromatograph to continuously monitor for loss of mass throughout the operational phase. The ER probe will be spliced to the SCADA system for real-time monitoring and will be removable for visual inspection and replacement, if required. The SCADA system will have automated triggers and alarms for alerting SCS1 of any anomalous readings.</p> <p><b>5.6 Wellbore Corrosion Prevention and Detection Plan (p. 5-21)</b> The purpose of this corrosion prevention and detection plan is to monitor the well materials to ensure they meet the minimum standards for material strength and performance, pursuant to N.D.A.C. § 43-05-01-11.4(1)(c).</p> <p><b>5.6.1 Downhole Corrosion Prevention</b> To prevent corrosion of the well materials in the TB Leingang 1 and 2 wellbores, the following preemptive measures will be implemented: 1) cement opposite of the injection interval and extending to the differential valve (DV) staging tool above the top of the Mowry Formation will</p>	<p><b>Figure 5-2.</b> Site map detailing the path of the CO<sub>2</sub> flowline to the CO<sub>2</sub> injection wellsite. Inset map (on left) illustrates a generalized injection well pad layout with key monitoring equipment identified. The flow diagram is identical for the TB Leingang 2 CO<sub>2</sub> injection well (not shown). (p. 5-12)</p> <p><b>Table 5-3.</b> Specification for the Commingled CO<sub>2</sub> Stream (p. 5-9)</p>

Subject	N.D.C.C./N.D.A.C. Reference	Requirement	Regulatory Summary	Storage Facility Permit Application (Section and Page Number; see main body for reference cited)	Figure/Table Number and Description (Page Number)
				<p>be CO<sub>2</sub>-resistant; 2) the well casing will also be CO<sub>2</sub>-resistant from the bottomhole to just above the Opeche/Spearfish Formation and from below the top of the Swift Formation to just below the top of the Skull Creek Formation; 3) the well tubing will be CO<sub>2</sub>-resistant from the injection interval to surface; 4) the packer will be CO<sub>2</sub>-resistant; and 5) the packer fluid will be an industry-standard corrosion inhibitor. The tubing-casing annulus will be filled with the packer fluid system that is planned to be a brine-based fluid treated with antimicrobial biocide, corrosion inhibitor, and oxygen scavenger to minimize potential corrosive effects of soluble oxygen.</p> <p>To prevent corrosion of the well materials in the Milton Flemmer 1 wellbore, the following preemptive measures are implemented: 1) cement opposite the injection interval and extending above the confining zones is CO<sub>2</sub>-resistant; 2) the well casing is CO<sub>2</sub>-resistant from the cast iron bridge plug set at 6550 feet in the well (to 137 feet above the Opeche/Spearfish Formation and from 214 feet below the top of the Swift Formation to 178 feet above the top of the Mowry Formation); and 3) the packer fluid is an industry-standard corrosion inhibitor. The tubing-casing annulus will be filled with a brine-based packer fluid treated with biocide, corrosion inhibitor, and oxygen scavenger. In addition, SCS1 plans to reevaluate replacement of packer and bottomhole assembly during the 5-year evaluation.</p> <p>Figures 11-2, 11-4, and 11-5 in Section 11.0 illustrate the downhole corrosion prevention measures in each of the wellbores.</p> <p><b>5.6.2 Downhole Corrosion Detection</b> PNLs will be run in the TB Leingang 1 and 2 and Milton Flemmer 1 wellbores to detect saturations of CO<sub>2</sub>. Further investigative methods of inspecting for corrosion in the wellbore could include ultrasonic logging or other equivalent CIL when required. Tables 5-1 and 5-2 specify the sampling frequency for acquiring data related to this downhole corrosion detection plan.</p>	
	N.D.A.C. § 43-05-01-05(1)(g)	<p><b>N.D.A.C. § 43-05-01-05(1) g.</b> A leak detection and monitoring plan for all wells and surface facilities pursuant to section 43-05-01-14. The plan must:</p> <ol style="list-style-type: none"> <li>(1) Identify the potential for release to the atmosphere;</li> <li>(2) Identify potential degradation of ground water resources with particular emphasis on underground sources of drinking water; and</li> <li>(3) Identify potential migration of carbon dioxide into any mineral zone in the facility area.</li> </ol>	e. A surface leak detection and monitoring plan for all wells and surface facilities pursuant to N.D.A.C. § 43-05-01-14;	<p><b>5.2 Surface Facilities Leak Detection Plan (p. 5-10)</b> The purpose of this leak detection plan is to specify the monitoring strategies SCS1 will use to quantify any losses of CO<sub>2</sub> from surface facilities during operations. Surface facilities include the CO<sub>2</sub> injection wellheads (TB Leingang 1 and 2), the reservoir-monitoring wellhead (Milton Flemmer 1), and the NDL-327 CO<sub>2</sub> flowline, which begins at the pipeline terminus of NDM-106 and ends at the inlet valve upstream of the automated emergency shutoff valve at each CO<sub>2</sub> injection wellhead. Figure 5-2 illustrates the CO<sub>2</sub> flowline path to CO<sub>2</sub> injection wellsite, and Figure 5-3 is a generalized flow diagram from the pipeline terminus of NDM-106 to the CO<sub>2</sub> injection wellheads, illustrating key surface facilities' connections and monitoring equipment.</p> <p>As illustrated in Figure 5-3, leak detection equipment includes 1) P/T gauges along the flowline, 2) a Coriolis mass flowmeter placed near each of the injection wellheads, and 3) gas detection stations placed on the CO<sub>2</sub> injection wellheads pursuant to N.D.A.C. § 43-05-01-14(1) and inside the pump/metering building. The gas detection stations, which will detect gases such as CO<sub>2</sub>, methane (CH<sub>4</sub>), and hydrogen sulfide (H<sub>2</sub>S), will have automated triggers and alarms to alert SCS1 of any anomalous readings. The SCADA system, which will continuously collect data streams from the leak detection equipment in real time, will also monitor for leaks with leak detection software.</p> <p>Field personnel from SCS1 will have multigas detectors with them for visiting wellsites or conducting flowline inspections. In addition, gas detection safety lights (part of the integrated alarm system) will be placed outside of the pump/metering building to warn field personnel of potential indoor air quality threats.</p> <p><b>5.2.2 Surface Facilities Leak Detection Plan QASP</b> Pursuant to N.D.A.C. § 43-05-01-14(1), the leak detection equipment will be inspected and tested on a semiannual basis. If equipment is defective, SCS1 will repair or replace the equipment within 10 days or, acting with good cause, SCS1 will propose an alternate timeline for approval by the DMR-O&amp;G. Each repaired or replaced detector will be retested, if required. The gas detection stations are described in Appendix D, Attachment D-2. The SCADA system and leak detection software are described in further detail in Appendix D, Attachment D-3, and the personnel multigas detectors are described in Appendix D, Attachment D-4. SCS1 will install the leak detection equipment according to the manufacturer's recommendations.</p> <p>The flowline will be regularly inspected for any visual or auditory signs of equipment failure. Any release of CO<sub>2</sub> to the atmosphere or near-surface environments from the surface facilities will be reported to DMR-O&amp;G within 24 hours pursuant to N.D.A.C. § 43-05-01-18(9)(e).</p>	N/A
	N.D.A.C. § 43-05-01-05(1)(h)	<b>N.D.A.C. § 43-05-01-05(1) h.</b> A leak detection and monitoring plan to monitor any movement of the carbon dioxide outside of the	f. A subsurface leak detection and monitoring plan to monitor for any movement of the carbon dioxide outside of the storage reservoir. This may include the	<p><b>5.7 Environmental Monitoring Plan (p. 5-22)</b> To verify the injected CO<sub>2</sub> is contained in the storage reservoir, protect all USDW, and demonstrate hydrogeologic properties of the storage reservoir, multiple environments will be monitored.</p>	

Subject	N.D.C.C./N.D.A.C. Reference	Requirement	Regulatory Summary	Storage Facility Permit Application (Section and Page Number; see main body for reference cited)	Figure/Table Number and Description (Page Number)
		<p>storage reservoir. This may include the collection of baseline information of carbon dioxide background concentrations in ground water, surface soils, and chemical composition of in situ waters within the facility area and the storage reservoir and within one mile [1.61 kilometers] of the facility area’s outside boundary. Provisions in the plan will be dictated by the site characteristics as documented by materials submitted in support of the permit application but must:</p> <p>(1) Identify the potential for release to the atmosphere;</p> <p>(2) Identify potential degradation of ground water resources with particular emphasis on underground sources of drinking water; and</p> <p>(3) Identify potential migration of carbon dioxide into any mineral zone in the facility area.</p>	<p>collection of baseline information of carbon dioxide background concentrations in ground water, surface soils, and chemical composition of in situ waters within the facility area and the storage reservoir and within one mile of the facility area’s outside boundary;</p>	<p>As required by N.D.A.C. § 43-05-01-11.4(1)(d) and (h), the near-surface environment, defined as the region from the surface down to the lowest USDW (Fox Hills Aquifer), will be monitored by sampling and analyzing vadose-zone soil gas at two soil gas profile stations, one new Fox Hills monitoring well, and up to four existing groundwater wells.</p> <p>The deep subsurface environment, defined as the region from below the lowest USDW to the base of the storage reservoir, will be monitored with multiple methods, starting with the above-zone monitoring interval (AZMI) or the geologic interval from the confining zone above the storage reservoir to the confining zone above the next permeable zone above the storage reservoir (i.e., Opeche/Spearfish Formation to the Skull Creek Formation). The AZMI will be continuously monitored with DTS fiber optics in the TB Leingang 1 and 2 wellbores as well as PNLs.</p> <p>Pursuant to N.D.A.C. § 43-05-01-11.4(1)(g), the storage reservoir will be monitored with both direct and indirect methods. Direct methods include continuous fiber optics (DTS) and downhole P/T measurements in the TB Leingang 1 and 2 and Milton Flemmer 1 and falloff tests and PNLs in the TB Leingang 1 and 2 wellbores. Falloff testing analysis will provide reservoir pressure data and the completion condition including transmissibility, skin factor, and well flowing and static pressure data for technical adequacy to demonstrate no migration from the reservoir. Indirect methods include time-lapse seismic surveys. These efforts will provide assurance that surface and near-surface environments are protected and that the injected CO<sub>2</sub> is safely and permanently contained in the storage reservoir. In addition, SCS1 will install multiple seismometer stations for passively detecting and locating seismic events.</p> <p><b>5.7.1 Soil Gas Monitoring</b> Vadose-zone soil gas monitoring directly measures the characteristics of the air space between soil components and is an indirect indicator of both chemical and biological processes occurring in and below a sampling horizon. Two permanent soil gas profile stations installed adjacent to both the CO<sub>2</sub> injection and Milton Flemmer 1 well pads will be sampled, as shown in Figure 5-4. Figure 5-5 is a typical wellbore schematic of a soil gas profile station.</p> <p>The sampling frequency for soil gas is summarized in Tables 5-1 and 5-2. During injection, SCS1 may install additional replacement or alternative soil gas sampling sites based on monitoring data results. SCS1 will notify DMR-O&amp;G if either replacement or alternative soil gas sampling sites are added pursuant to N.D.A.C. § 43-05-01-18(2). The results of the baseline soil gas sampling program will be provided to DMR-O&amp;G prior to injection.</p> <p><b>5.7.2 Groundwater Monitoring</b> Groundwater monitoring directly measures the chemical constituents of the water in the pore space between grains of subsurface geologic formations (aquifers) and is an indirect indicator of both chemical and biological processes occurring in and below a sampling horizon. Figure 5-4 identifies the sampling locations associated with the near-surface baseline and operational monitoring plan, which includes one new Fox Hills monitoring well, and up to four existing groundwater wells.</p> <p>SCS1 will work with landowners of the four existing groundwater wells (MGW01, MGW03, MGW04, and MGW09) to attempt to collect samples as specified in Tables 5-1 and 5-2. The number of samples collected from each existing groundwater well may vary by location, since some of the groundwater wells may not be operated year-round or site accessibility may be limited (e.g., snow cover during winter months). If SCS1 is ever unable to access the wells due to operational status or access concerns, it will document the reason why it was unable to take samples. An attempt was made to identify alternative wells that operate year-round with reduced access concerns but produced no results.</p> <p>SCS1 will install one Fox Hills monitoring well (MGW11) adjacent to the injection well pad (as shown in Figure 5-4). The Fox Hills monitoring well will be sampled according to the sampling frequency specified in Tables 5-1 and 5-2.</p> <p>SCS1 reserves the right to evaluate and modify, if necessary, appropriate groundwater sampling locations and frequency based on conformance of the CO<sub>2</sub> plume extent in the subsurface. SCS1 will notify DMR-O&amp;G if alternative or new water wells are added to the sampling program pursuant to N.D.A.C. § 43-05-01-18(2).</p> <p>Appendix B includes a supplemental baseline dataset of historic geochemistry results for four groundwater wells within the AOR boundary. The data were obtained from the Department of Water Resources (DWR) website. The wells are DWR 9433, 9053, 9055, and 9056, as shown in Figure B-1. These shallow groundwater wells were excluded from the baseline and operational monitoring plan primarily because they did not meet the depth criterion used to select wells for inclusion in the testing and monitoring plan.</p> <p><b>5.7.3 Deep Subsurface Monitoring</b></p>	

Subject	N.D.C.C./N.D.A.C. Reference	Requirement	Regulatory Summary	Storage Facility Permit Application (Section and Page Number; see main body for reference cited)	Figure/Table Number and Description (Page Number)
				<p>Pursuant to N.D.A.C. § 43-05-01-11.4(1)(g), SCS1 will implement direct and indirect methods to monitor the location, thickness, and distribution of the free-phase CO<sub>2</sub> plume and associated pressure relative to the permitted storage reservoir. The direct and indirect storage reservoir monitoring methods described in this subsection of the permit application will be used to characterize the CO<sub>2</sub> plume’s saturation and pressure within the AOR for the baseline and operational phases.</p> <p><i>5.7.3.3 Direct Reservoir Monitoring</i>  DTS fiber optics installed in the TB Leingang 1 and 2 and Milton Flemmer 1 wellbores will directly monitor the temperature of the storage reservoir. P/T readings from the casing-conveyed gauges in the CO<sub>2</sub> injection wells will also monitor conditions in the storage reservoir. To track the pressure front from CO<sub>2</sub> injection in the storage reservoir, pressure will be measured continuously from the downhole tubing-conveyed P/T gauge installed in the Milton Flemmer 1 well. To track the CO<sub>2</sub> plume in the storage reservoir, the DTS fiber-optic cable and temperature measurements from the downhole P/T gauge installed in the Milton Flemmer 1 well be used to estimate the timing of arrival of the CO<sub>2</sub> plume at the reservoir-monitoring well. The pressure and temperature data will be used to ensure the monitoring data from the Broom Creek Formation (from Amsden Formation through Opeche/Spearfish Formation) is conforming to the geologic model and numerical simulations. Pressure falloff tests will be performed in the CO<sub>2</sub> injection to demonstrate the performance of the storage reservoir.</p> <p><i>5.7.3.5 Indirect Reservoir Monitoring</i>  SCS1 will acquire 3D time-lapse seismic surveys to track the extent of the CO<sub>2</sub> plume within the storage reservoir. The 200-mi2 3D Beulah seismic survey referenced in Section 2.0 will serve as the baseline survey. To demonstrate conformance between the reservoir model simulation and site performance, localized 3D seismic surveys will be collected to monitor the extent of the CO<sub>2</sub> plume, as shown in Figure 5-6 and detailed in Table 5-2.</p> <p>SCS1 will reevaluate the testing and monitoring plan, inclusive of the design and frequency of the repeat 3D seismic surveys, at least once every 5 years, as required. If necessary, the time-lapse seismic monitoring strategy will be adapted based on updated simulations of the predicted extents of the CO<sub>2</sub> plume, including expanding the 3D survey area to capture additional data as the CO<sub>2</sub> plume expands in the storage reservoir.</p> <p>SCS1 plans to install multiple seismometer stations to continuously monitor for seismic events with a magnitude of &gt;1.5 within the AOR boundary during injection. The 3D seismic survey data (e.g., velocity modeling) collected within the AOR boundary will provide supporting evidence for confidently locating seismic events. A traffic light system for detecting larger magnitude events (e.g., &gt;2.7) is presented with the Indirect Reservoir Monitoring QASP section of this application.</p> <p><b>5.9 Adaptive Management Approach</b>  SCS1 will employ an adaptive management approach to implementing the testing and monitoring plan by completing periodic reviews of the testing and monitoring plan (Ayash and others, 2017) at least once every 5 years. During each review, monitoring and operational data will be analyzed, and the AOR will be reevaluated. Based on this reevaluation, it will either be demonstrated that 1) no amendment to the testing and monitoring program is needed or 2) modifications are necessary to ensure proper monitoring of storage performance is achieved moving forward. This determination will be submitted to DMR-O&amp;G for approval. Should amendments to the testing and monitoring plan be necessary, they will be incorporated into the permit following approval by DMR-O&amp;G. Over time, monitoring methods and data collection may be supplemented or replaced as advanced techniques are developed.</p> <p>Monitoring and operational data will be used to evaluate conformance between observations and history-matched simulation of the CO<sub>2</sub> plume and pressure distribution relative to the permitted geologic storage facility. If significant variance is observed, the monitoring and operational data will be used to calibrate the geologic model and associated simulations. The monitoring plan will be adapted to provide suitable characterization and calibration data as necessary to achieve such conformance. Subsequently, history-matched predictive simulation and model interpretations will, in turn, be used to inform adaptations to the monitoring program to demonstrate lateral and vertical containment of the injected CO<sub>2</sub> within the permitted geologic storage facility.</p>

**NOTICE OF HEARING**  
**N.D. INDUSTRIAL COMMISSION**  
**OIL AND GAS DIVISION**

You are hereby notified of a hearing pursuant to North Dakota Administrative Code § 43-05-01 requesting consideration for the geologic storage of carbon dioxide in the Broom Creek Formation from the Midwest Carbon Express Pipeline in the storage facility located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND pursuant to North Dakota Administrative Code Chapter 43-05-01. **The hearing will be held June 11 and June 12, 2024 at 9:00 a.m., 1000 East Calgary Avenue, Bismarck, North Dakota.**

Case No. **30869** In the matter of a hearing called on a motion of the Commission to consider the application of Summit Carbon Storage #1, LLC requesting consideration for the geologic storage of carbon dioxide in the Broom Creek Formation from the Midwest Carbon Express Pipeline in the storage facility located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND pursuant to North Dakota Administrative Code Chapter 43-05-01. View the draft storage facility permit, fact sheet, and storage facility [permit application at www.dmr.nd.gov/dmr/oilgas/](http://www.dmr.nd.gov/dmr/oilgas/). Summit Carbon Storage #1, LLC intends to receive carbon dioxide from the Midwest Carbon Express Pipeline and sequester it in the Broom Creek Formation. The Commission will accept and consider written comments on the merits of the application and draft permit if received no later than 5:00 pm CDT June 10, 2024. Submit written comments to the Oil and Gas Division, 1016 East Calgary Ave, Bismarck, ND 58503-5512 or [slforsberg@nd.gov](mailto:slforsberg@nd.gov). Further draft permit information may be obtained from Tammy Madche, and further hearing information may be obtained from Sara Forsberg, both at the ND Oil and Gas Division, 1016 East Calgary Ave, Bismarck, ND 58503-5512, 701-328-8020. Summit Carbon Storage #1, LLC, 2321 North Loop Dr Suite #221, Ames, IA 50010.

Case No. **30870** In the matter of a hearing called on a motion of the Commission to consider the application of Summit Carbon Storage #1, LLC to consider the amalgamation of the storage reservoir pore space, in which the Commission may require that the pore space owned by nonconsenting owners be included in the geologic storage, as required to operate the Summit Carbon Storage #1, LLC storage facility located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23,

25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, in the Broom Creek Formation, pursuant to North Dakota Century Code Section 38-22-10.

Case No. **30871** In the matter of a hearing called on a motion of the Commission to consider the application of Summit Carbon Storage #1, LLC for an order of the Commission determining the amount of financial responsibility for the geologic storage of carbon dioxide from the Midwest Carbon Express Pipeline in the storage facility located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, in the Broom Creek Formation, pursuant to North Dakota Administrative Code Section 43-05-01-09.1.

Case No. **30872** In the matter of a hearing called on a motion of the Commission to consider establishing the field and pool limits for lands located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, subject to the application of Summit Carbon Storage #1, LLC for the geologic storage of carbon dioxide in the Broom Creek Formation, and enact such special field rules as may be necessary.

Re: NDIC Case Nos. 30869 - 30872

**NOTICE OF HEARING**  
**N.D. INDUSTRIAL COMMISSION**  
**OIL AND GAS DIVISION**

You are hereby notified of a hearing pursuant to North Dakota Administrative Code § 43-05-01 requesting consideration for the geologic storage of carbon dioxide in the Broom Creek Formation from the Midwest Carbon Express Pipeline in the storage facility located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND pursuant to North Dakota Administrative Code Chapter 43-05-01. **The hearing will be held June 11 and June 12, 2024 at 9:00 a.m., 1000 East Calgary Avenue, Bismarck, North Dakota.**

Case No. **30869** In the matter of a hearing called on a motion of the Commission to consider the application of Summit Carbon Storage #1, LLC requesting consideration for the geologic storage of carbon dioxide in the Broom Creek Formation from the Midwest Carbon Express Pipeline in the storage facility located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND pursuant to North Dakota Administrative Code Chapter 43-05-01. View the draft storage facility permit, fact sheet, and storage facility [permit application at www.dmr.nd.gov/dmr/oilgas/](http://www.dmr.nd.gov/dmr/oilgas/). Summit Carbon Storage #1, LLC intends to receive carbon dioxide from the Midwest Carbon Express Pipeline and sequester it in the Broom Creek Formation. The Commission will accept and consider written comments on the merits of the application and draft permit if received no later than 5:00 pm CDT June 10, 2024. Submit written comments to the Oil and Gas Division, 1016 East Calgary Ave, Bismarck, ND 58503-5512 or [slforsberg@nd.gov](mailto:slforsberg@nd.gov). Further draft permit information may be obtained from Tammy Madche, and further hearing information may be obtained from Sara Forsberg, both at the ND Oil and Gas Division, 1016 East Calgary Ave, Bismarck, ND 58503-5512, 701-328-8020. Summit Carbon Storage #1, LLC, 2321 North Loop Dr Suite #221, Ames, IA 50010.

Case No. **30870** In the matter of a hearing called on a motion of the Commission to consider the application of Summit Carbon Storage #1, LLC to consider the amalgamation of the storage reservoir pore space, in which the Commission may require that the pore space owned by nonconsenting owners be included in the geologic storage, as required to operate the Summit Carbon Storage #1, LLC storage facility located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, in the Broom Creek Formation, pursuant to North Dakota Century Code Section 38-22-10.

Case No. **30871** In the matter of a hearing called on a motion of the Commission to consider the application of Summit Carbon Storage #1, LLC for an order of the Commission determining the amount of financial responsibility for the geologic storage of carbon dioxide from the Midwest Carbon Express Pipeline in the storage facility located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, in the Broom Creek Formation, pursuant to North Dakota Administrative Code Section 43-05-01-09.1.

Case No. **30872** In the matter of a hearing called on a motion of the Commission to consider establishing the field and pool limits for lands located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, subject to the application of Summit Carbon Storage #1, LLC for the geologic storage of carbon dioxide in the Broom Creek Formation, and enact such special field rules as may be necessary.

**N.D. INDUSTRIAL COMMISSION**  
**OIL AND GAS DIVISION**

You are hereby notified of a hearing pursuant to North Dakota Administrative Code § 43-05-01 requesting consideration for the geologic storage of carbon dioxide in the Broom Creek Formation from the Midwest Carbon Express Pipeline in the storage facility located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND pursuant to North Dakota Administrative Code Chapter 43-05-01. **The hearing will be held June 11 and June 12, 2024 at 9:00 a.m., 1000 East Calgary Avenue, Bismarck, North Dakota.**

Case No. **30869** In the matter of a hearing called on a motion of the Commission to consider the application of Summit Carbon Storage #1, LLC requesting consideration for the geologic storage of carbon dioxide in the Broom Creek Formation from the Midwest Carbon Express Pipeline in the storage facility located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND pursuant to North Dakota Administrative Code Chapter 43-05-01. View the draft storage facility permit, fact sheet, and storage facility [permit application at www.dmr.nd.gov/dmr/oilgas/](http://www.dmr.nd.gov/dmr/oilgas/). Summit Carbon Storage #1, LLC intends to receive carbon dioxide from the Midwest Carbon Express Pipeline and sequester it in the Broom Creek Formation. The Commission will accept and consider written comments on the merits of the application and draft permit if received no later than 5:00 pm CDT June 10, 2024. Submit written comments to the Oil and Gas Division, 1016 East Calgary Ave, Bismarck, ND 58503-5512 or [slforsberg@nd.gov](mailto:slforsberg@nd.gov). Further draft permit information may be obtained from Tammy Madche, and further hearing information may be obtained from Sara Forsberg, both at the ND Oil and Gas Division, 1016 East Calgary Ave, Bismarck, ND 58503-5512, 701-328-8020. Summit Carbon Storage #1, LLC, 2321 North Loop Dr Suite #221, Ames, IA 50010.

Case No. **30870** In the matter of a hearing called on a motion of the Commission to consider the application of Summit Carbon Storage #1, LLC to consider the amalgamation of the storage reservoir pore space, in which the Commission may require that the pore space owned by nonconsenting owners be included in the geologic storage, as required to operate the Summit Carbon Storage #1, LLC storage facility located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, in the Broom Creek Formation, pursuant to North Dakota Century Code Section 38-22-10.

Case No. **30871** In the matter of a hearing called on a motion of the Commission to consider the application of Summit Carbon Storage #1, LLC for an order of the Commission determining the amount of financial responsibility for the geologic storage of carbon dioxide from the Midwest Carbon Express Pipeline in the storage facility located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, in the Broom Creek Formation, pursuant to North Dakota Administrative Code Section 43-05-01-09.1.

Case No. **30872** In the matter of a hearing called on a motion of the Commission to consider establishing the field and pool limits for lands located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, subject to the application of Summit Carbon Storage #1, LLC for the geologic storage of carbon dioxide in the Broom Creek Formation, and enact such special field rules as may be necessary.

Please contact our office if you have any questions.

Sincerely,

Lynn D. Helms  
Director

# NORTH DAKOTA

## OIL AND GAS DIVISION

In re application of Summit : Case No(s). 30869  
Carbon Storage #1, LLC requesting : 30870  
consideration for the geologic : 30871  
storage of carbon dioxide in the : 30872  
Broom Creek Formation from the : 30873  
Midwest Carbon Express Pipeline in: 30874  
the storage facility located in : 30875  
Sections 31, 32, 33, and 34, : 30876  
Township 142 North, Range 87 West,: 30877  
Sections 1, 11, 12, 13, 14, 15, : 30878  
22, 23, 24, 25, 26, 35, and 36, : 30879  
Township 141 North, Range 88 West,: 30880  
Sections 2, 3, 4, 5, 6, 7, 8, 9, :  
10, 11, 14, 15, 16, 17, 18, 19, :  
20, 21, 22, 23, 25, 26, 27, 28, :  
29, 30, 31, 32, 33, 34, and 35, :  
Township 141 North, Range 87 West,:  
Sections 1, 2, 3, and 12, Township:  
140 North, Range 88 West and :  
Sections 4, 5, 6, and 7, Township :  
140 North, Range 87 West, Mercer, :  
Morton, and Oliver Counties, ND. :

In re application of Summit :  
Carbon Storage #1, LLC to :  
consider the amalgamation of the :  
storage reservoir pore space, in :  
which the Commission may require :  
that the pore space owned by :  
nonconsenting owners be included :  
in the geologic storage, as :  
required to operate the Summit :  
Carbon Storage #1, LLC storage :  
facility located in Sections 31, :  
32, 33, and 34, Township 142 :  
North, Range 87 West, Sections 1, :  
11, 12, 13, 14, 15, 22, 23, 24, :  
25, 26, 35, and 36, Township 141 :  
North, Range 88 West, Sections 2, :  
3, 4, 5, 6, 7, 8, 9, 10, 11, 14, :  
15, 16, 17, 18, 19, 20, 21, 22, :  
23, 25, 26, 27, 28, 29, 30, 31, :

32, 33, 34, and 35, Township 141 :  
North, Range 87 West, Sections 1, :  
2, 3, and 12, Township 140 North, :  
Range 88 West and Sections 4, 5, :  
6, and 7, Township 140 North, :  
Range 87 West, Mercer, Morton, :  
and Oliver Counties, ND, in the :  
Broom Creek Formation. :

In re application of Summit :  
Carbon Storage #1, LLC for an :  
order of the Commission :  
determining the amount of :  
financial responsibility for the :  
geologic storage of carbon dioxide: :  
from the Midwest Carbon Express :  
Pipeline in the storage facility :  
located in Sections 31, 32, 33, :  
and 34, Township 142 North, Range :  
87 West, Sections 1, 11, 12, 13, :  
14, 15, 22, 23, 24, 25, 26, 35, :  
and 36, Township 141 North, Range :  
88 West, Sections 2, 3, 4, 5, 6, :  
7, 8, 9, 10, 11, 14, 15, 16, 17, :  
18, 19, 20, 21, 22, 23, 25, 26, :  
27, 28, 29, 30, 31, 32, 33, 34, :  
and 35, Township 141 North, Range :  
87 West, Sections 1, 2, 3, and 12,: :  
Township 140 North, Range 88 West :  
and Sections 4, 5, 6, and 7, :  
Township 140 North, Range 87 West,: :  
Mercer, Morton, and Oliver :  
Counties, ND, in the Broom Creek :  
Formation. :

In re motion to consider :  
establishing the field and pool :  
limits for lands located in :  
Sections 31, 32, 33, and 34, :  
Township 142 North, Range 87 West,: :  
Sections 1, 11, 12, 13, 14, 15, :  
22, 23, 24, 25, 26, 35, and 36, :  
Township 141 North, Range 88 West,: :  
Sections 2, 3, 4, 5, 6, 7, 8, 9, :  
10, 11, 14, 15, 16, 17, 18, 19, :  
20, 21, 22, 23, 25, 26, 27, 28, :  
29, 30, 31, 32, 33, 34, and 35, :

Township 141 North, Range 87 West, :  
Sections 1, 2, 3, and 12, Township :  
140 North, Range 88 West and :  
Sections 4, 5, 6, and 7, Township :  
140 North, Range 87 West, Mercer, :  
Morton, and Oliver Counties, ND, :  
subject to the application of :  
Summit Carbon Storage #1, LLC for :  
the geologic storage of carbon :  
dioxide in the Broom Creek :  
Formation, and enact such special :  
field rules as may be necessary. :

In re application of Summit :  
Carbon Storage #2, LLC requesting :  
consideration for the geologic :  
storage of carbon dioxide in the :  
Broom Creek Formation from the :  
Midwest Carbon Express Pipeline :  
in the storage facility located in :  
Sections 27, 28, 29, 32, 33, 34, :  
and 35, Township 143 North, Range :  
88 West, Sections 1, 2, 3, 4, 5, :  
6, 7, 8, 9, 10, 11, 12, 13, 14, :  
15, 16, 17, 18, 19, 20, 21, 22, :  
23, 24, 25, 26, 27, 28, 29, 30, :  
32, 33, 34, 35, and 36, Township :  
142 North, Range 88 West, Sections :  
5, 6, 7, 8, 17, 18, 19, 20, 29, :  
30, and 31, Township 142 North, :  
Range 87 West, and Sections 1, 2, :  
and 3, Township 141 North, Range :  
88 West, Mercer and Oliver :  
Counties, ND. :

In re application of Summit :  
Carbon Storage #2, LLC to :  
consider the amalgamation of the :  
storage reservoir pore space, in :  
which the Commission may require :  
that the pore space owned by :  
nonconsenting owners be included :  
in the geologic storage, as :  
required to operate the Summit :

facility located in Sections 27, :  
28, 29, 32, 33, 34, and 35, :

Township 143 North, Range 88 West, :  
Sections 1, 2, 3, 4, 5, 6, 7, 8, :  
9, 10, 11, 12, 13, 14, 15, 16, 17, :  
18, 19, 20, 21, 22, 23, 24, 25, :  
26, 27, 28, 29, 30, 32, 33, 34, :  
35, and 36, Township 142 North, :  
Range 88 West, Sections 5, 6, 7, :  
8, 17, 18, 19, 20, 29, 30, 31, :  
Township 142 North, Range 87 :  
West, and Sections 1, 2, and 3, :  
Township 141 North, Range 88 :  
West, Mercer and Oliver Counties, :  
ND in the Broom Creek Formation. :

In re application of Summit :  
Carbon Storage #2, LLC to :  
consider the application of Summit :  
Carbon Storage #2, LLC for an :  
order of the Commission :  
determining the amount of :  
financial responsibility for the :  
geologic storage of carbon dioxide :  
from the Midwest Carbon Express :  
Pipeline in the storage facility :  
located in Sections 27, 28, 29, :  
32, 33, 34, and 35, Township 143 :  
North, Range 88 West, Sections 1, :  
2, 3, 4, 5, 6, 7, 8, 9, 10, 11, :  
12, 13, 14, 15, 16, 17, 18, 19, :  
20, 21, 22, 23, 24, 25, 26, 27, :  
28, 29, 30, 32, 33, 34, 35, and :  
36, Township 142 North, Range 88 :  
West, Sections 5, 6, 7, 8, 17, 18, :  
19, 20, 29, 30, and 31, Township :  
142 North, Range 87 West, and :  
Sections 1, 2, and 3, Township 141 :  
North, Range 88 West, Mercer and :  
Oliver Counties, ND, in the Broom :  
Creek Formation. :

In re motion of the Commission to :  
consider establishing the field :  
and pool limits for lands located :  
in Sections 27, 28, 29, 32, 33, :  
34, and 35, Township 143 North, :  
Range 88 West, Sections 1, 2, 3, :  
4, 5, 6, 7, 8, 9, 10, 11, 12, 13, :

14, 15, 16, 17, 18, 19, 20, 21, :  
22, 23, 24, 25, 26, 27, 28, 29, :  
30, 32, 33, 34, 35, and 36, :  
Township 142 North, Range 88 West, :  
Sections 5, 6, 7, 8, 17, 18, 19, :  
20, 29, 30, and 31, Township 142 :  
North, Range 87 West, and Sections :  
1, 2, and 3, Township 141 North, :  
Range 88 West, Mercer and Oliver :  
Counties, ND, subject to the :  
application of Summit Carbon :  
Storage #2, LLC for the geologic :  
storage of carbon dioxide in the :  
Broom Creek Formation, and enact :  
such special field rules as may :  
be necessary. :

In re application of Summit :  
Carbon Storage #3, LLC requesting :  
consideration for the geologic :  
storage of carbon dioxide in the :  
Broom Creek Formation from the :  
Midwest Carbon Express Pipeline in :  
the storage facility located in :  
Section 36, Township 143 North, :  
Range 87 West, Sections 19, 20, :  
21, 28, 29, 30, 31, 32, 33, 34, :  
35, and 36, Township 143 North, :  
Range 86 West, Sections 1, 2, 11, :  
12, 13, 14, and 24, Township 142 :  
North, Range 87 West, Sections 1, :  
2, 3, 4, 5, 6, 7, 8, 9, 10, 11, :  
12, 13, 14, 15, 16, 17, 18, 19, :  
20, 21, 22, 23, 24, 25, 26, 27, :  
28, 29, 30, 32, 33, 34, and 35, :  
Township 142 North, Range 86 :  
West, and Sections 6, 7, 17, 18, :  
19, and 20, Township 142 North, :  
Range 85 West, Oliver County, ND. :

In re application of Summit :  
Carbon Storage #3, LLC to consider :  
the amalgamation of the storage :  
reservoir space, in which the :  
Commission may require that the :  
pore space owned by nonconsenting :  
owners be included in the geologic :

storage, as required to operate :  
the Summit Carbon Storage #3, LLC :  
storage facility located in :  
Section 36, Township 143 North, :  
Range 87 West, Sections 19, 20, :  
21, 28, 29, 30, 31, 32, 33, 34, :  
35, and 36, Township 143 North, :  
Range 86 West, Sections 1, 2, 11, :  
12, 13, 14, and 24, Township 142 :  
North, Range 87 West, Sections 1, :  
2, 3, 4, 5, 6, 7, 8, 9, 10, 11, :  
12, 13, 14, 15, 16, 17, 18, 19, :  
20, 21, 22, 23, 24, 25, 26, 27, :  
28, 29, 30, 32, 33, 34, and 35, :  
Township 142 North, Range 86 West, :  
and Sections 6, 7, 17, 18, 19, and :  
20, Township 142 North, Range 85 :  
West, Oliver County, ND, in the :  
Broom Creek Formation. :

In re application of Summit :  
Carbon Storage #3, LLC for an :  
order of the Commission :  
determining the amount of :  
financial responsibility for the :  
geologic storage of carbon dioxide :  
from the Midwest Carbon Express :  
Pipeline in the storage facility :  
located in Section 36, Township :  
143 North, Range 87 West, Sections :  
19, 20, 21, 28, 29, 30, 31, 32, :  
33, 34, 35, and 36, Township 143 :  
North, Range 86 West, Sections 1, :  
2, 11, 12, 13, 14, and 24, :  
Township 142 North, Range 87 West, :  
Sections 1, 2, 3, 4, 5, 6, 7, 8, :  
9, 10, 11, 12, 13, 14, 15, 16, 17, :  
18, 19, 20, 21, 22, 23, 24, 25, :  
26, 27, 28, 29, 30, 32, 33, 34, :  
and 35, Township 142 North, Range :  
86 West, and Sections 6, 7, 17, :  
18, 19, and 20, Township 142 :  
North, Range 85 West, Oliver :  
County, ND, in the Broom Creek :  
Formation. :

In re motion of the Commission to :  
consider establishing the field :  
and pool limits for lands located :  
in Section 36, Township 143 North, :  
Range 87 West, Sections 19, 20, :  
21, 28, 29, 30, 31, 32, 33, 34, :  
35, and 36, Township 143 North, :  
Range 86 West, Sections 1, 2, 11, :  
12, 13, 14, and 24, Township 142 :  
North, Range 87 West, Sections 1, :  
2, 3, 4, 5, 6, 7, 8, 9, 10, 11, :  
12, 13, 14, 15, 16, 17, 18, 19, :  
20, 21, 22, 23, 24, 25, 26, 27, :  
28, 29, 30, 32, 33, 34, and 35, :  
Township 142 North, Range 86 West, :  
and Sections 6, 7, 17, 18, 19, and :  
20, Township 142 North, Range 85 :  
West, Oliver County, ND, subject :  
to the application of Summit :  
Carbon Storage #3, LLC for the :  
geologic storage of carbon dioxide :  
in the Broom Creek Formation, and :  
enact such special field rules as :  
may be necessary. :

1           (The following proceedings were had and  
2       made of record herein, commencing at 9:00 a.m.,  
3       Tuesday, the 11th day of June, 2024:)

4           HEARING EXAMINER GARNER: We are on the  
5       record for the hearings in the matters listed in  
6       the North Dakota Industrial Commission hearing  
7       docket for June 11. I am David Garner, hearing  
8       examiner for these hearings. We are at the hearing  
9       for the Department of Mineral Resources, Oil & Gas  
10      Division, and it is 9 a.m.

11           There are 12 cases on the docket which  
12      will be consolidated into one hearing. Before  
13      calling them, I would just like to give anyone  
14      appearing an opportunity to discuss any  
15      housekeeping matters or anything that we need to  
16      discuss at this point in time.

17           MR. BENDER: I'll make an appearance --  
18      excuse me -- I'll make an appearance, Mr. Examiner,  
19      if that's appropriate. Lawrence Bender, P.O.  
20      Box 1855, Bismarck. I'm with Fredrikson law firm,  
21      and with me here today is Mr. Ty Gludt. He's  
22      immediately to my left.

23           HEARING EXAMINER GARNER: Okay.

24           MR. BRAATEN: Derrick Braaten with Braaten  
25      Law Firm, Bismarck, North Dakota, here appearing on

1       behalf of and representing a number of the  
2       landowner intervenors, including The Swenson Living  
3       Trust, Michael Bauman, Glenn and Lisa Gerving,  
4       Michael and Bonnie Haupt, John Jochim, Kevin and  
5       Kimberly Kraft, Charmayne Liebelt, Kirk and Linda  
6       Maize, Allen Maize, Paul and Christy Metz, JoLene  
7       Rust, and Gary and Cassie Smith.

8               HEARING EXAMINER GARNER:   Okay.   Before I  
9       call the cases, I would just like to note in the  
10      interest of time, please try and have the witnesses  
11      not repeat each other's testimony.   It will  
12      obviously make things go a lot quicker if we can  
13      just keep it to that.

14              And just as a reminder, this is not a PSC  
15      hearing on the pipeline.   This is an Industrial  
16      Commission hearing on storage facilities.   So  
17      please keep your testimony limited to that subject  
18      matter.

