## **EXHIBIT D**

### Form of Pore Space Lease

Attached to and made part of the Storage Agreement  
~~SCS #1~~ TB Leingang Broom Creek – Secure Geological Storage  
Mercer, Morton & Oliver Counties, North Dakota

### **PORE SPACE LEASE**

THIS PORE SPACE LEASE (this “Lease”) is made effective as of the Effective Date (as defined below) by and between \_\_\_\_\_,  
whose address is \_\_\_\_\_,  
(whether one or more, “Lessor”), and Summit Carbon Storage #1, LLC, a Delaware limited liability company, whose address is 2321 N. Loop Dr., Ames, IA 50010 (whether one or more, “Lessee”). Lessor and Lessee may be individually referred to herein as a “Party” and collectively as the “Parties”.

1. Leased Premises. Lessor, for good and valuable consideration, the receipt and sufficiency of which is hereby acknowledged, does hereby grant, demise, lease and let unto Lessee for Lessee’s geologic storage operations and other purposes set forth herein, the lands described and incorporated herein by reference in Exhibit A attached (the “Leased Premises”).

2. Term.

(a) Initial and Primary Term. This Lease shall commence on the date Lessee executes this Lease (“Effective Date”) and continue for an initial term of twenty (20) years (“Initial Term”) unless sooner terminated in accordance with the terms of this Lease. As consideration for the Initial Term, Lessee shall pay to Lessor TWENTY-FIVE and NO/100 DOLLARS (\$25.00) per acre as a single one-time bonus payment, and an annual rental of Four and No/100 Dollars (\$4.00) per acre on or before January 1 of each year of the Initial Term. The annual rental shall increase by TWO percent (2.0%) commencing on January 1, 2026 and on January 1 each year thereafter. The first year’s rental has been paid in full, the receipt and sufficiency of which is hereby acknowledged by Lessor. Lessee may, at any time prior to the expiration of the Initial Term, elect to extend the Initial Term for up to an additional twenty (20) years by providing written notice to Lessor and payment of One Hundred and No/100 Dollars (\$100.00) per acre (the Initial Term, together with all extensions shall be referred to herein as the “Primary Term”). For the avoidance of doubt, Lessor’s consent to any such extension will not be required provided that the foregoing payment is tendered to Lessor prior to the expiration of the Initial Term. Lessee shall pay to Lessor the annual rentals when due throughout the Primary Term; *provided, however*, Lessee shall not be liable to Lessor for annual rentals with respect to any portion of the Leased Premises which are or become subject to Permit as set forth in Section 2(b), below.

(b) Operational Term. This Lease shall continue beyond the Primary Term for so long as any portion of the Leased Premises or Lessee's storage facilities located in, on or under the Leased Premises (including without limitation, any Reservoirs) are subject to a permit issued by the North Dakota Industrial Commission (the "Commission") (a "Permit") or under the ownership or control of the State of North Dakota; *provided, however*, that all of Lessee's obligations under this Lease shall terminate upon issuance of a certificate of project completion pursuant to Chapter 38-22 of the North Dakota Century Code (the "Operational Term"). If the Primary Term expires and no portion of the Leased Premises or Lessee's storage facilities located in, on or under the Leased Premises is subject to a Permit, this Lease shall terminate, and Lessee shall execute a document evidencing termination of this Lease in recordable form and shall record it in the official records of the county in which the Leased Premises is located. As consideration for the Operational Term, Lessee shall pay to Lessor the royalty set forth in Section 3, below.