19              MR. BENDER:   Mr. Examiner, maybe now is  
20      the appropriate time, since you mentioned you're  
21      consolidating the cases, and we believe that is  
22      going to be very helpful in expediting the hearings  
23      here today, you may recall in some of the other CO<sub>2</sub>  
24      sequestration matters we've had before the  
25      Commission, we've called our witnesses in groups.

1 Those groups are typically no larger than two, but  
2 I think that also expedites the hearing process  
3 because you can have two individuals up. One  
4 individual may not know the answer to something,  
5 the other witness is there, and that has in the  
6 past worked pretty well instead of -- instead of  
7 calling them singly in terms of expediting the  
8 hearing process. And I did talk to Mr. Braaten  
9 about that before the hearing.

10 HEARING EXAMINER GARNER: And one other  
11 matter. There was a motion to compel submitted at  
12 5 p.m. last night. Attorney Bender, did you have  
13 an opportunity to review that motion?

14 MR. BENDER: I did not.

15 HEARING EXAMINER GARNER: You did not.

16 MR. BENDER: But I will respond to it  
17 in -- I don't know what the time period is, 10 days  
18 or 14 days, but I will respond to it. Probably  
19 even respond to it more quickly than that.

20 HEARING EXAMINER GARNER: Okay. Well,  
21 with that, I will call the cases. Case Number  
22 30869, in the matter of a hearing called on a  
23 motion of the Commission to consider the  
24 application of Summit Carbon Storage #1, LLC,  
25 requesting consideration for the geologic storage

1 of carbon dioxide in the Broom Creek Formation from  
2 the Madison [sic] Carbon Express Pipeline.

3 Case Number 30870, in the matter of a  
4 hearing called on a motion of the Commission to  
5 consider the application of Summit Carbon Storage  
6 #1, LLC, to consider the amalgamation of the  
7 storage reservoir pore space, in which the  
8 Commission may require the pore space owned by the  
9 nonconsenting owners be included in the geologic  
10 storage.

11 In the matter of a hearing called on a  
12 motion of the Commission to consider the  
13 application of Summit Carbon Storage #1, LLC, for  
14 an order of the Commission determining the amount  
15 of financial responsibility for the geologic  
16 storage of a carbon dioxide -- of carbon dioxide  
17 from the Midwest Carbon Express Pipeline.

18 Case Number 30872, in the matter of a  
19 hearing called on a motion of the Commission to  
20 consider establishing the field and pool limits for  
21 lands located in Sections 31, 32, 33 and 34,  
22 Township 142 North, Range 87 West, Sections 1, 11,  
23 12, 13, 14, 15, 22, 23, 24, 25, 26, 35 and 36,  
24 Township 141 North, Range 88 West, Sections 2, 3,  
25 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19,

1 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33,  
2 34 and 35, Township 141 North, Range 87 West,  
3 Sections 1, 2, 3 and 12, Township 140 North, Range  
4 88 West, and Sections 4, 5, 6 and 7, Township 140  
5 North, Range 87 West, Mercer, Morton and Oliver  
6 Counties, subject to the application of Summit  
7 Carbon Storage #1, LLC, for the geologic storage of  
8 carbon dioxide in the Broom Creek Formation.

9 Case Number 30873, in the matter of a  
10 hearing called on motion of the Commission to  
11 considering the application of Summit Carbon  
12 Storage #2, LLC, requesting consideration for the  
13 geologic storage of carbon dioxide in the Broom  
14 Creek Formation from the Midwest Carbon Express  
15 Pipeline.

16 Case Number 30874, in the matter of a  
17 hearing called on a motion of the Commission to  
18 consider the application of Summit Carbon Storage  
19 #2, LLC, to consider the amalgamation of the  
20 storage reservoir pore space, in which the  
21 Commission may require that the pore space owned by  
22 the nonconsenting owners be included in the  
23 geologic storage, as required to operate the Summit  
24 Carbon Storage #2, LLC, storage facility.

25 Case Number 30875, in the matter of a

1 hearing called on a motion of the Commission to  
2 consider the application of Summit Carbon Storage  
3 #2, LLC, for an order of the Commission determining  
4 the amount of financial responsibility for the  
5 geologic storage of carbon dioxide from the Midwest  
6 Carbon Express Pipeline.

7 Case Number 30876, in the matter of a  
8 hearing called on a motion of the Commission to  
9 consider establishing the field and pool limits for  
10 lands located in Sections 27, 28, 29, 32, 33, 34  
11 and 35, Township 143 North, Range 88 West, sections  
12 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15,  
13 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28,  
14 29, 30, 32, 33, 34, 35 and 36, Township 142 North,  
15 Range 38 West -- 88 West, Sections 5, 6, 7, 8, 17,  
16 18, 19, 20, 29, 30 and 31, Township 142 North,  
17 Range 87 West, Sections 1, 2, 3, Township 141  
18 North, Range 88 West, Mercer and Oliver Counties,  
19 North Dakota, subject to the application of Summit  
20 Carbon Storage #2 for the geologic storage of  
21 carbon dioxide in the Broom Creek Formation.

22 Case Number 30877, in the matter of a  
23 hearing called on a motion of the Commission to  
24 consider the application of Summit Carbon Storage  
25 #3, LLC, requesting consideration for the geologic

1 storage of carbon dioxide in the Broom Creek  
2 Formation from the Midwest Carbon Express Pipeline.

3 Case Number 30878, in the matter of a  
4 hearing called on a motion of the Commission to  
5 consider the application of Summit Carbon Storage  
6 #3, LLC, to consider the amalgamation of the  
7 storage reservoir pore space, in which the  
8 Commission may require that the pore space owned by  
9 the nonconsenting owners be included in the  
10 geologic storage, as required to operate the Summit  
11 Carbon Storage #3, LLC, storage facility.

12 Case Number 30879, in the matter of a  
13 hearing called on a motion of the Commission to  
14 consider the application of Summit Carbon Storage  
15 #3, LLC, for an order of the Commission determining  
16 the amount of financial responsibility for the  
17 geologic storage of carbon dioxide from the Midwest  
18 Carbon Express Pipeline.

19 And 30880, in the matter of a hearing  
20 called on a motion of the Commission to consider  
21 establishing field and pool limits for lands  
22 located in Sections 36, Township 143 North, Range  
23 87 West, Sections 19, 20, 21, 28, 29, 30, 31, 32,  
24 33, 34, 35 and 36, Township 143 North, Range 86  
25 West, Sections 1, 2, 11, 12, 13, 14 and 24,

1 Township 142 North, Range 87 West, Sections 1, 2,  
2 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16,  
3 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29,  
4 30, 32, 33 and 34 and 35, Township 142 North, Range  
5 86 West, and Sections 6, 7, 17, 18, 19 and 20,  
6 Township 142 North, Range 85 West, Oliver County,  
7 North Dakota, subject to the application of Summit  
8 Carbon Storage #3, LLC, for the geologic storage of  
9 carbon dioxide in the Broom Creek Formation.

10 All interested parties please come  
11 forward.

12 MR. BENDER: I made my appearance. Maybe  
13 one more housekeeping matter, Mr. Examiner. As you  
14 know, these applications are lengthy in terms of  
15 how long it actually takes to get to the point  
16 where they'd be put on the docket. Numerous  
17 documents are filed with the Commission, both in  
18 paper and electronically, and those all become part  
19 of the record.

20 What we've done here today is we want to  
21 focus on what we're going to refer to as the final  
22 form of application, and that's -- what we have  
23 done is we've provided a paper copy of that final  
24 form to Sara as the official record. I know  
25 everyone has it on their computers, so we didn't

1     make a bunch of copies. I think the last time or  
2     the time before I made a bunch of copies and I took  
3     them back because no one wanted them. I did offer  
4     a copy -- paper copy to Mr. Braaten. He indicated  
5     that he was going to follow along on the computer.  
6     The witness will have a paper copy to follow  
7     through, and like I indicated, Sara will have the  
8     official record.

9             What our plan is today, Mr. Examiner, in  
10    addition to consolidating, what we're going to do  
11    is spend some time going through in relatively  
12    great detail the -- the application for the  
13    Leingang storage unit. And after we go through  
14    that in detail, there will be some testimony as to  
15    the -- to the other storage units, the Fischer and  
16    the Hintz, but for the most part we're going to go  
17    through very carefully the Leingang application.

18            And after we finish that, we will then  
19    call a witness who will summarize and compare the  
20    differences between Leingang versus Fischer and  
21    Hintz. We did that in the Minnkota application,  
22    thought it worked pretty well, saved a lot of time  
23    where hopefully we can do the same thing here.

24            HEARING EXAMINER GARNER: Okay.

25            MR. BENDER: And with that in mind, we

1 have two witnesses that we'd like to call: Wade  
2 Boeshans and Jeff Skaare.

3 HEARING EXAMINER GARNER: Can you repeat  
4 the first name?

5 MR. BENDER: Wade Boeshans,  
6 B-o-e-s-h-a-n-s.

7 HEARING EXAMINER GARNER: And the next one  
8 again.

9 MR. BENDER: And Jeff Skaare, S-k-a-a-r-e.

10 HEARING EXAMINER GARNER: Mr. Boeshans.

11 **WADE BOESHANS,**  
12 being first duly sworn, was examined and testified  
13 as follows:

14 **DIRECT EXAMINATION**

15 **BY MR. BENDER:**

16 Q. Wade, would you state your full name for  
17 the record, please?

18 A. Wade Wayne Boeshans.

19 Q. And by whom are you employed?

20 A. Summit Carbon Solutions.

21 Q. In what capacity?

22 A. As executive vice president.

23 Q. Wade, what I'd like you to do to begin  
24 with is briefly highlight for the examiner, the  
25 Commission staff and opposing counsel your

1 educational background and work experience.

2 A. Sure. My education, I have a B.S. in  
3 civil engineering from North Dakota State  
4 University, as well as I've completed the executive  
5 leadership program through the University of  
6 Minnesota's Carlson School of Business.

7 My work background after graduating, I  
8 started my career in consulting engineering and  
9 residential development in Phoenix, Arizona. Came  
10 back to North Dakota two years later and started my  
11 career in the lignite coal industry near Beulah.

12 Worked around the country and Gulf Coast,  
13 Powder River Basin. Came back to North Dakota  
14 about 20 years ago and most recently was the  
15 president and general manager of BNI Coal and BNI  
16 Energy operating the mine up by Center and as a  
17 subsidiary of ALLETE, a diversified energy company.

18 While I was there, it became very apparent  
19 to me that for there to be a future in the lignite  
20 energy, we were going to need a carbon solution,  
21 and so I started investing a significant amount of  
22 my time and energy working with other industry  
23 leaders, research leaders to advance the science,  
24 engineering and regulatory frameworks for  
25 commercializing carbon capture and storage.

1           Q.     Okay.  Wade, let's talk a little bit about  
2     some of your duties and responsibilities with  
3     respect to your employment with Summit Carbon  
4     Solutions.

5           A.     Yeah.  As executive vice president, I have  
6     responsibility for the CO<sub>2</sub> sequestration, the scope  
7     of Summit's project.  I lead a team based here in  
8     Bismarck that is responsible for, you know, the  
9     engineering, design, permitting, ultimately  
10    construction of the storage facilities.

11          Q.     Okay.  Now let's move into what you're  
12    primarily here to talk about today and that's  
13    the -- the project, and I'll refer to it as the  
14    project summary.  Can you provide us with some  
15    background on Summit Carbon Solutions?

16          A.     Yes.  So Summit Carbon Solutions is a U.S.  
17    company with U.S. roots that is committed to  
18    driving economic growth and job growth in the  
19    Midwest, reducing emissions and providing a  
20    substantial boost to the agriculture and energy  
21    industries that are critical to rural American  
22    communities and the livelihoods of its citizens.  
23    We believe we can fulfill those commitments through  
24    carbon management solutions.

25                 And so in 2021, the company announced its

1 partnership with ethanol plants to build out what  
2 is now known as the Midwest Carbon Express system,  
3 and in that partnership what we're proposing to do  
4 is to capture CO<sub>2</sub> that's currently being emitted  
5 into the atmosphere from those plants, transport it  
6 to North Dakota via a pipeline system, and inject  
7 it in the deep subsurface, approximately one mile  
8 below the surface, for injection and -- and  
9 permanent storage and sequestration.

10 Q. Okay. Wade, now I'd like you to turn your  
11 attention to Exhibits 1A, 1B and 1C. Can you tell  
12 me what those exhibits are?

13 A. Yes. So Exhibit 1A is the application in  
14 final form for the Carbon Storage, LLC, #1 TB  
15 Leingang permit application.

16 Q. And then what is Exhibit 1B?

17 A. It is the application in final form for  
18 Summit Carbon Storage #2, geologic storage facility  
19 permit for the BK Fischer.

20 Q. And what is Exhibit 1C?

21 A. It's the application in final form for the  
22 KJ Hintz storage facility permit.

23 MR. BENDER: Move admission of these three  
24 exhibits.

25 HEARING EXAMINER GARNER: Any objection?

1           MR. BRAATEN: Just a point of  
2 clarification, if I may. I should have asked this  
3 beforehand. But the exhibits that we're referring  
4 to here that you're submitting are the same as the  
5 applications on the case docket; right?

6           MR. BENDER: That's correct.

7           MR. BRAATEN: Okay. No -- I object to any  
8 kind of hearsay, hearsay within hearsay,  
9 unsupported statements that are contained within  
10 the applications. To the extent we're marking and  
11 admitting the applications just to have the  
12 application in the record, I don't have an  
13 objection to that.

14           HEARING EXAMINER GARNER: The objection is  
15 noted. The exhibits are admitted.

16           MR. BENDER: Okay.

17           Q. (MR. BENDER CONTINUING) What I'd like you  
18 to do, Wade, is let's turn to what's been  
19 previously marked as Exhibit 2A, 2B and 2C, and  
20 this is an exhibit we haven't handed out yet.  
21 We'll do that right now.

22           Wade, can you briefly describe what these  
23 exhibits are?

24           A. So these exhibits -- start with 2A -- is  
25 an updated business structure that depicts, you

1 know, the SCS, LLC, #1 business structure as a  
2 wholly owned subsidiary of Summit Carbon Storage.

3 Q. And was -- were these two exhibits  
4 prepared either by you or under your control and  
5 supervision?

6 A. Yes.

7 MR. BENDER: Offer the exhibits.

8 HEARING EXAMINER GARNER: Any objection?

9 MR. BRAATEN: No objection.

10 HEARING EXAMINER GARNER: Exhibits are  
11 admitted.

12 Q. (MR. BENDER CONTINUING) Why don't you  
13 spend a little time, Wade, just going through  
14 Exhibits 2B and 2C and explain just what is being  
15 requested?

16 A. Yes. So the exhibit reflects the business  
17 structure, as I mentioned. At the bottom you see  
18 the Summit Carbon Storage, LLC, #1, Summit Carbon  
19 Storage, LLC, #2, and Summit Carbon Storage, LLC  
20 [sic], which respectively are the owners and  
21 operators of the TB Leingang storage facility, BK  
22 Fischer storage facility and KJ Hintz storage  
23 facilities. These are all wholly owned  
24 subsidiaries of Summit Permanent Carbon Storage  
25 LLC, which is a wholly owned subsidiary of Summit

1 Carbon Solutions.

2 Also you see on the diagram SCS Carbon  
3 Transport which is the operator of the pipeline  
4 system and will be the operator of the flowline  
5 systems included in the three respective storage  
6 facility permit applications. We will have  
7 operating agreements between Summit Carbon Storage,  
8 LLC, #1, #2 and #3 and Summit Carbon Transport --  
9 or SCS Carbon Transport -- excuse me -- LLC.

10 Q. Okay. All right. Well, thank you for  
11 describing Exhibits 2B and 2C. Let's now -- I'll  
12 ask you the question again. What are each of these  
13 applicants requesting?

14 A. They're each requesting commercial permits  
15 for operations and injection of CO<sub>2</sub> and the  
16 flexibility to receive CO<sub>2</sub> from a variety of  
17 industrial sources.

18 Q. Okay. Now, you've touched on this, but  
19 can you go into a little bit more detail in terms  
20 of the purpose of the applications that are being  
21 made by SCS1, SCS2 and SCS3?

22 A. Yeah. The purpose of the application is  
23 to receive -- again, to receive commercial permits  
24 to operate the TB Leingang storage facility, the BK  
25 Fischer storage facility and the KJ Hintz storage

1 facility for the injection of CO<sub>2</sub>.

2 Q. And where is the CO<sub>2</sub> that these entities  
3 are planning to store -- where is that coming from?

4 A. The CO<sub>2</sub> is coming from industrial sources  
5 across five states in the upper Midwest: North  
6 Dakota, South Dakota, Iowa, Nebraska and Minnesota.

7 Q. And I'd like you now to maybe explain just  
8 in a little bit more detail the Midwest Carbon  
9 Express project.

10 A. Yes. So the Midwest Carbon Express  
11 project is an integrated carbon capture,  
12 transportation and storage project that proposes to  
13 capture CO<sub>2</sub> from industrial facilities across the  
14 five-state footprint, transport that CO<sub>2</sub> to North  
15 Dakota via a pipeline system where it will then be  
16 injected and permanently stored.

17 Q. Okay. Why don't you go into a little bit  
18 more detail in terms of after the CO<sub>2</sub> is captured  
19 and it comes to North Dakota, what happens next?

20 A. So after the CO<sub>2</sub> is captured, it's  
21 transported via a pipeline system. Essentially we  
22 have smaller what I'll describe as lateral lines  
23 connecting each one of the sources to a mainline  
24 trunk line system, 24-inch line that will deliver  
25 the CO<sub>2</sub> to North Dakota to the area of the storage

1 facilities in Oliver and Mercer Counties, where we  
2 would then inject the CO<sub>2</sub> into the Broom Creek  
3 Formation per these applications for permanent  
4 storage.

5 Q. Now, Mr. Garner made it pretty clear that  
6 today is not a PSC hearing. It's an Industrial  
7 Commission hearing and we don't want to talk about  
8 pipelines, but I think it might be appropriate just  
9 for you to describe very, very briefly construction  
10 of the pipeline.

11 A. Yes. As I mentioned, it's an integrated  
12 pipeline system, about 2,500 miles. It will all be  
13 designed, constructed and operated per PHMSA  
14 standards. Have a minimum depth of pipe of 4 feet  
15 to the top of pipe. All the pipe is high carbon --  
16 or high-strength carbon steel. And the system will  
17 be fitted with automatic valves and remote system  
18 operations and operated through a control center  
19 based in Ames, Iowa, and be monitored and operated  
20 24/7.

21 Q. And what's the cost of the project?

22 A. It's about \$8 billion.

23 Q. And how does that -- how does this  
24 project, what you're here today to discuss, compare  
25 to other CO<sub>2</sub> sequestration projects?

1           A.     So it's -- it's similar to the currently  
2     operating Red Trail Energy ethanol carbon capture  
3     project and the Blue Flint carbon capture ethanol  
4     project up at Underwood. Similar to those in that  
5     we're capturing -- planning to capture CO<sub>2</sub> primarily  
6     from ethanol plants and -- and sequester it. The  
7     difference being that this project has 57 plants so  
8     it's much larger in scale and includes a longer  
9     transportation system.

10          Q.     And what does this project do in terms of  
11     benefits to the U.S. economy?

12          A.     So the ethanol industry in the U.S.  
13     supports about 360,000 jobs and contributes about  
14     45 billion annually to the U.S. GDP. Our project  
15     which is proposing to connect with 57 ethanol  
16     plants, those 57 plants produce about 5.7 billion  
17     gallons of ethanol annually and consume about  
18     1.7 billion bushels of corn that is produced on 30  
19     million acres or about 30 million acres, so  
20     significant to the regional economy and regional  
21     corn market.

22                 Additionally, we also have an agreement  
23     with a sustainable aviation facility that's  
24     proposed in South Dakota. And sustainable aviation  
25     fuels are essentially making jet fuel out of corn.

1 Last year it was reported that 158 million gallons  
2 of sustainable aviation fuels were delivered to the  
3 airline industry globally. That same industry has  
4 commitments for 3.3 billion gallons by 2030.

5 So that is a significant opportunity for  
6 the corn producers and by extension the corn  
7 markets which has a material impact on land prices  
8 and commodity prices.

9 Q. Wade, I now want to direct your attention  
10 to Exhibit 3A. I've had it circulated amongst the  
11 Commission staff and opposing counsel. Can you  
12 tell me what Exhibit 3A is?

13 A. It's the project overview map.

14 Q. Okay. And was this prepared by you or  
15 under your control and supervision?

16 A. It was.

17 MR. BENDER: Offer the exhibit.

18 HEARING EXAMINER GARNER: Any objections?

19 MR. BRAATEN: No objection.

20 HEARING EXAMINER GARNER: Exhibit's  
21 admitted.

22 Q. (MR. BENDER CONTINUING) Let's take a look  
23 at Exhibit 3A, Wade. Can you briefly discuss  
24 what's contained upon it and the importance of this  
25 exhibit with respect to this hearing?

1           A.     Sure.  So the -- the exhibit is a project  
2     overview map.  All of the red squares on the map  
3     are the approximate locations of the 57 ethanol  
4     plants that are part of the project.  And then in  
5     the gray shaded area in North Dakota, you can see  
6     the diamonds that reflect the approximate location  
7     of the storage facilities that we're proposing to  
8     permit.  The significance of this exhibit is that  
9     it revises the Figure PS-2 that's in the  
10    application and revises the number of plants to 57  
11    sources.

12          Q.     So PS-2 would be in each one of the  
13    exhibits, 1A, 1B and 1C; is that correct?

14          A.     Yes.  That's right.

15          Q.     And this would, in essence, be updated  
16    information to that particular page; is that  
17    correct?

18          A.     That's correct.

19          Q.     Now, you spent some time discussing what  
20    this project will do for the U.S. economy.  Can you  
21    tell us what it will do -- what the project will do  
22    for the 57 ethanol plants that you just briefly  
23    mentioned and that are depicted on your Exhibit 3A?

24          A.     Yes.  What the project does for the  
25    ethanol plants is it allows them to lower their

1 carbon intensity score of the ethanol they produce  
2 which then enables them to participate in emerging  
3 low carbon fuels markets, both fuel transportation  
4 and sustainable aviation fuels in the future.

5 And by doing so, in essence, the biggest  
6 thing it does is it solves from a proximity  
7 challenge, if you will, in that as you can see by  
8 the diagram on Exhibit 3A, most of the ethanol  
9 plants are situated on -- over the Corn Belt, which  
10 the Corn Belt is not situated for most of the  
11 plants over suitable geologic storage, and so  
12 ultimately it connects -- provides an opportunity  
13 for these plants to capture their CO<sub>2</sub>, lower their  
14 CO -- their CI score -- excuse me -- and transport  
15 their CO<sub>2</sub> to a suitable geologic storage basin here  
16 in North Dakota.

17 Q. Now I'd like you to spend just a little  
18 time explaining what benefits this project will  
19 bring to the -- to North Dakota.

20 A. Sure. So --

21 MR. BRAATEN: I'm going to object, Your  
22 Honor, to the extent this is being offered as any  
23 kind of expert testimony without foundation about  
24 any kind of economic or other benefits that would  
25 require some sort of economist. If he's just

1 talking generally about what they believe the  
2 benefits of the project are, I don't have that  
3 objection.

4 HEARING EXAMINER GARNER: Overruled.

5 Q. (MR. BENDER CONTINUING) You can answer.

6 A. Yeah. So, you know, the North Dakota  
7 economy or agriculture and energy represent about  
8 70 percent of the North Dakota economy, and in  
9 North Dakota, you know, we -- we produce a  
10 significant volume of corn. The Red Trail --  
11 excuse me, not the Red Trail -- the Tharaldson  
12 Ethanol plant, which is part of our project,  
13 consumes about 60 million bushels of corn a year.  
14 We grow between 350 and 400 million corns -- or  
15 bushels of corn per year. So the Tharaldson plant  
16 alone consumes around 15 percent -- 15 to  
17 20 percent of the corn that's produced in North  
18 Dakota annually.

19 Additionally, the ethanol industry  
20 consumes over half of North Dakota's corn. And so  
21 these -- this project and its participants provide  
22 material markets and market demand for corn that's  
23 grown here in North Dakota.

24 Q. Okay. And these -- some of the CO<sub>2</sub> that's  
25 going to go into your storage facilities that are

1 before the Commission today are going to be coming  
2 from the Tharaldson Ethanol plant; is that correct?

3 A. Yes.

4 Q. And can you tell me where the Tharaldson  
5 Ethanol plant gets its corn from?

6 A. According to my conversations with  
7 Tharaldson, they have -- they purchase corn from  
8 about a 150-mile radius around the Casselton plant  
9 there.

10 Q. And how does the project, in your opinion,  
11 benefit agricultural -- agriculture and energy in  
12 the state of North Dakota?

13 A. It benefits agriculture and energy in  
14 North Dakota in that it develops CCS  
15 infrastructure, or specifically carbon pipeline  
16 infrastructure, that is a common carrier system  
17 that could be used for others. It commercially  
18 deploys CCS in the state that again provides  
19 support for others doing the same.

20 Q. And, in your opinion, is the project  
21 good -- good for or will benefit regional corn  
22 markets?

23 A. Yes. It provides significant demand for  
24 regional corn.

25 Q. Let's talk a little bit about stream

1 composition. What I mean by that is what's the  
2 composition of the CO<sub>2</sub> going to be? And perhaps we  
3 could turn to Exhibit 1A and on page PS-3. Might  
4 be easier for everyone to follow if we're looking  
5 at that page.

6 Can you just briefly summarize what's  
7 contained on that page?

8 A. Yes. So Table PS-1 on page PS-3 indicates  
9 the CO<sub>2</sub> system specification. As you can see,  
10 it's -- the system spec is greater than  
11 98.25 percent CO<sub>2</sub> and then trace amounts of other  
12 constituents listed on -- in the table, primarily  
13 constituents of air, nitrogen, oxygen.

14 Q. Okay. And you talked briefly about  
15 possibly down the road the project taking some CO<sub>2</sub>  
16 from a sustained aviation fuel facility. What are  
17 some of the considerations that Summit will have  
18 with respect to the requirements for potentially  
19 taking this additional CO<sub>2</sub> from nonethanol sources?

20 A. Yeah. So we are -- we have conservatively  
21 designed the system and the -- again, within this  
22 permit to greater than 95 percent CO<sub>2</sub>. And so as we  
23 secure new sources, the requirements will be that  
24 they are greater than 95 percent CO<sub>2</sub> at capture, and  
25 when commingled and delivered to the sequestration

1 sites, greater than 98.25 percent CO<sub>2</sub>.

2 Q. And, Wade, is North Dakota a good place to  
3 store or sequester CO<sub>2</sub>, and if so, why?

4 A. Yes, North Dakota has -- has ideal geology  
5 for sequestration. We'll hear a lot from the rest  
6 of the team here later about the geology. But  
7 specifically North Dakota has, you know, extensive  
8 sand layers that are surrounded by confining layers  
9 that provide for -- that cover a large areal extent  
10 and provide for suitable geologic reservoir for  
11 storage.

12 Q. Wade, you sometimes hear concerns that  
13 perhaps we shouldn't be storing CO<sub>2</sub> in the state of  
14 North Dakota from other states because there is  
15 this concern about whether there's an abundance of  
16 storage space in North Dakota. Can you tell us a  
17 little bit about what your understanding is of  
18 that?

19 MR. BRAATEN: Object to foundation.

20 HEARING EXAMINER GARNER: Overruled.

21 MR. BOESHANS: Yes. The U.S. Geologic  
22 Survey has recorded an estimated storage resource  
23 in the Williston Basin of over 250 billion tons.  
24 That would be the equivalent of storing all of the  
25 CO<sub>2</sub> from all North Dakota industrial sources for

1 over 5,000 years. So it's a very prolific storage  
2 resource.

3 Q. (MR. BENDER CONTINUING) Okay. Wade, I'm  
4 going to direct your attention to Exhibit -- wait a  
5 minute -- yeah. I'm going to direct your attention  
6 back to Exhibit 1A and particularly page PS-5. Can  
7 you provide us with an overview of the proposed  
8 location?

9 A. Sure. As you see laid out in figure PS-3  
10 on page PS-5 of Exhibit 1, you see the locations of  
11 the storage facilities within Oliver and Mercer  
12 Counties, and so you see that the BK Fischer site,  
13 or SCS2 as the applicant, is located in Mercer  
14 County; and then SCS1, the TB Leingang, is located  
15 in Oliver County; and SCS3, the KJ Hintz storage  
16 facility, is located in Oliver County as well.

17 Q. Do you believe this is a good area to  
18 store CO<sub>2</sub>?

19 A. We do.

20 MR. BRAATEN: Object to foundation.

21 HEARING EXAMINER GARNER: Overruled.

22 Q. (MR. BENDER CONTINUING) How did Summit  
23 select this project area and the injection sites?

24 A. So we looked at, you know, available  
25 information, particularly mapping of sand

1       thicknesses, previous oil and gas and stratigraphic  
2       well drilling information, ultimately identified an  
3       area in -- that included, you know, Oliver, Mercer  
4       and Morton Counties as a suitable target area for  
5       CO<sub>2</sub> storage.

6           Q.     Okay. And you talked about the storage  
7       area, but what about -- how about the injection  
8       sites? How did you select those?

9           A.     So after we'd identified, you know, this  
10      general area of the three counties, we then  
11      identified a specific area within that. Based on  
12      that information of about 170,000 acres, we  
13      proceeded to secure permissions to do survey and  
14      secure land rights and completed site-specific  
15      characterization, including seismic survey on over  
16      95 percent of roughly a 140,000-acre block within  
17      that.

18                   And then based on utilizing kind of that  
19      information to build a -- engaged with the EERC to  
20      build a geologic model, run simulations. And based  
21      on the geology of the area as well as landowner  
22      participation or cooperation for those who had  
23      signed leases and then considering also surface  
24      infrastructure, including roads, availability of  
25      power, locations of dwellings, et cetera,

1 identified the specific injection sites and -- and  
2 the storage boundaries came from that.

3 Q. Now, Wade, are there flowlines that are  
4 associated with the injection wells? And if it's  
5 easier to discuss that by looking at Exhibit 1A,  
6 please do so.

7 A. Sure. Yes. I'm looking at Figure PS-3 on  
8 page PS-5 in Exhibit 1A. You can see that there  
9 are flowlines. You can see the mainline system  
10 upon this diagram labeled NDM-106 comes into the --  
11 to Oliver County. At that point there's a terminus  
12 and then there's flowlines from that point out with  
13 NDL-326 going to the KJ Hintz site, NDL-327  
14 continuing to the west to the TB Leingang site, and  
15 then NDL-325 going to the BK Fischer storage site.

16 Q. And in selecting this area, did Summit  
17 give any consideration to other permitted projects  
18 in the area?

19 A. We did.

20 Q. Okay. And perhaps I already handed it  
21 out, but Exhibit 4A -- I show you what's been  
22 marked Exhibit 4A. Can you tell me what that  
23 exhibit is?

24 A. Yeah. So this is an exhibit that includes  
25 the three Summit sites proposed in the application

1 here, three Summit storage facilities -- TB  
2 Leingang, BK Fischer and KJ Hintz -- as well as the  
3 already permitted Minnkota facilities, DCC West and  
4 DCC East.

5 And what this -- what you see from that is  
6 kind of the proximity between the storage  
7 facilities with DCC facilities being closest to the  
8 KJ Hintz site. It's approximately 11 miles from  
9 the DCC West injection site to the KJ Hintz  
10 injection site and about 19 miles from the DCC East  
11 injection site to the KJ Hintz injection site.

12 Q. And it's -- I'm sorry. I interrupted you.

13 A. And the storage boundaries between DCC  
14 West and KJ Hintz are approximately 3 miles apart.

15 Q. And is it a fair statement that you're  
16 very familiar with both the permitted sites and the  
17 proposed sites that you're here today to permit?

18 A. I am.

19 Q. And is it a fair statement that this  
20 exhibit was prepared under your control and  
21 supervision?

22 A. Yes.

23 Q. Okay.

24 MR. BENDER: Offer Exhibit 4A.

25 HEARING EXAMINER GARNER: Any objections?

1           MR. BRAATEN: Yeah. I object to  
2 foundation.

3           HEARING EXAMINER GARNER: Overruled. The  
4 exhibit is admitted.

5           Q. (MR. BENDER CONTINUING) Wade, you  
6 indicated that Summit did consider impacts on other  
7 permitted projects. Which permitted facilities did  
8 Summit consider?

9           A. The DCC West and DCC East permits.

10          Q. Okay. And can you explain just a bit as  
11 to what sort of considerations you gave to those  
12 sites?

13          A. Yeah. So what you're seeing on the  
14 exhibit indicates the extent of the CO<sub>2</sub> plumes of  
15 each of the five sites operating at permitted  
16 limits at the end of five years. And so as you can  
17 see, the plumes do not go outside of the storage  
18 areas at -- by the end of five years, which, of  
19 course, is then our understanding that they're --  
20 the Commission requires a reevaluation and  
21 adjustments to the permit in a five-year  
22 reevaluation period.

23                 And so what this tells us is that there is  
24 no risk. From this simulation it indicates the  
25 plume boundaries are within the storage area at the

1 end of the -- end of five years and -- and the  
2 renewal period, which then gives us the opportunity  
3 to validate modeling assumptions and adjust  
4 accordingly or present to the Commission proposed  
5 amendments to the permits.

6 Q. And this shows what you believe will be  
7 the plume extent after five years; is that correct?

8 A. That's correct.

9 Q. And you said the Commission will have an  
10 opportunity to review these storage areas -- or the  
11 storage units after five years; is that correct?

12 A. That's correct.

13 Q. Is it also your understanding that the  
14 Commission has continuing jurisdiction, and if it  
15 deems necessary, could review earlier than five  
16 years?

17 A. Yes. That's correct.

18 Q. Okay. Now, Wade, in the past the  
19 Commission has always requested information on an  
20 NAICS industrial classification code.

21 A. Yes.

22 Q. Do you know what that is?

23 A. I do. It is NAICS code 486990, all other  
24 pipeline transportation.

25 Q. Okay. And, in your opinion, is the

1 storage facility in the public interest?

2 A. Yes.

3 MR. BENDER: That's all the questions I  
4 have for this witness, Mr. Examiner. We would like  
5 to move to the next witness and then give the  
6 Commission and opposing counsel an opportunity to  
7 ask questions at that time so they can switch back  
8 and forth without wasting time.

9 HEARING EXAMINER GARNER: I'm sorry, you'd  
10 like to call your second witness before cross?

11 MR. BENDER: Yes. Yep.

12 HEARING EXAMINER GARNER: Any objections  
13 to that?

14 MR. BRAATEN: No.

15 HEARING EXAMINER GARNER: Okay. You can  
16 proceed. Mr. Skaare.

17 MR. BENDER: Skaare.

18 HEARING EXAMINER GARNER: Skaare. Sorry.

19 **JEFFREY SKAARE,**  
20 being first duly sworn, was examined and testified  
21 as follows:

22 **DIRECT EXAMINATION**

23 **BY MR. BENDER:**

24 Q. Jeff, state your full name for the record,  
25 please.

1           A.     Yeah.   Jeffrey Skaare.

2           Q.     And, Jeff, by whom are you employed?

3           A.     Summit Carbon Solutions.

4           Q.     In what capacity?

5           A.     I am the director of land, legal and  
6 regulatory affairs for sequestration.

7           Q.     And I would like -- what I'd like you to  
8 do next, Jeff, is I'd like you to briefly highlight  
9 for the Commission staff and opposing counsel your  
10 educational background and work experience.

11          A.     Sure.   I received a bachelor of science  
12 degree in business administration from the  
13 University of North Dakota in 1997.   Went on to law  
14 school at UND, received my juris doctorate degree  
15 in 2000.   I have spent the majority of my career  
16 working in the oil and gas sector, primarily as a  
17 landman throughout mostly the Williston Basin.

18          Q.     Okay.   And what are some of your duties  
19 and responsibilities with respect to your  
20 employment with Summit?

21          A.     Yeah.   My duties with respect to Summit  
22 include essentially the pore space acquisition  
23 efforts which included mineral and, you know,  
24 surface title review; the document creation; the  
25 negotiations; and, of course, some of the surface

1 facilities and flowline acquisitions throughout  
2 that project.

3 Q. And you were also involved in the notice  
4 requirement that is provided by statute prior to  
5 holding this hearing; is that correct?

6 A. That is correct.

7 Q. And would you characterize those notice  
8 requirements somewhat stringent?

9 A. They are.

10 Q. Okay. Can you describe what you did in  
11 terms of identifying owners and then making sure  
12 those owners were provided notice?

13 A. Certainly. So we started by doing a  
14 complete surface and mineral title review of the  
15 areas inside the storage facility permits and  
16 within the one-half mile buffer outside of that  
17 particular area to determine who the record owners  
18 are.

19 Q. And were you specifically involved in  
20 identifying those owners?

21 A. I was.

22 Q. Okay. But you had others who were working  
23 under your control and supervision; is that  
24 correct?

25 A. That is correct. I oversaw the team.

1           Q.     Now, after you identified the individuals  
2     that you were going to provide notice to, what did  
3     you do next?

4           A.     So consistent with North Dakota Century  
5     Code, we provided notice to all within that inside  
6     and one-half mile boundary, notice of the -- notice  
7     to all the surface owners, to all the mineral  
8     owners, to any mineral lessees within that same  
9     boundary, and any owner or lessee of record as  
10    well.

11          Q.     And was that notice given by certified  
12    mail return receipt requested?

13          A.     It was.

14          Q.     Okay. And what -- what information was  
15    contained in that notice, Jeff?

16          A.     So, again, also consistent, we included  
17    the legal description of each of the storage  
18    facilities; the date, time and location of the  
19    hearing; notice that a copy of the permit  
20    application was available through the NDIC. We  
21    also included an explanation on how comments could  
22    be submitted. And then, lastly, a notice that  
23    amalgamation would be required.

24          Q.     And you've indicated this was sent  
25    certified mail return receipt; is that correct?

1           A.     That is correct.

2           Q.     And were all of the certified mailings  
3 delivered? In other words, did you get a green  
4 card back that was signed by the owner that you  
5 sent the certified mailing to?

6           A.     We did not.

7           Q.     Okay. And what steps did you take with  
8 respect to giving notice to those individuals who  
9 did not receive notice and you knew they didn't  
10 receive notice because the green card came back  
11 unsigned?

12          A.     Yeah. When we received something back, we  
13 employed a third-party search to essentially  
14 identify an updated address. And when an updated  
15 address was obtained, we sent out a second notice.

16          Q.     Okay. Were you also involved, Jeff, in  
17 taking pore space leaseings -- pore space leases --  
18 excuse me -- for the storage permit facility area?

19          A.     I was.

20          Q.     And was all of that work done under your  
21 control and supervision?

22          A.     Yes, it was.

23          Q.     Can you provide for us a brief summary of  
24 that?

25          A.     Gladly. So the process started by

1 identifying landowners through public court  
2 records, essentially verifying title, creating the  
3 documents necessary to engage with the landowners.  
4 Next we -- we did engage with those landowners and  
5 worked on any terms. And then we essentially moved  
6 forward acquiring a lot of that pore space through  
7 an option and a lease and as a result signed  
8 approximately 90 percent of the landowners in the  
9 SCS1/TB Leingang and approximately 92 percent of  
10 the landowners in the SCS2, also known as the BK  
11 Fischer. And then, lastly, in SCS -- and when I  
12 say "SCS," I mean Summit Carbon Solutions #3 --  
13 storage #3, LLC, and the KJ Hintz we acquired  
14 approximately 97 percent.

15 Q. And having been involved in searching  
16 title to provide notice and searching title to take  
17 pore space leases, you would know if there was any  
18 federal acreage in any of these proposed units; is  
19 that a fair statement?

20 A. That is a fair statement.

21 Q. Is there any federal acreage in the  
22 proposed units?

23 A. There is not.

24 Q. Is there any State acreage in the proposed  
25 units?

1           A.     Yes, there is.

2           Q.     Okay. Can you tell us a little bit about  
3 that? Where is it located and how much land are we  
4 talking about?

5           A.     Within each of the applications, there is  
6 a single quarter of land that is under the control  
7 and direction of the North Dakota Trust Lands. The  
8 first one in the TB Leingang, also Summit Carbon  
9 Storage #1, would be in Township 141, Range 88,  
10 Section 36 in the southwest quarter.

11                     In SCS2 in the BK Fischer, there's one  
12 quarter in Township 143, Range 88, Section 32 in  
13 the southwest. And then, lastly, in the KJ Hintz,  
14 Township 143, Range 87, Section 36, the southwest  
15 quarter.

16           Q.     And has Summit secured an interest in the  
17 pore space of the State lands?

18           A.     We have not.

19           Q.     Are you in the process of attempting to  
20 acquire a pore space lease?

21           A.     We are actively engaged in our discussions  
22 with North Dakota Trust Lands.

23           Q.     Okay. Let's talk a little bit more about  
24 the fee owners. Can you very briefly discuss for  
25 us the procedure or procedures that Summit utilized

1     under your control and supervision to secure pore  
2     space leases from private owners?