3. Royalty. Lessee shall pay to Lessor its proportionate share of FIFTY cents (\$0.50) per metric ton of carbon dioxide (CO<sub>2</sub>) injected into the reservoirs and subsurface pore spaces (as used herein, such terms shall have the meanings set forth in Chapter 38-22 and Chapter 47-31 of the North Dakota Century Code), stratum or strata underlying the Leased Premises (collectively, "Reservoirs"), or reservoirs and subsurface pore spaces, stratum or strata unitized or amalgamated therewith. The royalty shall increase TEN percent (10.0%) on January 1, 2026 and an additional TEN percent (10.0%) every five years thereafter, as outlined on attached Exhibit B. The quantity of CO<sub>2</sub> so injected shall be measured by meters installed by Lessee. Lessor's "proportionate share" shall be determined on a net acre basis and the Parties hereby stipulate that the acreage set forth in Section 1 shall be used to calculate Lessor's proportionate share. The quantity of CO<sub>2</sub> injected into the Reservoirs or any reservoirs or subsurface pore spaces, stratum or strata unitized or amalgamated therewith shall be determined through the use of metering equipment installed and operated by Lessee at the injection site. All royalties due hereunder for CO<sub>2</sub> injected into the Reservoirs or any reservoirs or subsurface pore spaces, stratum or strata unitized or amalgamated therewith during any calendar month shall be paid to Lessor annually on or before March 31<sup>st</sup> for the prior year's injection volumes. Lessor and Lessee agree that this Lease shall continue as specified herein even in the absence of injection operations and the payment of royalties.

4. Right to Pore Space/Storage of Carbon Dioxide. Lessor grants to Lessee the exclusive right to inject and store carbon dioxide (CO<sub>2</sub>) and other incidental gaseous substances into the Reservoirs, together with the right to construct, replace, inspect, repair, monitor, maintain, relocate, change the size of such surface or subsurface facilities on the Leased Premises that Lessee determines necessary or desirable for Lessee's storage operations, including, but not limited to fences, pipelines, tanks, reservoirs, electric and communication lines, roadways, underground facilities and equipment, surface facilities and equipment, buildings, structures and other such facilities and appurtenances. Lessor shall not grant any other person the right to inject or store CO<sub>2</sub> or any other incidental substances.

5. Facility Right of Ways/Compensation. Lessor grants Lessee the right of reasonable use of the surface of the Leased Premises, including without limitation, the rights of ingress and egress over the Leased Premises together with the right of way over, under and across the Leased Premises and the right from time to time to construct, replace, inspect, repair, monitor, maintain, relocate, change the size of such surface or subsurface facilities on the Leased Premises that Lessee determines necessary or desirable for Lessee's storage operations, including, but not limited to fences, pipelines, tanks, reservoirs, electric and communication lines, roadways, underground facilities and equipment, surface facilities and equipment, buildings, structures and other such facilities and appurtenances, (each a "Facility" and collectively the "Facilities"); *provided, however*, that (i) Lessee shall provide Lessor with notice of operations and an offer of damage, disruption and loss of production payments, as each may be applicable, prior to the installation of any such Facilities on the Leased Premises, and (ii) the agreed up terms, including the amount of damage payments to be paid to Lessor, shall be memorialized in an agreement separate from this Lease, such agreement to be consistent with the grant contained herein. Lessee shall be entitled to proceed with the installation of the Facilities while the separate agreement and amount of damage, disruption or loss is being agreed or determined. Lessee shall have the further right to fence the perimeter of any Facility on the Leased Premises and sufficiently illuminate the site for the safety and security of operations.

6. Amalgamation. Lessee, in its sole discretion, shall have the right and power, at any time and from time to time during the term of this Lease to pool, unitize, or amalgamate any reservoirs or subsurface pore spaces, stratum or strata underlying the Leased Premises with any other lands or interests into which such reservoirs or subsurface pore spaces extend and document such unit in accordance with applicable law or agency order. Amalgamated units shall be of such shape and dimensions as Lessee may elect and as are approved by the Commission. Amalgamated areas may include, but are not required to include, land upon which injection or extraction wells have been completed or upon which the injection and/or withdrawal of carbon dioxide and/or related gaseous substances has commenced prior to the effective date of amalgamation. In exercising its amalgamation rights under this Lease and if required by law, Lessee shall record or cause to be recorded a copy of the Commission's amalgamation order or other notice thereof in the county in which the amalgamated unit is located. Amalgamating in one or more instances shall, if approved by the Commission, not exhaust the rights of Lessee to amalgamate Reservoirs or portions of Reservoirs into other amalgamation areas, and Lessee shall have the recurring right to revise any amalgamated area formed under this Lease by expansion or contraction or both. Lessee may dissolve any amalgamated area at any time and document such dissolution by recording an instrument in accordance with applicable law or agency order. Lessee shall have the right to negotiate, on behalf of and as agent for Lessor, any unit, amalgamation, storage or operating agreements with respect to amalgamation of reservoir or pore space interests underlying the Leased Premises or the operation of any amalgamated areas formed under such agreements. To the extent any of the terms of such agreements conflict with the terms of this Lease, the terms of such agreements shall control, and the provisions of this Lease shall be deemed modified to conform to the terms, conditions, and provisions of any such agreements which are approved by the Commission.

7. Lessee Obligations. Lessee shall have no obligation, express or implied, to begin, prosecute or continue storage operations in, upon or under the Leased Premises, or store and/or sell or use all or any portion of the gaseous substances stored thereon. The timing, nature, manner and extent of Lessee's operations, if any, under this Lease shall be at the sole discretion of Lessee. All obligations of Lessee are expressed herein, and there shall be no covenants implied under this Lease, it being agreed that all amounts paid hereunder constitute full and adequate consideration for this Lease.

8. Ownership. Lessee shall at all times be the owner of (i) the carbon dioxide (CO<sub>2</sub>) and other gaseous substances stored in the Reservoirs or any reservoirs or subsurface pore spaces, stratum or strata unitized or amalgamated therewith, and (ii) all equipment, buildings, structures, facilities and other property constructed or installed by Lessee on the Leased Premises. Lessee shall have the right, but not the obligation, at any time during this Lease to remove all or any portion of the property or fixtures placed by Lessee on the Lease Premises. Notwithstanding the foregoing, title to the storage facility and to the stored CO<sub>2</sub> or other gaseous substances shall be transferred to the State of North Dakota upon issuance of a certificate of project completion by the Commission in accordance with Chapter 38-22 of the North Dakota Century Code.

9. Minerals, Oil and Gas. This Lease is not intended to grant or convey, nor does it grant or convey, any right to or obligation for Lessee to explore for or produce minerals, including oil and gas, that may exist on or under the Leased Premises.

10. Surrender of Leased Premises. Lessee shall have the right, but not the obligation, at any time from time to time to execute and deliver to Lessor a surrender and/or release covering all or any part of the Leased Premises for which the Reservoirs are not being utilized for storage as set forth herein, and upon delivery of such surrender and/or release to Lessor this Lease shall terminate as to such lands, and Lessee shall be released from all further obligations and duties as to the lands so surrendered and/or released, including, without limitation, any obligation to make payments provided for herein, except obligations accrued as of the date of the surrender and/or release. Lessee shall be able to surrender the any and or all of the Leased Premises if not utilizing the Reservoirs located thereunder.

11. Hold Harmless and Indemnification. The Lessee agrees to defend, indemnify, and hold harmless Lessor from any claims by any person that are a direct result of the Lessee's use of the Leased Premises or Reservoirs. Notwithstanding the foregoing, such indemnity/hold harmless obligation excludes (i) any claim or cause of action, or alleged or threatened claim or cause of action, damage, judgment, interest, penalty or other loss arising or resulting from the negligence or intentional acts of Lessor or Lessor's agents, invitees, or licensees; or third parties, and (ii) any claim for exemplary, punitive, special or consequential damages claimed by Lessor. Lessee further accepts liability and indemnifies Lessor for reasonable costs, expenses and attorneys' fees incurred in establishing and litigating the indemnification coverage provided above. The legal defense provided by Lessee to the Lessor under this paragraph must be free of any conflicts of interest even if this requires Lessee to retain separate legal counsel for Lessor.

12. Hazardous Substances. Lessee shall have no liability for any regulated hazardous substances located on the Leased Premises prior to the Effective Date or placed in, on or about the Leased Premises by Lessor or any third-party on or after the Effective Date, and nothing in this Lease shall be construed to impose upon Lessee any obligation for the removal of such regulated hazardous substances. As used herein, “hazardous substances” shall have the meaning set forth in the Comprehensive Environmental Response Compensation and Liability Act (CERCLA) and any amendments thereto, or any other local, state or federal statutes.