3           A.     Sure.   So once we have -- as I testified  
4     before determining title, we reached out both by  
5     phone calls and having landmen setting up meetings  
6     and meeting with specific landowners.   Within the  
7     unit, one of -- one more step that we took, I  
8     guess, of multiple steps included after all of  
9     those engagements when we had difficulty locating  
10    somebody, we did send out a copy of the option and  
11    pore space lease via certified mail.   We did that  
12    last fall in 2023.   We did the same again via  
13    certified mail to the unleased owners in just this  
14    past spring of 2024.

15               In addition to that, we had sent out an  
16    invitation to -- you know, prior to the hearing to  
17    all of the landowners, surface owners within the  
18    storage facility areas and within that half-mile  
19    buffer to essentially two different informational  
20    meetings.   One was held in Beulah and the second  
21    one was held in New Salem about a week apart to  
22    accommodate for schedules.   And while we were  
23    there, we included a hard copy of the -- the pore  
24    space -- the option and pore space lease to be  
25    delivered directly.

1           And then, lastly, leading into these  
2       hearings, this late spring, early summer I  
3       personally took efforts wherein I was able to  
4       locate a phone number to contact the landowners  
5       that had not leased.

6           Q.     Okay. And with respect to those owners  
7       who have -- have not leased at this point in time,  
8       are you requesting that the Commission amalgamate  
9       those unleased interests; is that correct?

10          A.     That is correct.

11          Q.     And let's talk a little bit about -- I  
12       think you testified that in TB Leingang you have  
13       approximately 90 percent of the pore space leased;  
14       is that correct?

15          A.     Just a touch under 90. Yes. That is  
16       correct.

17          Q.     Okay. And what do you have with respect  
18       to the BK Fischer?

19          A.     The BK Fischer is approximately  
20       92 percent.

21          Q.     And the KJ Hintz?

22          A.     The KJ Hintz is approximately 97 percent.

23          Q.     And do you know what the requirement is in  
24       terms of leased acreage within a storage area that  
25       you need before the Commission can amalgamate the

1 remaining portion?

2 A. I do.

3 Q. What is that?

4 A. It is 60 percent.

5 Q. Okay. And you touched on this when you  
6 discussed what you have been doing in terms of  
7 securing leases from private pore space owners.  
8 Now that you have those high percentages that you  
9 testified to, have you just stopped leasing? Have  
10 you taken the position, hey, this is -- we're well  
11 over the 60 percent, we don't need to go out and  
12 get any more leases?

13 A. No.

14 Q. Okay. What have you done?

15 A. We have continued to secure pore space  
16 leases. The last one -- the most recent one signed  
17 yesterday morning.

18 Q. All right. Let me switch gears now on  
19 you, Jeff. Let's go to one of the exhibits.  
20 Perhaps that's -- that's Exhibit 1A, I believe; is  
21 that --

22 A. It is.

23 Q. Okay. And I'm going to have you turn in  
24 to -- turn in that particular exhibit, 1A, to the  
25 storage agreement.

1           A.     I am there.

2           Q.     Okay. And were you involved in drafting  
3 that storage agreement?

4           A.     I was.

5           Q.     Okay. I'm going to have you go to  
6 Exhibit A in that storage agreement. It's a little  
7 confusing. We're in Exhibit 1A, but now we're  
8 going to go to Exhibit A of the storage agreement  
9 in 1A.

10          A.     I am there.

11          Q.     And can you tell me what Exhibit A is?

12          A.     Yes. It is a tract map showing the  
13 boundary of the storage facility area. In that map  
14 you can see the townships, ranges and sections, and  
15 in addition you will be able to see the tract  
16 numbering system.

17          Q.     Okay. And you would have a similar  
18 storage agreement in a similar exhibit in each one  
19 of the other storage units that's before the  
20 Commission today, the Hintz and the -- I guess  
21 that's the TB Leingang -- you'd also have one for  
22 the Fischer and the Hintz; is that correct?

23          A.     That is correct.

24          Q.     Okay. Let's go to Exhibit B. Tell me  
25 what Exhibit B is, of the storage agreement.

1           A.     Sure.   Tract B -- or excuse me --  
2     Exhibit B, rather, is the -- the tract summary of  
3     the -- the different owners within that previous  
4     storage facility outline.

5           Q.     And can you describe the tract  
6     participation for each pore space owner?

7           A.     Certainly.   What you will see across this  
8     document is, of course, the legal description, the  
9     total acres, the owners, the acreage that they own,  
10    which would then indicate their participation in  
11    the tract itself, as well as that tract's  
12    participation in the greater storage facility.

13          Q.     And since -- since the application was  
14    filed -- in fact, you mentioned a few moments ago  
15    that you've secured additional leases as recently  
16    as yesterday afternoon -- have you had an  
17    opportunity to update the tract participation  
18    summary which is Exhibit B in each one of the  
19    storage units in the three applications?

20          A.     Yes, we have.

21          Q.     Okay.   I'm going to show you what's been  
22    previously marked as Exhibit 5A.   I'll give you --  
23    I'll just give it a minute till everybody has a  
24    copy.

25                 Okay.   Jeff, let's turn to what's been

1 previously marked as Exhibit 5A, 5B and 5C. Can  
2 you tell me what each one of those exhibits is?

3 A. It is a tract participation summary  
4 similar to what we just discussed as the tract  
5 summary, with the addition of the last column  
6 furthest to the right showing the percentage of  
7 acreage leased with a total leasehold on the final  
8 page.

9 Q. Okay. And let's just go to 5A. I don't  
10 think we need to go through each one of these, but  
11 let's go to the last page of 5A. You talked about  
12 it including an additional column. Does that  
13 confirm what you previously testified to that  
14 you -- that Summit has approximately 90 percent of  
15 the area within that storage area leased?

16 A. That is correct.

17 Q. Okay. And then that's how the other two  
18 exhibits would work as well, 5B and 5C, having that  
19 additional column and indicating what the  
20 percentage of leased acreage is?

21 A. That is correct.

22 MR. BENDER: Okay. We'd offer  
23 Exhibits 5A, 5B and 5C.

24 HEARING EXAMINER GARNER: Any objection?

25 MR. BRAATEN: No objection.

1                   HEARING EXAMINER GARNER: Exhibits are  
2 admitted.

3           Q.     (MR. BENDER CONTINUING) Let's go to  
4 Exhibit D in Exhibit 1A. We've been discussing  
5 Exhibit C, so that would be the next exhibit;  
6 correct?

7           A.     I believe we have not touched on  
8 Exhibit C.

9           Q.     We have not touched on what?

10          A.     Exhibit C.

11          Q.     All right. Well, we can -- I think we did  
12 actually, but --

13          A.     Okay.

14          Q.     So I think you testified that it was the  
15 tract participation schedule. But to make sure,  
16 let's just go back very quickly to Exhibit C and  
17 tell me what that is.

18          A.     Sure. Much like Exhibit B, it is a bit  
19 more of a summary showing the section of land that  
20 is, you know, listed by tract with the acres of  
21 that particular section and the total tract  
22 participation. A bit more of a summary. Not to  
23 confuse everybody. I just wanted to --

24          Q.     No. No. That's fine.

25          A.     -- make sure we're talking about the same

1        thing.

2            Q.     I thought we touched on it, but perhaps we  
3        did not.

4                    Let's go to D.

5            A.     I am there.

6            Q.     Okay. And tell us what Exhibit D is.

7            A.     Yes. Exhibit D is the Form of Pore Space  
8        Lease that we used largely to acquire the  
9        percentages we previously discussed.

10          Q.     Okay. And will nonconsent -- well, let me  
11        rephrase that. Will unleased owners be subject to  
12        the provisions of Exhibit D?

13          A.     Yes.

14          Q.     Okay. And how does Summit propose to  
15        compensate the unleased pore space owners that  
16        appear in Exhibit D or ultimately do not lease?

17          A.     Equally to the leased owners.

18          Q.     Okay. And can you be a little bit more  
19        specific in terms of what -- what that means? Is  
20        there a bonus, is there a royalty? Can you -- and  
21        without giving percentages or numbers because I  
22        think we've made some promises to landowners that  
23        we're not going to discuss that, so can you just  
24        generally talk about what's going to be the same?

25          A.     Yes. So under the terms of the pore space

1     lease, there is a bonus. That is the same bonus  
2     that we pay to the existing leased owners, so  
3     consistent with what you'll see in term -- or  
4     Section 2(a). In addition we have a royalty that  
5     is called out and that royalty is the same as well.  
6     That royalty can be found in paragraph 3 of the  
7     Form of Pore Space Lease.

8           Q.     And it's based on the tonnage of  
9     injection; is that correct?

10          A.     That is correct.

11          Q.     Okay. Let's go to Article 8 of the  
12     storage agreement.

13          A.     I am there.

14          Q.     Okay. And I believe it was your testimony  
15     that if the Commission grants the request for  
16     amalgamation, this -- this storage -- well, yeah,  
17     this storage agreement will be effective for those  
18     owners; is that correct?

19          A.     That is correct.

20          Q.     Tell me how unleased owners will be  
21     treated with respect to Article 8.

22          A.     So consistent with our practices thus far,  
23     we intend to specifically engage with willing  
24     landowners and -- for any surface impact that may  
25     exist and try our -- to minimize any impact that

1     may exist on any surface owner. As it stands  
2     today, I do not believe we have any significant  
3     surface use needs outside of what we have leased.

4           Q.     Let me try to summarize that and you tell  
5     me if this is correct. If you have unleased owners  
6     in a storage unit now and the Commission  
7     amalgamates those owners, you will do your level  
8     best -- Summit will do its level best not to have  
9     surface activities on those lands; is that a fair  
10    statement?

11          A.     That is a very fair statement.

12          Q.     Okay. What types of activities is Summit  
13     anticipating in terms of surface use within the  
14     storage areas?

15          A.     As of today, we have identified our  
16     locations for injection and then --

17          Q.     Let me stop you. I want you to talk about  
18     just generally first and then you can talk about  
19     where you are in terms of the process. I apologize  
20     for interrupting you, Jeff --

21          A.     No. That's okay.

22          Q.     -- but why don't you talk about just  
23     generally what type of surface use and then talk  
24     about where you are in the process, the status.

25          A.     Sure. Generally for surface use, we would

1     need, of course, our well site locations and the  
2     flowlines.

3           Q.     Perhaps some roads?

4           A.     And perhaps some roads, yes.

5           Q.     Okay. Now let's move to where Summit is  
6     in that process.

7           A.     Yes. Thank you. So we have identified  
8     the location of our three injection wells, and we  
9     have worked with those landowners regarding those  
10    locations. We have secured 100 percent voluntary  
11    easements for the location of the flowlines, and we  
12    will continue to engage with the county as needed  
13    regarding any particular road use.

14          Q.     Okay. And with respect to well pads where  
15    you have secured surface rights, were those -- were  
16    those owners -- did they also lease pore space?

17          A.     They did.

18          Q.     Okay. And was that also the case where  
19    you have secured easements for flowlines?

20          A.     That is true.

21          Q.     Okay. What was the approach that you took  
22    in securing surface for easements for well pads,  
23    flowlines, roads, that sort of thing?

24          A.     Sure. We invited all the impacted  
25    landowners into our office in Bismarck, sat down

1 with them and explained what we were doing and how  
2 it worked. We gave them all an opportunity to ask  
3 questions together. We met with some of them as a  
4 group and some of them individually and came to  
5 terms and signed all of those easements.

6 MR. BENDER: Thank you, Jeff. I don't  
7 have any other questions at this time,  
8 Mr. Examiner.

9 HEARING EXAMINER GARNER: Why don't we --  
10 rather than move to cross, why don't we take a  
11 ten-minute break at this point in time.

12 (Recessed at 10:08 a.m. and reconvened at  
13 10:20 a.m.)

14 HEARING EXAMINER GARNER: Okay. We are  
15 back on the record, and we will resume with  
16 cross-examination of the witnesses by Attorney  
17 Braaten.

18 MR. BRAATEN: Thank you. Your Honor.

19 **CROSS-EXAMINATION**

20 **BY MR. BRAATEN:**

21 Q. Why were the applications submitted by  
22 Summit Carbon Solutions, LLC?

23 A. (BY MR. BOESHANS) Excuse me?

24 Q. Why were the applications submitted to the  
25 North Dakota Industrial Commission by Summit Carbon

1 Solutions, LLC?

2 A. So Summit Carbon Solutions, LLC, is the  
3 parent to Summit Permanent Carbon Storage and the  
4 parent -- who is then the parent to or owner of  
5 Summit Carbon LLC #1, 2 and 3.

6 Q. And so Summit Carbon Solutions submitted  
7 the three applications on behalf of the Summit  
8 Carbon Storage #1, LLC, Summit Carbon Storage #2,  
9 LLC, and Summit Carbon Storage #3, LLC?

10 A. No. I believe the applicant is -- or the  
11 applicant is Summit Carbon Storage #1, LLC, #2,  
12 LLC, and #3, LLC; correct.

13 Q. So why did the applications get submitted  
14 by Summit Carbon Solutions, LLC?

15 MR. BENDER: What do you mean by  
16 "submitted"? I'm not trying to argue with you,  
17 but --

18 Q. (MR. BRAATEN CONTINUING) Filed with the  
19 NDIC.

20 A. Just that they were -- Summit Carbon  
21 Solutions is the parent to Summit Carbon Storage --  
22 excuse me -- yeah, Summit Carbon Storage, LLC, #1,  
23 #2 and #3.

24 Q. Okay. You talked a little bit about  
25 industrial sources for the CO<sub>2</sub> coming in the state

1 and there was a discussion of ethanol plants and an  
2 aviation facility. Is there anything else that is  
3 connecting or are there any other sources  
4 connecting to the system that you didn't discuss?

5 A. Not at this time.

6 Q. Okay. Do you have any plans to connect  
7 other sources to the system at this time?

8 A. We've had commercial discussions with  
9 others, but no -- no affirmative plans, if you  
10 will, or agreements.

11 Q. Are those discussions all with facilities  
12 that would have a CO<sub>2</sub> stream within the parameters  
13 you said in your application?

14 A. So I'm not the chief commercial officer so  
15 I can't speak to the specifics of -- on the CO<sub>2</sub>  
16 stream characteristics of all potential sources  
17 that we've had commercial discussions with, but --  
18 but per the application, they would be required to  
19 be within that specification.

20 Q. Okay. Would you agree with the statement  
21 that North Dakota has a huge economic advantage  
22 because our geology is such that we can do storage  
23 in pore space in North Dakota where other states  
24 can't?

25 A. I can't testify to the, quote, magnitude

1 of the advantage, but I would agree that being  
2 located on top of suitable storage is an advantage.

3 Q. And so would you agree that Red Trail  
4 Energy as an ethanol plant has an economic  
5 advantage by being able to sequester its own CO<sub>2</sub>  
6 emissions directly beneath the earth under its  
7 facility?

8 A. Yeah. Again, I can't testify to the  
9 specific economics of Red Trail Energy and what  
10 their operating and production costs are, et  
11 cetera, et cetera, but certainly being located on  
12 top of geologic storage is advantageous to them, I  
13 would believe.

14 Q. Does your project sell that advantage to  
15 ethanol plants in other states?

16 A. Can you restate that?

17 Q. Does your project sell that advantage to  
18 ethanol plants in other states?

19 A. I don't believe so.

20 Q. Do they obtain an advantage by being able  
21 to inject their CO<sub>2</sub>?

22 A. Being able to connect to our system and by  
23 extension store their CO<sub>2</sub>, they're able to lower  
24 their CI score, yes, and then that creates an  
25 advantage for them or benefit to them.

1           Q.     And that takes away the advantage North  
2     Dakota ethanol plants would have if they were the  
3     only ones doing sequestration of their CO<sub>2</sub>?

4           A.     I don't believe so.

5           Q.     How -- how is that?

6           A.     Well, I don't believe that the North  
7     Dakota plants can support -- given their size can  
8     support a greater than 1-billion-gallon market.

9           Q.     So they would find themselves in a system,  
10    in a market with a massive demand and a low supply?

11          A.     I -- I would say that it's -- there likely  
12    wouldn't be enough supply to support the market.

13          Q.     Do you think that that supply could then  
14    be filled by development of other projects?

15          A.     Potentially.

16          Q.     Do you think that other projects would  
17    have an advantage if they were able to sequester CO<sub>2</sub>  
18    directly underneath their facility?

19          A.     They may have.

20          Q.     All of the ethanol plants connected to  
21    your system but one are from outside of North  
22    Dakota?

23          A.     Currently, yes.

24          Q.     You testified regarding what has been  
25    marked as Exhibit 4A. Do you have a copy of that

1 in front of you still?

2 A. I do.

3 Q. You indicated that this was prepared under  
4 your direction and control?

5 A. Correct.

6 Q. Who prepared it?

7 A. The Energy & Environmental Research  
8 Center.

9 Q. And who at the Energy & Environmental  
10 Research Center prepared it?

11 A. I don't know specifically who.

12 Q. How did you direct them if you don't know  
13 who they are?

14 A. I directed the project lead at the EERC to  
15 prepare this exhibit, but I don't know exactly  
16 which one of the EERC experts did the work.

17 Q. Who is the project lead at EERC?

18 A. That would be Amanda.

19 Q. Amanda who?

20 A. Amanda -- excuse me -- Amanda Douglas.

21 Q. How long has Amanda Douglas been working  
22 on the project?

23 A. She's been involved in the project since  
24 we started developing the project in late 2021.

25 Q. How did Amanda's team determine where to

1 put the lines on this particular map for this  
2 exhibit?

3 A. Amanda will have to testify to that.

4 Q. Well, but you directed her to create this  
5 exhibit for you; right?

6 A. I did. Correct.

7 Q. What did you ask her to put on the  
8 exhibit?

9 A. I asked her to put on the exhibit the  
10 plume extent after five years of injection and the  
11 other -- the storage boundaries, et cetera.

12 Q. Okay. Do you have an understanding of how  
13 the plume extent at five years was calculated and  
14 then put onto this map as a line?

15 A. Say that one more time.

16 Q. I think I can. Do you have an  
17 understanding of how the plume extent at five years  
18 was calculated and then put on this map as a line?

19 A. Yes. It's my understanding that the plume  
20 extent was calculated using dynamic model  
21 simulation to determine the extent.

22 Q. Would it be fair to say that you wouldn't  
23 have any independent information of your own as to  
24 where the line should be drawn to indicate the CO<sub>2</sub>  
25 extent at five years of injection?

1           A.     That I wouldn't have any independent --

2           Q.     I'm not trying to be tricky. Let me be  
3     basic here. You asked Amanda to put the lines on  
4     here, but you don't know how she created these  
5     lines or where the data comes from to determine  
6     that that's where the line should go?

7                     So let me ask a better question. That  
8     wasn't fair. That's just what I'm trying to get  
9     at, though.

10          A.     Okay.

11          Q.     So as far as where the plume extent is on  
12     this exhibit, you would have to rely on Amanda in  
13     order to determine whether that's accurate; is that  
14     fair?

15          A.     That's correct. I would have to -- I  
16     would have to rely on, you know, the geoscience  
17     team and reservoir engineers at EERC that ran the  
18     model to produce the plume extent.

19          Q.     Okay. And so other than what you  
20     testified to that this Exhibit 4A represents, in  
21     order to understand where all of the information  
22     came from and how the decisions were made as to  
23     where to put the lines, we would have to talk to  
24     EERC about the models they ran?

25          A.     Yes. To understand the process, if you

1 will, and the modeling that produces the lines, the  
2 EERC geoscience team would be the experts.

3 Q. Does Summit Carbon Solutions, LLC, have a  
4 contract with the EERC for that work?

5 A. It does.

6 Q. And does the EERC have a contract with any  
7 of the Summit or SCS entities listed on  
8 Exhibits 2A, 2B or 2C other than Summit Carbon  
9 Solutions, LLC?

10 A. I don't believe so.

11 Q. To your knowledge, does EERC have a  
12 contract -- well, let me back up.

13 Are you aware of any contracts EERC has  
14 with private parties that relate specifically to  
15 the project that we are here today for?

16 A. Specific parties related -- can you  
17 specify which parties or --

18 Q. With anyone. But do you know if EERC has  
19 contracts with any private parties, other than the  
20 one you just mentioned with Summit Carbon  
21 Solutions, that relate to this subject matter and  
22 this Summit project that brings us here today?

23 A. I'm aware that they also have contracts  
24 with Minnkota, but it's not related to this  
25 project.

1           Q.     Okay.  Yeah.  So, no, just related to this  
2     project, are you aware of EERC having contracts  
3     with other parties other than Summit for the  
4     purposes of working on or related to this Summit  
5     project?

6           A.     I'm not.

7           Q.     Okay.  Is the EERC a State-funded  
8     institution?

9           A.     I'm not sure how the EERC is funded.  I  
10    know they're part of the University of North  
11    Dakota, but in terms of how they're funded, I'm not  
12    aware.

13          Q.     Do they regularly take on work producing  
14    applications for industry clients to get permits  
15    for new projects?

16          A.     Yes.  That's my understanding.

17          Q.     What other projects are you aware of them  
18    doing that for?

19          A.     I'm aware of them doing that for the  
20    Minnkota projects, the DCC projects.  I'm also  
21    aware that they did work on the Red Trail project.

22          Q.     Okay.  So outside of the few carbon  
23    sequestration projects that have occurred in North  
24    Dakota in the last five or so years, are you aware  
25    of EERC ever helping industry participants with

1 applications to get permits for new projects?

2 A. I'm not aware of their role in projects,  
3 you know, outside of North Dakota for sure.

4 Q. But are you aware of them contracting with  
5 and helping industry participants with applications  
6 for permits for new projects outside of carbon  
7 sequestration?

8 A. I am not.

9 Q. Okay. Does the contract signed between  
10 Summit Carbon Solutions, LLC, and EERC in 2021  
11 cover the scope of all work that EERC has done for  
12 Summit on this project?

13 A. No. We have multiple contracts with the  
14 EERC.

15 Q. Okay. How many contracts does Summit or  
16 its affiliates and subsidiaries have with the EERC  
17 related to the project we're here for today?

18 A. Today we have, I believe, one active --  
19 active contract.

20 Q. Okay. How many contracts have you had  
21 since you signed -- and when I say "you," I'm  
22 referring to Summit Carbon Solutions, LLC, its  
23 affiliates and subsidiaries. How many contracts  
24 have you had since you signed the first contract  
25 with EERC for this project?

1           A.    I believe we had four --

2           Q.    Okay.

3           A.    -- separate.

4           Q.    And did the four contracts cover different  
5 subject matter or scope of work or were they  
6 renewals of the same contract?

7           A.    It was all similar subject matter,  
8 slightly different scopes.

9           Q.    Did Summit Carbon Solutions, LLC, or its  
10 affiliates or subsidiaries get bids or proposals  
11 from any institutions or consulting firms other  
12 than EERC for the work it eventually contracted to  
13 EERC?

14          A.    Not that I'm aware of.

15          Q.    How do you know whether the expense or  
16 charges from EERC are competitive with other  
17 providers?

18               MR. BENDER:  Objection.  Relevance.

19               HEARING EXAMINER GARNER:  Overruled.

20               MR. BOESHANS:  I would just say from the  
21 Summit perspective, we've engaged lots of different  
22 advisors across a broad scale of our scope, and so  
23 what we do is we look at rates comparable to what  
24 others would do for similar types of work on other  
25 scopes of the overall project, and that's how we

1 judge competitive or not.

2 Q. (MR. BRAATEN CONTINUING) Okay. Right.

3 But you just said that with respect to the work  
4 EERC did for you. You didn't actually get any bids  
5 or scope out any other competitors to do that work;  
6 right?

7 A. We did.

8 Q. You did?

9 A. No. Excuse me. We did not. That's what  
10 I said.

11 Q. So how do you know if EERC's rates were  
12 competitive?

13 A. Again, as -- as I stated, we look at  
14 similar proposals for similar types of work,  
15 permitting, engineering, modeling, those kinds of  
16 things on the project overall and that's our best  
17 comparison.

18 Q. So did you compare the work you were  
19 asking EERC to do with estimates or proposals from  
20 other institutions or consulting firms who could  
21 have done the work?

22 A. So if your question is did we  
23 competitively bid this specific work, the answer  
24 would be no, we did not get proposals from -- for  
25 the exact scope of work or request for proposal.

1           Q.     Okay.  Are you testifying that you did  
2           nonetheless generally look at rates for similar  
3           types of work as part of that process or did you  
4           just choose to go with the EERC regardless of  
5           whether their rates were competitive?

6           A.     We, again, looked at comparables to others  
7           to do, you know, professional work and the same --  
8           not the exact same type of work but what I would  
9           describe as similar work, and we accepted their  
10          proposal.

11          Q.     Okay.  Is the amount charged by EERC more  
12          or less than what you saw in the similar types of  
13          rates that would be charged for work by other  
14          firms?

15          A.     I don't recall specifically.  I would say  
16          it was similar in nature from looking at hourly  
17          rates perspective.

18          Q.     And does Summit actually compensate EERC  
19          under the contract for the work that they're doing?

20          A.     If your question is do we pay them for  
21          their services, yes.

22          Q.     Are you familiar with the contract Summit  
23          has with private engineering and consulting firms?

24          A.     Generally.

25          Q.     Are there any provisions in the EERC

1 contracts that allow them to do things like use  
2 your data for research and education purposes?

3 A. I don't recall specifically. I don't  
4 recall those provisions.

5 Q. Do you have copies of those contracts?

6 A. We do.

7 Q. Is there anyone testifying today that  
8 knows the provisions of those agreements?

9 A. Not that I'm aware of. It's possible, but  
10 I don't -- I don't -- I can't say for sure.

11 Q. Does your contract with EERC require them  
12 to maintain your data in a confidential manner?

13 A. It does.

14 Q. How does that work with a public  
15 institution subject to open records requests?

16 A. That would --

17 MR. BENDER: If you know, Wade.

18 MR. BOESHANS: Yeah, I don't know for  
19 sure, but, again, that's a better question for the  
20 EERC.

21 Q. (MR. BRAATEN CONTINUING) Are you having  
22 the EERC testify in support of your application?

23 A. We are.

24 Q. You made some comments about the NAICS  
25 industrial classification code. Can you tell me

1       again what you were saying about that?

2           A.     I was saying that this was the  
3       classification code.

4           Q.     According to whom?

5           A.     What's that?

6           Q.     According to whom?

7           A.     According to how it's been, I guess,  
8       classified based on the type of the system it is.

9           Q.     By whom?

10           MR. BOESHANS:   Jeff.

11           A.     (BY MR. SKAARE)   Yeah, I don't recall --  
12       what was the acronym again?   Can you -- what was  
13       the acronym for the code?   I think we have it  
14       somewhere.

15           Q.     NAICS industrial classification code.

16           A.     I don't have the answer for you.   I'm  
17       sorry.

18           Q.     486990 was the number you guys gave.   You  
19       knew that much; right?

20           A.     We did.

21           Q.     What's that number for?

22           A.     I'm not sure I'm the appropriate person to  
23       answer that question, but we can --

24           Q.     Well, who -- who knew -- well, let me ask  
25       the question again.   What is the NAICS industrial

1 classification code you claim applies to the  
2 storage facilities?

3 A. (BY MR. BOESHANS) I can't answer that  
4 question.

5 Q. But you did.

6 A. No. I stated this is what the  
7 classification code is. We'll have --

8 Q. But you don't know if it is?

9 A. I can confirm that Jay Volk, who will be  
10 testifying here later today who works under my  
11 direction, made that determination along with our  
12 counsel, and he can testify specifically to that  
13 question.

14 Q. What's his name?

15 A. Jay.

16 Q. Jay.

17 Did he make the determination that 486990  
18 is the NAICS industrial classification code?

19 A. Yes. That's my understanding.

20 Q. Do you have any understanding of why?

21 A. I do not.

22 Q. Is it because that refers -- well, how  
23 would you describe the facility that you're saying  
24 has classification code 486990? What is it?

25 A. How would I describe the facility?

1 Q. Yeah.

2 A. It's a storage facility.

3 Q. Is it a coal pipeline transportation  
4 facility?

5 A. No, it's not a coal pipeline. I believe  
6 it falls in the "other" category.

7 Q. Is it a slurry pipeline transportation?

8 A. It is not.

9 Q. Is it pipeline transportation except crude  
10 oil, natural gas, refined petroleum products?

11 A. Say that again.

12 Q. Pipeline transportation except crude oil,  
13 natural gas -- natural gas, refined petroleum  
14 products?

15 A. That sounds correct.

16 Q. Your storage facility is for pipeline  
17 transportation?

18 MR. BENDER: Mr. Examiner, you know, we  
19 can continue to waste time asking these questions.  
20 We've identified another person who may be able to  
21 help us with this, so --

22 MR. BRAATEN: He testified to this already  
23 and only upon cross-exam is it being discovered  
24 that he doesn't know that much about it, but I  
25 think I'm entitled to exhaust my questions given

1       that this was a very specific code that they  
2       brought up on direct and said is the code, and I'm  
3       just asking why it is.

4                   HEARING EXAMINER GARNER: Overruled.

5       Q.       (MR. BRAATEN CONTINUING) So you think  
6       pipeline transportation except crude oil, natural  
7       gas and refined petroleum products is an accurate  
8       description of your carbon sequestration facility?

9       A.       Yes. That's my understanding based on  
10      the -- the advice of our team.

11      Q.       Are you going to store the CO<sub>2</sub> in a  
12      pipeline underground?

13      A.       We are not. We are going to transport it  
14      to the site.

15      Q.       And then you're going to transport it out  
16      of a pipeline and into a wellbore; right?

17      A.       Yes. It will -- from the pipeline it goes  
18      to the wellhead and then into a wellbore.

19      Q.       And then into the reservoir?

20      A.       Correct.

21      Q.       Where is the pipeline in the reservoir?

22      A.       There is no pipeline in the reservoir.

23      Q.       Then why would you call a storage facility  
24      in the reservoir a pipeline?

25      A.       Based on the, again, advice of our team,

1 we believe that's the appropriate -- the  
2 appropriate classification.

3 Q. Well, but not because it's an accurate  
4 description of the facility; right?

5 A. It describes it as "all other."

6 Q. What describes what as "all other"?

7 A. The classification, as I understand it.

8 Q. 486990 is for "all other"?

9 A. Yes. That's my understanding.

10 Q. There was some discussion earlier about  
11 how there are PSC hearings going on regarding the  
12 Midwest Carbon Express; do you recall that?

13 A. I do.

14 Q. Is the Midwest Carbon Express the same as  
15 the storage facility that we're here talking about  
16 today?

17 A. It's not the same.

18 Q. It's a different project; right?

19 A. Well, no, the Midwest Carbon Express --  
20 excuse me. Let me restate that.

21 The Midwest Carbon Express is the -- is  
22 the pipeline. This is the storage facility that's  
23 part of -- the storage component of the Midwest  
24 Carbon Express project, if you will.

25 Q. What is the Midwest Carbon Express

1 project?

2 A. So the Midwest Carbon Express project, as  
3 I understand it, is the combination of capturing of  
4 CO<sub>2</sub> at the plants, transporting the CO<sub>2</sub> via the  
5 pipeline and storing the CO<sub>2</sub> at the injection  
6 facilities that we're permitting here today or the  
7 storage facilities -- excuse me -- that we're  
8 permitting here today.

9 Q. Where does the Midwest Carbon Express  
10 pipeline end?

11 A. The -- you said where does the Midwest  
12 Carbon Express Pipeline end?

13 Q. Yes.

14 A. It's -- you know, back to the exhibit that  
15 shows the terminus of the pipeline.

16 Q. Can you direct me to the -- or you're on  
17 one of the marked exhibits?

18 A. Yes. Oh, excuse me. It's in Exhibit 1.

19 MR. BENDER: 1A.

20 MR. BOESHANS: Exhibit 1A. Yes. If you  
21 refer to page PS-5, Figure PS-3, the red box  
22 indicates the terminus of the Midwest Carbon  
23 Express Pipeline. That's the end of the line.

24 Q. (MR. BRAATEN CONTINUING) With respect to  
25 the applications under consideration today, does

1 the subject matter for those applications all begin  
2 where that pipeline ends?

3 A. It does.

4 Q. And so when we're talking about an  
5 industrial classification that's applicable to  
6 these three sequestration facilities that we see on  
7 PS-5, it would not be accurate to classify those as  
8 a pipeline, would it?

9 A. I don't agree with that. There's --  
10 there's a flowline and the injection facilities  
11 that are all part of this application.

12 Q. So the flowlines. Anything else that you  
13 would consider a pipeline that begins after the  
14 terminus of the Midwest Carbon Express Pipeline?

15 A. Okay. Anything else that I would consider  
16 a pipeline?

17 Q. Right.

18 A. No.

19 Q. Going back to Exhibit 1, PS-5, the diagram  
20 you noted, there's a terminus point for the Midwest  
21 Carbon Express Pipeline?

22 A. Yes.

23 Q. Are there any booster pumping stations  
24 after that terminus point?

25 A. There are.

1 Q. Where are those?

2 A. At the well pads.

3 Q. Okay. Is there a valve station at the  
4 terminus point?

5 A. Yes, there is.

6 Q. Where is that valve station operated from?

7 A. The -- all the valves will have the  
8 ability to be operated from the main control center  
9 and/or backup control center. Current plans for  
10 the main control center are in Ames, Iowa. They're  
11 also capable of being operated manually in the  
12 field.

13 Q. You had indicated there was no federal  
14 acreage within the sequestration areas. Was that a  
15 criteria used in the search in order to avoid  
16 federal acreage?

17 A. (BY MR. SKAARE) It was not.

18 Q. Okay. You had indicated you signed pore  
19 space leases yesterday. Was that with individual  
20 landowners?

21 A. It was.

22 Q. You're asking the Commission after this  
23 hearing to amalgamate all unleased property owners;  
24 is that right?

25 A. That is right.

1           Q.     If you've not reached a deal with the  
2     North Dakota Department of Trust Lands for the  
3     State-owned lands, are you asking the Commission to  
4     also amalgamate the State-owned lands administered  
5     by the Department of Trust Lands?

6           A.     So we've -- well, I can answer that  
7     question this way: Zack Pelham, who has been busy  
8     with a number of different hearings, has been  
9     appointed to assist the North Dakota Department of  
10    Trust Lands. We have agreed on the substantive  
11    lease -- or easement agreement, and we're  
12    anticipating the ability to complete that shortly.  
13    It just wasn't capable of being done prior to this  
14    hearing.

15          Q.     Have you come to an agreement on  
16    compensation?

17          A.     I would say we've covered all substantive  
18    issues including compensation.

19          Q.     What do you mean by you've covered the  
20    issue of compensation?

21          A.     Sure. So the State of North Dakota Trust  
22    Lands, of course, is an easement agreement rather  
23    than a -- for pore space rather than a pore space  
24    lease. We have presented and worked through a  
25    number of terms, including our compensation offers

1     that are consistent with the existing leased  
2     landowners and have received no pushback regarding  
3     those terms. We're working through the remaining  
4     terms on that agreement. Quite honestly, we've  
5     been very busy. We submitted this to the State I  
6     would say probably about a year ago and have been  
7     working on it off and on through that time frame.

8           Q.     Are the provisions of the easement that  
9     you're negotiating with the Department of Trust  
10    Lands different than the pore space leases you  
11    signed with landowners?

12          A.     To the extent that they call it an  
13    easement versus a lease, yes. Beyond that, not any  
14    significant changes.

15          Q.     But there are some changes?

16          A.     Sure. Because they consider the pore  
17    space a -- you know, instead of a lease, they  
18    consider it an easement. But beyond those  
19    primary -- that is your primary difference, that  
20    they consider it an easement rather than a lease.  
21    So that would be a difference.

22          Q.     Are there any additional protections for  
23    reclamation or soils or anything like that in the  
24    Department of Trust Land lease or easement?

25          A.     Yeah, there are. However, as part of our

1       discussions with the State, we have no plans for  
2       any surface on there. So, again, those are -- I  
3       mean, that's a good point, and I do believe that  
4       they have some specific requirements when there are  
5       pipelines or there are facilities. We, however, do  
6       not have any surface plants on any of those lands.

7           Q.     So why wouldn't you offer those same  
8       reclamation provisions to all of the landowners for  
9       whom you don't have plans for their surface?

10          A.     Sure. In fact, we went further and  
11       offered every unleased landowner a no surface  
12       facilities clause, thus, signaling that prior to  
13       essentially any surface encounter, that we would  
14       enter into a separate written agreement. So as we  
15       go forward with amalgamation, that was -- if you  
16       recall in my testimony, that every unleased owner  
17       received a copy of the lease -- the option and  
18       lease agreement via certified mail in the fall of  
19       '23 and again in the spring of '24 that included a  
20       no surface facilities clause.

21          Q.     Did you also include language related to  
22       soil reclamation and soil separation in the  
23       Department of Trust Lands easement?

24          A.     So they have a -- what I would consider a  
25       standardized form regarding pipelines. In my

1     experience of acquiring right-of-way in North  
2     Dakota, I've encountered that same form. That  
3     includes, of course, things such as -- and I'm --  
4     forgive me, I'm going from memory -- soil  
5     segregations and other certain conditions, seed  
6     mixtures and the likes, and I believe that they  
7     included that on this particular agreement. I know  
8     that Attorney Pelham and I talked about the  
9     necessity as we considered perhaps a no surface  
10    occupancy that would sort of negate the need for  
11    that, but it is on that agreement.

12         Q.     So you said you're familiar with some of  
13    the Department of Trust Lands standardized forms;  
14    would that be accurate?

15         A.     I would say I'm generally familiar. I've  
16    been involved in other right-of-way.

17         Q.     So you're aware, for example, that the  
18    State Department of Trust Lands has standardized  
19    forms for things like a pipeline easement or a well  
20    pad agreement out in the oil patch?

21         A.     I am.

22         Q.     And you may also know that with some of  
23    those forms, they have some specific exhibits or  
24    attachments that cover things like their preferred  
25    seed mixture or soil stripping requirements. Have

1       you seen those before?

2           A.     I certainly have, yes.

3           Q.     And have you noticed that a lot of the  
4       language throughout some of those different  
5       agreements tends to be the same?

6           A.     I would say that's a fair statement.

7           Q.     That was a bad question, but thank you.

8                   Are you aware of who at the Department of  
9       Trust Lands actually drafts those agreements and  
10      forms?

11          A.     I am not.

12          Q.     But we can assume it's the staff; right?

13          A.     Yes.

14          Q.     Do you know who did a lot, if not all, of  
15      the negotiating for the surface division in the  
16      development of a lot of the surface divisions forms  
17      for the Department of Trust Lands throughout the  
18      oil boom?

19          A.     I would be speculating if I answered. I  
20      do not.

21          Q.     Do you know who Mike Haupt is?

22          A.     I do.

23          Q.     Are you aware that he developed the forms  
24      and the leases that were submitted to Summit on  
25      behalf of landowners working off of the exact same

1 forms that he developed for the State Department of  
2 Trust Lands while he was at the State for his whole  
3 career?

4 A. Will you please repeat that?

5 MR. BRAATEN: Would you mind reading it  
6 back, Steph?

7 (Record read as requested.)

8 MR. SKAARE: Okay. So what I'm -- I want  
9 to answer your question, but are you specifically  
10 referencing a lease that we received?

11 Q. (MR. BRAATEN CONTINUING) Correct.

12 A. And what lease are we talking about  
13 specifically?

14 Q. The one from Mike Haupt.

15 A. We received one from the Swenson group  
16 that had some of the same forms that I would say  
17 looked familiar or similar to the State. I'm not  
18 sure that answers your question, but I understand  
19 that there were some similarities.

20 Q. So does the State get that language in  
21 their contract and the landowners don't simply  
22 because they're the State?

23 A. I would disagree. We offered all unleased  
24 landowners a no surface occupancy.

25 Q. But not protections for the surface;

1 right?

2 A. Well, by suggest -- or by entering into a  
3 separate written agreement in the event that we  
4 needed something, that would give them the  
5 opportunity. So we did not gain access to the  
6 surface for any facilities, pipeline, roads or  
7 otherwise.

8 Q. Until the end of this hearing when you ask  
9 the Commission to give that to you; right?

10 A. Under amalgamation you are correct, yes,  
11 there are certain rights that would come in that  
12 particular direction.

13 Q. So it doesn't really matter what the  
14 landowner signed, does it?

15 A. What landowner? I -- I'm sorry. I'm not  
16 trying to be tricky here. Can you ask that  
17 question --

18 Q. Regardless of what any landowner signs  
19 with you for your project, they are going to be  
20 subject to Exhibit D to your storage agreement;  
21 right?

22 A. I would disagree.

23 Q. Why?

24 A. Because we have a separate written  
25 contract.

1           Q.     That is superseded by that storage  
2 agreement the second this Commission issues its  
3 order; right?

4           A.     No.

5           Q.     Okay. Why not?

6           A.     Well, let me correct that. Your question  
7 was whether the storage agreement overrides the  
8 existing contracts with individual landowners for  
9 pore space leases. Did I understand your question  
10 correctly?

11          Q.     I don't know, but I'd like the answer to  
12 that question.

13          A.     Sure. I believe that a written contract  
14 with our landowners is a contract that we will  
15 adhere to.

16          Q.     Unless it is in conflict with the storage  
17 agreement; right?

18          A.     No.

19          Q.     So you're going to ask the Industrial  
20 Commission to impose the storage agreement and  
21 impose Exhibit D as a pore space lease on every  
22 unleased landowner; right?

23          A.     Yes.

24          Q.     And are you saying that you're not going  
25 to impose that on the landowners that signed a

1 lease?

2 A. It will exist, but I think there are  
3 additional protections in those leases. Yes.

4 Q. Additional protections that will not be  
5 superseded or obviated by the storage agreement?

6 A. Well, for example, where we have a no  
7 surface occupancy, we will honor that contract.

8 Q. Okay. Any others?

9 A. Nothing at -- that comes to mind  
10 specifically.

11 Q. So other than a no surface occupancy  
12 agreement, any agreement any landowner signed is  
13 not going to be honored if it violates the storage  
14 agreement?

15 A. I disagree with that. I think that is a  
16 mischaracterization of what I was trying to say.

17 Q. Well, I'm not trying to characterize what  
18 you're trying to say. I'm asking you a question.

19 If a landowner signed a lease with  
20 Summit --

21 A. Mm-hmm.

22 Q. -- for the use of their pore space --

23 A. Mm-hmm.

24 Q. -- and that lease now has terms that  
25 conflict with the terms of the storage agreement,

1       what controls?

2           A.     We would honor the lease.

3           Q.     And so you're not asking the Industrial  
4       Commission to impose any kind of contractual terms  
5       on any single landowner if they signed a lease with  
6       you?

7           A.     Okay.   Having an opportunity to re-review  
8       this, would you mind if I had the question read  
9       back to me so I can be accurate in my answer?

10           MR. BRAATEN:   Sure.   Would you mind  
11       reading it?

12                   (Record read as requested.)

13           MR. SKAARE:   I think we're asking them to  
14       execute the storage facility agreement as -- as  
15       here as part of the application.   I'm not sure that  
16       it creates any additional burdens on landowners  
17       that we don't address in our lease.

18           Q.     (MR. BRAATEN CONTINUING)   Does the storage  
19       agreement or Exhibit D to the storage agreement  
20       have any applicability to a landowner who signed a  
21       lease with you?

22           A.     It does.

23           Q.     How so?

24           A.     I'm not sure I understand your question.  
25       Can you repeat it?

1           Q.     How does the storage agreement apply to a  
2     landowner who signed a lease -- pore space lease  
3     with Summit?

4           A.     Well, I believe the storage agreement  
5     applies to all landowners.  However, I believe  
6     we've also entered into a separate legal contract  
7     or agreement with certain landowners that has  
8     additional details and considerations.

9           Q.     Does the storage agreement impose the  
10    lease at Exhibit D on landowners?

11          A.     I would say it imposes those on the  
12    unleased landowners, yes.

13          Q.     Okay.  And are you saying it does not  
14    impose Exhibit D and the terms of Exhibit D on the  
15    leased landowners?

16          A.     I would say that's a fair  
17    characterization.  I believe that we've entered  
18    into a lease agreement with individual landowners.

19          Q.     Do the individual lease agreements that  
20    you've entered into with landowners have any  
21    material differences to the Exhibit D in the  
22    storage agreement?

23          A.     I would say not material.

24          Q.     And that's because you absolutely refuse  
25    to negotiate any kind of material change to the

1       lease for exactly that reason; right?

2           A.     That is not true.

3           Q.     Why was it that you did not negotiate  
4       material changes to your lease?

5           A.     Well, Mr. Braaten, through good-faith  
6       negotiations with over 450 landowners, we acquired  
7       in excess of 146,500 acres covering 16 townships  
8       and 3 counties, and from the start we had some  
9       changes to that agreement.

10          Q.     How many?

11          A.     I don't recall specifically, but we've  
12       made some changes to the agreement.   Some --

13          Q.     More than five?

14          A.     I don't recall the exact number.

15          Q.     Less than ten?

16          A.     I don't recall the exact number.

17          Q.     Less than 20?

18          A.     I don't recall the exact number of  
19       changes.

20          Q.     Less than a hundred?

21          A.     I don't recall the exact number of  
22       changes.

23          Q.     But none of them were material?

24          A.     No, I believe some were, including an  
25       increase in the royalty rate.

1 Q. How much?

2 A. A 50 percent increase in royalty rate.

3 Q. To whom?

4 A. All landowners that signed equally.

5 Q. Okay. Okay. So you've made a few changes  
6 to the global lease you circulated. Other than  
7 changes that you made to the lease for anyone who  
8 signed the lease, did you make any changes to the  
9 lease in response to concerns expressed from any  
10 individual that were material?

11 A. Yes. As I testified before, as we  
12 developed the project, we offered a no  
13 surface-facilities clause to a number of  
14 individuals.

15 Q. Okay. Anything other than that?

16 A. Not that I recall.

17 Q. How many leases did you say you signed?

18 A. So we've executed -- the exact number I  
19 don't know. What I could tell you is I know that  
20 it's over 450 different individual signatures  
21 across multiple different agreements. That covers  
22 the -- the large scope of the project, including  
23 the 146,000 acres that we've acquired.

24 Q. And you didn't allow a single landowner a  
25 single material change based on their concerns in

1 all of those negotiations?

2 A. I think that's a mischaracterization.

3 Q. Can you name one?

4 A. Sure. Favored nations at the request of  
5 your client.

6 Q. And that went to everyone; right?

7 A. It did, yes.

8 Q. So I'm talking about changes that weren't  
9 global to the lease for everybody who signed.

10 A. No, we treated everybody equally.

11 Q. So no material changes to the lease form  
12 based on negotiations with landowners about their  
13 concerns?

14 A. No, but we took into consideration all of  
15 our discussions across that entire footprint with  
16 all these different landowners.

17 Q. If your answer to the landowners' concerns  
18 and questions before they even expressed them is  
19 no, how is that good faith?

20 A. Well, our answer wasn't no. We sat down  
21 and had multiple meetings with many landowners from  
22 the start of the project.

23 Q. How many material changes to the lease did  
24 those meetings result in?

25 A. Again, I don't know the exact number, but

1 I can say that we've made some adjustments to that  
2 lease. I think that lease is reflected in the  
3 exhibits.

4 Q. And so the landowners who signed a lease  
5 with you would get the same lease imposed on them  
6 if they had not signed that lease?

7 A. Yes, with a few minor exceptions. For  
8 example, a no surface occupancy clause that we've  
9 granted to some.

10 Q. Okay. Any other exceptions?

11 A. No.

12 Q. Did you grant the no surface occupancy  
13 clause only to those landowners who you were not  
14 intending to put anything on anyway?

15 A. Well, I think the best way to understand  
16 this is that when we started our project and our  
17 leasing, it required some site characterization,  
18 and so we didn't have a -- a complete understanding  
19 of where everything would go. Through that site  
20 characterization process, we were able to determine  
21 where those things are located. And so it is  
22 something that we were willing to grant to those  
23 once we understood where we -- where we were  
24 putting our facilities.

25 Q. If you do not reach an agreement with the

1 North Dakota Department of Trust Lands at the time  
2 that this Commission issues its order, are you  
3 asking this Commission to issue an order also  
4 amalgamating the State lands that are administered  
5 by detail?

6 A. If we were unable to enter into an  
7 agreement and the Commission entered an order, it  
8 would amalgamate those lands. It is not our  
9 intention to do that. As I stated previously,  
10 we've been actively working through the terms of  
11 that agreement with the attorney appointed to  
12 assist who's been in some of the many hearings I  
13 think that you've been in, too, so --

14 Q. Has he shared any price points with you  
15 from other transactions?

16 A. Can you elaborate on that question?

17 Q. Has the attorney with whom you're  
18 negotiating for the Department of Trust Lands  
19 shared with you any price points or comparable  
20 transactions he thought you might want to review in  
21 talking about compensation?

22 A. They have not.

23 MR. BRAATEN: Lawrence, were you using --  
24 which number are you using for the application?

25 MR. BENDER: 1A.

1           MR. BRAATEN: Okay. I'm going to have you  
2 take a look at Exhibit 1A, which I understand to be  
3 the application for the Leingang facility?

4           MR. BENDER: Yes.

5           Q. (MR. BRAATEN CONTINUING) And I'd like to  
6 direct your attention to the storage agreement  
7 within the application. Do you have the page up in  
8 front of you -- I show it as page 2 that has the  
9 recitals listed at the top?

10          A. I do.

11          Q. Okay. So the recital states, "It is in  
12 the public interest to promote the geologic storage  
13 of carbon dioxide in a manner which will benefit  
14 the state and the global environment by reducing  
15 greenhouse gas emissions and in a manner which will  
16 help ensure the viability of the state's coal and  
17 power industries, to the economic benefit of North  
18 Dakota and its citizens."

19                 How does the Summit project benefit the  
20 State and the global environment by reducing  
21 greenhouse gas emissions?

22          A. (BY MR. BOESHANS) So clearly our project  
23 reduces greenhouse gas emissions. We're storing  
24 significant amounts of CO<sub>2</sub>.

25          Q. How is that a benefit to the global

1 environment?

2 A. So it's reducing emissions, number one.  
3 Number two is we are providing -- we're -- we are  
4 commercializing CCS and demonstrating commercial  
5 CCS that can be implemented for others or by  
6 others. We're also supporting North Dakota's  
7 largest industries. Obviously the -- the CO<sub>2</sub> that's  
8 coming from our project is being -- originated from  
9 corn and corn markets are important to the citizens  
10 of North Dakota. Supporting commodity prices and  
11 land prices for agricultural sector. We're also  
12 creating the opportunity for owners of pore space  
13 to monetize that value of that resource.

14 Q. At whatever price you choose?

15 A. At the -- at the royalty rate in which  
16 we've agreed to with in this case 93 percent of the  
17 landowners.

18 Q. You didn't change it for a single one of  
19 them, though; right?

20 A. No. As Jeff testified to, we changed --  
21 we adjusted the royalty rate during our  
22 negotiations.

23 Q. Globally.

24 A. Correct. We -- we entered into a --  
25 included a favored nations clause, so it applies to

1 all.

2 Q. How does reducing greenhouse gas emissions  
3 benefit the state of North Dakota?

4 A. Well, in this case it allows the  
5 continued -- allows the plants in this case, the  
6 ethanol plants, to continue producing ethanol and  
7 selling that -- having access to new markets,  
8 continuing the viability of those plants and that  
9 industry --

10 Q. Which ethanol plants?

11 A. -- therefore supporting the -- therefore  
12 supporting the corn markets.

13 Q. Oh, okay. I'm sorry. I should have let  
14 you finish. Sorry.

15 But that's a benefit from a speculative  
16 uplift in the price of corn from the financial  
17 success of the ethanol plants flowing from their  
18 response to a regulatory issue; right?

19 A. I wouldn't characterize it that way.

20 Q. How would you characterize it?

21 A. I'd say corn is a globally traded  
22 commodity, and our project and our project partners  
23 create a significant demand. And so there's a  
24 supply/demand relationship. And to the extent that  
25 they continue to operate and purchase that volume

1 and likely more, that that has a positive impact on  
2 the overall agricultural commodity markets and  
3 specifically corn.

4 Q. Okay. So let's put that aside and I want  
5 to ask my specific question again, which is how  
6 does reducing greenhouse gas emissions benefit the  
7 state of North Dakota?

8 A. Again, as I said, this project reduces  
9 greenhouse gas emissions.

10 Q. But I'm not asking about projects that  
11 are -- or benefits that flow from this project.  
12 I'm simply asking how does reducing greenhouse gas  
13 emissions benefit the state of North Dakota? Or  
14 maybe I should start does it benefit the state of  
15 North Dakota to reduce greenhouse gas emissions in  
16 Iowa?

17 A. So I think as you think about greenhouse  
18 gas, you can't think about it as one state at a  
19 time. Obviously, air goes everywhere. CO<sub>2</sub> is in  
20 the air so reducing it at one point impacts the  
21 overall concentration of CO<sub>2</sub>, you know, globally, so  
22 to speak.

23 Q. But that's not a substantial and direct  
24 impact for the citizens of North Dakota with  
25 respect to the air they're breathing because we

1       took emissions out of the air in Iowa?

2           A.     I would say that reducing -- excuse me --  
3       reducing CO<sub>2</sub> emissions -- reducing CO<sub>2</sub> emissions is  
4       not about making the air healthier. I don't really  
5       understand the question or the -- the point of the  
6       question.

7           Q.     What benefits flow to anyone from reducing  
8       greenhouse gas emissions?

9           A.     (BY MR. SKAARE) Perhaps this will provide  
10       a little more understanding to the recitals. North  
11       Dakota Century Code Chapter 38-22-01 is policy. It  
12       reads, "It is in the public interest to promote" --  
13       excuse me -- "to promote geologic storage of carbon  
14       dioxide." Doing so will benefit the State and the  
15       global environment by reducing greenhouse gas  
16       emissions. Consistent with the statute, we  
17       included this in our recitals, and we believe that  
18       there is benefits. I don't know that we can get  
19       into the very specifics here. I think you're  
20       asking a broad question.

21          Q.     What benefits do you think there are to  
22       the State of North Dakota from reducing greenhouse  
23       gas emissions? Can you name one?

24          A.     Yes.

25          Q.     What?

1           A.    I believe it -- it allows one of our major  
2 ethanol plants the opportunity to engage in  
3 low-carbon fuel markets.

4           Q.    How does the Summit project help ensure  
5 the viability of the state's coal industry?

6           A.    (BY MR. BOESHANS) So I would say based on  
7 my experience pursuing commercial CCS for the coal  
8 industry, the biggest challenge is others having  
9 done it before, having been done at large  
10 commercial scale. And so by deploying CCS at  
11 commercial scale, as we will here, we, in essence,  
12 build out the pathway, if you will, for others to  
13 follow and do the same.

14                   Additionally, we're building a CO<sub>2</sub>  
15 transportation network that can provide benefits to  
16 others or opportunities for others to -- to use as  
17 well.

18          Q.    So how is the coal industry going to  
19 benefit from what you're doing?

20          A.    They're going to benefit from ultimately  
21 the -- the demonstration at commercial scale and  
22 that it's -- that it's been done and that by  
23 extension makes the second of a kind -- kind of  
24 provides a road map, so to speak.

25          Q.    Didn't Minnkota already demonstrate it's

1 fully capable of doing that and then come in here  
2 and express concerns about your application?

3 A. So Minnkota has a proposed project that  
4 has yet to be constructed.

5 Q. Have you constructed your project?

6 A. Not yet.

7 Q. What projects are constructed?

8 A. Could you be more specific?

9 Q. Well, Red Trail is demonstrating success  
10 with ethanol doing direct injection of carbon in  
11 North Dakota; right?

12 A. They are.

13 Q. What are you doing that they don't already  
14 know how to do?

15 A. We are replicating the same or similar at  
16 scale.

17 Q. You're just bigger?

18 A. Yes, it's bigger.

19 Q. How does the Summit project help ensure  
20 the viability of the state's power industries?

21 A. In the same way.

22 Q. If Summit constructs its project and  
23 injects CO<sub>2</sub> as planned for the next 20 years, will  
24 that reduce the global temperature?

25 A. So you're asking me to speculate?

1 Q. I don't know if I am.

2 A. You are asking me to speculate.

3 Q. Okay.

4 A. Because I don't know what others are going  
5 to do as well.

6 Q. Hold all other things constant.

7 A. Again, I'm not a climate scientist, but I  
8 don't believe so.

9 Q. The recitals also state that to further  
10 geologic storage of carbon dioxide, a potentially  
11 valuable commodity, may allow for its ready  
12 availability if needed for commercial, industrial  
13 or other uses, including enhanced recovery of oil,  
14 gas and other minerals. Does any of that apply to  
15 the Summit project?

16 A. Read that one more time.

17 Q. "To further geologic storage of carbon  
18 dioxide, a potentially valuable commodity, may  
19 allow for its ready availability if needed for  
20 commercial, industrial, or other uses, including  
21 enhanced recovery of oil, gas and other minerals."

22 A. (BY MR. SKAARE) So as I mentioned before,  
23 right, these recitals are codified to a large  
24 extent under 38-22-01 which also reads, "Further  
25 geologic storage of carbon dioxide, a potentially

1     valuable commodity, may allow for its ready  
2     availability if needed for commercial, industrial  
3     or other uses, including enhanced oil recovery" --  
4     excuse me -- "including enhanced recovery of oil,  
5     gas and other minerals." And as I testified  
6     earlier, the recitals are talking about the policy  
7     as issued by the North Dakota State Legislature in  
8     38-22-01.

9           Q.     With the implication being that they apply  
10    to your project, though; right?

11           A.     Sure.

12           Q.     And that one doesn't? That's a question.  
13    Sorry. It's a bad question. Does anything in the  
14    recitals, Section B, apply to your Summit project?

15           A.     (BY MR. BOESHANS) Well, in reading it, it  
16    says, "To further geologic storage of carbon  
17    dioxide," which we are doing.

18           Q.     And is the carbon dioxide that is going to  
19    be stored by the Summit project going to be readily  
20    available for commercial, industrial or other uses,  
21    including enhanced oil -- recovery of oil, gas and  
22    other minerals?

23           A.     Not under the current sets of agreements,  
24    but potentially it could be.

25           Q.     If you change the law?

1           A.     If I change the law? Excuse me. I don't  
2 understand the question.

3           Q.     Meaning that -- well, let me back up. In  
4 order to get your tax credits for your project, you  
5 have to permanently sequester the CO<sub>2</sub> underground;  
6 right?

7           A.     Yes, for the -- for the current customers,  
8 yes, or partners, if you will.

9           Q.     At what point are you going to switch your  
10 45Q credits over the EOR credits?

11          A.     We don't have any plans to do that.

12          Q.     When do you think you will?

13          A.     Again, I said we don't have any plans to  
14 do that.

15          Q.     So you're going to do the first 20 years  
16 and then do that?

17          A.     I would just say we don't have any plans  
18 to do that.

19          Q.     Have you talked about it?

20          A.     Have we talked about?

21          Q.     Switching to the EOR credit?

22          A.     We have not.

23          Q.     Are you going to pull the CO<sub>2</sub> being  
24 sequestered in your project back out of the ground  
25 at some point?

1           A.     That's not the plan.

2           Q.     Could be the plan, though, if it changes?

3           A.     I would say it's -- it's -- the current  
4 contracts require us to permanently store it.

5           Q.     Which contracts?

6           A.     What's that? Our agreements.

7           Q.     Agreements with who, though?

8           A.     With our -- our -- with our plant  
9 partners.

10          Q.     Is that because they need it to be  
11 permanently sequestered in order to get their  
12 low-carbon fuel standard credits?

13          A.     That's my understanding.

14          Q.     How long are those agreements locked in  
15 for?

16                 MR. BENDER: Can you speak up just a  
17 little bit?

18          Q.     (MR. BRAATEN CONTINUING) Sorry. How long  
19 are those agreement terms?

20          A.     I have not seen all the agreements so I  
21 don't know the terms.

22          Q.     Would it be fair to say that the CO<sub>2</sub> is  
23 going to get stored there until 2040?

24          A.     I don't -- I don't know that that's fair.

25          Q.     Okay. Is it possible that you will

1       withdraw CO<sub>2</sub> from the reservoir before the year  
2       2040?

3           A.     Again, it's not part of our plan.  It  
4       might be technically possible.  I believe it would  
5       be economically prohibitive and it's not part of  
6       our plan.

7           Q.     Are there any legal barriers that you have  
8       identified that would prevent you from doing that  
9       other than your contracts with the partners?

10          A.     I haven't analyzed that to determine.  
11       Again, not part of our plan.

12          Q.     If you made a plan to withdraw CO<sub>2</sub> from the  
13       reservoir, would the landowners receive any  
14       additional compensation?

15               MR. BOESHANS:  I'm going to defer to you,  
16       Jeff.

17          A.     (BY MR. SKAARE)  Sure.  Again, not our  
18       plan, as Wade testified.  Under the existing  
19       contract, there is no additional compensation for  
20       the removal of CO<sub>2</sub>.

21          Q.     Have you ever reviewed any gas storage  
22       agreements?

23          A.     Nothing specific or lately.

24          Q.     Have you seen gas storage agreements with  
25       pricing structures that require payments both for

1 things being injected into and taken out of the  
2 storage facility?

3 A. I have not.

4 Q. Are you aware that that's the most common  
5 price structure for a gas storage agreement in the  
6 United States?

7 A. Sure.

8 Q. Does Summit intend to compensate the  
9 landowners for the withdrawals of gases at any  
10 point if it starts withdrawing CO<sub>2</sub>?

11 MR. BENDER: Asked and answered.

12 HEARING EXAMINER GARNER: Sustained.

13 Q. (MR. BRAATEN CONTINUING) Have you done  
14 technical feasibility studies on your ability to  
15 withdraw CO<sub>2</sub> from the reservoir after injection?

16 A. (BY MR. BOESHANS) We have not.

17 Q. Have you done any kind of research or  
18 study on that?

19 A. We have not.

20 Q. Why do you say that you think it would not  
21 be feasible to withdraw the CO<sub>2</sub> then?

22 A. I say that I believe it would not be  
23 feasible because when you withdrew the CO<sub>2</sub>, you'd  
24 have to separate it from the rest of the -- you  
25 know, from the fluids and -- and separate out the

1 CO<sub>2</sub>, compress it, transport it, and then reinject  
2 the other fluids. And so from that perspective,  
3 you'd take the CO<sub>2</sub> from the line first. But, again,  
4 we haven't -- I haven't done any studies on it to  
5 validate costs or -- it's just my -- from my  
6 general knowledge or understanding of how this, you  
7 know, would work under the question you were  
8 asking.

9 Q. Is it your understanding that after  
10 20 years these facilities will stop taking further  
11 injections?

12 A. It's my understanding that we are  
13 permitting these facilities for -- for 20 years.  
14 That those permits will be reviewed and updated  
15 every 5 years, and the time frame, you know, could  
16 change if CCS continues to be a commercial --  
17 commercially viable solution.

18 Q. But the facilities are still going to fill  
19 up at some point; right?

20 A. Yes. At some point the facilities would  
21 be full.

22 Q. What do you do with all the CO<sub>2</sub> coming  
23 through that pipeline when they're full?

24 A. Well, then we would permit additional  
25 facilities or -- assuming we needed additional

1 storage, at that point we would proceed to permit  
2 additional facilities.

3 Q. Might those facilities include things  
4 other than storage?

5 A. Your question is "might they"?

6 Q. Correct.

7 A. I guess that's possible.

8 Q. Would it be accurate to say there are no  
9 plans to shut down the flow into that pipeline when  
10 these storage facilities are full?

11 A. I would say that we have designed the  
12 project around 20 years. We haven't contemplated  
13 plans to shut it down afterwards. It's just that  
14 is the estimated project life at this point, but  
15 there are no plans to shut it down when the  
16 facilities are full. Again, I think it would come  
17 back to a -- you know, commercial considerations  
18 that are viable options at that point in time.

19 Q. Do you have a permanent required offtake  
20 agreement as a term of the agreements you have with  
21 your partners?

22 A. Say that one more time.

23 Q. Yeah. That was bad. Let me start over.

24 Do you have any contracts with your  
25 partners that require you to permanently take all

1 of the CO<sub>2</sub> coming out of their ethanol plants for  
2 the life of their facility?

3 A. Again, I'm not aware of all the details of  
4 those contracts. I haven't reviewed them, so I  
5 can't answer that question.

6 Q. Well, this is just a general question,  
7 too, though. Is the idea or the commitment being  
8 made by Summit that they're committing to take all  
9 the CO<sub>2</sub> from these plants for the life of those  
10 plants or is it just for a 20-year project period?

11 A. I don't know the term of how long.

12 Q. That's pretty fundamental to the entire  
13 project, though; right?

14 A. Certainly the offtake agreements I would  
15 say, yes, I would agree are fundamental to the  
16 project. What I'm telling you is I don't know the  
17 specific duration of 57 different contracts because  
18 I haven't reviewed them.

19 Q. Okay. I'll have you go to the definitions  
20 in the storage agreement.

21 Real quick on the last question, have you  
22 had any of your partners renew any contracts at  
23 this point for offtake?

24 A. Yes, I'm aware of renewals.

25 Q. How many?

1           A.    I don't know.  I'm just generally aware  
2   that we've renewed.  I don't know how many.

3           Q.    Have you discussed plans to expand the  
4   geographic area of your storage facilities where  
5   they exist right now in the future as a way to  
6   increase your storage capacity?

7           A.    So we have secured agreements with  
8   landowners that own about 145,000 or over  
9   145,000 acres.  Our project is much like a  
10  mine-mouth coal plant operation in that we have a  
11  very large capital investment, \$8 billion, that's  
12  depending on utilizing every resource at the end of  
13  the line, much like a coal plant has -- mine-mouth  
14  coal plant is dependent on the lignite coal  
15  resource.  And so they in those operations, you  
16  know, have secured, generally leased hundreds of  
17  millions of tons adjacent to the plant.

18               Initially, they'll permit a portion of  
19  that, develop it.  As they continue through  
20  operations, they'll permit incremental reserves  
21  over time.  I would anticipate -- you know, that's  
22  why we lease such a large area, and we don't have  
23  current plans in terms of an application or a  
24  specific design, but we secured pore space leases  
25  over a larger area with the -- with the intent at

1     some point in time having the optionality to permit  
2     additional areas and develop additional resources.  
3     But we don't have specific plans, which I believe  
4     is what your question was.

5           Q.     But if you wanted to, for example, simply  
6     expand the boundary of one of these storage units,  
7     what is the limiting factor on how much more CO<sub>2</sub> you  
8     can put in? Is it simply the geographic size of  
9     what is permitted or is it related to the pressures  
10    at which you're injecting?

11          A.     Yeah, that's going to -- I would say  
12    that's perhaps a better question for the reservoir  
13    engineers, but certainly there's a variety of  
14    factors that would come to play there. It would be  
15    the design of the facility, the geologic  
16    characteristics, the reservoir performance and all  
17    of these different factors.

18          Q.     Have you done modeling to determine how  
19    much further out from the injectors past the  
20    boundaries of the current storage facility you  
21    could extend the plume in those storage facilities?

22          A.     We have not. We ran our simulations for  
23    20 years.

24          Q.     On page 3 of the storage agreement in the  
25    definitions -- this is back to Exhibit 1A --

1       there's a definition at 1.10 for storage expense.  
2       It states it's all costs, expenses or indebtedness  
3       incurred by the storage operator pursuant to this  
4       agreement for or on account of storage operations.  
5       Can you tell me generally what costs, expenses and  
6       indebtedness would be covered by this definition  
7       with respect to Summit's actual costs, expenses and  
8       indebtedness for this project?

9           A.     (BY MR. SKAARE) Is it -- is it referenced  
10       elsewhere in the agreement besides the definition?

11          Q.     I don't know.

12               MR. BENDER: Do you mind if I help?

13               MR. BRAATEN: Oh, no. Go ahead.

14               MR. BENDER: Take a look at 11.3.

15               MR. SKAARE: Yeah, almost there. Yeah,  
16       11.3 references under Article 11, Relationship of  
17       Parties, 11.3, Pore Space Owners Free of Cost.  
18       "This Agreement is not intended to impose and shall  
19       not be construed to impose upon any Pore Space  
20       Owner any obligation to pay any Storage Expense  
21       unless such Pore Space Owner is otherwise  
22       obligated." So I would suggest or -- that it was a  
23       definition intended to come back to reference that  
24       section, which is, "All costs, expenses or  
25       indebtedness incurred by the Storage Operator," as

1 sort of a comprehensive definition of any expenses  
2 that are not allocated to the pore space owner.

3 Q. (MR. BRAATEN CONTINUING) Can you give me  
4 a few examples of costs and expenses or  
5 indebtedness incurred by the storage operator  
6 pursuant to this agreement for or on account of  
7 storage operations?

8 A. Sure. Lease operating costs or other  
9 things are not intended to be imposed upon the pore  
10 space owners.

11 Q. What are the lease operating costs for the  
12 leases here?

13 A. So a lease operator would be someone who's  
14 working on the project or other sort of expenses in  
15 relation to the operation of the facilities are  
16 what I consider storage expenses.

17 Q. Okay. So the lease operator, you're  
18 referring to the pore space leases with the  
19 landowner and Summit as the operator?

20 A. Yes.

21 Q. Okay. And those are the expenses for the  
22 operations related to those pore space leases;  
23 right?

24 A. That is correct.

25 Q. And so storage expense as used here

1 doesn't cover the amounts paid for the pipeline  
2 easements for the Midwest Carbon Express; correct?

3 A. I don't know that that's correct. Can you  
4 repeat that question?

5 Q. Well, let me ask it -- I thought I knew  
6 the answer so let me ask it. Do storage expenses  
7 as defined in the storage agreement as all costs,  
8 expense or indebtedness incurred by the storage  
9 operator pursuant to this agreement for or on  
10 account of storage operations refer to the payments  
11 made for easements for the Midwest Carbon Express  
12 Pipeline?

13 A. I'm sorry. I need it again. I want to be  
14 clear on this one.

15 MR. BRAATEN: Steph, would you mind  
16 reading it?

17 (Record read as requested.)

18 MR. SKAARE: Your question is confusing.  
19 I can answer it this way: I believe that the  
20 definition is comprehensive, and that pursuant to  
21 Article 11.3 that it is not intended to impose any  
22 of those costs upon the pore space owners.

23 Q. (MR. BRAATEN CONTINUING) What confuses  
24 you about the question?

25 A. The length, for starters.

1 Q. Okay. I can shorten it up for you.

2 A. Sure.

3 Q. Lease operating expenses, you're referring  
4 to that as the expenses of the operator; right?

5 A. Well, I -- you asked for an example.

6 Q. Okay. And you're saying lease operating  
7 expenses.

8 A. So I was not comprehensive at all.

9 Q. Right. But that's one?

10 A. Sure.

11 Q. Okay. Has Summit paid money for easements  
12 for the Midwest Carbon Express Pipeline?

13 A. Yes.

14 Q. Is that money that you paid for those  
15 easements something you would consider a storage  
16 expense as defined under Section 1.10 of the  
17 storage agreement?

18 A. I believe it falls under the overall costs  
19 and expenses of a storage operator.

20 Q. How about the cost of the pipe?

21 MR. BENDER: Are you talking about the  
22 costs of the pipe for the pipeline or are you  
23 talking about costs of the pipe for the flowlines?

24 Q. (MR. BRAATEN CONTINUING) That's a fair  
25 question. I mean for the main pipeline, the

1 Midwest Carbon Express Pipeline.

2 MR. BENDER: If you know.

3 MR. SKAARE: I don't know.

4 Q. (MR. BRAATEN CONTINUING) You don't know  
5 if the cost for the pipe for the Midwest Carbon  
6 Express Pipeline would be considered part of the  
7 storage expenses as they are defined in the storage  
8 agreement, Section 1.10?

9 A. I don't know that I'm the best person to  
10 answer the question with respect to all things that  
11 would be considered a storage expense.

12 Q. Did you draft that definition?

13 A. I worked and oversaw the development of  
14 this, yes.

15 Q. Well, what did you mean when you wrote it?

16 A. I think as I was testifying earlier, it  
17 was intended to create, as listed in 11.3, cost  
18 free to the pore space owners, much like an oil and  
19 gas lease, that they're not intended to pay for the  
20 expenses of the injection operations.

21 Q. But there's never a question that any of  
22 those oil and gas lessors need to pay for the  
23 Dakota Access Pipeline, is there?

24 A. No.

25 Q. So why would the people in the storage

1 facility have any concern with the pipeline from  
2 Iowa?

3 Let me ask you a different question. Are  
4 you telling me that all the expenses for your  
5 pipeline are included in the storage expenses for  
6 the storage facility?

7 A. I guess I'm not sure I'm understanding the  
8 line of questioning.

9 Q. Do you understand that question?

10 A. Can you rephrase it?

11 Q. Are all of your expenses for the Midwest  
12 Carbon Express Pipeline considered expenses  
13 incurred by the storage operator on account of the  
14 storage operations?

15 A. I would say yes.

16 Q. So is that pipeline part of what you're  
17 asking the Commission to give you a permit for  
18 today?

19 A. No. If you're referring to the pipeline  
20 in front of the PSC, the answer is no.

21 Q. Well, I don't mean the siting permit. I'm  
22 asking you when you refer to the storage facilities  
23 you're asking the Commission to permit, are you  
24 including your pipeline to Iowa in that?

25 A. No.

1           HEARING EXAMINER GARNER:   Okay.   Why don't  
2   we stop here and take an hour for lunch.

3           MR. BRAATEN:   Okay.

4           (Recessed at 12:08 p.m. and reconvened at  
5   1:10 p.m.)

6           HEARING EXAMINER GARNER:   We are back on  
7   the record.   Mr. Braaten, I believe you were  
8   questioning Summit's witnesses.

9           MR. BRAATEN:   Thank you, Your Honor.

10          Q.   (MR. BRAATEN CONTINUING)   There was a  
11   short discussion, Mr. Boeshans, about mine-mouth  
12   plants, and I think you were explaining how North  
13   Dakota's mine-mouth plants work as an analogy for  
14   the Summit project; is that a fair statement?

15          A.   (BY MR. BOESHANS)   That's correct.

16          Q.   Okay.   Is it your testimony that the  
17   lignite mines and the mine-mouth plants in North  
18   Dakota are a single source?

19          A.   I can't testify to the agreements that  
20   exist between all of the mines and all of the  
21   plants because they all have contracts -- different  
22   contracts and contract terms.   My point is those  
23   utilities and/or co-ops made significant  
24   investments and entered into relationships with --  
25   or contracts with their coal providers that

1 required the coal provider to provide them the fuel  
2 they needed to run the plant or the resource, said  
3 differently, for decades. And many of those have  
4 survived for now greater than 50 years.

5 The similarity to the Summit situation is  
6 that we were investing \$8 billion to move CO<sub>2</sub> to  
7 Oliver and Mercer County and so, consequently, you  
8 know, we've secured to date over 145,000 acres of  
9 pore space and today we're considering permits to  
10 develop 90,000 acres.

11 Q. You were an executive at a coal mine;  
12 right?

13 A. I was.

14 Q. Do the coal power plants and the coal  
15 mines have different industrial classification  
16 codes?

17 A. I don't recall what their industrial  
18 classification codes are.

19 Q. If they used different industrial  
20 classification codes, would that indicate to you  
21 that perhaps Summit should consider something  
22 similar by way of analogy?

23 A. I -- again, I'm not an expert in those  
24 codes and classification codes in terms of how  
25 they're used for tracking. I really can't answer

1 your question.

2 Q. Do the words "other nonhazardous waste  
3 treatment and disposal" describe the storage  
4 facilities?

5 A. Say that again. Repeat that again.

6 Q. "Other nonhazardous treatment and  
7 disposal."

8 A. Again, I'd have to look at all of the  
9 codes to say which one fits the best.

10 Q. Well, and I'm not asking what fits the  
11 best, but do those words describe the Summit  
12 storage facility?

13 Let's break it down. The emissions -- the  
14 CO<sub>2</sub> is coming from emissions from ethanol plants;  
15 right?

16 A. Correct.

17 Q. Would they consider that a waste stream  
18 coming out of their emissions stack?

19 A. Coming out of their stack they would, yes,  
20 I presume.

21 Q. Are you -- and we've talked about how you  
22 don't have any plans to pull the CO<sub>2</sub> back out;  
23 right?

24 A. Correct. Back out of the reservoir,  
25 you're saying?

1 Q. Correct.

2 Could we agree that CO<sub>2</sub> is nonhazardous?

3 A. In -- yes, in the atmosphere, for sure.

4 Q. So other nonhazardous treatment and  
5 disposal, do those words just generally describe  
6 what Summit's doing with its storage facilities?

7 A. I would say the way you've described it,  
8 yes.

9 Q. Okay. Are you aware that 221112 is the  
10 industrial classification code for fossil fuel  
11 generation?

12 A. I'm not.

13 Q. Are you aware that 212114 is the  
14 industrial classification code for surface coal  
15 mining?

16 A. I am not.

17 Q. Does fossil fuel generation describe the  
18 lignite power plants in North Dakota, generally  
19 speaking?

20 A. Yes, generally speaking.

21 Q. And does surface coal mining describe the  
22 lignite mines at the mine-mouth plants in North  
23 Dakota, generally speaking?

24 A. Yes. Generally speaking, yes.

25 Q. And you'd agree that a fossil fuel

1 generation plant is a different facility than a  
2 surface coal mine?

3 A. Yes.

4 Q. There was testimony earlier that you would  
5 do your level best to not put surface facilities on  
6 an unleased landowner. Why can't you just put into  
7 the Exhibit D lease no surface access for the  
8 unleased landowners?

9 A. The Exhibit D in the storage agreement?

10 Q. Sorry. Yes.

11 MR. BOESHANS: Go ahead, Jeff.

12 A. (BY MR. SKAARE) Sure. To the extent that  
13 we had a clause for no surface facilities, I don't  
14 know that it would be that difficult to add that to  
15 the -- to the lease.

16 Q. Can --

17 A. We know that some access may be necessary  
18 for things such as seismic or other things.

19 Q. Is that something that you would know well  
20 in advance?

21 A. I think that's safe to say.

22 Q. So is it also safe to say that the  
23 Industrial Commission could include a provision  
24 allowing no surface access for unleased mineral --  
25 or unleased surface owners, and if you needed any

1 relief from that, say, to conduct seismic, you  
2 could always come back and ask for that; right?

3 A. To be clear, you used the term no surface  
4 access, and I probably should be clear about it's a  
5 no surface-facilities clause.

6 Q. What can you do other than put facilities  
7 on the surface with a no surface-access clause that  
8 you have in your leases?

9 A. To the extent we'd be required, we would  
10 continue to negotiate and work with landowners for  
11 purposes of seismic or other times we would need to  
12 enter into the land, thus access.

13 Q. So if you had agreed to a no  
14 surface-access provision with a landowner -- sorry.  
15 Let me start over.

16 With respect to the provision you've  
17 referenced that is a no surface-access provision  
18 that was included in some of Summit's pore space  
19 leases, is it your testimony that Summit would  
20 still be allowed to conduct seismic operations on  
21 those properties even with the applicability of  
22 that no surface-access clause?

23 A. This may be a good time to make sure that  
24 my testimony is straight. I may have used the term  
25 no surface access in general terms. What it is is

1 a no surface facilities that we've offered to the  
2 landowners across the -- across the board. So to  
3 the extent that I said that differently, that was  
4 not intentional.

5 Q. Specifically, does the provision state,  
6 "Unless otherwise agreed in writing, lessee agrees  
7 that there will be no facilities, including well  
8 sites, pipelines, power lines, or other surface  
9 facilities on the following described real  
10 property," and then it would go on to describe  
11 whatever lease --

12 A. Yes. That's correct. Thank you for  
13 bringing that up. That's the clause.

14 Q. And so what -- the version I have at least  
15 states as the title before what I just read No  
16 Surface Occupancy. And so is it a fair statement  
17 that the no surface-access or no surface-facilities  
18 clause that we've discussed, let's call it a no  
19 surface occupancy clause for the moment, regardless  
20 of what we call it, we're still always talking  
21 about the same clause; right?

22 A. Yes.

23 Q. And with respect to that clause and the  
24 leases in which it appears with Summit and then the  
25 pore space owners, is it your position that Summit

1 still has the right to go on and conduct seismic  
2 operations even on property with a lease that has  
3 that no surface occupancy clause?

4 A. Yes.

5 Q. Did you hear concerns from landowners  
6 about seismic operations?

7 A. Yes.

8 Q. And what were those concerns?

9 A. Concerns about distances from existing  
10 water wells.

11 Q. With respect to the storage facilities, is  
12 Summit asking to amalgamate the interests of just  
13 the unleased owners?

14 A. That is correct.

15 Q. But is it intending to impose the  
16 provisions of the storage agreement with the  
17 attached pore space lease on all owners, leased or  
18 unleased?

19 A. So, Mr. Braaten, as I testified before, I  
20 do believe that, yes, it does, but it also -- you  
21 know, we have written agreements with the existing  
22 lease owners that we feel would govern with respect  
23 to the -- the terms of the lease.

24 Q. Can I have you look at Section 3.3 of the  
25 storage agreement?

1           A.     Sure.

2           Q.     And so you're able to testify that you're  
3 going to honor those other leases because in  
4 Section 3.3 of the storage agreement you're going  
5 to impose on everyone, leased or unleased, it  
6 states that the provisions of the various leases,  
7 agreements, or other instruments pertaining to  
8 respective tracts or the storage and storage  
9 substances therein, including the pore space leases  
10 attached hereto as Exhibit D, are amended to the  
11 extent necessary to make them conform to the  
12 provisions of this agreement.

13                     Did I read that right?

14          A.     You did read that correctly.

15          Q.     So anyone who signed a lease is having  
16 their lease conformed to this storage agreement no  
17 matter what they negotiated with you and that's  
18 what you're asking the Industrial Commission to do  
19 right here, right now. Did I get any of that  
20 wrong?

21          A.     I don't necessarily agree with that.

22          Q.     What do you disagree with?

23          A.     I think the two work hand in hand still.

24          Q.     What two?

25          A.     The storage agreement and the pore space

1 leases that we've entered into.

2 Q. How so?

3 A. Because it says that they shall otherwise  
4 remain in effect.

5 Q. But only to the extent they are now in  
6 perfect conformance with the lease that you have  
7 submitted to the Industrial Commission to impose;  
8 right?

9 A. Perhaps, but I don't -- I know that  
10 Summit's intention is to honor the lease agreements  
11 that we've entered into.

12 Q. Then why doesn't it put that intent in  
13 writing that it's asking the Commission to do  
14 today?

15 A. I'm not sure.

16 Q. Would you like to ask the Commission to do  
17 that, then?

18 A. I would think so.

19 Q. Yeah?

20 A. I think it would be fair.

21 Q. So we're going to amend this provision to  
22 allow all of the pore space leases signed to remain  
23 in full force and effect and not be abridged in any  
24 way by the storage agreement submitted here?

25 A. I think I'll defer to counsel on the best

1 way to amend it rather than testify to it.

2 Q. Okay. Up above in the definitions there's  
3 a storage facility participation, the term, and  
4 then that refers to -- well, I'll just read it to  
5 start. It says "Storage Facility Participation" --  
6 sorry, I'm on page 4.

7 A. Mm-hmm.

8 Q. -- "is the percentage shown on Exhibit 'C'  
9 for allocating payments for use of the Pore Space  
10 under each Tract identified in Exhibit 'B'."

11 So I think I will start with Exhibit C, if  
12 we can.

13 Would it be accurate to say that when you  
14 listed the tracts -- let me start that over.

15 Would it be accurate to say that the  
16 tracts listed were identified as all of the acreage  
17 that is both in the storage facility and in any  
18 given section and that would be one tract?

19 A. I think so.

20 Q. That was a bad question. Sorry. So let  
21 me just -- tract number 1 includes all lands in  
22 Section 27 that are also in the storage facility;  
23 is that right?

24 A. I'm -- the one I'm looking at is maybe  
25 different. I'm looking at --

1 Q. Oh, sorry.

2 A. -- storage 1, but I anticipate that your  
3 question is -- the answer is yes.

4 Q. Yeah. Let me grab the one you're on real  
5 quick. Okay. So tract 1 refers to Section 34 on  
6 the application you're looking at in Exhibit C to  
7 the storage agreement; is that right?

8 A. It does.

9 Q. Okay. And so it's only 120 acres, and I'm  
10 presuming that that is because tract 1 includes all  
11 acreage from Section 34 that is also in the storage  
12 facility; is that accurate?

13 A. That is accurate.

14 Q. And is that how you determined each  
15 separate tract would essentially be a separate  
16 section and all of the land from that separate  
17 section then is also within the storage facility?

18 A. That is correct.

19 Q. Okay. And so just as one example, tract  
20 number 1 refers to Section 34, Township 142 North,  
21 Range 87 West, and that has 120 acres and a tract  
22 participation factor of 0.40754336 percent. Would  
23 it be fair to say that that is the percentage of  
24 the total acreage that tract 1 makes up of the  
25 storage facility?

1           A.     Yes.

2           Q.     Okay.  And so if we go up to Exhibit B.

3           MR. BENDER:  Did you say B or D?

4           MR. BRAATEN:  Exhibit B, as in boy.

5           MR. BENDER:  Okay.  Thank you.

6           MR. BRAATEN:  And it is the tract summary.

7           Q.     (MR. BRAATEN CONTINUING)  And there,  
8           again, we have tract number 1, Section 34, Township  
9           142 North, Range 87 West, 120 acres, but we have  
10          three different owners of interest each with, we'll  
11          just say, 40 acres each.

12          A.     Mm-hmm.

13          Q.     And so they each have 33.3 percent tract  
14          participation and that is the tract participation  
15          factor for that tract number 1 and their interest  
16          in it; is that accurate?

17          A.     Yes.

18          Q.     Okay.  And then the storage facility  
19          participation would essentially -- well, let's just  
20          go straight across the top line for Gerald.  So  
21          essentially what this means, then, is for tract  
22          1 -- and I don't know, Gerald may have other  
23          tracts, but let's say that Gerald just owns tract  
24          1 -- what this says is that Gerald's interest in  
25          that tract is 33 percent and therefore you would

1 multiply that -- well, actually, how do you get  
2 from the tract participation to the storage  
3 facility participation?

4 A. Sure. Let me grab one number and I can  
5 explain it. May I see Exhibit 5A? I think we had  
6 it below us here. I have it. Exhibit 5A shows  
7 that the total acreage for the Summit Carbon -- or  
8 for the SCS1, TB Leingang, as 29,444.72 acres. If  
9 you were to divide 40 by that number, you would see  
10 that Gerald -- he pronounces his name Gerald --

11 Q. Thank you.

12 A. -- at .00135848 or .13584799 -- or 779 --

13 Q. Okay.

14 A. Sorry.

15 -- percent.

16 Q. So the storage facility participation  
17 number would be the proportionate share of the  
18 acreage for that individual landowner based on  
19 their interest in that tract if we are following  
20 their name across the row in your Exhibit B? That  
21 was bad. Let me start over.

22 So let's start with Gerald. If we go  
23 across, that storage facility participation number  
24 is .13584779?

25 A. Correct.

1           Q.     That would be his -- and putting aside  
2     potential other interests, but if we assume this is  
3     his only interest, what that is indicating is  
4     that's his proportionate interest in the storage  
5     facility based on his percentage interest in  
6     tract 1?

7           A.     That is right.

8           Q.     Okay. How did Summit determine which  
9     landowners it would ask the Commission to  
10    amalgamate for its projects? And just so I'm not  
11    confusing you, I'm not trying to ask for names  
12    here. What I mean is not -- not the people, but  
13    how did you decide which tracts of property or what  
14    land you needed to amalgamate for purposes of the  
15    project and the applications?

16          A.     Sure. The unleased landowners inside the  
17    storage facility boundary.

18          Q.     Okay. Why the ones that are inside the  
19    storage facility boundary?

20          A.     So development of CO<sub>2</sub> or CO<sub>2</sub> storage  
21    projects requires the cooperation of multiple  
22    parties, and because their land is internal or  
23    inside of that boundary, we know that it will be  
24    impacted, or said differently, have CO<sub>2</sub> stored in it  
25    and that's why we're seeking to amalgamate that

1 interest to develop the rights of the other  
2 93 percent on average.

3 Q. How was the storage facility boundary  
4 determined?

5 A. By the geologic model.

6 Q. Based on landowners that need to be  
7 amalgamated or what was the basis for the  
8 boundaries as set?

9 A. (BY MR. BOESHANS) Yeah. So maybe I can  
10 help with that one. So the storage facility  
11 design, or said different, simulation determines  
12 the boundary or the plume extents at the end of  
13 20 years of injection. Then we also modeled the  
14 stabilized plume and then established the boundary  
15 outside of that generally following describable  
16 lines. It would have curved lines. We followed a  
17 describable boundary that included buffer around  
18 that.

19 Q. How far did you place the storage facility  
20 boundary from the extent of the modeled plume?

21 A. The boundary was not always consistent.  
22 In other words, we didn't just use the same buffer  
23 everywhere.

24 Q. What's the range?

25 A. Don't recall specifically. I would say it

1 ranges between 500 feet, thousand feet, somewhere  
2 in that neighborhood per my recollection, and maybe  
3 as much as half a mile or so.

4 Q. With respect to the modeled CO<sub>2</sub> plume --

5 A. Mm-hmm.

6 Q. -- that line was drawn based on literally  
7 what the model generated for the external  
8 boundaries of that plume; right?

9 A. Yeah. I'll let Amanda testify more  
10 specifically to that, but that was my understanding  
11 is we were looking at the -- the model output for  
12 the plume boundary at the end of 20 years of  
13 injection. And then, additionally, the plume  
14 boundary -- or the stabilized plume boundary  
15 approximately 16 years later or I forget exactly  
16 the name, but the stabilized plume boundary, and  
17 that's what -- then we developed a storage boundary  
18 outside of that.

19 Q. Did someone at EERC make the decisions on  
20 the extent of the buffer area between the  
21 stabilized plume boundary and the buffer zone -- or  
22 the storage facility boundary?

23 A. No. They had -- they had input on it, but  
24 we made the decisions -- Summit made the decisions.

25 Q. Based on what considerations?

1           A.     Based on all the things I mentioned, along  
2     with kind of the -- the -- which included, you  
3     know, describable boundaries, reasonable buffer and  
4     participating landowners.

5           Q.     So you didn't draw the boundaries to  
6     exclude unleased owners that you weren't able to  
7     get leases from?

8           A.     So if we had adequate buffer, we would --  
9     we would not -- try to -- try to minimize the  
10    amalgamation or the force --

11          Q.     How do you determine whether the buffer is  
12    adequate?

13          A.     Basically, we know that the boundaries, if  
14    you will, that are identified, you know, by the  
15    modeling are at -- on thousand-foot blocks,  
16    thousand-foot grid cells, and 5 percent saturation,  
17    so we know what we start out with. It's fairly  
18    thick to begin with. And then ultimately from that  
19    we look at what is a reasonable boundary or buffer  
20    that we have -- I would describe it as confidence  
21    the plume will stay -- plume will stay inside of  
22    and have included margin for error.

23          Q.     What was the range of the buffer area from  
24    the plume limit?

25          A.     As I recall, it was around 500 feet to a

1 half mile, maybe more. Again, I'd have to go back  
2 and look specifically or we'd have to look  
3 specifically at those. I don't recall them off the  
4 top of my head.

5 Q. But you're saying the model was using  
6 thousand-foot blocks?

7 A. Yes. The grid cell size was a thousand  
8 feet, as I recall it.

9 Q. Why 5 percent saturation and not something  
10 lower?

11 A. I'm going to defer that one to the -- to  
12 the EERC team.

13 Q. Why did you use 5 percent?

14 A. I used 5 percent because that's what the  
15 standard that EERC had indicated had been used in  
16 other permits, to my knowledge.

17 Q. Do you have any actual testing?

18 A. What kind of testing?

19 Q. Any.

20 A. Again, I -- what kind of testing?

21 Q. Testing to determine the saturation.

22 A. No. Testing to determine the saturation,  
23 it's predicted by the model from my understanding.

24 Q. If you're using thousand-foot blocks, how  
25 can that model tell you anything about where to put

1 a buffer in a 500--to-2,000-foot range?

2 A. Again, I'm going to defer that to the  
3 reservoir engineering and geoscience team that is  
4 more knowledgeable on the model and the software  
5 and its reliability and predictability and how it's  
6 been used.

7 Q. Is it your understanding that a change in  
8 the 5 percent saturation could change the extent of  
9 the plume model?

10 A. Again, that's outside of my specific area  
11 of expertise and knowledge on how the model works,  
12 but I would anticipate change of saturation  
13 would -- potentially could change the boundary,  
14 push it into a different cell.

15 Q. And it's your testimony that EERC is the  
16 one who made the decision on -- well, let me start  
17 that over.

18 With respect to the saturation percentage,  
19 generally speaking, is it your testimony that the  
20 folks at EERC made the decisions related to that  
21 percentage and the modeling?

22 A. The EERC team of experts made a  
23 recommendation to us on percentage saturation that  
24 as I understand was consistent with what other  
25 projects had done, and that's what we used in

1     developing the -- the permit application. But,  
2     again, they'll be testifying later. They can speak  
3     more specifically to the exact methodologies and  
4     workings of the software.

5           Q.     Is there any reason you would want to hide  
6     that data from further review?

7           A.     Hide what data?

8           Q.     The data used by EERC to create the model.

9           A.     Not to my knowledge. I believe it's  
10    submitted to the -- to the DMR.

11          Q.     The raw data for the model is submitted to  
12    the DMR?

13          A.     I'm going to let them testify  
14    specifically, but that's my understanding is that  
15    the model itself has been submitted to the DMR.

16          Q.     Do you know when?

17          A.     I don't know exactly the date.

18          Q.     Was it within the last four weeks?

19          A.     No. It would have been prior to that.

20          Q.     And you're testifying that the data -- the  
21    data decks and the model itself were all submitted  
22    to the DMR?

23          A.     Again, I'll have to, you know, defer to  
24    the team that put all of the submittals into the  
25    DMR. It is my understanding that the geologic

1 model was submitted to the DMR.

2 Q. Is there a reason that you would not want  
3 people to have the data to assess that model?

4 A. No, I don't -- I don't think so. I --  
5 it's my understanding that that, once submitted to  
6 the DMR, is publicly available. But, again, my  
7 understanding.

8 Q. Can I have you turn to Section 1.15 and  
9 the definition of Storage Reservoir.

10 I'll ask a quick question first. I was  
11 going to ask some questions about, for example, the  
12 variation or range of vertical depth of pore space  
13 throughout the reservoir. Would those be better  
14 for the EERC folks?

15 A. Yes.

16 Q. Okay. Let's go down to 1.16 for Storage  
17 Rights, then. From where does Summit obtain  
18 storage rights to explore, develop and operate  
19 lands within the facility area?

20 MR. BOESHANS: Jeff, I'll defer to you.

21 A. (BY MR. SKAARE) So I'm a little confused  
22 by the question. Are you wondering -- well, maybe  
23 you can ask it in a different way so I can  
24 understand the question.

25 Q. Does Summit have any rights to explore,

1 develop and operate lands within the facility area  
2 for the storage of storage substances as those  
3 words are used in Section 1.16 of the storage  
4 agreement?

5 A. Yes. Under the terms of the lease.

6 Q. Which lease?

7 A. To the extent that we have leased owners,  
8 and then this would tie back, of course, to the  
9 lease that we're -- we've attached as Exhibit D.

10 Q. Okay. So as defined, storage rights are  
11 the rights to explore, develop and operate lands  
12 within the facility area for the storage of storage  
13 substances, and your testimony is that the source  
14 of those rights is the -- or are the leases signed  
15 with the individual pore space owners as well as  
16 the lease attached as Exhibit D to the storage  
17 agreement; is that accurate?

18 A. I think that's fair.

19 Q. When you sign a lease -- one of the pore  
20 space leases with one of the landowners who signed,  
21 how is it that you get rights from signing a  
22 contract with them?

23 A. Well, I think the question's basic, and I  
24 don't mean this to sound -- we've entered into a  
25 property right agreement --

1 Q. Yeah.

2 A. -- through the terms of a lease.

3 Q. Yep.

4 A. Is that the question you're asking me?

5 Q. And are they conveying property rights to  
6 you in exchange for money?

7 A. Yes.

8 Q. And so in that situation, there's a  
9 consensual transaction by which that landowner  
10 transfers specific property rights to Summit?

11 A. That is correct.

12 Q. In the case of Exhibit D attached to the  
13 storage agreement, there's no consent from any  
14 landowners, so by what power is that imposed on a  
15 landowner if not by his consent?

16 A. If the Commission were to enforce  
17 Exhibit D, the rights to inject and store carbon  
18 dioxide under the terms of that lease would exist  
19 in paragraph 4, but I understand that that's an  
20 imposed lease.

21 Q. And what power does the Commission have to  
22 impose a contractual document on a North Dakota  
23 citizen?

24 A. I think that's more of a legal question.

25 Q. Are you a lawyer?

1           A.     I am.   So that's -- the powers granted by  
2     the legislature in 38-22 to allow for the  
3     amalgamation is the power that is granted to the  
4     Commission through the legislature.

5           Q.     And what is the Commission doing when it  
6     amalgamates property rights?

7           A.     Again, not trying to be flippant, I mean,  
8     they're amalgamating the rights -- i mean,  
9     they're -- can you expand on the question? I'm not  
10    sure I understand the next --

11          Q.     After the Commission amalgamates property  
12    rights, does Summit end up with some property  
13    rights that previously belonged to a landowner?

14          A.     I would say yes, that's fair.

15          Q.     Because the Commission took it from them  
16    and gave it to you?

17          A.     I wouldn't characterize it like that. I  
18    think the Commission's working under the authority  
19    granted to it by the State legislature.

20          Q.     Authority to take private property; right?

21          A.     To amalgamate interests across multiple  
22    owners for the development of CO<sub>2</sub>. I understand the  
23    question, yes, it is the property --

24          Q.     In order to amalgamate the owners, what  
25    you're doing is taking their property rights and

1     telling them you no longer have the right to  
2     exclude me from your property. I'm coming on  
3     whether you like it or not, and that means that you  
4     now have a property right, the right to exclude,  
5     that they used to have, but now they don't have and  
6     you do have, all by virtue of the Commission order;  
7     is that accurate?

8             MR. BENDER: Objection. Argumentative.  
9     Compound.

10            HEARING EXAMINER GARNER: Sustained.

11            Q.     (MR. BRAATEN CONTINUING) Can Summit  
12     operate the storage facility without amalgamating  
13     it?

14            A.     No.

15            Q.     Why not?

16            A.     Much like oil and gas, in order to develop  
17     a resource, in this case pore space, would require  
18     the cooperation of multiple landowners for  
19     development into that formation.

20            Q.     And what happens if they don't cooperate?

21            A.     The same thing we've just discussed which  
22     is an order for amalgamation.

23            Q.     What happens in oil and gas when they  
24     don't cooperate?

25            A.     An unleased landowner has certain

1 statutory rights regarding the development of oil  
2 and gas.

3 Q. And you do oil and gas law; right?

4 A. I do.

5 Q. They get their just and equitable and  
6 their proportionate share in the reservoir; right?

7 A. So a nonleased landowner in North Dakota  
8 who decides to go nonconsent to a well is subject  
9 to a risk penalty, and upon completion of that risk  
10 penalty, they are entitled to their proportionate  
11 share of the minerals that they reserved or own in  
12 that particular unit, and I believe there's a  
13 statutory provision for a royalty along the way.

14 Q. So essentially what they get is a  
15 16 percent interest cost free, meaning on gross,  
16 and the remainder 84 percent on net revenue?

17 A. After the imposed risk penalty.

18 Q. Which is statutorily prescribed to be just  
19 for oil and gas?

20 A. Yes. That's true.

21 Q. So if we want to apply oil and gas law to  
22 the Summit project, let's go up to Exhibit B,  
23 specifically Exhibit B, the Tract Summary attached  
24 to the storage agreement. Gerald's just and  
25 proportionate equitable share if we were talking

1 about an oil and gas reservoir would  
2 be .13584779 percent; right?

3 A. Yes.

4 Q. And under the oil and gas laws you were  
5 just talking about, it would be that percentage  
6 split out into a 16 percent on gross and an  
7 84 percent on net revenue?

8 A. In oil and gas when it is the extraction  
9 of an existing mineral, yes.

10 Q. Right. Because that mineral isn't owned  
11 by the operator necessarily; it's owned by the  
12 mineral owners?

13 A. That's right.

14 Q. Just like the pore space is owned by the  
15 surface owners?

16 A. I understand. Yes.

17 Q. Can I have you turn to Section 2.4 of the  
18 storage agreement in the application, Exhibit 1A.  
19 There's a Section 2.4 on correcting errors, and the  
20 second sentence says, "If it subsequently appears  
21 that any Tract, mechanical miscalculation or  
22 clerical error has been made, Storage Operator,  
23 with the approval of Pore Space Owners ... shall  
24 correct the mistake."

25 Can you just tell me what is meant by a

1 "mechanical miscalculation"?

2 MR. BENDER: Can I help?

3 MR. BRAATEN: Yeah, please.

4 MR. BENDER: I think that's a typo. I  
5 think that should say mathematical.

6 MR. BRAATEN: Okay. That makes more  
7 sense.

8 Q. (MR. BRAATEN CONTINUING) Okay. So in the  
9 same exhibit, at Section 3.1 we had some discussion  
10 of this, but it states that any pore space owner in  
11 the storage facility who owns a pore space interest  
12 in the storage reservoir that is not leased for the  
13 purposes of this agreement and during the term  
14 hereof, shall be treated as if it were subject to  
15 the pore space lease attached hereto as Exhibit D.

16 Is Summit willing to adjust that Exhibit D  
17 to ensure there is no surface occupancy as it has  
18 done for some of the signed lease owners?

19 A. Yes, we would do that.

20 Q. Okay. Can I have you go down to Section  
21 8.1 of the storage agreement. 8.1 states, "Grant  
22 of Easement. Storage Operator shall have the right  
23 to use as much of the surface of the land within  
24 the Facility Area as may be reasonably necessary  
25 for Storage Operations in the injection of Storage

1 Substances."

2 Does that apply to unleased lands, surface  
3 lands?

4 A. As written today, it does.

5 Q. And would Summit also change that  
6 provision so that it does not apply to unleased  
7 surface lands?

8 A. Yes. I -- I think it was implied in my  
9 answer that consistent with the leases that we sent  
10 to everybody in the spring of -- excuse me -- the  
11 fall of '23 and again in the spring of '24, we've  
12 included that no surface-facilities clause and so  
13 it's an easy thing to provide. And so we can add  
14 that to the Exhibit D pore space lease.

15 Q. Okay.

16 A. And -- and then it would have its impact  
17 in here as well, if that's the question, subject to  
18 Exhibit D.

19 Q. Okay. As it's written right now, with the  
20 landowners who have signed leases with Summit --

21 A. Mm-hmm.

22 Q. -- do their leases give Summit explicitly  
23 the right to use as much of the surface of the land  
24 within the facilities area as may be reasonably  
25 necessary for operations?

1           A.     No, it does not.

2           Q.     Okay.  So this is granting additional  
3 rights to Summit to use the surface of property  
4 that is leased as well as unleased?

5           A.     So as I testified earlier in direct, we do  
6 not anticipate additional surface usage  
7 specifically towards facilities, roads, pipelines,  
8 et cetera.  There may be needs for ingress and  
9 egress for purposes of various studies or  
10 otherwise.

11          Q.     And are you saying that if your existing  
12 leases and agreements with the landowners don't  
13 give you those rights of ingress and egress, you're  
14 asking the Commission here to grant those rights to  
15 you regardless of whether you have them in the  
16 private contracts; is that accurate?

17          A.     No.  Our existing leases do have rights of  
18 ingress and egress.

19          Q.     Okay.  So I want to back up, though.  Do  
20 you think that this provision 8.1 gives Summit any  
21 rights on the surface of landowners who have signed  
22 leases that aren't already explicitly in the lease?

23          A.     So it -- in its language it states "as may  
24 be reasonably necessary."

25          Q.     In the lease or in this?

1           A.     In this clause.

2           Q.     Okay.  And that --

3           A.     So --

4           Q.     Sorry.  Go ahead.

5           A.     I'm sorry too.  The storage operator shall  
6     have the right to use as much of the surface of the  
7     land within the facility area as may be reasonably  
8     necessary for storage operations and the injection  
9     of stored substances.  I read that sentence in its  
10    entirety, and there is an imposed reasonableness  
11    standard on what's there.  So unless it's  
12    reasonably necessary, I -- I think it's limited by  
13    "reasonably necessary."

14          Q.     Does the grant of an easement to do what  
15    is reasonably necessary for your operations expand  
16    your rights to use the surface of any of the lands  
17    that are leased?

18          A.     I don't believe it expands the rights when  
19    we have an existing lease.  We have an existing  
20    written contract when there is a lease.

21          Q.     So it's not your intent to obtain any  
22    rights to use the surface beyond the rights  
23    explicitly granted in your leases with respect to  
24    the properties that are under lease?

25          A.     With respect to the properties that are

1 under lease, that is correct.

2 Q. Okay. And with respect to the unleased  
3 properties, would it be accurate to say that you're  
4 asking the Commission to give you the property  
5 rights necessary to do what is reasonably necessary  
6 for your storage operations on the surface of those  
7 unleased lands?

8 A. Yes. That's correct.

9 Q. By what authority do you think the North  
10 Dakota Industrial Commission can grant anyone the  
11 right to use the surface?

12 MR. BENDER: I'm going to object with  
13 respect to his characterization of "anybody."  
14 We're not talking about anybody. We're talking  
15 about the operator of the pore -- of the storage  
16 unit.

17 MR. BRAATEN: That's fair. I'll withdraw  
18 the question and reask.

19 Q. (MR. BRAATEN CONTINUING) By what  
20 authority do you think the North Dakota Industrial  
21 Commission can grant Summit property rights  
22 sufficient to allow it to do what is reasonably  
23 necessary for storage operations on the property of  
24 the intervenor landowners I represent?

25 A. So the North Dakota Industrial Commission

1 is operating under North Dakota Century Code  
2 Chapter 38-22 and its administrative rules which I  
3 believe are 43-01-05. I might have that backwards.

4 Q. Two -- 2-05.

5 A. Oh, 2-05? Allow me to look. 43-05-01.

6 Q. Oh, we're both wrong.

7 A. And so I think that the authority, to  
8 answer your question, comes both from the  
9 legislature and the Century Code and then based on  
10 the rules that they've developed.

11 Q. What provision of Chapter 38-22 provides  
12 any authority to do anything, amalgamation or  
13 otherwise, to the surface lands as opposed to the  
14 pore space?

15 A. I would say under 38-22-03 entitled  
16 Commission Authority, which reads, "The Commission  
17 has authority over all persons and property  
18 necessary to administer and enforce this chapter  
19 and its objectives."

20 Q. And so are there no limits on the  
21 Commission's authority as long as that's what  
22 they're doing?

23 A. I think that's a mischaracterization.

24 Q. Well, I'm asking. I'm not saying that's  
25 what you said.

1           A.     Certainly there are limitations, much like  
2     the reasonableness standard that's in the draft  
3     storage agreement.

4           Q.     And what are those limitations?

5           A.     I would say limited to the extent  
6     necessary to develop and store CO<sub>2</sub> under Century  
7     Code.

8           Q.     Would you agree it's also limited by the  
9     mandates and prohibitions of the constitution of  
10    North Dakota?

11          A.     So I'm not a constitutional lawyer. I  
12    don't know that I have an opinion on that.

13          Q.     Well, as a lawyer, do you support and  
14    uphold the constitution --

15          A.     I do.

16          Q.     -- as a practicing lawyer?

17          A.     Yes, I do.

18          Q.     Does that trump the other law?

19          A.     Does -- when you say "that" --

20          Q.     The constitution?

21                MR. BENDER: Mr. Examiner, I think we're  
22    getting into areas now where we're arguing legal  
23    issues, and I don't think this is the appropriate  
24    way to make those legal arguments.

25                HEARING EXAMINER GARNER: Sustained.

1           Q.     (MR. BRAATEN CONTINUING) Can I have you  
2     turn to Section 8.4 of the agreement that we're  
3     looking at. There's a reference to the surface and  
4     subsurface operating rights, and it references use  
5     of water. Can you explain the ways that you  
6     understand Summit intends to use water from the  
7     reservoir in the formation?

8           A.     (BY MR. BOESHANS) Yes. I would say this  
9     is more of a question for the drilling operations  
10    and that team. My understanding is that as we  
11    drill the well and maintain the well, we have needs  
12    to pull samples or move fluids in or out of the  
13    reservoir during the drilling and completion  
14    process, but they can speak more specifically to  
15    that.

16          Q.     Are the drilling folks the folks from  
17    EERC?

18          A.     No. They're members of our team.

19          Q.     Okay. And is it like a separate drilling,  
20    like, consultant or they're actual employees of  
21    Summit?

22          A.     We have employees of Summit that will --

23          Q.     Okay.

24          A.     -- be testifying here.

25          Q.     Okay. Are you asking in this provision

1       for the Commission to grant property rights or  
2       ownership rights to the water or just the ability  
3       to use the water in the drilling operation?

4           A.     I would defer to Jeff here as well. My  
5       understanding is that we're requesting the  
6       permission to use the water as needed to facilitate  
7       operation and injection of CO<sub>2</sub>.

8           Q.     So I'll ask a couple questions just to  
9       kind of explain what I'm getting at here.

10          A.     Sure.

11          Q.     The -- are you aware that, generally  
12       speaking, until put to beneficial use, water in  
13       North Dakota is generally all considered waters of  
14       the state?

15          A.     Mm-hmm.

16          Q.     And to the extent any waters in the  
17       reservoir have not been put to any kind of  
18       beneficial use, they may be deemed to be waters of  
19       the state. And so my question is simply in here  
20       are you asking to be able to use the waters in the  
21       reservoir as necessary for your operation, or are  
22       you asking for the State to actually grant you the  
23       right to that water in that reservoir to use  
24       however you please?

25               MR. BOESHANS: Sure. Jeff, I'll let you

1 take that. That's more of a definition.

2 A. (BY MR. SKAARE) Sure. "Except to the  
3 extent modified in this Agreement, Storage  
4 Operator" -- "Operator shall have the same rights  
5 to use the surface and sub-surface and use of water  
6 and any other rights granted to Storage Operator in  
7 any lease covering the Pore Space Interests." I  
8 understand that to mean the rights to use water  
9 where necessary. Our needs for water will be  
10 privately contracted for drilling.

11 Q. So just to use perhaps a slightly  
12 ridiculous example, you don't have plans and it's  
13 not your intent that you would be able to, then,  
14 open up a water depot and start pumping water out  
15 and selling it?

16 A. That would not be commercially reasonable.  
17 It would not -- no. Absolutely.

18 Q. Okay. And so if we were in the oil and  
19 gas context -- and you can object -- but generally  
20 what you're saying is what you're asking for is the  
21 ability to use the water in the reservoir as  
22 reasonably necessary for your operations; is that a  
23 fair statement?

24 A. That is correct.

25 Q. Okay. Turn down now to Exhibit D, the

1 Form of Pore Space Lease, that we've referred to a  
2 few times. It's in the application.

3 A. I am there.

4 Q. In Section No. 2 under the Term, there's a  
5 reference to bonus payment of \$20 per acre and an  
6 annual rental of \$4 per acre for the initial term.

7 MR. BENDER: I think you may have misread  
8 that, Mr. Braaten. Mine says \$25.

9 MR. SKAARE: So does mine.

10 MR. BRAATEN: What did I say?

11 MR. SKAARE: 20.

12 MR. BENDER: You said 20.

13 Q. (MR. BRAATEN CONTINUING) Sorry. Let me  
14 start that over. So I read this to say they're  
15 paying a bonus payment of \$25 per acre and it  
16 states that's a single one-time bonus payment. And  
17 an annual rental of \$4 per acre for the initial  
18 term. How did Summit decide upon those numbers for  
19 the bonus and rental?

20 A. (BY MR. BOESHANS) Yeah, I would say kind  
21 of two ways. We initially started with numbers  
22 that were consistent with coal leases and coal  
23 leasing that I had familiarity with in obviously my  
24 previous experience. They were then adjusted from  
25 there based on negotiations with the landowners.

1 Those are some of the terms that changed during  
2 the -- the negotiations.

3 Q. And then just to follow up on that,  
4 there's a Section 3, Royalty, that has a 50 cent  
5 per metric ton and then later percentage increases.  
6 Did you decide on those numbers the same way as the  
7 bonus and the rental?

8 A. That's what we ultimately started with.

9 Q. Okay.

10 A. And then, again, same deal as -- through  
11 negotiations, they were adjusted.

12 Q. And the coal leases, are those with just  
13 one operator or numerous operators?

14 A. You're -- you're asking me for my points  
15 of -- point of reference?

16 Q. Yeah.

17 A. Yeah. With numerous.

18 Q. Okay. And those were North Dakota coal  
19 leases?

20 A. Correct.

21 Q. Were any of them new leases signed within  
22 the last 50 years?

23 A. Yes. Haven't been in the business  
24 50 years.

25 Q. What companies are still leasing coal in

1 North Dakota?

2 A. I don't know specifically who's actively  
3 leasing or not leasing. We were leasing when I was  
4 at BNI.

5 Q. When you were leasing at BNI, had you  
6 adjusted the rates you were paying since the 1930s?

7 A. We had.

8 Q. How much, just percentagewise?

9 A. Well, I wasn't there in the 1930s.

10 Q. No. That's fair. Sorry. I didn't mean  
11 to imply you were.

12 A. I know I'm getting gray, but -- I am gray.

13 Q. Okay. So how many times did you adjust or  
14 change the bonus or rental or royalty amount that  
15 you were offering landowners for a pore space  
16 lease? And I'm speaking now -- sorry. We were  
17 talking about BNI. So I'm talking Summit now. In  
18 the time with Summit, how often did Summit adjust  
19 the bonus, rental or royalty in response to their  
20 negotiations with the landowners?

21 MR. BOESHANS: Maybe I could defer to Jeff  
22 here as well. We -- I don't recall specifically  
23 the order in which the changes were made, but we  
24 were moving those around or adjusting them through  
25 the negotiations, but I don't recall was it all at

1       once or multiple steps. My recollection is it was  
2       multiple steps, but I'm going to defer to Jeff and  
3       his -- his --

4           A.       (BY MR. SKAARE) Sure. So we began  
5       negotiations in September of '21, made significant  
6       offers -- and when I say "significant," we reached  
7       out to a large number of landowners. We started to  
8       see some of these leases come in. We received  
9       feedback from a number of people, including some of  
10      your clients, regarding multiple terms. Those  
11      terms included annual rental, and I'm going off of  
12      memory. They included increase in royalty, an  
13      increase in the extension term bonus. They  
14      included percentage increase year over year. They  
15      included favored nations. And perhaps others that  
16      I'm not recalling at the moment.

17           Q.      And, I'm sorry, I should have asked that  
18      question more specifically, but what I -- what I'd  
19      intended was just -- and let me actually start --  
20      break it down and ask some different questions.

21                   Is the \$25-an-acre bonus, \$4-an-acre  
22      rental and 50 cent per metric ton the monetary  
23      offer made by Summit in the first pore space leases  
24      you mentioned that were set out -- sent out?

25           A.      No.

1           Q.     And what was the opening offer that Summit  
2     made to landowners?

3           A.     If my memory serves me correct, the bonus  
4     payment of \$25 an acre is consistent. The royalty  
5     was 25 cents. The annual rental was \$2 per acre.  
6     And the reason the majority of the changes came  
7     together, though discussed with multiple  
8     landowners, is primarily due to the favored nations  
9     clause, at which point we sent out a first  
10    amendment to our pore space agreements to anyone  
11    who had signed prior to provide them with the same  
12    terms as what we eventually came to from the  
13    negotiations on -- as I testified was 450-plus  
14    different landowners.

15          Q.     And so once you had given all of the  
16    landowners that most favored nations clause, you  
17    were unable to modify things for any additional  
18    landowners negotiating with you without changing  
19    all the other agreements. Is that your testimony?

20          A.     With respect to compensation, yes. Well,  
21    may I qualify that? Any change applied to  
22    everyone.

23          Q.     And so other than the change such as the  
24    no surface-facilities clause we discussed, what  
25    were the changes to the compensation level you just

1 mentioned, you simply didn't make changes for other  
2 landowners in individual negotiations; is that  
3 right?

4 A. I think that's correct, yes.

5 MR. BOESHANS: Change to compensation.

6 MR. BRAATEN: I included that, yeah.

7 Q. (MR. BRAATEN CONTINUING) So other than  
8 the coal leases you say you looked at when you  
9 started developing this, did you gather any  
10 information or do any research or investigation  
11 other than that to arrive on monetary amounts to  
12 put into the leases?

13 A. (BY MR. BOESHANS) With my -- you know, in  
14 my former role I was aware of compensation related  
15 to Minnkota's project, but other than that, at the  
16 time there weren't any other public available  
17 references, if you will, lease terms around CO<sub>2</sub>  
18 projects that I was -- had access to. And so the  
19 only thing from a CO<sub>2</sub> perspective, market  
20 perspective that I had was the one project that I  
21 was familiar with. And --

22 Q. But -- I'm sorry. Go ahead.

23 A. So, yeah, that was kind of the -- that was  
24 what I would describe as the extent of it.

25 Q. Okay. Can I have you turn to Section 17

1 of Exhibit D to the storage agreement in the  
2 application, Exhibit 1A. Sorry, we've got exhibits  
3 within exhibits. That got a little long. But we  
4 are looking at Exhibit 1A, the application. Within  
5 that exhibit there is a storage agreement, and  
6 attached to that storage agreement is Exhibit D  
7 which is the Form of Pore Space lease.

8 A. (BY MR. SKAARE) Yep.

9 Q. Within that Exhibit D, Section 17 I'd like  
10 to direct your attention to.

11 A. I am there.

12 Q. Thank you. So this section states that  
13 the bonus and royalty amounts contemplated and paid  
14 to lessor hereunder is compensation for, among  
15 other things, damages sustained by lessor for lost  
16 land value, lost use of and access to lessor's land  
17 and lost value of improvements, if any, and to the  
18 extent applicable.

19 So if Summit needs to access some of its  
20 facilities and it drives across the farm field  
21 planted with wheat and takes out part of a farmer's  
22 crop and that farmer is unleased, this provision  
23 says they don't get damages for the part of their  
24 crop that was destroyed and they've already been  
25 compensated with the royalty?

1           A.     That is incorrect.

2           Q.     Okay.   Explain how that's wrong.

3           A.     So under paragraph 11 on page D-4, we have  
4     our Hold Harmless and Indemnification.   The intent  
5     of paragraph 17 is essentially acknowledgment that  
6     the bonus and royalties are compensation for the  
7     use of, in this case, the real property or the pore  
8     space.   So acknowledging that if we did permanent  
9     storage, that that particular reservoir may be  
10    unusable in the future, so the clause was intended  
11    to be acknowledgment that the compensation would  
12    utilize and use that pore space.

13          Q.     So then in 17 would it be accurate to say  
14    that the intent is to limit that language as if we  
15    added to the end "rising out of the ordinary and  
16    reasonable operations of Summit"?   And I'm not  
17    asking to amend it.   I'm just trying to make myself  
18    understood here that when you say that the bonus  
19    and the royalty amounts are compensation for lost  
20    land value, lost use of access, you're saying it's  
21    compensation for lost land value, lost use and  
22    access arising from exercising the rights to inject  
23    into the pore space but not I accidentally started  
24    a fire in your field?

25          A.     You are correct.   We are not seeking --

1       your characterization is correct.

2           Q.     Okay. So in Section 16 there's a force  
3       majeure clause. When a force majeure clause is  
4       signed between two parties to a contract, generally  
5       speaking we understand how that's going to work if  
6       there's a dispute, but in the event of force  
7       majeure here if -- well, let me start over.

8                     In the event of a force majeure event to  
9       which Section 16 would apply, who would make the  
10      determination as to whether it was a legitimate  
11      force majeure event for an unleased mineral  
12      owner -- or an unleased surface owner on whom this  
13      contract is being imposed by the Commission?

14           A.     I'm sorry to ask the qualifying question.  
15      Who would make the decision that the force majeure  
16      event happened in an unleased landowner scenario?

17           Q.     Yeah. Maybe a better way to ask it is to  
18      whom should the landowner go to for relief in that  
19      scenario, the Commission or a court?

20           A.     I don't know.

21           Q.     Okay. Let's look at Section 18. If a  
22      landowner gives Summit a warranty of title and  
23      someone else sues Summit saying I own that  
24      property, not Joe over there, does a warranty of  
25      title require that landowner to step in and defend

1 Summit and hire lawyers to defend them?

2 A. Technically, perhaps, but I'm not sure  
3 that's how it works in general practice.

4 Q. But as a matter of law, that landowner who  
5 gave the warranty of title is legally obligated to  
6 provide a defense to Summit because that's  
7 literally what the warranty is; right?

8 A. Sure. Yes.

9 Q. And Summit is asking the North Dakota  
10 Industrial Commission to impose an obligation to  
11 warrant title on a landowner; is that right?

12 A. I understand the question. Yes.

13 Q. That is right?

14 A. It is right.

15 Q. Do you understand how that would even be  
16 possible as a lawyer? Because it starts to sound  
17 like indentured servitude, doesn't it?

18 A. Wouldn't characterize it that far.

19 Q. On that spectrum?

20 A. My answer to warranty of title is  
21 generally that, to be clear, common property law in  
22 my experience in property law is that while, yes,  
23 it does suggest that there be a duty to defend, it  
24 means that your ownership, that you would stand by  
25 that and support in the form of documentation or

1 otherwise that would show your ownership. So if  
2 there was recorded deeds and everything was in  
3 place, that would stand to -- you know, that would  
4 stand as record title. If there were things such  
5 as dresser-drawer deeds or deeds to others, late  
6 filed or after death filed -- excuse me --  
7 recorded, I think we're looking at those types of  
8 warranties that they don't exist or that to the  
9 extent that they're aware.

10 Q. But if you simply said the lessor hereby  
11 represents that to the best of his knowledge he has  
12 no dresser deeds or stray deeds and is not aware of  
13 any unrecorded documents, that would all mean  
14 exactly what you just said.

15 A. Mm-hmm.

16 Q. But then when you used the word "lessor  
17 represents and warrants," that triggers all the  
18 warranties of title and covenants of title that  
19 includes a title warranty, that includes the  
20 obligation to defend, that includes the obligation  
21 to hire lawyers to defend Summit; right?

22 A. Fair.

23 Q. Does Summit believe that the Commission  
24 can impose a warranty of title on an unwilling  
25 landowner to warrant title to another person or

1 company or anyone? Is that what you're asking for?

2 A. I think it would make sense that to the  
3 extent the lease indicates what you're suggesting,  
4 a modification would make sense. That is not our  
5 intention.

6 Q. But you agree that is what it says?

7 A. I don't necessarily agree. I would need  
8 to look at it closely. I don't believe that was  
9 the intention, but I understand the argument.

10 Q. I mean, it says, "Lessor hereby warrants  
11 and agrees to defend title."

12 A. Yes, it does.

13 Q. Real quick, I just want to note that we  
14 had a discussion just now about the warranty of  
15 title and I didn't address that, but there is a  
16 warranty as well in the storage agreement at 7.1.  
17 Would you agree that similarly there it was not the  
18 intent to impose a title warranty on individual  
19 landowners to defend title for Summit?

20 A. Yeah. I think that's fair. And -- and  
21 for the sake of the Commission to know and  
22 understand that, typically the warranty and -- and,  
23 again, this is in practice. If somebody else  
24 claims that they own your land, we are asking that  
25 you would stand up alongside us and say, no, I own

1 my land. And so that was the intention. I  
2 understand the adjustments that may need to be made  
3 for that purpose.

4 Q. Before I leave it again, in the storage  
5 agreement at 10.1, there's a provision on Transfer  
6 of Title. I'll let you get there.

7 A. Thank you. I'm sorry, I was taking notes.  
8 Can you tell me where we're going?

9 Q. I think I sent us to the wrong place  
10 anyway so that worked out. I'll come back to it,  
11 but I do want to check on also to 10.2. It's on  
12 page 13. Oh, sorry, I'm on a different one. I  
13 don't know if my page numbers are the same, but  
14 Section 10.2, Waiver of Rights to Partition.

15 Sort of a similar question, but with  
16 respect to Section 10.2, are you asking the  
17 Commission to issue an order that landowners have  
18 no further rights in perpetuity to bring a  
19 partition action of property?

20 A. No. So a modification may be required  
21 there.

22 Q. And you'd agree that even if the  
23 Commission had jurisdiction over an individual, it  
24 doesn't have jurisdiction to bar partition actions  
25 in perpetuity for a piece of property?

1           A.     That's correct.

2           Q.     Are you familiar with the process, just  
3 generally, that occurs at the end of project and  
4 upon certification to the State of North Dakota?

5           A.     Yes.

6                   MR. BOESHANS:   Generally, yes.

7           Q.     So in the Century Code 38-22-17, it says  
8 that once a certificate is issued, title to the  
9 storage facility and to the stored carbon dioxide  
10 transfers without payment of any compensation to  
11 the State. Are you just generally familiar with  
12 that provision and what it means?

13          A.     I am.

14          Q.     And when that provision states title to  
15 the storage facility and to the stored carbon  
16 dioxide transfers, can you tell me how you  
17 understand, and you not as a lawyer but you as  
18 Summit, how -- or let me ask it better. How does  
19 Summit understand the phrase "title to the storage  
20 facility" and what that means?

21          A.     I would say it is a transfer of the  
22 leasehold rights as well as the stored CO<sub>2</sub>.

23          Q.     And so would another way to say that be to  
24 say that it transfers all property rights Summit  
25 has in the storage facility to the State as well as

1 the stored CO<sub>2</sub>?

2 A. That is fair.

3 Q. Okay. Could one of the unleashed  
4 landowners market the CO<sub>2</sub> being stored?

5 A. No.

6 Q. Why not?

7 A. Under the terms of the lease and also  
8 under the terms of the lease that we intend to ask  
9 for in Exhibit D, ownership to the CO<sub>2</sub> in exchange  
10 for the compensation belongs to Summit or in that  
11 case the State.

12 Q. And if there were no lease, would the CO<sub>2</sub>  
13 being put under land of an objecting landowner  
14 eventually be abandoned there as a matter of law?  
15 Well, let me ask a different question.

16 You indicated that a landowner couldn't  
17 commercialize or market the CO<sub>2</sub> being stored there  
18 and it's because of the provisions of the pore  
19 space leases signed by individuals or by the  
20 provisions of the Form of Pore Space Lease. If the  
21 Commission didn't impose that Form of Pore Space  
22 Lease on a landowner, would there be any barrier to  
23 them pulling the CO<sub>2</sub> out and marketing it?

24 A. Legally or technically?

25 Q. Both. And I understand you can't

1 necessarily speak to all of them, but just whatever  
2 you know.

3 A. To the extent -- so the storage and in  
4 this case the removal would require the cooperation  
5 of multiple landowners, and so I don't believe  
6 technically they could without other agreements.

7 Q. Why couldn't a landowner put a well  
8 directly under their own property into their own  
9 pore space and just pull up whatever's there?

10 A. Because it would likely impact the  
11 surrounding landowners depending upon -- I  
12 understand the question. Yes, assuming it didn't  
13 impact other landowners.

14 Q. Can I have you turn to Exhibit 1A to the  
15 storage agreement and specifically to Exhibit D,  
16 the Form of Pore Space Lease to the storage  
17 agreement, and then specifically Section 25.

18 A. I am there.

19 Q. And 25 states Confidentiality and says,  
20 "Lessor shall maintain in the strictest confidence,  
21 for the benefit of Lessee, all information  
22 pertaining to the compensation paid under this  
23 Lease, any information regarding Lessee and its  
24 business or operations on the Leased Premises or on  
25 any other lands, the capacity and suitability of

1     any Reservoir or reservoirs and subsurface pore  
2     spaces, stratum or strata unitized or amalgamated  
3     therewith, and any other information that is deemed  
4     proprietary or that Lessee requests or identifies  
5     to be held confidential, in each such case whether  
6     disclosed by Lessee or discovered by Lessor."

7                 Is Summit asking the North Dakota  
8     Industrial Commission to impose that prohibition on  
9     free speech on unleased mineral owners and surface  
10    owners?

11            A.     We would strike that clause.

12            Q.     Section 34 of that same document has an  
13    insurance clause.

14                 MR. BENDER:   We'd be willing to strike  
15    that.

16                 MR. BRAATEN:   Okay.   I guess that gets rid  
17    of all my questions.

18            Q.     (MR. BRAATEN CONTINUING)   No.   So I have a  
19    specific one.   Is the intent here that the million  
20    dollar limit is a limit in place with respect to  
21    that tract in that lease or a million dollar limit  
22    for the entire project?

23            A.     I'm not sure.

24            Q.     Okay.   Is Summit only maintaining an  
25    insurance policy with a million dollar limit for

1       this project?

2           A.     (BY MR. BOESHANS)   No.

3           Q.     Okay.   And so just to follow up, this  
4       provision is not indicative of what Summit's actual  
5       insurance levels are but rather what they're  
6       providing within a contract as a contractual  
7       obligation that they will take on for a landowner;  
8       is that fair?

9           A.     I think that's fair, yes.

10          Q.     Okay.

11                HEARING EXAMINER GARNER:   I think now's  
12       probably a good time to take another ten-minute  
13       break.

14                MR. BRAATEN:   Sure.   Thank you.

15                HEARING EXAMINER GARNER:   We're off the  
16       record.

17                (Recessed at 3:03 p.m. and reconvened at  
18       3:18 p.m.)

19                HEARING EXAMINER GARNER:   We are back on  
20       the record.   Mr. Braaten, you were questioning  
21       Summit's witnesses.

22                MR. BRAATEN:   Thank you, Your Honor.

23           Q.     (MR. BRAATEN CONTINUING)   So back to the  
24       insurance provision.   Would Summit do a waiver of  
25       subrogation with respect to the insurance it's

1 carrying for the landowners?

2 A. (BY MR. SKAARE) Yeah, I believe we could.

3 Q. And would that apply to both the  
4 landowners and their renters?

5 A. Well, so waiving rights of subrogation  
6 would prevent any insurance company from recovering  
7 from who is legally held liable.

8 Q. But just as to the landowner and their  
9 renter is what I'm asking.

10 A. I think we could consider that, yes.

11 Q. And would that be a change, then, to  
12 the -- both the Exhibit D form lease as well as the  
13 section in the storage agreement we talked about?  
14 Wait. Now I confused myself. Never mind.

15 I'm just talking about Section 34 of the  
16 Exhibit D. Is that a change that could be made  
17 there?

18 A. I believe we could present something to  
19 that effect.

20 Q. Would the commercial general liability  
21 insurance cover -- that's referenced in Section 34  
22 here cover pollution events or contamination  
23 events?

24 A. I am not sure.

25 Q. Is that something that Summit is willing

1 to have insurance for that covers the landowners?

2 A. I believe we've indemnified under  
3 paragraph 11 --

4 Q. Okay.

5 A. -- for those same purposes.

6 Q. If that's true, is it fair to assume that  
7 you do have insurance for that?

8 A. I would believe we do, yes.

9 Q. And so with respect to whatever insurance  
10 policy Summit has for pollution and contamination  
11 events, can it add the landowners who own the  
12 property as additional insureds on those policies?

13 A. Subject to that language, I think we could  
14 add as additional named insureds. Let me verify  
15 that with my team.

16 Q. I understand.

17 A. There is a legal term of art there that I  
18 would need to address with my legal team.

19 Q. Okay. Is there a reason for -- well, let  
20 me ask: With respect to Section 34 and the million  
21 dollar liability limit, is Summit putting in place  
22 a separate insurance policy for each tract?

23 A. No, I don't believe that to be the case.

24 Q. Okay. So is there one insurance policy  
25 covering all tracts of land with a million dollar

1 limit?

2 A. I believe the limit's -- yes, there is a  
3 policy.

4 Q. Okay. And can Summit add the landowners  
5 to its general liability policy as additional  
6 insureds?

7 A. I would need to talk to our legal team.

8 Q. Okay. Does that seem like a fair thing to  
9 do if you're forcing those landowners into this  
10 facility to take on that risk without any choice in  
11 the matter?

12 A. I think it seems fair, yeah.

13 Q. We were looking at the application earlier  
14 at I think PS-5. Yeah, if you could look at the  
15 application, page PS-5 with the diagram on it.  
16 It's Figure PS-3, project summary map. We talked a  
17 little bit about the facilities and I'm going to  
18 talk about the facilities after the terminus point,  
19 and when I say that, what I mean is essentially  
20 everything downstream from the Midwest Carbon  
21 Express Pipeline.

22 So after that terminus point, we talked  
23 about flowlines. We talked about a valve station  
24 at the terminus point and obviously there's the  
25 Class VI injector wells. What other surface

1 facilities will you have, if any, other than the  
2 ones I just mentioned downstream from that terminus  
3 point?

4 A. (BY MR. BOESHANS) Sure. There's --  
5 that's going to be covered in Section 5 of the  
6 application and there's a diagram in there. It'll  
7 be testified here later when we get to that  
8 section. But, generally speaking, there's a  
9 launcher receiver there. There's metering and  
10 measurement, there's -- as well as -- as I recall,  
11 but, anyway, we'll get into the system layout in  
12 Section 5.

13 Q. And is that one of the folks from EERC  
14 that'll be covering that?

15 A. It will be a person from EERC along with  
16 Jimmy Powell, our chief operating officer.

17 Q. Okay. And I see that you have positive  
18 manual shutoff valves, emergency shutoff valves, a  
19 blow-down, a pressure control valve, some check  
20 valves and block valves. Have you done any kind of  
21 modeling or investigation or research into the  
22 safety aspects of those valves and what happens  
23 with a valve failure?

24 A. Yeah, again, I'm going to defer those to  
25 Jimmy and the team that comes up here for that

1 specific section.

2 Q. If I have questions about performing LOPA,  
3 or level of protection analysis, or hazard and  
4 operability study, would those also be questions  
5 for those same folks?

6 A. That's correct.

7 Q. I'm going to have you go back up to  
8 Section 3.9 of the storage agreement within the  
9 application. We were talking earlier about  
10 Exhibits B and C to the storage agreement and the  
11 tract participation factors, and I think I was  
12 asking if the participation factor was the  
13 percentage of acreage owned proportionately within  
14 the storage facility. Is that the proportionate  
15 acreage owned in that particular storage facility,  
16 being the Hintz or the Leingang or the BK Fischer?

17 A. (BY MR. SKAARE) I believe I understood  
18 your question. I believe the answer is yes. That  
19 was a little long.

20 Q. So in Sections 3.7, 3.8 and 3.9 of the  
21 storage agreement, there's a discussion of transfer  
22 of storage substances from one storage facility to  
23 another. And it says that this is allowed when the  
24 ownership between the storage facility and the  
25 transfer storage facility is common. What do you

1 mean by -- or what does this contract or storage  
2 agreement mean when it says the ownership between  
3 the storage facility and the transfer storage  
4 facility is common?

5 A. It's not intended to talk about a storage  
6 facility that is adjacent to each other. It is  
7 intended to talk about the storage facilities that  
8 may be in a stacked play.

9 Q. Okay. Makes a lot more sense that way.

10 A. It does.

11 Q. And so this provision doesn't -- or  
12 wouldn't have any applicability unless and until  
13 Summit were to permit an additional storage  
14 facility in a formation above or below the  
15 formation it's targeting with these proceedings?

16 A. That is correct.

17 Q. Okay. Did any of the landowners attempt  
18 to limit the scope of their lease vertically based  
19 on the formation being targeted?

20 A. If you recall, that was a request that you  
21 made.

22 Q. Okay. Did -- did any other landowners  
23 make a request to limit vertically the scope of the  
24 lease with Summit?

25 A. No.

1           Q.     Okay.  Do you have all of the agreements  
2     and rights under contract necessary for any surface  
3     facilities planned at present?

4           A.     Yes.

5           Q.     There was some discussion earlier about  
6     the boundary lines for both the CO<sub>2</sub> plume as well as  
7     the storage facility boundaries.

8           A.     Mm-hmm.

9           Q.     Do you have an understanding of why the  
10    storage facility boundary is required to be drawn  
11    outside of the CO<sub>2</sub> plume?

12          A.     (BY MR. BOESHANS)  Yes.  My understanding  
13    of why the storage boundary is outside of the CO<sub>2</sub> is  
14    so that, you know, kind of per the requirements of  
15    the permit, we're required to operate within the  
16    boundary that we're permitted to operate in.  Okay.  
17    And so we use the methodology described to  
18    determine a boundary, you know, with the  
19    understanding there's five-year review and renewal  
20    and adjustment.  So we've identified the boundary  
21    in our case of outside of the post-injection  
22    stabilized plume area, so --

23          Q.     Is it your position or belief that the  
24    area of the reservoir in which you are operating is  
25    confined to the area of the reservoir into which

1     you are physically injecting CO<sub>2</sub> and it is existing  
2     in the reservoir thereafter?

3           A.     Say that again so I under -- make sure I  
4     got the question.

5           MR. BRAATEN:   Could I have you read it  
6     back.

7           (Record read as requested.)

8           MR. BENDER:   I don't think that the  
9     question's clear.   I think it's ambiguous.   You  
10    aren't talking about whether you're talking about  
11    the areal extent, you're talking about vertical.  
12    So I don't know that he can answer without you  
13    being specific.

14          Q.     (MR. BRAATEN CONTINUING)   Okay.   Well, let  
15    me just take another run at it.

16          MR. BENDER:   What I'm getting at is  
17    there's vertical limits and horizontal limits,  
18    and --

19          MR. BRAATEN:   Right.

20          MR. BENDER:   -- you haven't defined --  
21    perhaps you want him to answer both.   I don't know.

22          MR. BRAATEN:   Yeah.   No.   That's fair.

23          Q.     (MR. BRAATEN CONTINUING)   So let's confine  
24    my question to within -- in between -- vertically  
25    in between the confining layers as defined by the

1 application. So when I am talking about the  
2 reservoir for this question, it's in between the  
3 confining layers. And we'll call that the target  
4 reservoir.

5 A. Mm-hmm.

6 Q. Is it your position or belief that  
7 Summit's operations are confined to that part of  
8 the target reservoir containing actual CO<sub>2</sub> that was  
9 injected by Summit?

10 A. It's my understanding and belief that in  
11 our application we're requesting a permit to store  
12 CO<sub>2</sub> in that -- in this case the Broom Creek  
13 Formation and the confining layers above and below.  
14 If that's what you mean by operations is the  
15 storage of CO<sub>2</sub>, then I would say yes.

16 Q. What else constitutes your operations  
17 other than the storage of CO<sub>2</sub> downhole from the well  
18 injectors?

19 A. So we have monitoring of various, you  
20 know, reservoir formations, monitoring equipment  
21 along the well, monitoring of the plume using 3D  
22 seismic, for example, and so those are all parts of  
23 what I would say the operations is the monitoring  
24 of the activities of the well which we're  
25 monitoring outside of the storage horizons.

1           Q.     Why are you monitoring outside of the  
2 storage horizon?

3           A.     To confirm -- confirm storage or permits,  
4 if you will.

5           Q.     Are you monitoring anything other than the  
6 chemical makeup of the fluids in the reservoir, the  
7 target reservoir?

8           A.     So we're going to get into that, you know,  
9 extensively in the monitoring plan, of course. You  
10 know, we're -- we're monitoring, you know, water  
11 quality at various horizons which will be  
12 identified in the monitoring plan. We are  
13 monitoring the plume movement over time, and that's  
14 covered in the monitoring plan as well.

15          Q.     How do you monitor --

16          A.     We're monitoring the -- or monitoring the  
17 wellbore and doing inspections on the wellbore,  
18 those kinds of things.

19          Q.     How do you monitor the movement of the  
20 plume?

21          A.     We're proposing again in our monitor plan,  
22 which we'll get into that in detail, but we're  
23 planning to monitor it incrementally using -- or  
24 periodically using 3D seismic as our current --  
25 current proposal.

1           Q.    Does any of your monitoring look at the  
2 pressures in the formation?

3           A.    Yes.  There is -- or there are pressure  
4 temperature sensors within the -- within the  
5 wellbore.

6           Q.    Do you get data on temperature and  
7 pressure anywhere other than at the wellbore?

8           A.    We will also get that in the deep  
9 subsurface monitoring wells, stratigraphic wells  
10 that are identified on -- what is it, PS-3 or 4.

11          Q.    How many of those do you have?

12          A.    We have three.

13          Q.    Three stratigraphic -- stratigraphic test  
14 wells?

15          A.    Well, monitoring wells, yeah.

16          Q.    Okay.  How many total monitors do you have  
17 for temperature and pressure within the reservoir?

18          A.    So I'll defer that to the discussion on  
19 monitoring because I don't -- but we have them on  
20 the stratigraphic wells, as I mentioned, deep  
21 stratigraphic monitoring wells.

22          Q.    Why are you monitoring the temperature and  
23 pressures in the reservoir?

24          A.    Again, I'm going to defer to the -- to the  
25 team that presents the monitoring plan to give you

1 the specifics on the recommendations and why we're  
2 doing that.

3 Q. Do you know what the Safe Drinking Water  
4 Act says about where to place the boundaries for  
5 your storage facility?

6 A. I do not specifically.

7 Q. Do you think that the boundaries as  
8 defined by the Safe Drinking Water Act for the  
9 protection of freshwater aquifers is the same as  
10 the area within which you need to obtain property  
11 rights for your project?

12 A. Say that again.

13 Q. Do you believe that the area required to  
14 be used for a storage facility in the Safe Drinking  
15 Water Act is the same as the area within which you  
16 need to acquire property rights for your project?

17 A. I would say I don't specifically know  
18 that.

19 Q. Who would know that?

20 A. (BY MR. SKAARE) So if I can ask, are you  
21 asking if the Safe Water Drinking Act applies?

22 Q. No. I'm asking if the boundaries required  
23 by the Safe Drinking Water Act are the same as the  
24 boundary around the property rights that you needed  
25 to acquire for your project?

1 MR. BENDER: We have another witness that  
2 we're going to call who will be able to answer that  
3 question.

4 Q. (MR. BRAATEN CONTINUING) You guys don't  
5 know the answer?

6 A. I'm not sure I understand the question.

7 MR. BRAATEN: I have nothing further.

8 HEARING EXAMINER GARNER: Any questions  
9 from the staff?

10 **EXAMINATION**

11 **BY MS. MADCHE:**

12 Q. I'll jump in here first. Just as a  
13 preamble before I start asking my questions,  
14 because we are listening to these as combined cases  
15 for all three applications, if I ask a question and  
16 it applies to all three, by all means provide the  
17 answer for each individual one. I'll try to  
18 clarify if I think there's going to be a question  
19 that would be more consistent across all three or  
20 an individual question.

21 And to start out, my questions here I'm  
22 going to be talking about are within the Project  
23 Summary section of the three applications.

24 So in your Exhibit 2A through 2C that you  
25 had provided showing the business structure for the

1 three LLCs, I just want to have you clarify that  
2 when you have SCS Carbon Transport LLC listed as  
3 the flowline operator, that you are intending to  
4 mean that the three flowlines for these three  
5 facilities will be operated by SCS Carbon Transport  
6 LLC but the ownership will still be under the  
7 individual Summit Carbon Storage, LLCs; is that  
8 correct?

9 A. (BY MR. BOESHANS) That's correct.

10 Q. You currently stated that you have 57  
11 ethanol plants with contracts on. Is it fair to  
12 state at this time all of those ethanol plants are  
13 currently emitting all of their CO<sub>2</sub> production that  
14 they make?

15 A. Yes, to the best of my knowledge.

16 Q. How many miles of MCE pipeline, the  
17 transmission pipeline, is within the PSC  
18 jurisdiction in North Dakota?

19 A. So there's -- okay. You're asking how  
20 many miles within the --

21 Q. Of the transmission pipeline, how many  
22 miles are in North Dakota that would be under PSC  
23 jurisdiction?

24 A. I'm going to defer to Jimmy on that  
25 question. My recollection is it's 352 miles, but,

1 again, that -- I want to make sure that we get the  
2 right number.

3 Q. On page PS-3 of all three applications,  
4 you report that the three storage facilities  
5 combined over a 20-year proposed injection period  
6 were modeled to be able to store approximately 352  
7 million metric tons of carbon dioxide which would  
8 be on average around 17.6 million metric tons a  
9 year. Additionally, later on on that page you  
10 state that the Midwest Carbon Express, the MCE  
11 transmission pipeline, is being designed to  
12 transport 18 million metric tons a year. Can you  
13 provide approximately how many metric tons you  
14 currently have contracts for?

15 A. Yes. Couple of things there. The current  
16 design of the MCE pipeline system is 18 and a half  
17 million metric tons. With the 57 plants we have  
18 approximately 16 million tons -- or they emit  
19 approximately 16 million tons that could be  
20 captured.

21 Q. And as a follow-up to that, if you ended  
22 up getting to a point where you have contracts with  
23 a value that is up to what your current design is  
24 for the MCE pipeline, would you just be looking at  
25 additional storage facilities to be permitted to

1 take on the additional capacity?

2 A. That's correct.

3 MS. MADCHE: Those are the only questions  
4 I have for this group. Thank you.

5 **EXAMINATION**

6 **BY MR. STOLLDORF:**

7 Q. I'm going to talk a little bit about  
8 Section 1 of the pore space to start off with, and,  
9 again, some of these answers may relate to SCS2 and  
10 3. Please answer for all of them if you can.

11 Within the proposed storage facility area  
12 shown, it's both Figure 1-1 on page 1-2, or it's  
13 Exhibit A, the tract map of the storage agreement.  
14 In relation to that, has any pore space been  
15 severed from the surface estate since April 9,  
16 2009?

17 A. (BY MR. SKAARE) No.

18 Q. Is that the case for SCS2 and 3 -- 1, 2  
19 and 3?

20 A. That is the case for all three units.

21 Q. Was any pore space leased from the surface  
22 owner prior to Summit leasing of the storage  
23 facility?

24 A. No, for all three units.

25 Q. Is the storage facility and proposed well

1 sites, testing and monitor equipment, flowline --  
2 and flowline located on or proposed to be located  
3 on any Indian lands, historic or archeological  
4 sites?

5 A. (BY MR. BOESHANS) No.

6 Q. Okay. And is that for all of them?

7 A. Yes, for all three.

8 Q. Have you guys seen the written comments  
9 from the North Dakota State Historical Preservation  
10 Office that was sent on May 15, 2024?

11 A. (BY MR. SKAARE) I have.

12 Q. And do you intend to meet their requests?

13 A. We do.

14 Q. Will the development or operations of the  
15 storage facility affect hydrocarbons, coal reserves  
16 or any other potential mineral zones?

17 MR. BENDER: The next witness will handle  
18 that question.

19 Q. (MR. STOLLDORF CONTINUING) Okay. I will  
20 defer -- based on that answer, I will defer a  
21 couple questions and go to a couple of errors we  
22 found on the land descriptions.

23 A. Okay.

24 Q. The -- provided as part of the storage  
25 facility area, a document called the Unit Legal

1 Description for KJ Hintz, we'll need an amended  
2 copy. The errors are in Township 142 North, Range  
3 85 West, Section 7. It's listed as all of this  
4 section is within the storage facility area. This  
5 instead appears to be the west half and the west  
6 half of the northeast quarter, the northwest  
7 quarter of the southeast quarter and the south half  
8 of the southeast quarter. Did you catch all that?

9 MR. BENDER: Do you have tract numbers?

10 MR. STOLLDORF: No, but we could pull them  
11 up.

12 Q. (MR. STOLLDORF CONTINUING) And then the  
13 second one is Township 142 North, Range 86 West,  
14 Section 25 where it states the east half of the  
15 northeast quarter. This instead appears to be the  
16 west half of the northeast quarter.

17 A. Understood.

18 Q. And that is all for that section. Oh, no.  
19 No. I've got a couple more.

20 MR. STOLLDORF: Did you find that tract?

21 MS. MADCHE: I'll keep looking.

22 MR. STOLLDORF: Okay.

23 Q. (MR. STOLLDORF CONTINUING) Now we'll move  
24 on to the storage agreement. And Article 1.1  
25 defines carbon dioxide as including incidental

1 associated substances following the definition of  
2 carbon dioxide stream from North Dakota  
3 Administrative Code Chapter 43-05-01. In the pore  
4 space lease section, 3, royalty, page D-2, carbon  
5 dioxides -- CO<sub>2</sub> or carbon dioxides is called out.

6 Is -- the question is is payment based on  
7 the mass of the CO<sub>2</sub> component of the stream only or  
8 the full injection stream mass including  
9 incidental?

10 A. I believe it is on the full stream, but  
11 there is someone better able to answer that  
12 question.

13 Q. Okay. Can you briefly explain why you  
14 used the Milton Flemmer 1 as the type log in  
15 Article 1.15 for all three storage agreements?

16 MR. BENDER: We'll have another witness  
17 who can answer that question.

18 MR. STOLLDORF: Okay. I think that's --  
19 sorry, I'm moving to a different question based on  
20 your answer.

21 Q. (MR. STOLLDORF CONTINUING) I'm going to  
22 move to Article 5, Tract Participations. In the  
23 storage agreement you indicate the tract  
24 participation is based a hundred percent upon the  
25 ratio of surface acreage within the facility area.

1 Can you explain the reasoning behind using land  
2 basis rather than pore volume?

3 A. Sure. We believe that using a tract basis  
4 provides an equitable method for compensating all  
5 landowners based upon the life of the project.

6 Q. In Article 8, you touched on some of these  
7 things earlier in cross-examination. Just a couple  
8 things I wanted to clarify. That this use of  
9 the -- the activities this is going to cover  
10 includes like the location of monitoring equipment  
11 for soil, gas, Fox Hills groundwater wells and also  
12 any seismic equipment or activity?

13 A. That is correct.

14 Q. Okay.

15 A. And for the Commission's understanding,  
16 we'll continue to work as we have with willing  
17 landowners for every opportunity.

18 MR. STOLLDORF: Okay. I think that's all  
19 I have for that section and you guys.

20 MS. MADCHE: So just to jump in, for the  
21 two corrections, the first one was in tract 23.  
22 The second one is tract 56.

23 MR. BENDER: Thank you for that.

24

25

**FURTHER EXAMINATION**

**BY MS. MADCHE:**

Q. And just one additional item in the storage agreement and the pore space lease agreement. There is a note, so in Article 1.15 you're currently defining the storage reservoir is including both the upper and lower confining zone in addition to the injection zone, and then in Article 3.6 where you talk about injection rights, it states, The storage operator is granted to inject into the storage reservoir any storage substances in whatever amounts the storage operator may deem necessary.

I just want to clarify, again, that the injection and storage of CO<sub>2</sub> should only occur within the injection zone and not within the confining zones.

A. (BY MR. BOESHANS) Yeah. Understood.

MS. MADCHE: Thank you.

**EXAMINATION**

**BY MR. SUGGS:**

Q. All right. I'll try to bat cleanup here. A couple of things. First, there were a number of items that were discussed through the surface use agreement and the lease attached to Exhibit D as

1 possible amendments to language within both. I  
2 guess at this time I'm going to ask that whatever  
3 that amended language is proposed to be, that it be  
4 worked up and submitted as a supplemental.

5 And that -- I've got a -- I don't know if  
6 it's a complete list, but there was a discussion  
7 on -- so in the surface agreement it would be 3.3,  
8 2.4, 7.1, 10.2 and 8.1, and then I think 25 and 34  
9 of Exhibit D is what I caught. I might have missed  
10 a couple.

11 A. (BY MR. SKAARE) Would you mind repeating  
12 that so I can cross-reference my notes?

13 Q. Okay. All right. So I had notes on  
14 3.3 -- so surface agreement -- I'll start with  
15 surface agreement, 3.3, 2.4, 7.1, 10.2 and 8.1.

16 A. That matches.

17 Q. And then in the Exhibit D, I had Article  
18 24 and 34?

19 A. That matches my notes.

20 Q. I'm also going to request -- the court  
21 reporter is currently working up a transcript. I'm  
22 going to request that the transcript be provided as  
23 a supplemental exhibit after the hearing.

24 Wade, specifically, there was a fair  
25 amount of discussion as to the economics and the

1 effect that this project would have on the North  
2 Dakota economy. And per your preamble in the  
3 project summary on PS-3, you indicate that the CO<sub>2</sub>  
4 storage is critical to both agriculture and energy  
5 industries in North Dakota. Is it your intent at  
6 this time that the Commission will make a  
7 determination with respect to 43-05-01-17 and the  
8 fees required for submission -- or for injection of  
9 CO<sub>2</sub> and whether or not those fees shall be charged  
10 pursuant to part A of that or part B, part A being  
11 they contribute to the North Dakota energy or  
12 agricultural economies, and part B, they don't? Is  
13 it your -- so the question is are you requesting  
14 that that determination be made as a part of this  
15 hearing?

16 A. (BY MR. BOESHANS) Yeah, our request is  
17 that the Commission make the determination on  
18 Summit's project part A or part B.

19 Q. And you understand that if the  
20 determination were to be that it did not contribute  
21 and was subject to 1B, that we would need a  
22 supplemental -- or not a supplemental -- subsequent  
23 hearing to determine what those fees should be set  
24 at?

25 A. I do understand that, yes.

1           Q.     With respect to that request, I'm going to  
2     ask for another supplement of what you provided as  
3     Exhibit 3A identifying, I guess, each of the  
4     capture facilities that you have identified there  
5     and where their locations are. It's probably  
6     sufficient just to indicate which states they're in  
7     or just number them and give us the name so we can  
8     determine whether or not they're -- where exactly  
9     they are.

10          A.     Understood.

11          Q.     With respect to the cases on the docket  
12     for the establishment of the pool and field  
13     boundaries associated with these facilities,  
14     does -- does Summit have any opposition or any  
15     concern if the field boundaries are established as  
16     the facility area boundaries, and the storage  
17     reservoir or pool defined in those would be  
18     equivalent to the storage area as proposed in the  
19     surface use agreement?

20          A.     No.

21          Q.     I'm going to ask this here, though it may  
22     be appropriate for another witness. On your Figure  
23     1-1, page 1-2, this is the map illustrating the  
24     pore space. Looking at Section 35 and 141-88, it  
25     would look like the plume boundary is almost

1       equivalent if not at the exact same point as the  
2       storage facility boundary. The line appears to be  
3       at the same spot.

4           A.     So can you say the diagram you're looking  
5       at again?

6           Q.     So Figure 1-1, it's on page 1-2 of the  
7       application.

8           A.     Okay. Yes. I have it now.

9           Q.     And, again, so Township 141, Range 88,  
10       Section 35, there's a little portion of the  
11       identified stabilized CO<sub>2</sub> plume extent that is at  
12       the same point as the storage facility area -- at  
13       the line that the storage facility area identifies.  
14       So it looks like there's no buffer there. Is that  
15       intentional or is that something that should be  
16       directed at another witness?

17          A.     Yeah, we have another witness that can  
18       testify to the specifics, but there is a buffer  
19       there.

20          Q.     Okay. Do you know what that buffer is?

21          A.     We'll have another witness testify exactly  
22       the buffer.

23          Q.     And would the other witness also be the  
24       person to direct the odd shape of the plume? So  
25       when I say "the odd shape of the plume," there's a

1     little carveout in the middle. It looks like no CO<sub>2</sub>  
2     is going to affect that central area.

3           A.     Yes. I think we'll defer that to the next  
4     section here --

5           Q.     Next group.

6           A.     -- the geologic modeling and simulations,  
7     to answer that.

8           Q.     Okay. There was a fair bit of discussion  
9     on Section 8 of the storage agreement. And I just  
10    want to point out that, I guess, there's -- Article  
11    8.3 within -- within there indicates that the  
12    damages will be paid to any surface owners  
13    disturbed at the surface; is that correct?

14          A.     (BY MR. SKAARE) That is correct.

15          Q.     One minor typo in the surface use  
16    agreement, Article 15.1, I believe the title of  
17    that section should be bolded and underlined.

18          A.     (BY MR. BOESHANS) Oh, Term?

19          Q.     Yep. Single word.

20                 Article 16.2 on page 15 of the storage  
21    agreement, I'm not a lawyer so I'm just looking for  
22    what this language means. The joinder and dual  
23    capacity language here, I don't really want to  
24    quote it at you -- I think you can read it  
25    yourself -- but what is the intent of that article

1 and specifically with respect to the "and any  
2 additional interest thereafter acquired" language?

3 MR. BENDER: Do you want me to take a  
4 crack at it?

5 MR. SUGGS: I don't care who answers it.

6 MR. BENDER: You don't have any objection?

7 MR. BRAATEN: No.

8 MR. BENDER: If there were a situation  
9 where the operator, Summit, who is the operator,  
10 and also owned an interest in the pore space, by  
11 executing the storage agreement, they'd be  
12 executing basically as both parties, both as an  
13 operator and as an owner of the pore space.

14 MR. SUGGS: So with that explanation, it  
15 would have nothing to do with anything that a  
16 landowner acquired after the point at which they  
17 executed?

18 MR. BENDER: I don't believe so. It would  
19 be -- it -- it would apply to a situation, though,  
20 if Summit were to sign this as a -- as a joint  
21 owner and then acquired additional surface  
22 interests, that surface interest would then be  
23 basically agreed upon with this language. If -- if  
24 that's something you -- I don't know that it's --  
25 it's certainly not necessary in -- in this

1 | agreement, so it's something that I can speak with  
2 | my clients and see if we can't get it resolved.

3 MR. SUGGS: Okay. Add that to the list of  
4 supplemental language adjustments.

5 MR. BENDER: Okay.

6 MR. SUGGS: Okay. That's all I've got.

7 Thank you.

8 EXAMINATION

9 BY MR. BOHRER:

10 Q. Just a couple quick questions, Jeff, on  
11 Exhibit 5A, if you go to page B-3. That would be  
12 as good as any.

13 A. (BY MR. SKAARE) And what page was that?

14 Q. B-3. On the very right column there's  
15 blank columns, and we'll look at tract number 8, in  
16 the life estate those columns are filled out all  
17 the way across, and then there's four blank ones  
18 there. What's the -- what's the meaning of that --  
19 those interests or whatever they are with basically  
20 zero participation?

21           A.     Sure.  So as you look specifically on page  
22     B-3, tract number 8, JoAnne Skalsky owns a life  
23     estate.  The -- the parties listed below her are  
24     the remaindermen such that upon her death, they  
25     gain the interest in the property.

1 Q. Okay.

2 A. And so we joined them in our pore space  
3 lease because they own a future interest.

4 Q. Okay. And then with your no surface  
5 facility, no surface occupancy discussion and any  
6 amendments that may take place with that, would it  
7 be your intent that that language would not  
8 preclude Summit from conducting future seismic  
9 operations?

10 A. That is correct. It is a no surface  
11 facilities.

12 MR. BOHRER: Thank you.

13 MR. SUGGS: Apologies, I do have two more  
14 things to address.

15 **FURTHER EXAMINATION**

16 **BY MR. SUGGS:**

17 Q. There was a fair bit of discussion about  
18 the NAICS code, the industrial codes. The  
19 provision in the rules, 43-05-01-07, it's part 3.c  
20 indicates that four standard industrial  
21 classification codes which best reflect the  
22 principal products or services provided by the  
23 facility shall be provided as part of the  
24 application. To date, the codes that have been  
25 provided for other facilities have listed either

1 the ethanol facility -- that have been related to  
2 the ethanol facility that was being used or the  
3 industrial entity as the source of the CO<sub>2</sub> in the  
4 case of DGC. I don't recall what it was, but it  
5 was related to the synfuels plant.

6 The code you provided would indicate it  
7 was pipeline related as the source of the CO<sub>2</sub> as far  
8 as the sequestration facilities were concerned. Do  
9 you have the code or do you know what it is or can  
10 you supply it for ethanol facilities as the source  
11 of the CO<sub>2</sub>?

12 A. (BY MR. BOESHANS) We could supply it. I  
13 don't have it.

14 Q. We'll probably request that. If another  
15 witness doesn't have it available, we'll request  
16 that that probably be provided as well as the  
17 potential -- well, at this time you're not  
18 including the alternate source of the CO<sub>2</sub> as the --

19 MR. BENDER: Mr. Suggs, one of our  
20 witnesses is going to talk about Section 12 in  
21 the -- in the application. He would be the witness  
22 to address the question about the codes.

23 MR. SUGGS: Okay. That's fine. We'll --  
24 we'll hit it there then.

25 Q. (MR. SUGGS CONTINUING) And then one --

1     one more, I guess, piece of clarification. When  
2     you were being questioned, Wade, regarding the  
3     model and what was submitted to the Commission, you  
4     indicated that the model had been submitted to the  
5     Commission, the whole model. Point of just  
6     clarification, what is submitted to the Commission  
7     is the numerical simulation in the GEM software  
8     which includes the model as it was imported from  
9     the geologic model that the EERC developed in  
10    Petre -- or Petrel. Sorry. So we don't have the  
11    whole geologic model. What we have is the version  
12    of it that comes in through the numerical  
13    simulation. So just a point of clarification on  
14    that testimony.

15           A. Yeah. That's my understanding as well,  
16    and certainly Amanda can testify on more specifics  
17    as needed related to what was submitted to the DMR  
18    in that regard.

19           MR. SUGGS: And that's all I've got.  
20    Thank you.

21           HEARING EXAMINER GARNER: Any redirect,  
22    Attorney Bender?

23           MR. BENDER: No redirect.

24           HEARING EXAMINER GARNER: Okay. Call your  
25    next witness.

1 MR. BENDER: Okay. We'll be calling  
2 Amanda Douglas and Caitlin Olsen.

3 HEARING EXAMINER GARNER: Okay.  
4 Ms. Douglas, please raise your right hand.

5 AMANDA DOUGLAS,  
6 being first duly sworn, was examined and testified  
7 as follows:

8 DIRECT EXAMINATION  
9 BY MR. BENDER:

10 Q. Amanda, state your full name for the  
11 record, please.

12 A. Amanda Jordan Douglas. I'd just like to  
13 note that I do go by Amanda Livers-Douglas, so you  
14 may hear that as well today.

15 Q. And, Amanda, by whom are you employed by?

16 A. The Energy & Environmental Research Center  
17 at the University of North Dakota.

18 Q. In what capacity?

19 A. So I'm an assistant director for  
20 integrated subsurface projects.

21 Q. Can you explain just very briefly what  
22 that title includes in terms of your role with  
23 EERC?

24 A. Yes. So I oversee and manage the  
25 collection of geophysical and geologic

1     characterization data. I also manage and serve as  
2     an advisor on commercial, carbon capture and  
3     storage development projects. I also oversee and  
4     manage a team of geoscientists, including ten  
5     geologic modelers.

6           Q.     Okay. And I'd like you to highlight for  
7     us your educational background and work experience.

8           A.     I have a bachelor's from -- in physics  
9     from Concordia College in Moorhead, Minnesota, and  
10    I have a master's in geology from the University of  
11    Kansas.

12                   My work experience includes three years as  
13    a graduate research assistant at the Kansas  
14    Geological Survey where I worked on a professional  
15    seismic crew, and eight years of employment at the  
16    EERC.

17           Q.     Amanda, what are some of your duties and  
18    responsibilities with respect to your employment  
19    with EERC generally and specifically with respect  
20    to the project that's before us today -- or  
21    projects?

22           A.     So as previously stated, my roles at the  
23    EERC with respect to this project in particular, I  
24    oversaw the development of several sections of the  
25    storage facility permit application. I also

1     advised on data collection as well as geologic  
2     modeling and simulation.

3           Q.     And it's my understanding that you had  
4     direct involvement in Sections 2 and 3 as well as  
5     Appendix C; is that correct?

6           A.     That's correct.

7           Q.     Okay. Let's turn your attention to  
8     Sections 2 and 3 of the application. Can you  
9     provide us with a brief overview of what your  
10    testimony will cover?

11          A.     Yes. So I'll be providing a high-level  
12    overview of the key takeaways from Section 2, 3 and  
13    associated appendices which are Appendix A and C.

14          Q.     Okay. And Wade provided us with sort of a  
15    high-level overview of the project. What I'd like  
16    you to do is provide the Commission with a more  
17    detailed overview of the project.

18          A.     Okay.

19          Q.     You'll do that?

20          A.     Yeah.

21          Q.     Okay. Let's start, how was the project  
22    area selected?

23          A.     So as Wade previously testified to, there  
24    are several factors with respect to the technical  
25    considerations related to the suitability of the

1 geology for determining the site location.

2 Previous state and federal funded projects  
3 suggested that this region of North Dakota has  
4 suitable geology for CO<sub>2</sub> storage. Through this  
5 project, acquisition of site-specific data  
6 confirmed the viability of the subsurface geology  
7 for safe and permanent storage of CO<sub>2</sub>.

8 Q. Can you explain for the Commission staff  
9 and opposing counsel why the Broom Creek Formation  
10 in this area is a good candidate for CO<sub>2</sub> storage?

11 A. Yes. So the Broom Creek in this area has  
12 sufficient thickness and porosity and permeability  
13 for the injection and storage of large volumes of  
14 CO<sub>2</sub>. It's also at a depth at which CO<sub>2</sub> would stay  
15 in a super-critical state which is conducive for  
16 the efficient use of pore space.

17 I'd also like to point to figure 2.9 on  
18 page 2-16. So this is a map of the extent of the  
19 Broom Creek Formation in North Dakota showing that  
20 the Broom Creek is laterally extensive across this  
21 project site. The Broom Creek is also overlain by  
22 an upper confining zone that is devoid of  
23 transmissive faults and fractures with sufficient  
24 vertical extent and permeability to serve as fluid  
25 migration pathways, and that upper confining zone

1 is laterally continuous over the storage facility  
2 areas.

3 Q. Amanda, now I'd like you to discuss a bit  
4 the confining zones of the Broom Creek Formation.  
5 You explained for us why the Broom Creek Formation  
6 was selected from the standpoint of it being  
7 prevalent in the area. Can you now discuss for us  
8 the confining zones above and below the Broom  
9 Creek?

10 A. Yes. So the upper confining zone is  
11 considered to be all of the formations from the top  
12 of the Spearfish Formation down to the top of the  
13 Broom Creek Formation. And so I'd like to point  
14 you guys to page 2-19. So we're showing on Figure  
15 2-11 a well log display, and I'd just like to point  
16 you to the upper confining zone which is labeled as  
17 the Opeche/Spearfish.

18 So this is log data from the Milton  
19 Flemmer 1 well, and so at the Milton Flemmer 1 well  
20 the upper confining zone consists of the Spearfish,  
21 Minnekahta and the Opeche. The Minnekahta is  
22 typically used to differentiate between the  
23 Spearfish and the Opeche. At the Milton Flemmer  
24 well, the Minnekahta is approximately 23 feet  
25 thick, but the Minnekahta pinches out. And so

1     that's why we'll refer to the upper confining zone  
2     here as the Opeche/Spearfish because in most places  
3     for this specific storage facility area and the  
4     other two storage facility areas, the  
5     Opeche/Spearfish is undifferentiated due to the  
6     absence of the Minnekahta.

7           Q.     Now, what properties in the upper  
8     confining zone that you just discussed make it a  
9     good seal?

10          A.     So the upper confining zone has a low  
11     permeability and porosity. It also has a high  
12     relative permeability -- or sorry -- a high  
13     capillary entry pressure relative to the injection  
14     zone. It is devoid, as I mentioned, of faults and  
15     fractures with sufficient permeability and vertical  
16     extent to act as a fluid migration pathway. And  
17     it's laterally extensive across the storage  
18     facility areas.

19          Q.     And what data did you use to validate  
20     suitability of the storage complex for CO<sub>2</sub> injection  
21     and long-term storage?

22          A.     So I'm going to point you to the two maps  
23     on page 2-5 and 2-6, which is Figure 2-3 and Figure  
24     2-4. So these maps are showing the data used for  
25     our evaluation as well as the construction of the

1 geologic model. So this includes 2D and 3D seismic  
2 data. It includes site-specific well log, core,  
3 fluid sampling and formation testing data as well  
4 as regional logs, core, fluid samples and formation  
5 testing data.

6 Q. And, Amanda, what are the mechanisms for  
7 geologic confinement?

8 A. So initially as -- after the CO<sub>2</sub> is  
9 injected, it will be contained by the upper  
10 confining zone itself. So the CO<sub>2</sub> is a buoyant  
11 fluid and it will be contained under the effects of  
12 relative permeability.

13 So laterally the CO<sub>2</sub> will be contained via  
14 residual gas trapping, and as CO<sub>2</sub> dissolves in the  
15 formation brine, it'll be confined through  
16 solubility trapping. As mentioned after the -- as  
17 the CO<sub>2</sub> dissolves, the brine it dissolves into will  
18 become more dense and that will eventually sink  
19 lower in the Broom Creek Formation. And over a  
20 much longer period of time, hundreds of years,  
21 mineralization will start to occur and that will  
22 also become a trapping mechanism.

23 Q. Amanda, in your expert opinion, will  
24 geochemical interaction impact seal integrity or  
25 injectivity?

1           A.     So, no, geochemical interactions of  
2     injected CO<sub>2</sub> with the upper confining zone will not  
3     impact the integrity of the confining zone. So we  
4     did an analysis using geochemical modeling. So the  
5     upper confining zones, as I mentioned, are low  
6     porosity and low permeability. We don't expect the  
7     CO<sub>2</sub> to have much interaction with the upper  
8     confining zone, but we wanted to look at an extreme  
9     case or a conservative case what would happen if  
10    the CO<sub>2</sub> did have interactions with the upper  
11    confining zone, would there be any adverse  
12    geochemical reactions that would impact the ability  
13    of the confining zone to contain the CO<sub>2</sub>.

14                So what we did is we used a software  
15    called PHREEQC to do modeling of the upper  
16    confining zone. So the PHREEQC software doesn't --  
17    it uses a transport mechanism of dispersion to  
18    allow CO<sub>2</sub> to flow through the model cells. It  
19    doesn't use permeability to dictate flow in the  
20    model. And so this is a conservative case where  
21    we're able to expose the model cells to that CO<sub>2</sub>.

22                So to populate the model, we used  
23    site-specific geochemical analysis of fluids, of  
24    mineralogy from the core data and CO<sub>2</sub> composition.  
25    So it should be noted for the CO<sub>2</sub> composition we

1     also took a conservative approach where we modeled  
2     the CO<sub>2</sub> stream of 95 percent CO<sub>2</sub> and 2 percent  
3     oxygen. So this is more oxygen -- higher oxygen  
4     amount than is in the anticipated CO<sub>2</sub> stream, as  
5     Wade testified to earlier. We chose to use this  
6     composition for modeling as oxygen is known to be  
7     more reactive, and so we wanted to look at an  
8     extreme case.

9             And even in this extreme case where we're  
10    ignoring permeability, we're allowing CO<sub>2</sub> to contact  
11    the upper confining zone, we're using a CO<sub>2</sub>  
12    composition with higher O<sub>2</sub>, the modeling  
13    demonstrated that action with the CO<sub>2</sub> to the upper  
14    confining zone would result in no adverse effects.  
15    So there is little to no porosity change due to  
16    precipitation or dissolution from the model.

17            Additionally -- sorry --

18            Q.    No. You're fine.

19            A.    Additionally, related to injection we also  
20    did geochemical modeling of the injection reservoir  
21    using CMG's GEM software where we simulated CO<sub>2</sub>  
22    injection into the reservoir, again using that  
23    95 percent CO<sub>2</sub> and 2 percent oxygen case, and we  
24    saw, similarly, little to no effect on porosity due  
25    to precipitation or dissolution of minerals due to

1 the interaction of the CO<sub>2</sub>, so we don't anticipate  
2 geochemical reactions will impact injectivity  
3 adversely.

4 Q. Okay. When the two previous witnesses  
5 were up here testifying, there were some questions  
6 about what sort of impact injection could have on  
7 underground sources of drinking water. In your --  
8 in your expert opinion, will there be any adverse  
9 effects?

10 A. No. There will be no adverse effects on  
11 underground sources of drinking water. As I  
12 previously mentioned, the Broom Creek is overlain  
13 by a competent confining zone that is devoid of  
14 transmissive faults and fractures that could serve  
15 as fluid migration pathways.

16 I'd also like to note that above that  
17 primary confining zone there is approximately a  
18 thousand feet of additional low permeability rock  
19 that will contain the CO<sub>2</sub>. In addition to that  
20 thousand feet, there is another 2,000-plus feet of  
21 impermeable rock below the lowest USDW which we're  
22 defining as the Fox Hills Formation.

23 Q. Now, you indicated that there was no  
24 evidence of fluid migration pathways. How did you  
25 determine an absence of fluid migration pathways?

1           A.     So we looked at several data sets,  
2     including 3D seismic data. We looked at formation  
3     image logs in terms of fracture analysis. We also  
4     did fracture analysis of the whole core that was  
5     collected from the project. Additionally, we  
6     looked at fluid samples to evaluate if the Broom  
7     Creek Formation was hydraulically isolated from the  
8     next porous and permeable zone, which is the Inyan  
9     Kara Formation.

10          Q.     Let's talk a little bit about seismicity.  
11     In your expert opinion, is there a risk that  
12     seismicity will interfere with the containment of  
13     the CO<sub>2</sub>?

14          A.     There is little risk that seismicity will  
15     interfere with containment of CO<sub>2</sub>. So I'm referring  
16     to both naturally and induced seismicity. So there  
17     is a lack of historical earthquakes in North  
18     Dakota. So we've looked at historical earthquake  
19     data. Just one study in the permit that references  
20     this, a study done by Anderson and others in 2016,  
21     on page 2-69, Figure 2-44, shows -- the dots on  
22     this map reflect the historical earthquakes from  
23     the late 1800s to 2015, and there's fewer than 20  
24     historical earthquakes during this time frame.

25                 And so this can be attributed to the

1     general geologic stability of the formation. So in  
2     addition to this stability of the -- the region,  
3     we'll be operating the project under the fracture  
4     pressure gradient of the Broom Creek Formation  
5     which is also lower than the fracture pressure  
6     gradient of the upper confining zone which reduces  
7     risks of induced seismicity.

8           Q.     Now, Commission staff had some questions  
9     of the past two witnesses about commercially  
10    valuable minerals. Do any of the three proposed  
11    storage facilities contain commercially valuable  
12    minerals?

13          A.     Yes. So there is lignite coal reserves  
14    within each storage facility.

15          Q.     And are there any oil-bearing formations  
16    or other hydrocarbon reserves located within the  
17    boundaries of the storage facilities?

18          A.     So the North Dakota Geological Survey  
19    recognizes the Spearfish Formation as the only  
20    hydrocarbon-bearing formation above the Broom Creek  
21    Formation, and that is devoid of hydrocarbons in  
22    the project area. We also found no evidence of  
23    hydrocarbons in formations below the Broom Creek  
24    Formation or within the Broom Creek Formation.

25                 We evaluated this through review of legacy

1 wellbores, existing oil and gas exploration  
2 studies, historical production data which are  
3 discussed in the permit, as well as evaluation of  
4 the mud logs for the three stratigraphic test  
5 wells.

6 Q. What if hydrocarbons were ultimately  
7 discovered within the storage facility area? Is  
8 there some way to develop those hydrocarbons?

9 A. Yes. So engineering controls could be  
10 used to produce hydrocarbons located below the  
11 injected CO<sub>2</sub> at each storage facility area. These  
12 may include, you know, increased mud weight to  
13 account for increased pressure in the reservoir due  
14 to injection. Also, you could potentially drill  
15 horizontally underneath the plume to produce any  
16 potential hydrocarbons that are discovered in the  
17 future.

18 Q. And directional as well; is that correct?

19 A. Yes.

20 Q. Okay. I don't know if you covered this so  
21 I'm going to go back to it just for a moment. I  
22 think you indicated that there were some reclaimed  
23 coal mines in the area. Are there any -- are there  
24 any plans to mine any coal that's in the area?

25 A. So there's a map on page 2-77. It's

1     Figure 2-51. So 2-51 is showing the future and  
2     reclaimed mining areas for the Coyote Creek and the  
3     Beulah Mine, so those are the two mines closest to  
4     the three storage facility areas. So within the  
5     storage facility areas themselves, there is no --  
6     currently there's no future mining plans from  
7     either of these wells.

8             Additionally, operation of the storage  
9     facility area wouldn't preclude future production  
10    of the coal. And the areas where there's surface  
11    facilities for this project, there are no active  
12    coal leases that are known.

13         Q.     And since the storage zone is quite a bit  
14    deeper than the coal in this area, is it a  
15    possibility of mining the coal even though you have  
16    a storage facility in place?

17         A.     Yes.

18         Q.     Okay. Let's -- let's switch now to  
19    Section 3 of the application. And can you briefly  
20    provide an explanation of which permit requirements  
21    are addressed in Section 3?

22         A.     Yes. So Section 3 provides an overview of  
23    the geologic modeling and dynamic reservoir  
24    simulation activities that were conducted to define  
25    the vertical and lateral extents and migration of

1     injected CO<sub>2</sub> as well as the associated pressure  
2     front, the stabilized CO<sub>2</sub> plume and the area of  
3     review.

4           Q.     And can you talk a little bit about the  
5     geologic modeling activities that were conducted  
6     with respect to these three applications?

7           A.     So geologic modeling was conducted using  
8     industry standard methods and Petrel software. So  
9     this included the evaluation of geologic data, the  
10    construction of a structural framework and  
11    distribution of rock and petrophysical properties.

12          Q.     How was the geologic model utilized to  
13    address the permit requirements?

14          A.     The geologic model served as inputs for  
15    the dynamic reservoir simulations. So the dynamic  
16    reservoir simulations were done using industry  
17    standard methods and CMG software.

18                 As mentioned, the dynamic reservoir  
19    simulations were conducted to determine the lateral  
20    and vertical extents of the injected CO<sub>2</sub> to define  
21    the project boundaries.

22          Q.     And how was the area of review delineated?

23          A.     The area of review was delineated using a  
24    risk-based approach developed by the EERC and  
25    published in Matt Burton-Kelly 2021.

1           Q.     Amanda, before I get to the statutory  
2           questions, there were some questions about  
3           previously filed information that ultimately  
4           resulted in what I'm going to call the final form  
5           of the application. Can you just enlighten us as  
6           to when you started working on this project, when  
7           you started filing things with the Commission and  
8           give us a little bit of an idea of what you filed?

9           A.     Previously or --

10          Q.     Yeah.

11          A.     -- the final form?

12          Q.     Yeah.

13          A.     So EERC was -- submitted a contract to  
14          Summit, I believe Wade mentioned, in early 2020.  
15          We began work on collecting the site-specific data.  
16          We helped prepare permit applications and we  
17          submitted draft permit applications to the DMR, I  
18          believe, late spring, early summer of 2023.

19          Q.     And there was some discussion about some  
20          of the data that was submitted and the modeling  
21          that was done. Could you describe just a little  
22          bit of that and what was submitted to the  
23          Commission in terms of the data and providing the  
24          Commission an opportunity to review that data and  
25          do simulations?

1           A.     Yep.   So as requested by the DMR, we  
2           supplied all the shapefiles associated with the  
3           project.   We also provided the geologic model in  
4           the form of the output that was used for dynamic  
5           reservoir simulations.

6           Q.     And is it your understanding that all that  
7           information that was submitted to the Commission  
8           was available to the public?

9           A.     Yes.   And in addition to that, the -- the  
10          majority of the input data for the model is  
11          publicly available.   A lot of the data -- or  
12          majority of the data used in the geologic model can  
13          be found on the NDIC's website which included, you  
14          know, core data, well logs, fluid sample analysis,  
15          as well as formation tests.

16          Q.     Okay.   Now, the statutory questions.   In  
17          your opinion, Amanda, is the storage facility  
18          suitable and feasible for carbon dioxide injection  
19          and storage?

20          A.     Yes.   As I previously mentioned, the Broom  
21          Creek Formation has characteristics that are  
22          conducive for geologic storage of CO<sub>2</sub>, including  
23          being overlain by a competent confining zone.

24          Q.     And in your opinion is the carbon dioxide  
25          to be stored of a quality that allows it to be

1 safely and efficiently stored in the storage  
2 reservoir?

3 A. Yes. So we conducted geochemical modeling  
4 that demonstrated that the anticipated CO<sub>2</sub> stream  
5 will not have adverse geochemical interactions on  
6 the upper confining zone.

7 Q. And, in your opinion, will substances that  
8 compromise the integrity of the storage reservoir,  
9 will they not enter the storage reservoir?

10 A. Yes. So the anticipated CO<sub>2</sub> stream to be  
11 used for the project is not anticipated to have  
12 adverse impact due to geochemical interactions.

13 Q. Okay. And to get a conclusion from you  
14 with respect to some of the things you discussed  
15 having to do with minerals in the area, do the  
16 storage facilities contain commercially valuable  
17 minerals?

18 A. Yes. As previously mentioned, all three  
19 storage facilities contain lignite coal reserves.

20 Q. And as you testified previously, that  
21 doesn't prohibit that this storage facility or  
22 these storage facilities won't prohibit the mining  
23 of those -- of that coal if it's economically  
24 possible to do so; is that correct?

25 A. Yes. That's correct.

1           Q.     Okay. In your opinion, will issuance of a  
2 storage facility permit adversely affect mineral  
3 owners or mineral lessees?

4           A.     No. As previously stated, if there's  
5 hydrocarbon reserves discovered in the future,  
6 there is engineering controls and other methods for  
7 the extraction of those minerals.

8           Q.     And, in your opinion, can the proposed  
9 storage facility be operated in a manner that will  
10 not adversely affect surface waters or formations  
11 containing fresh water?

12          A.     Yes. So as mentioned, the storage  
13 formation is overlain by a competent upper  
14 confining zone that's devoid of transmissive faults  
15 and fractures with sufficient permeability and  
16 vertical extent that could act as a fluid migration  
17 pathway.

18          Q.     And you touched on this in your testimony,  
19 but just a question to confirm. In your opinion,  
20 can the proposed storage facility be operated so  
21 that carbon dioxide will not escape from the  
22 storage reservoir?

23          A.     Yes. As mentioned, it's -- the storage  
24 reservoir is overlain by a competent upper  
25 confining zone that is devoid of -- sorry -- devoid

1 of potential fluid migration pathways.

2 Q. And based on your study and review of the  
3 testimony and exhibits that you've testified here  
4 today and your knowledge of the project as a whole,  
5 in your expert opinion are the horizontal and  
6 vertical boundaries of the storage reservoir  
7 adequately defined and include buffer areas to  
8 ensure that the storage facility is operated  
9 safely?

10 A. Yes. So geologic modeling and dynamic  
11 reservoir simulations were used to define the  
12 vertical and horizontal boundaries of the storage  
13 facility area, and the storage facility area  
14 includes an appropriate buffer.

15 MR. BENDER: That's all the questions I  
16 have for this witness. We'd like to move to  
17 Caitlin Olsen, if we may.

18 HEARING EXAMINER GARNER: Ms. Olsen,  
19 please raise your right hand.

20 CAITLIN OLSEN,  
21 being first duly sworn, was examined and testified  
22 as follows:

23 DIRECT EXAMINATION

24 BY MR. BENDER:

25 Q. Caitlin, can you state your full name for

1 the record, please?

2 A. Caitlin Olsen.

3 Q. And, Caitlin, by whom are you employed?

4 A. The Energy & Environmental Research  
5 Center.

6 Q. In what capacity?

7 A. I am a principal policy and regulatory  
8 strategist.

9 Q. And like Amanda did, what I'd like you to  
10 do is briefly highlight for us your educational  
11 background and work experience.

12 A. I graduated with a bachelor's of science  
13 degree in geology with an emphasis in hydrogeology  
14 from the University of Wisconsin, River Falls. I  
15 started work for the Department of Mineral  
16 Resources where I started as a petroleum engineer  
17 field inspector. I ended here with the Department  
18 of Mineral Resources as a production supervisor.

19 In 2022 -- I held those positions for  
20 eight years, and in 2022 I started working for the  
21 EERC where I -- my position was a senior regulatory  
22 and permitting specialist. My position today with  
23 the EERC is a principal policy and regulatory  
24 strategist.

25 Q. Caitlin, what I'd like you now to discuss

1     for us is what some of your duties and  
2     responsibility are with respect to your employment  
3     with the EERC generally and specifically with  
4     respect to the projects that are before the  
5     Commission today.

6           A.     Sure.  So generally I oversee commercial  
7     CO<sub>2</sub> storage projects and development of their  
8     permits.  I also work in oil and gas regulations  
9     and provide policy advisement there.  Specific to  
10    this storage facility permit, I oversaw the  
11    creation of the storage facility permit and  
12    compliance with regulations.

13          Q.     Okay.  So Amanda spent some time  
14    discussing Sections 2 and 3 in the application.  
15    Let me direct your attention to Section 4 of the  
16    applications.  Can you briefly explain how the AOR  
17    was used to evaluate the region and to meet  
18    specific permit requirements?

19          A.     Sure.  The area of review, as you'll see  
20    on page 4-1, is defined as the region surrounding  
21    the geologic storage project where underground  
22    sources of drinking water may be endangered.  The  
23    AOR in this case contains the storage facility area  
24    boundary, and that is based on the simulation  
25    extent of the stabilized plume.  It includes a

1     one-mile buffer outside of the storage facility  
2     area to encompass the entire area of review.

3           Q.     So can you direct your attention to the  
4     map in the application that depicts the AOR. And  
5     give everyone a little time to get there.

6           A.     If you'll look at Figure 4-3, that map  
7     shows the area of review on the outside in purple.  
8     In farther is the storage facility area denoted as  
9     a black line. And in even farther is the  
10    stabilized CO<sub>2</sub> plume extent. Within this map,  
11    you'll see groundwater wells and one spring.  
12    You'll see the stratigraphic reservoir monitoring  
13    well, the Milton Flemmer 1. You'll see the two  
14    proposed injection wells. And if there were legacy  
15    oil and gas wells present, they would be shown  
16    here, but there are no legacy oil and gas wells  
17    present in this particular permit.

18          Q.     So, Caitlin, after you identified the AOR,  
19    what type of evaluation was conducted by you and  
20    other staff members of EERC?

21          A.     A review of data of public record was  
22    performed where -- for all wells within the storage  
23    facility area and the AOR itself, and included in  
24    that review was any wells that penetrate the  
25    overlying seal, the Opeche/Spearfish Formation and

1 any other wells that might exist in the area of  
2 review.

3 Q. So the first step of evaluating the AOR is  
4 you look for any wells that are drilled in the  
5 area; is that correct?

6 A. That's correct.

7 Q. Okay. And did you identify any wells?

8 A. We did. There's one particular well  
9 that -- only one well in this area of review that  
10 penetrates the upper confining seal, the  
11 Opeche/Spearfish Formation, and that well is  
12 described as the Milton Flemmer 1, which was  
13 drilled specifically for this project as a  
14 stratigraphic test well and as the monitoring well.

15 Figure 4-4 further explains the Milton  
16 Flemmer 1 and how it's constructed. So the Milton  
17 Flemmer 1, during this review process by a  
18 geologist and an engineer, was found to be properly  
19 isolated which prevents the migration of any fluids  
20 into USDWs, and a determination was made that no  
21 corrective action is needed for this well.

22 Q. Now, Caitlin, it's -- it's my  
23 understanding that a reevaluation of the AOR and  
24 corrective action plan period is proposed not to  
25 exceed five years. In your opinion, what would

1 trigger reevaluation prior to the five years and  
2 what sort of reevaluation would that address?

3 A. Yeah. So Summit will comply with North  
4 Dakota rules which is to reevaluate the storage  
5 facility area every five years. Any triggers prior  
6 to that five years where Summit would be required  
7 to reevaluate the area of review and storage  
8 facility area would be if monitoring operational  
9 data requires it or if there's a significant enough  
10 change found in the area of review that would  
11 warrant it.

12 Q. If there were significant changes, what  
13 would happen next, in your opinion?

14 A. Summit would update the model using  
15 history match data or the site-specific data that  
16 they found through injection activities. And then  
17 based on that updated model would work with the DMR  
18 to perform any corrective action if required or if  
19 needed.

20 Q. Now, in addition to the matters that were  
21 discussed by Amanda with respect to confining  
22 zones, what other information and data was used to  
23 assess protection of underground sources of  
24 drinking water within the AOR?

25 A. So aside from looking at the DMR database

1     for the Milton Flemmer 1 well and using Summit's  
2     own records -- alongside using Summit's records and  
3     DMR records for the Milton Flemmer 1 stratigraphic  
4     test well, other data sources were used. Those  
5     data sources to review these wells within the area  
6     of review include the USGS database, the U.S.  
7     Geological Survey database, the Public Service  
8     Commission and the Department of Water Resources.

9           Q.     And did you examine freshwater zones?

10          A.     We did.

11          Q.     Can you explain to us what the lowest  
12     freshwater zone was that you examined?

13          A.     So described on page 4-12, the lowest USDW  
14     in the AOR is the Fox Hills Formation, and together  
15     that comprises -- includes the Hell Creek Formation  
16     to comprise the confined aquifer system that  
17     includes both. The Fox Hills Formation in the AOR  
18     is about 1500 feet deep here and about 250 to  
19     300 feet thick.

20          Q.     Are there any Fox Hills wells in the AOR?

21          A.     There is one Fox Hills well existing in  
22     the area of review. That's included in a map on  
23     the next page -- nope -- on Figure 4-10 on  
24     page 4-17. That well is included to be in the  
25     testing and monitoring plan during the life of the

1 Summit project and is included in the baseline  
2 testing and monitoring plan.

3 Q. So other than the Fox Hills, did you look  
4 at any other freshwater zones?

5 A. Yes. So Summit worked with landowners in  
6 the area to identify any other potential freshwater  
7 zones above the Fox Hills where testing could be  
8 performed. They ground-truthed the area based on  
9 the groundwater well maps that you'll see in Figure  
10 4-3, and during those ground-truthing efforts and  
11 based on depth of wells, a final determination of  
12 the baseline testing and monitoring plan with  
13 respect to groundwater monitoring and the life of  
14 the injection project groundwater monitoring plan  
15 was determined, and the final wells to be included  
16 is shown on Figure 4-10.

17 Q. So other than what you've discussed so  
18 far, what additional protections are in place or  
19 will be in place for underground sources of  
20 drinking water?

21 A. There are multiple impermeable layers  
22 throughout the -- this area. So as Amanda  
23 testified to, directly above the Broom Creek is the  
24 Opeche/Spearfish Formation, and then directly below  
25 the Fox Hill Formation is the Pierre Shale which is

1 an impermeable shale that provides the -- the  
2 protection directly beneath the Fox Hills, and in  
3 between those two impermeable layers are multiple  
4 confining layers that provide protection to USDWs.

5 Q. Caitlin, in your expert opinion, can the  
6 storage facility be operated so that it will not  
7 endanger human health nor unduly endanger the  
8 environment?

9 A. Yes. Engineering safeguards are in place,  
10 and the site consists of ideal geologic confinement  
11 and geologic mechanisms that will protect human  
12 health and the environment from any CO<sub>2</sub> injection  
13 activity.

14 MR. BENDER: No further questions of  
15 Ms. Olsen.

16 HEARING EXAMINER GARNER: Mr. Braaten.

17 MR. BRAATEN: Thank you, Your Honor.

18 **CROSS-EXAMINATION**

19 **BY MR. BRAATEN:**

20 Q. Is there a lower porosity in the lower  
21 confining zone than the upper confining zone?

22 A. (BY MS. DOUGLAS) So Table 2-7b on  
23 page 2-32 contains ranges for permeability as well  
24 as averages from core analysis as well as the  
25 simulation model. With respect to the -- the

1     Amsden Formation, typically the Opeche/Spearfish,  
2     which is the upper confining zone, has lower  
3     permeability than the Amsden Formation, which is  
4     the lower confining zone.

5           Q.     You discussed the Fox Hills freshwater  
6     aquifer. Is that the only freshwater aquifer that  
7     you studied with respect to the application?

8           A.     No. As Caitlin mentioned, we identified  
9     several other freshwater aquifers in the project  
10    area. Additionally, I'll point you to Appendix B  
11    which includes some of the fluid sample analyses.  
12    So one of the other horizon samples listed on page  
13    B-1 includes the Tongue River.

14          Q.     Do you have a depth for where that sample  
15    came from?

16          A.     I don't have one in front of me at this  
17    time.

18          Q.     Is -- do you know whether the Mission  
19    Canyon or Lodgepole or anything in the Minnelusa  
20    Group contains a freshwater aquifer within North  
21    Dakota, as defined by the Safe Drinking Water Act?

22          A.     (BY MS. OLSEN) Are you asking if those  
23    are USDWs?

24          Q.     Correct.

25          A.     The lowermost USDW is the Fox Hills

1       Formation, so nothing below that would be  
2       considered a USDW.

3           Q.     Based on the criteria in the Safe Drinking  
4       Water Act or just classification?

5           A.     Yeah, based on -- I mean, specific -- what  
6       specifically in the Safe Water Drinking Act are you  
7       referring to?

8           Q.     Does it -- does -- are these freshwater  
9       aquifers pursuant to the criteria for a U.S.  
10      drinking water in the Safe Drinking Water Act?

11          A.     (BY MS. DOUGLAS) I can't speak to the  
12      entirety of the Williston Basin or North Dakota,  
13      but within the storage facility area, I do not  
14      believe that they are below 10,000 parts per  
15      million.

16          Q.     How does the permeability of the Spearfish  
17      or the other impermeable zones compare to the  
18      Bakken or the Three Forks?

19          A.     I don't have data from those formations on  
20      hand.

21          Q.     Do you know how it compares generally,  
22      though?

23                   MR. BENDER: Objection. Relevance.

24                   HEARING EXAMINER GARNER: Overruled.

25                   MS. DOUGLAS: I'd say it's comparable.

1           Q.     (MR. BRAATEN CONTINUING) Did you take any  
2 water samples from any areas within the Minnelusa  
3 Group or the Madison Group?

4           A.     We did not. I'm basing that answer on  
5 regional salinity maps.

6           Q.     And based on regional salinity maps,  
7 those -- you're saying the total dissolved solids  
8 for those are above the thresholds in the Safe  
9 Drinking Water Act or below?

10          A.     Above. So they're above 10,000 parts per  
11 million.

12          Q.     Do you know what they are?

13          A.     I don't have those maps on hand, no.

14          Q.     Do you know if they're between 10 and 15  
15 thousand?

16          A.     I don't know that.

17          Q.     Where would that information be contained?

18          A.     Several of those maps can be found  
19 publicly available. I believe the North Dakota  
20 Geological Survey has published some of those  
21 online.

22          Q.     Do you know whether -- well, do you know  
23 for certain whether the total dissolved solids in  
24 any of those -- in any of the water in those  
25 formations -- let me start over.

1           With respect to any waters in the  
2 Minnelusa Group or the Madison Group, do you know  
3 sitting here today that they are below 10,000 total  
4 dissolved solids?

5           A.    I do not know that. We did not sample  
6 that as part of this data characterization plan  
7 regarding potential leakage pathways from the  
8 storage reservoir into those zones. The Amsden is  
9 also devoid of transmissive faults and fractures  
10 that have sufficient vertical extent of  
11 permeability for CO<sub>2</sub> to leak from the Amsden into  
12 lower formations.

13          Q.    Would you make any suggestions on  
14 alternative ways to conduct operations here if you  
15 discovered that there was a U.S. drinking water and  
16 a freshwater aquifer under the Safe Drinking Water  
17 Act in the Minnelusa or Madison Group?

18          A.    So for the operation we'd potentially want  
19 to add additional monitoring of those zones as  
20 well, but I don't believe the injection operations  
21 as a -- in my opinion, I would not recommend any  
22 changes to injection operations besides additional  
23 monitoring.

24          Q.    And when you say you wouldn't recommend  
25 any changes to injection operations, are you

1 referring primarily to the injection pressures and  
2 the max pressure of injection?

3 A. Correct. And targeting the Broom Creek  
4 itself for injection.

5 Could you clarify your earlier question?  
6 You talked about the Madison Group. Did you also  
7 mention the Minnelusa Group?

8 Q. I did.

9 A. So the Broom Creek itself is within the  
10 Minnelusa Group, and so we've sampled that and it  
11 is over 10,000 parts per million.

12 Q. And that sample was from above the Amsden  
13 Formation?

14 A. Correct.

15 Q. So as part of developing this application,  
16 you ran a model in the Petrel software?

17 A. I personally did not, but the EERC team  
18 did, yes.

19 Q. Okay. And ran a model in the GEM  
20 software?

21 A. So I'd say we constructed the model in the  
22 Petrel software and then we used it to run dynamic  
23 reservoir simulations in CMG.

24 Q. And you also used the PHREEQC model for  
25 the geochemical interaction modeling?

1           A.     That's correct.

2           Q.     And did you submit the data decks for each  
3 of those three models to the oil and gas division?

4           A.     So all of the data that was used is either  
5 described in the permit, was provided to the DMR,  
6 or is publicly available outside of the seismic  
7 data.

8           Q.     Did you say that all of the data provided  
9 to the DMR is what is in the permit application?  
10 No. I misheard that.

11                     Did you, EERC, provide the data decks for  
12 those three models to the oil and gas division?

13           A.     Can you define "data decks"?

14           Q.     What do you understand a data deck to be?

15           A.     So the -- the raw data we use is publicly  
16 available. Any assumptions used have been detailed  
17 in the permit. It -- for example, geochemical  
18 modeling, we list the mineralogy from the specific  
19 sample that was used. We listed the CO<sub>2</sub>  
20 composition. We listed the -- some of the  
21 additional other input data, including -- just one  
22 second -- including parameters such as exposure  
23 level and things like that.

24                     So we believe that in the case of  
25 geochemical modeling, they would have all the

1 information they would need to evaluate or  
2 replicate the modeling.

3 Q. You say they would have the data they need  
4 to replicate the modeling. Who's "they"?

5 A. The DMR. In the case of the geochemical  
6 modeling, all the information is publicly  
7 available, so anyone could potentially replicate  
8 these results.

9 Q. Is your education and professional  
10 background in geology or engineering or both?

11 A. So I have a master's in geology with an  
12 emphasis in geophysics, and I have a bachelor's in  
13 physics.

14 Q. Okay. Do you ever talk to coworkers and  
15 other colleagues about the models that we just  
16 discussed?

17 A. That's correct. So as I mentioned  
18 earlier, I actually oversee the EERC's geologic  
19 modeling team.

20 Q. And have you ever heard someone at EERC  
21 use the phrase "data deck"?

22 A. No, we don't use that term.

23 Q. Have you ever heard anyone doing petroleum  
24 reservoir engineering use the term "data deck"?

25 A. The term's familiar.

1 Q. Do you know what a data deck is?

2 A. I think the definition's subjective.

3 Q. Is the well testing data that you used to  
4 tune and develop the permeability model publicly  
5 available?

6 A. The well testing data from the Milton  
7 Flemmer 1 well is publicly available on the NDIC  
8 website, yes.

9 Q. The .DAT file?

10 A. I'm uncertain of the format that's online.

11 Q. What would you do with a PDF file with  
12 that information? It's not really usable; right?

13 A. Depending if it's in tabular or table  
14 format or if it's graphical.

15 HEARING EXAMINER GARNER: You know, now's  
16 a good time to take our last ten-minute break and  
17 then we'll come back and finish up.

18 (Recessed at 5:11 p.m. and reconvened at  
19 5:23 p.m.)

20 HEARING EXAMINER GARNER: We are back on  
21 the record. Mr. Braaten, you were questioning  
22 Summit's witnesses.

23 MR. BRAATEN: Thank you, Your Honor.

24 Q. (MR. BRAATEN CONTINUING) You said that  
25 the data to run the geologic model is publicly

1       available; right?

2           A.     (BY MS. DOUGLAS)   Everything except the 3D  
3       seismic and interpretative volumes from the 3D  
4       seismic.

5           Q.     Can you do it without the 3D seismic?

6           A.     Can we replicate the exact model?

7           Q.     Yeah.

8           A.     No.   Actually let me correct that.   So  
9       based on what's in the permit, yes, because with  
10      the 3D seismic, we used the seismic to interpret  
11      variograms, and the variograms links interpreted  
12      from the seismic were listed here.   The -- the one  
13      thing you might not be able to replicate is that we  
14      used interpreted seismic horizons from the seismic  
15      data for the structural model.   So that would be  
16      not duplicatable without the 3D seismic.

17          Q.     If you were asked to analyze the models  
18      that you created here, as a third party and given  
19      the data you're saying is publicly available but  
20      knowing nothing about the project going in, how  
21      long would it take you by yourself to replicate  
22      these models by going through all of the publicly  
23      available data and reconstructing it, collating it,  
24      organizing it, choosing it, picking your tops?   How  
25      long would it take you to recreate that model?

1           A.     Typically our modeling workflow for a  
2     model of this size and scale with this amount of  
3     data would be approximately six to eight weeks to  
4     go through that process. Keeping in mind with the  
5     formation tops, there are publicly available  
6     formation tops out there. It's a matter of QC'ing  
7     them.

8           Q.     Is that what you did?

9           A.     Yes.

10          Q.     But you chose the formation tops used in  
11     your model; right?

12          A.     So we went through the publicly available  
13     ones and quality controlled them.

14          Q.     How did you do that?

15          A.     So our method is based on core analysis.  
16     So we also looked at core analysis to determine  
17     where we thought the top of the Broom Creek was,  
18     and so we've reported in the permit how we picked  
19     the top of the Broom Creek. So if someone wanted  
20     to pick how we picked it, we report where we pick  
21     it on gamma ray log signatures. That's -- that's  
22     in the permit. And so we evaluate whether the  
23     publicly available picks match that specific  
24     signature in the logs to determine if we're going  
25     to use that top or adjust it.

1           Q.     Without the impedance data, you could not  
2     recreate the model to the same degree of accuracy  
3     as you did; right?

4           A.     The models would be different.

5           Q.     And you said if you had to start from  
6     scratch knowing nothing, you think you could get it  
7     done in -- was it six to eight weeks?

8           A.     Six to eight weeks with the -- with what's  
9     published in the permit and the publicly available  
10    data. I think what's published in the permit  
11    provides a lot of time savings.

12          Q.     And is that time estimate for you and your  
13    team to do that?

14          A.     If we were to replicate this with all the  
15    things in the permit, it would be significantly  
16    quicker.

17          Q.     Meaning it would be quicker if you had  
18    your whole team doing it?

19          A.     No. Quicker if we're replicating using  
20    assumptions, using the variogram links that we  
21    report and stuff like that because we're not  
22    interpreting the data to come up with new variogram  
23    links. So if we wanted to replicate the model  
24    using the -- the permit -- what's in the permit and  
25    the publicly available data, it -- it'd be

1 considerably faster than six to eight weeks.

2 Q. And, again, is that for you and your team  
3 to do that?

4 A. That would be for one or two individuals,  
5 correct.

6 Q. Working full-time?

7 A. Yes.

8 Q. All day, every day?

9 A. Eight hours a day.

10 Q. If we didn't have the impedance data, how  
11 would the model be different?

12 A. So as I mentioned, the main difference  
13 would be the structural surfaces. So your  
14 structural surfaces would be confined with your  
15 well control, so there would be slight variations  
16 on the structure of the formations. Petrophysical  
17 property distribution might be slightly different  
18 as well.

19 Q. Different meaning less accurate?

20 A. Is -- is your -- so --

21 Q. It results in a less predictive model?

22 MR. BENDER: Which question do you want  
23 her to answer, Derrick?

24 MR. BRAATEN: Well, I was clarifying my  
25 prior one.

1 MR. BENDER: Okay.

2 MS. DOUGLAS: So I'd say the models are  
3 different. I think it's subjective how you define  
4 model accuracy.

5 Q. (MR. BRAATEN CONTINUING) But if we define  
6 it as how predictive it is, it would be less  
7 predictive if we didn't have the impedance data?

8 A. It would have potentially less detail in  
9 it.

10 Q. Are you familiar with the PHREEQCi input  
11 files?

12 A. Generally.

13 Q. Did you create one for the PHREEQC model  
14 you ran here?

15 A. Yes, an input file was generated.

16 Q. And did you give that to the oil and gas  
17 division?

18 A. No.

19 Q. Why not?

20 A. The DMR staff did not request it directly.

21 Q. Did you submit that to the EPA's portal?

22 A. What EPA portal are you referring to?

23 The --

24 Q. Did you file it with the EPA?

25 A. No.

1           Q.     Did you have some kind of an input file  
2     that was created for the other two models?

3           A.     The other two models being the geochemical  
4     model for GEM and the geologic model?

5           Q.     Correct.

6           A.     Those models use multiple sources of input  
7     data, so it's not a specific input file.

8           Q.     It's a data deck?

9           A.     You could confine it as a data deck.

10          Q.     Do you have a data package that contains  
11     all of the input files in one zip file or something  
12     similar that can then be used as a load file with  
13     the software programs?

14          A.     Yes.   The Petrel project itself can be  
15     saved as a file.   One thing to note about that,  
16     while all the data is publicly available, that  
17     Petrel file, as it is now, does contain some  
18     digitized well logs that were purchased from a data  
19     broker and are deemed confidential under a license  
20     agreement.   So that would have to be -- those  
21     specific digitized logs would have to be stripped  
22     from that Petrel project.

23          Q.     Or simply paid for by someone else to get  
24     a license?   Why do you say they would have to be  
25     stripped?   For what purpose would you strip them

1 from the package?

2 A. They're governed by a specific license  
3 agreement, so I don't have those terms available  
4 now. But there are potential ways that someone  
5 else could purchase those digitized logs for those  
6 specific wells.

7 Q. And if they had a license, you could give  
8 your copy to them?

9 A. Again, I'm not sure the specific license  
10 terms for the logs in question.

11 Q. Are you aware of the GEM model having a  
12 single file called -- with a file extension .DAT  
13 that you can use to run a model on the program?

14 A. Correct.

15 Q. Do you have one of those .DAT files that  
16 would allow us to run the model you ran in that  
17 program?

18 A. For the CO<sub>2</sub> simulations or the geochemical  
19 simulations?

20 Q. CO<sub>2</sub> simulation.

21 A. Yes, I believe that was provided to the  
22 Commission already.

23 Q. And that could just be taken and loaded  
24 into the GEM program to run the model that you ran?

25 A. That's my understanding, yes.

1           Q.    Any idea why Summit won't provide that to  
2 the intervenors?

3           A.    I believe it was already provided to the  
4 DMR so it's publicly available.

5           Q.    Any idea why the DMR would refuse to  
6 provide that to the intervenors?

7           A.    I can't speak to that.

8           Q.    Did EERC in your -- to your knowledge tell  
9 the DMR not to provide those files to the  
10 intervenors?

11          A.    Not the specific files we provided to DMR,  
12 no.

13          Q.    Did the EERC tell the DMR not to provide  
14 anything to the intervenors?

15          A.    No.

16          Q.    Okay. Did the EERC tell the DMR not to  
17 disclose any information that it was providing to  
18 the DMR?

19          A.    No.

20          Q.    And there is a .DAT file that can be used  
21 to run that GEM model for the CO<sub>2</sub> dispersion that  
22 was provided to the DMR? That's your testimony?

23          A.    That is my understanding, yes.

24          Q.    I'm going to have you turn to Exhibit 1A,  
25 which was a copy of the application we were using.

1           A.     What page?

2           Q.     Can I have you turn to page 3-15?

3           A.     I'm there.

4           Q.     Can I have you just review the first full  
5 paragraph I think that starts, "The simulation  
6 model permeability."

7           A.     I've reviewed it.

8           Q.     Can you explain what you did when you say  
9 that the simulation model permeability was tuned  
10 globally by applying a permeability multiplier to  
11 match the reservoir properties estimated from the  
12 well-testing data on the Milton Flemmer?

13          A.     Yep. So the injection test from the  
14 Milton Flemmer 1 well resulted in an estimation of  
15 permeability for the Broom Creek Formation, so that  
16 permeability was significantly higher than the  
17 permeability determined through well log  
18 interpretation core analysis. So based on those  
19 results, a 2.5 X multiplier was applied to the  
20 permeability of the model globally.

21          Q.     And is 2.5 essentially the delta between  
22 what you had in your model and what you saw in the  
23 Milton Flemmer, or does that represent the delta?

24          A.     Yes. I believe the injection well data  
25 suggested slightly higher. We thought 2.5 was

1 reasonable.

2 Q. Does that affect your ultimate injection  
3 pressure limit?

4 A. Permeability is a factor that could impact  
5 predicted pressure. Yes.

6 Q. Would you describe the permeability in  
7 these storage facilities in the Broom Creek as  
8 heterogenous or homogenous?

9 MS. DOUGLAS: Could you repeat the  
10 question?

11 (Record read as requested.)

12 MS. DOUGLAS: They're heterogenous.

13 Q. (MR. BRAATEN CONTINUING) Did you consider  
14 looking for a heterogenous cause rather than  
15 applying a multiplier across the entire reservoir?

16 A. So the model already represented  
17 heterogenous distribution of permeability as  
18 distributed by the well log controls, the -- from  
19 seismic data as well as the variograms used to  
20 distribute properties, so applying the 2.5  
21 multiplier would increase -- or it would increase  
22 the -- the permeability for the full range of  
23 permeabilities.

24 And so a single multiplier was applied as  
25 we felt, you know, the -- that test covers a large

1 area as determined by the radius of investigation.  
2 And so the response of the reservoir to determine  
3 permeability we felt is representative of the  
4 response that we're going to encounter during  
5 operations.

6 Q. But even taking all that, it's possible  
7 that what you saw there was simply the result of  
8 heterogenous permeability and it didn't require an  
9 adjustment to the model at all; right?

10 A. That's a possibility. There have also  
11 been previous studies that have published results  
12 from injection tests that have also seen similarly  
13 higher permeability as determined by injection  
14 tests. So in our technical opinion and experience  
15 with the Broom Creek Formation, we felt 2.5 was  
16 adequate to apply.

17 Q. Those other studies that did the injection  
18 tests, were those done in oil fields?

19 A. No. The other study I'm referring to is  
20 the injection test published in the Tundra SGS  
21 storage facility permits.

22 Q. Did you try running the adjustment on  
23 models for each of the facilities individually  
24 versus across the entire reservoir?

25 A. No. The way we set up the model, we

1        didn't have an indicator that would allow us to  
2        multiply permeabilities for individual regions.

3            Q.     The simulation model permeability that you  
4        had to begin with, was that based on the core logs?

5            A.     It was based on evaluation of several well  
6        logs, site-specific core analysis, as well as  
7        regional core data. It was also informed from rock  
8        properties derived from inversion of the 3D seismic  
9        data.

10          Q.     And you changed all that based on one  
11        injection well test?

12          A.     Yes.

13          Q.     Can I have you go to page 3-7 and Figure  
14        3-4?

15          A.     I'm there.

16          Q.     Can you describe what we're looking at in  
17        this Figure 3-4?

18          A.     So this is an aerial view for one layer of  
19        the simulation model showing the permeability  
20        within the Broom Creek.

21          Q.     And can you explain the units being used  
22        in the legend with the various colors on the right  
23        and the numbers indicating which color is which  
24        number?

25          A.     Yeah. So permeability is being displayed

1 here in millidarcies.

2 Q. Are these pre or post application of  
3 multiplier?

4 A. Post application.

5 Q. I'm sorry. You said post application?

6 A. Mm-hmm. Yep. So the 2.5 permeability  
7 multiplier is already applied, and then it's hard  
8 to view at this scale but -- so the top there we're  
9 looking at is 5,000 millidarcies. That's a decimal  
10 place.

11 Q. Does that map look like a reasonable range  
12 in distribution of millidarcies?

13 A. Yes. So one thing that should be noted  
14 about the Broom Creek and one thing that supports  
15 the use of applying a permeability multiplier is  
16 the fact that the Broom Creek contains several  
17 unconsolidated sands, so these are poorly cemented  
18 sands with extremely high porosity and  
19 permeability. Because of the unconsolidated nature  
20 of the sands, we're unable to perform core analysis  
21 in them.

22 And so the geologic model that's based on  
23 the well log data, the core analysis and the  
24 seismic is -- typically underpredicts the  
25 permeability because we aren't able to capture data

1 from these unconsolidated sands. And so that's one  
2 of the reasons that we believe applying the 2.5  
3 permeability multiplier is reasonable in this case.

4 Q. What was the max perm you observed in the  
5 cores?

6 A. So on page 2-24, Table 2-6 has the range  
7 of permeabilities from core analysis. So  
8 permeability for the high range is 2,700  
9 millidarcies.

10 Q. Sorry. I'm just finding it. Did you say  
11 2,700?

12 A. Yep. So --

13 Q. Oh, I see. Got it.

14 So your model has 10 to 20 percent at what  
15 appears to be 5,000 millidarcies. Does that seem  
16 reasonable?

17 A. Given the unconsolidated nature of the  
18 Broom Creek, yes. One thing to be noted, I gave  
19 you the max range for the TB Leingang permit. The  
20 other permits have slightly different data sets,  
21 some of which are higher from the core data for  
22 those specific stratigraphic test wells.

23 Q. Higher perm?

24 A. Higher permeability. So if I can point  
25 you to Exhibit -- the Fischer storage facility

1 permit, similar on page 2-24, Table 2-6. The  
2 maximum permeability from the core analysis for the  
3 Archie Erickson well is over 3,700 millidarcies.

4 Q. When you say the 2.5 multiplier, are you  
5 literally saying that you're increasing the perm  
6 across the entire reservoir by two and a half  
7 times?

8 A. Correct.

9 Q. Based on one injection test?

10 A. Correct. So, again, on our years of  
11 experience studying the -- the Broom Creek in  
12 multiple forms with core log analysis, well log  
13 analysis -- sorry -- core analysis, well log  
14 analysis, seismic interpretation, we believe that's  
15 reasonable. One thing that should be noted, you  
16 know, we felt confident in using that value from  
17 this test. We will be using actual operational  
18 data to validate our model every five years as part  
19 of the reevaluation.

20 Q. Does an overall increase in the modeled  
21 permeability across the reservoir allow you in the  
22 end to inject higher -- at higher pressures thus  
23 resulting in the ability to inject more CO<sub>2</sub> into the  
24 ground?

25 A. So the pressure you can inject at is

1 constrained by 90 percent of the fracture pressure  
2 gradient, so you can't inject higher than that. If  
3 you had higher permeability, you would be able --  
4 you'd likely be able to inject higher volumes of CO<sub>2</sub>  
5 before reaching that.

6 Q. Okay. Can I have you go to page 2-18 and  
7 Figure -- sorry, I mean 2-19.

8 A. I'm there.

9 Q. Okay. You have an isopach map indicated  
10 on the prior page and the well log of the  
11 formation. Other than this data, did you do any  
12 kind of research or study of the depositional  
13 environments for the formation?

14 A. Yes.

15 Q. And what did you do?

16 A. So the EERC has studied the Broom Creek  
17 way back into the early 2000s, so we produced a  
18 formation outline in the Broom Creek. Regarding  
19 the depositional environment, the gold standard  
20 published study on that is a thesis by an author  
21 named Rygh that details the depositional  
22 environment. EERC has been a part of projects that  
23 have drilled and collected core from numerous  
24 wells, Broom Creek core, and our evaluation of  
25 those core data as well as the 3D seismic confirmed

1 Rygh's interpretation of the depositional  
2 environment.

3 Q. Was Rygh looking at certain rock types?

4 A. Offhand, I can't recall. You know, his  
5 thesis focused on the depositional environment and  
6 he also looked at type logs through those means.  
7 Yes, he would have looked at rock types.

8 Q. Eolian sand dunes and interbedded marine  
9 and lacustrine limestones, are those part of the  
10 depositional environment in the Broom Creek?

11 A. Are you referring to a specific paragraph  
12 or page from the formation -- or from the --  
13 sorry -- from the permit?

14 Q. No. I'm asking if those are  
15 depositional -- if those are rock types in the  
16 depositional environment studied by Rygh.

17 A. I don't believe that there is limestone  
18 within the Broom Creek. I know he describes it  
19 eolian dunes as well as interbedded carbonates  
20 which consist mostly of dolostone as well as  
21 anhydrite.

22 Q. Did you put a description of the  
23 depositional environment into the application?

24 A. Yes. It can be found on page 2-16 in the  
25 second sentence under -- in the text at the top.

1 We talk about how the formation comprises of  
2 interbedded eolian/nearshore marine sandstone and  
3 dolostone layers with minor amounts of siltstones  
4 and anhydrites.

5 Q. How did your analysis of the depositional  
6 environment affect your analysis of the variability  
7 of the permeability across the reservoir?

8 A. So I'll speak to -- interpret depositional  
9 environment which is -- can be prevalently seen on  
10 the 3D seismic with attribute analysis. From the  
11 3D seismic, you can actually see dune forms. You  
12 can also see indication of interbedded carbonates  
13 and anhydrites in that.

14 Through evaluation of -- of the 3D seismic  
15 as well as correlation to well logs in the area  
16 analysis of that core, we have an understanding of  
17 the lateral distribution of the different  
18 lithologies within the Broom Creek, particularly as  
19 I mentioned those unconsolidated sands. The Broom  
20 Creek sands come in several different forms. We  
21 have those very unconsolidated sands. We also have  
22 high-angle crossbedded sandstones and things like  
23 that.

24 So all those data sets gave us a better  
25 understanding of the heterogeneity in the

1     reservoir; the depositional environment; how those  
2     different reservoir lithologies, particularly the  
3     sands, were distributed across the area; and what  
4     was reasonable and prudent in terms of applying for  
5     rock and petrophysic properties as well as the  
6     multiplier.

7           Q.     Are you familiar with the Broom Creek  
8     Formation in Wyoming?

9           A.     I am not.

10          Q.     Okay. Are you familiar with how wind  
11     direction can influence deposition and produce sand  
12     dunes elongated in one direction?

13          A.     Yes, I am.

14          Q.     And have you seen that phenomenon in the  
15     Broom Creek in North Dakota?

16          A.     Yes, we have. As inferred, we can see  
17     that orientation in the 3D seismic data, and that  
18     orientation was accounted for with using the  
19     acoustic impedance derived from the seismic data  
20     for variograms which are used to distribute  
21     properties in the model.

22          Q.     How useful would your model be if you did  
23     not account for the deposition that we just  
24     discussed?

25          A.     Define "useful."

1           Q.     Would it have had utility to create the  
2 application for Summit for this proceeding?

3           A.     Yes.    So there are multiple ways to create  
4 geologic models.    The EPA has a guidance document  
5 out there where they suggest modeling best  
6 practices.    Some modeling best practices also  
7 include recommendations for simplified models.  
8 That might just include well log data.    So even  
9 simple models can have utilities to define  
10 storage -- or define vertical and horizontal  
11 boundaries.    Uncertainties with those different  
12 types of models need to be accounted for when  
13 determining appropriate buffers and things of that  
14 nature.

15          Q.     Can I have you turn back to page 3-7 and  
16 specifically the Figure 3-4?

17          A.     I'm there.

18          Q.     Would you expect a map showing the range  
19 of permeability of the formation to reflect the  
20 deposition of the elongated sand dunes in the Broom  
21 Creek that we just discussed?

22          A.     Yeah.    So to -- one comment to make about  
23 that is some of these dunes are reworked.    So while  
24 we can see elongated dunes, if you're looking at a  
25 particular slice, there might be difference in

1       cementation of the sands and things like that. As  
2       being a part of the team that interpreted the 3D  
3       seismic, I can tell you that the elongated dunes  
4       more orientated northeast to the southwest. And  
5       based on that orientation, to my trained eye, I can  
6       see that reflected here on Figure 3-4.

7           Q.     But only because you had access to that  
8       seismic data and the 3D modeling that was done with  
9       it?

10          A.     Correct.

11          Q.     How would we replicate the permeability  
12       distribution without the 3D seismic and the  
13       attribute analysis?

14          A.     So if you turn to page 3-2, Section 3.2.3  
15       talks about the variograms derived from the 3D  
16       seismic data. These variograms are what were used  
17       to distribute properties. So the only difference  
18       in a model made without using acoustic impedance  
19       derived from the seismic is that you wouldn't have  
20       that as a control point.

21          Q.     What would you do without the control  
22       point?

23          A.     You would still have the log data and the  
24       variograms to distribute properties.

25          Q.     In 3.2.3.2 it states, "Seismic data were

1       resampled to the geologic model grid."

2               Can you explain what that means?

3       A.     Yes.   The seismic data were sampled at  
4       intervals related to the bin spacing, which I  
5       believe were on the order of 80 to 120 feet in this  
6       case.   So we have a data point from each one of  
7       those bins, and so the seismic data from those bins  
8       had to be upscaled to the modeled grid cell size.

9       Q.     And if we use the variograms, we wouldn't  
10      be able to double-check your interpretations of the  
11      3D seismic; right?

12      A.     Correct.

13      Q.     I'll have you go to page 3-4.   My  
14      electronic copy is marked at least a little weird,  
15      but --

16      A.     I'm there.

17      Q.     Let me start by having you just describe  
18      what we're looking at here.

19      A.     On page 3-4 we're looking at Figure 3-1.  
20      Is that what you're looking at; correct?

21      Q.     Yes.

22      A.     So this is a west-east cross-section of  
23      the geologic model showing the PHIE property from  
24      the model that was used to distribute permeability  
25      through the model.

1           Q.     Are you able to look at this picture and  
2     find something that you would interpret to be  
3     undulating sand dunes?

4           A.     So the high porosity zones in yellow and  
5     red represent those reservoir sands. The dunes  
6     here in the Broom Creek is a dune complex where  
7     there is deposition of sediments and formation of  
8     the dunes. When sea level rose, there was  
9     reworking of the dunes. When sea level fell, there  
10    is again deposition and reworking of -- deposition  
11    sediments, reworking of -- of the sands to form  
12    dune complexes. So it's a stacked dune complex.

13                   Interpretation from a cross-section alone  
14    makes it difficult to interpret the dune complex.  
15    That's why a plainer view would be required to  
16    interpret dune complexes with more certainty.

17          Q.     Is there anything you see on Figure 3-1  
18    that would be an indication to you of those types  
19    of undulating sand dunes?

20          A.     Yes. Again, based on my involvement and  
21    experience with interpretation of the larger data  
22    set, my trained eye can -- can pick out the dune  
23    forms or the stacked dune complexes.

24          Q.     Based on the knowledge and information you  
25    have from reviewing the seismic data?

1           A.     Correct.

2           Q.     What were the actual test results from the  
3 injection well that you used to make the adjustment  
4 to the model on the permeability?

5           A.     The results from the injection tests were  
6 a calculated permeability.

7           Q.     Calculated from what data derived from the  
8 injection test?

9           A.     I'll defer that question to a later  
10 witness.

11          Q.     Do you know where in the application it's  
12 referenced?

13          A.     Outside of the paragraph you previously  
14 had me review about the 2.5 X multiplier, I do not  
15 believe that test is discussed in terms of  
16 interpretation.

17          Q.     Okay. I apologize. I needed to find my  
18 place here. But back on 3-15, that paragraph I  
19 referred to earlier, it says, "The permeability  
20 multiplier was calculated based on the area of  
21 study during the injectivity test, the radius of  
22 investigation, and the permeability thickness  
23 (transmissibility) values from the pressure  
24 transient analysis."

25                 Were you involved in determining or

1     assessing the area of study during the injectivity  
2     test?

3           A.     I was not, but we have a witness coming up  
4     that was involved with this testing.

5           Q.     And were you involved in determining the  
6     radius of investigation?

7           A.     I was not involved in interpretation of  
8     the well test results.

9           Q.     Okay. And I don't know what this means so  
10    I don't know if it's that, but were you involved in  
11    permeability thickness (transmissibility) values  
12    from the pressure transient analysis?

13          A.     No.

14          Q.     Okay. Were you involved in deciding on  
15    whether or not the global multiplier should be the  
16    number 2.5?

17          A.     Yes.

18          Q.     Okay. What data did you review in order  
19    to assess what that number should be, in your  
20    opinion?

21          A.     Results of the well tests were presented  
22    to me. I've also been involved or aware of  
23    previous studies with similar injection tests as  
24    previously discussed, as well as knowledge, again,  
25    of the Broom Creek and the other data sets that

1 support use of a permeability multiplier.

2 Q. And the studies you reference is just the  
3 one well in Project Tundra when that was done?

4 A. Correct.

5 Q. And when you say you were given the  
6 results of the injection well test, does that -- I  
7 don't know if I got that right. Is that right?

8 A. I was presented the results by subject  
9 matter experts.

10 Q. Okay. And, generally speaking, what did  
11 they present to you as the results?

12 A. What's listed in the paragraph. Their  
13 interpretation from the injection tests of those  
14 different parameters, including radius of  
15 investigation, permeability thickness and such.

16 Q. And how did you use those, then, to  
17 determine a multiplier of 2.5?

18 A. So the -- the permeability -- the summary  
19 of those results was the -- the permeability was  
20 higher, on the order of 2.7 or so times higher than  
21 permeability from some of the laboratory analysis.

22 Q. Are you aware of what a calculated KH was?

23 A. I don't recall at this time.

24 Q. Were you given that number at some point?

25 A. I -- I don't recall at this time. I know

1 we've looked at KH in terms of -- of the model. I  
2 was given the permeability thickness.

3 Q. And what was that?

4 A. I don't recall at this time.

5 Q. Do you have the time height?

6 A. I don't have the test results in front of  
7 me.

8 Q. Okay. But were you given those -- that  
9 information?

10 A. I don't recall specifically, but I believe  
11 that information is in the well testing report  
12 that's on the NDIC website.

13 Q. All of the information included the --  
14 including the calculated KH is all on the NDIC  
15 website?

16 A. I would have to review it. I can't speak  
17 to that level of specifics.

18 Q. And can you explain -- you've said that it  
19 was -- the difference in the perm was calculated at  
20 2.7 and you went with 2.5. Can you explain why?  
21 And actually let me back up.

22 The number calculated from the injection  
23 test was 2.7; right?

24 A. On the order -- approximately. I don't  
25 recall the exact value.

1           Q.     Okay. And you decided to go with a  
2 multiplier of 2.5. Why use 2.5 instead of the  
3 actual value?

4           A.     We felt it was a conservative assumption.

5           Q.     Why do you describe it with the word  
6 "conservative"? How is it conservative?

7           A.     It's lower than the -- the test results  
8 reflected.

9           Q.     Is there any reason to assume it's more  
10 likely that the perm is lower than the test result  
11 than higher?

12          A.     So I don't think we have data that would  
13 indicate which is the appropriate choice to go,  
14 higher or lower. We chose 2.5 based on our  
15 knowledge of the Broom Creek. We believe that was  
16 a conservative estimate to use in the model. As we  
17 discussed previously, higher permeability might  
18 result in higher volume of CO<sub>2</sub> but also potential  
19 higher pressure. So using the more conservative,  
20 going on a lesser number, helps ensure that we're  
21 not overestimating CO<sub>2</sub> plume size.

22          Q.     And are you being conservative because  
23 you're concerned about the risk of having that  
24 number be 2.7 -- having a delta of 2.7 between the  
25 injection test and your modeled perm?

1           A.     There's -- there's not a concern with  
2     using the exact value. We wanted to be  
3     conservative in what we chose in terms of how we  
4     defined the horizontal and the vertical boundaries.

5           Q.     But isn't the actual data the best data  
6     that you have?

7           A.     I -- again, it's not the only data set we  
8     have.

9           Q.     Okay. So you're putting less weight on  
10    the data derived from the injection well test than  
11    from the projected permeability from the other data  
12    you've used?

13          A.     Not less weight. We just chose to choose  
14    a conservative value.

15          Q.     But when you say the word "conservative,"  
16    why is it more conservative to go to 2.5 from 2.7  
17    rather than going to 2.9 from 2.7?

18          A.     Can you repeat the last part of the  
19    question?

20          Q.     Well, when you say that you were choosing  
21    2.5 rather than 2.7 because you're being  
22    conservative, I'm asking why it's conservative to  
23    adjust down to 2.5 versus adjusting up to 2.9. Why  
24    is that conservative?

25          A.     Again, as you mentioned, this is a single

1 test and it was -- this permeability multiplier  
2 applied to the model which the model was used to  
3 define the storage facility boundaries. In then  
4 the development of the project, we felt it was  
5 prudent not to overpredict the plume size if the  
6 reservoir doesn't act like that. Then we've  
7 permitted an area much larger than would be needed.

8 HEARING EXAMINER GARNER: Okay. I think  
9 this is a good place to stop. We will resume  
10 tomorrow morning at 9 a.m. So that will, I guess,  
11 conclude our hearings for the day. Off the record  
12 at 6:30 p.m.

13 (Recessed at 6:30 p.m., Tuesday, the 11th  
14 day of June, 2024.)

## NORTH DAKOTA

## OIL AND GAS DIVISION

In re application of Summit : Case No(s). 30869  
 Carbon Storage #1, LLC requesting : 30870  
 consideration for the geologic : 30871  
 storage of carbon dioxide in the : 30872  
 Broom Creek Formation from the : 30873  
 Midwest Carbon Express Pipeline in: 30874  
 the storage facility located in : 30875  
 Sections 31, 32, 33, and 34, : 30876  
 Township 142 North, Range 87 West,: 30877  
 Sections 1, 11, 12, 13, 14, 15, : 30878  
 22, 23, 24, 25, 26, 35, and 36, : 30879  
 Township 141 North, Range 88 West,: 30880  
 Sections 2, 3, 4, 5, 6, 7, 8, 9, :  
 10, 11, 14, 15, 16, 17, 18, 19, :  
 20, 21, 22, 23, 25, 26, 27, 28, :  
 29, 30, 31, 32, 33, 34, and 35, :  
 Township 141 North, Range 87 West,:  
 Sections 1, 2, 3, and 12, Township:  
 140 North, Range 88 West and :  
 Sections 4, 5, 6, and 7, Township :  
 140 North, Range 87 West, Mercer, :  
 Morton, and Oliver Counties, ND. :

In re application of Summit :  
 Carbon Storage #1, LLC to :  
 consider the amalgamation of the :  
 storage reservoir pore space, in :  
 which the Commission may require :  
 that the pore space owned by :  
 nonconsenting owners be included :  
 in the geologic storage, as :  
 required to operate the Summit :  
 Carbon Storage #1, LLC storage :  
 facility located in Sections 31, :  
 32, 33, and 34, Township 142 :  
 North, Range 87 West, Sections 1, :  
 11, 12, 13, 14, 15, 22, 23, 24, :  
 25, 26, 35, and 36, Township 141 :  
 North, Range 88 West, Sections 2, :  
 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, :  
 15, 16, 17, 18, 19, 20, 21, 22, :  
 23, 25, 26, 27, 28, 29, 30, 31, :

32, 33, 34, and 35, Township 141 :  
 North, Range 87 West, Sections 1, :  
 2, 3, and 12, Township 140 North, :  
 Range 88 West and Sections 4, 5, :  
 6, and 7, Township 140 North, :  
 Range 87 West, Mercer, Morton, :  
 and Oliver Counties, ND, in the :  
 Broom Creek Formation. :

In re application of Summit :  
 Carbon Storage #1, LLC for an :  
 order of the Commission :  
 determining the amount of :  
 financial responsibility for the :  
 geologic storage of carbon dioxide: :  
 from the Midwest Carbon Express :  
 Pipeline in the storage facility :  
 located in Sections 31, 32, 33, :  
 and 34, Township 142 North, Range :  
 87 West, Sections 1, 11, 12, 13, :  
 14, 15, 22, 23, 24, 25, 26, 35, :  
 and 36, Township 141 North, Range :  
 88 West, Sections 2, 3, 4, 5, 6, :  
 7, 8, 9, 10, 11, 14, 15, 16, 17, :  
 18, 19, 20, 21, 22, 23, 25, 26, :  
 27, 28, 29, 30, 31, 32, 33, 34, :

 Township 141 North, Range 88 :  
 West, Mercer and Oliver Counties, :  
 ND in the Broom Creek Formation. :

In re application of Summit :  
 Carbon Storage #2, LLC to :  
 consider the application of Summit :  
 Carbon Storage #2, LLC for an :  
 order of the Commission :  
 determining the amount of :  
 financial responsibility for the :  
 geologic storage of carbon dioxide :  
 from the Midwest Carbon Express :  
 Pipeline in the storage facility :  
 located in Sections 27, 28, 29, :  
 32, 33, 34, and 35, Township 143 :  
 North, Range 88 West, Sections 1, :  
 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, :  
 12, 13, 14, 15, 16, 17, 18, 19, :  
 20, 21, 22, 23, 24, 25, 26, 27, :  
 28, 29, 30, 32, 33, 34, 35, and :  
 36, Township 142 North, Range 88 :  
 West, Sections 5, 6, 7, 8, 17, 18, :  
 19, 20, 29, 30, and 31, Township :  
 142 North, Range 87 West, and :  
 Sections 1, 2, and 3, Township 141 :  
 North, Range 88 West, Mercer and :  
 Oliver Counties, ND, in the Broom :  
 Creek Formation. :

In re motion of the Commission to :  
 consider establishing the field :  
 and pool limits for lands located :  
 in Sections 27, 28, 29, 32, 33, :  
 34, and 35, Township 143 North, :  
 Range 88 West, Sections 1, 2, 3, :  
 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, :

14, 15, 16, 17, 18, 19, 20, 21, :  
 22, 23, 24, 25, 26, 27, 28, 29, :  
 30, 32, 33, 34, 35, and 36, :  
 Township 142 North, Range 88 West, :  
 Sections 5, 6, 7, 8, 17, 18, 19, :  
 20, 29, 30, and 31, Township 142 :  
 North, Range 87 West, and Sections :  
 1, 2, and 3, Township 141 North, :  
 Range 88 West, Mercer and Oliver :  
 Counties, ND, subject to the :  
 application of Summit Carbon :  
 Storage #2, LLC for the geologic :  
 storage of carbon dioxide in the :  
 Broom Creek Formation, and enact :  
 such special field rules as may :  
 be necessary. :

In re application of Summit :  
 Carbon Storage #3, LLC requesting :  
 consideration for the geologic :  
 storage of carbon dioxide in the :  
 Broom Creek Formation from the :  
 Midwest Carbon Express Pipeline in :  
 the storage facility located in :  
 Section 36, Township 143 North, :  
 Range 87 West, Sections 19, 20, :  
 21, 28, 29, 30, 31, 32, 33, 34, :  
 35, and 36, Township 143 North, :  
 Range 86 West, Sections 1, 2, 11, :  
 12, 13, 14, and 24, Township 142 :  
 North, Range 87 West, Sections 1, :  
 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, :  
 12, 13, 14, 15, 16, 17, 18, 19, :  
 20, 21, 22, 23, 24, 25, 26, 27, :  
 28, 29, 30, 32, 33, 34, and 35, :  
 Township 142 North, Range 86 :  
 West, and Sections 6, 7, 17, 18, :  
 19, and 20, Township 142 North, :  
 Range 85 West, Oliver County, ND. :

In re application of Summit :  
 Carbon Storage #3, LLC to consider :  
 the amalgamation of the storage :  
 reservoir space, in which the :  
 Commission may require that the :  
 pore space owned by nonconsenting :  
 owners be included in the geologic :

storage, as required to operate :  
 the Summit Carbon Storage #3, LLC :  
 storage facility located in :  
 Section 36, Township 143 North, :  
 Range 87 West, Sections 19, 20, :  
 21, 28, 29, 30, 31, 32, 33, 34, :  
 35, and 36, Township 143 North, :  
 Range 86 West, Sections 1, 2, 11, :  
 12, 13, 14, and 24, Township 142 :  
 North, Range 87 West, Sections 1, :  
 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, :  
 12, 13, 14, 15, 16, 17, 18, 19, :  
 20, 21, 22, 23, 24, 25, 26, 27, :  
 28, 29, 30, 32, 33, 34, and 35, :  
 Township 142 North, Range 86 West, :  
 and Sections 6, 7, 17, 18, 19, and :  
 20, Township 142 North, Range 85 :  
 West, Oliver County, ND, in the :  
 Broom Creek Formation. :

In re application of Summit :  
 Carbon Storage #3, LLC for an :  
 order of the Commission :  
 determining the amount of :  
 financial responsibility for the :  
 geologic storage of carbon dioxide :  
 from the Midwest Carbon Express :  
 Pipeline in the storage facility :  
 located in Section 36, Township :  
 143 North, Range 87 West, Sections :  
 19, 20, 21, 28, 29, 30, 31, 32, :  
 33, 34, 35, and 36, Township 143 :  
 North, Range 86 West, Sections 1, :  
 2, 11, 12, 13, 14, and 24, :  
 Township 142 North, Range 87 West, :  
 Sections 1, 2, 3, 4, 5, 6, 7, 8, :  
 9, 10, 11, 12, 13, 14, 15, 16, 17, :  
 18, 19, 20, 21, 22, 23, 24, 25, :  
 26, 27, 28, 29, 30, 32, 33, 34, :  
 and 35, Township 142 North, Range :  
 86 West, and Sections 6, 7, 17, :  
 18, 19, and 20, Township 142 :  
 North, Range 85 West, Oliver :  
 County, ND, in the Broom Creek :  
 Formation. :

In re motion of the Commission to :  
consider establishing the field :  
and pool limits for lands located :  
in Section 36, Township 143 North, :  
Range 87 West, Sections 19, 20, :  
21, 28, 29, 30, 31, 32, 33, 34, :  
35, and 36, Township 143 North, :  
Range 86 West, Sections 1, 2, 11, :  
12, 13, 14, and 24, Township 142 :  
North, Range 87 West, Sections 1, :  
2, 3, 4, 5, 6, 7, 8, 9, 10, 11, :  
12, 13, 14, 15, 16, 17, 18, 19, :

1 (The following proceedings were had and  
 2 made of record herein, commencing at 9:00 a.m.,  
 3 Tuesday, the 11th day of June, 2024:)  
 4 HEARING EXAMINER GARNER: We are on the  
 5 record for the hearings in the matters listed in  
 6 the North Dakota Industrial Commission hearing  
 7 docket for June 11. I am David Garner, hearing  
 8 examiner for these hearings. We are at the hearing  
 9 for the Department of Mineral Resources, Oil & Gas  
 10 Division, and it is 9 a.m.  
 11 There are 12 cases on the docket which  
 12 will be consolidated into one hearing. Before  
 13 calling them, I would just like to give anyone  
 14 appearing an opportunity to discuss any  
 15 housekeeping matters or anything that we need to  
 16 discuss at this point in time.  
 17 MR. BENDER: I'll make an appearance --  
 18 excuse me -- I'll make an appearance, Mr. Examiner,  
 19 if that's appropriate. Lawrence Bender, P.O.  
 20 Box 1855, Bismarck. I'm with Fredrikson law firm,  
 21 and with me here today is Mr. Ty Gludt. He's  
 22 immediately to my left.  
 23 HEARING EXAMINER GARNER: Okay.  
 24 MR. BRAATEN: Derrick Braaten with Braaten  
 25 Law Firm, Bismarck, North Dakota, here appearing on

12

1 behalf of and representing a number of the  
 2 landowner intervenors, including The Swenson Living  
 3 Trust, Michael Bauman, Glenn and Lisa Gerving,  
 4 Michael and Bonnie Haupt, John Jochim, Kevin and  
 5 Kimberly Kraft, Charmayne Liebelt, Kirk and Linda  
 6 Maize, Allen Maize, Paul and Christy Metz, JoLene  
 7 Rust, and Gary and Cassie Smith.  
 8 HEARING EXAMINER GARNER: Okay. Before I  
 9 call the cases, I would just like to note in the  
 10 interest of time, please try and have the witnesses  
 11 not repeat each other's testimony. It will  
 12 obviously make things go a lot quicker if we can  
 13 just keep it to that.  
 14 And just as a reminder, this is not a PSC  
 15 hearing on the pipeline. This is an Industrial  
 16 Commission hearing on storage facilities. So  
 17 please keep your testimony limited to that subject  
 18 matter.  
 19 MR. BENDER: Mr. Examiner, maybe now is  
 20 the appropriate time, since you mentioned you're  
 21 consolidating the cases, and we believe that is  
 22 going to be very helpful in expediting the hearings  
 23 here today, you may recall in some of the other CO<sub>2</sub>  
 24 sequestration matters we've had before the  
 25 Commission, we've called our witnesses in groups.

13

1 Those groups are typically no larger than two, but  
 2 I think that also expedites the hearing process  
 3 because you can have two individuals up. One  
 4 individual may not know the answer to something,  
 5 the other witness is there, and that has in the  
 6 past worked pretty well instead of -- instead of  
 7 calling them singly in terms of expediting the  
 8 hearing process. And I did talk to Mr. Braaten  
 9 about that before the hearing.  
 10 HEARING EXAMINER GARNER: And one other  
 11 matter. There was a motion to compel submitted at  
 12 5 p.m. last night. Attorney Bender, did you have  
 13 an opportunity to review that motion?  
 14 MR. BENDER: I did not.  
 15 HEARING EXAMINER GARNER: You did not.  
 16 MR. BENDER: But I will respond to it  
 17 in -- I don't know what the time period is, 10 days  
 18 or 14 days, but I will respond to it. Probably  
 19 even respond to it more quickly than that.  
 20 HEARING EXAMINER GARNER: Okay. Well,  
 21 with that, I will call the cases. Case Number  
 22 30869, in the matter of a hearing called on a  
 23 motion of the Commission to consider the  
 24 application of Summit Carbon Storage #1, LLC,  
 25 requesting consideration for the geologic storage

14

1 of carbon dioxide in the Broom Creek Formation from  
 2 the Madison [sic] Carbon Express Pipeline.  
 3 Case Number 30870, in the matter of a  
 4 hearing called on a motion of the Commission to  
 5 consider the application of Summit Carbon Storage  
 6 #1, LLC, to consider the amalgamation of the  
 7 storage reservoir pore space, in which the  
 8 Commission may require the pore space owned by the  
 9 nonconsenting owners be included in the geologic  
 10 storage.  
 11 In the matter of a hearing called on a  
 12 motion of the Commission to consider the  
 13 application of Summit Carbon Storage #1, LLC, for  
 14 an order of the Commission determining the amount  
 15 of financial responsibility for the geologic  
 16 storage of a carbon dioxide -- of carbon dioxide  
 17 from the Midwest Carbon Express Pipeline.  
 18 Case Number 30872, in the matter of a  
 19 hearing called on a motion of the Commission to  
 20 consider establishing the field and pool limits for  
 21 lands located in Sections 31, 32, 33 and 34,  
 22 Township 142 North, Range 87 West, Sections 1, 11,  
 23 12, 13, 14, 15, 22, 23, 24, 25, 26, 35 and 36,  
 24 Township 141 North, Range 88 West, Sections 2, 3,  
 25 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19,

<p style="text-align: right;">15</p> <p>1 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33,  2 34 and 35, Township 141 North, Range 87 West,  3 Sections 1, 2, 3 and 12, Township 140 North, Range  4 88 West, and Sections 4, 5, 6 and 7, Township 140  5 North, Range 87 West, Mercer, Morton and Oliver  6 Counties, subject to the application of Summit  7 Carbon Storage #1, LLC, for the geologic storage of  8 carbon dioxide in the Broom Creek Formation.  9 Case Number 30873, in the matter of a  10 hearing called on motion of the Commission to  11 considering the application of Summit Carbon  12 Storage #2, LLC, requesting consideration for the  13 geologic storage of carbon dioxide in the Broom  14 Creek Formation from the Midwest Carbon Express  15 Pipeline.  16 Case Number 30874, in the matter of a  17 hearing called on a motion of the Commission to  18 consider the application of Summit Carbon Storage  19 #2, LLC, to consider the amalgamation of the  20 storage reservoir pore space, in which the  21 Commission may require that the pore space owned by  22 the nonconsenting owners be included in the  23 geologic storage, as required to operate the Summit  24 Carbon Storage #2, LLC, storage facility.  25 Case Number 30875, in the matter of a</p>	<p style="text-align: right;">17</p> <p>1 storage of carbon dioxide in the Broom Creek  2 Formation from the Midwest Carbon Express Pipeline.  3 Case Number 30878, in the matter of a  4 hearing called on a motion of the Commission to  5 consider the application of Summit Carbon Storage  6 #3, LLC, to consider the amalgamation of the  7 storage reservoir pore space, in which the  8 Commission may require that the pore space owned by  9 the nonconsenting owners be included in the  10 geologic storage, as required to operate the Summit  11 Carbon Storage #3, LLC, storage facility.  12 Case Number 30879, in the matter of a  13 hearing called on a motion of the Commission to  14 consider the application of Summit Carbon Storage  15 #3, LLC, for an order of the Commission determining  16 the amount of financial responsibility for the  17 geologic storage of carbon dioxide from the Midwest  18 Carbon Express Pipeline.  19 And 30880, in the matter of a hearing  20 called on a motion of the Commission to consider  21 establishing field and pool limits for lands  22 located in Sections 36, Township 143 North, Range  23 87 West, Sections 19, 20, 21, 28, 29, 30, 31, 32,  24 33, 34, 35 and 36, Township 143 North, Range 86  25 West, Sections 1, 2, 11, 12, 13, 14 and 24,</p>