13. Termination. A material violation or default of any terms of this Lease by Lessee shall be grounds for termination of the Lease. Lessor shall give Lessee written notice of violation or default and Lessee shall have sixty (60) days after receipt of said notice to substantially cure such violations or defaults. If Lessee fails to substantially cure such violations or defaults within the 60-day cure period, Lessor may terminate the Lease; provided that if it is not possible to cure such violations or defaults within the 60-day cure period, Lessee shall have a reasonable longer period of time to cure such violations or defaults provided it commences cure within the initial 60-day cure period and thereafter diligently pursues such cure. Lessee may terminate the lease with thirty (30) days written notice to Lessor. Upon termination of this Lease, Lessee shall have one hundred eighty (180) days to remove all facilities and property of Lessee located on the Leased Premises. For the avoidance of doubt, Lessee shall not be required to remove any CO<sub>2</sub> or other incidental gaseous substances injected into the Reservoirs.

14. Taxes. Lessee shall pay all taxes, if any, levied against its personal property or on its improvements to the Leased Premises. Lessor shall pay for all real estate taxes and other assessments levied upon the Leased Premises. Lessee shall have the right to pay all taxes, assessments and other fees on behalf of Lessor and to deduct the amount so paid from other payments due to Lessor hereunder.

15. Conduct of Operations. In conducting its operations hereunder, Lessee shall use its best efforts to comply with all applicable laws, rules and regulations and ordinances pertaining thereto. Lessee reserves and shall have the right to challenge and/or appeal any law, ruling, regulation, order or other determination and to carry on its operations in accordance with Lessee’s interpretation of the same, pending final determination.

16. Force Majeure. Should Lessee be prevented from complying with any express or implied covenant of this Lease or from utilizing the Lease Premises for underground storage purposes by reason of scarcity of or an inability to obtain or to use equipment or material or failure or breakdown of equipment, or by operation of force majeure, any federal or state law or any order, rule or regulation of governmental authority, then while so prevented, Lessee's obligation to comply with such covenant shall be suspended and the primary term of this Lease shall be extended while and so long as Lessee is prevented by any such cause from utilizing the property for underground storage purposes and the time while Lessee is so prevented shall not be counted against Lessee, anything in this Lease to the contrary notwithstanding.

17. Surface Damage Compensation. The bonus and royalty amounts contemplated and paid to Lessor hereunder is compensation for, among other things, damages sustained by Lessor for lost land value, lost use of and access to Lessor's land and lost value of improvements, if any and to the extent applicable. Subject to Lessee's obligation to compensate Lessor for the installation of any Facilities on the Leased Premises pursuant to Section 5 of this Agreement, Lessor agrees that such compensation is just and adequate for any and all such damages and all other damages which Lessor may sustain as a result of Lessee's use of the property for its storage operations.

18. ~~Warranty of Title and Quiet Enjoyment.~~ Lessor ~~represents and warrants to Lessee that Lessor is the owner of the surface of the Leased Premises and the pore space located thereunder. Lessor hereby warrants and agrees to defend title to the Leased Premises and the pore space located thereunder and Lessor~~ hereby agrees that Lessee, at its option, shall have the right to discharge any tax, mortgage, or other lien upon the Leased Premises, and in the event Lessee does so, Lessee shall be subrogated to such lien with the right to enforce the same and apply royalty payments or any other payments due to Lessor toward satisfying the same.

Lessor warrants that, except as disclosed to Lessee in writing, there are no liens, encumbrances, leases, mortgages, deeds of trust, options, or other exceptions to Lessor's fee title ownership of the Leased Premises (collectively, "Liens") which are not recorded in the public records of the County in which the Leased Premises is located. Lienholders (including tenants), whether or not their Liens are recorded, shall be Lessor's responsibility, and Lessor shall cooperate with Lessee to obtain a non-disturbance agreement from each party that holds a Lien (recorded or unrecorded) that might interfere with Lessee's rights under this Lease. A non-disturbance agreement is an agreement between Lessee and a lienholder which provides that the lienholder shall not disturb Lessee's possession or rights under the Lease or terminate this Lease so long as Lessor is not entitled to terminate this Lease under the provisions hereof.

Lessor shall have the quiet use and enjoyment of the Leased Premises in accordance with the terms of this Lease. Lessor's activities and any grant of rights Lessor makes to any person or entity, whether located on the Leased Premises or elsewhere, shall not, currently or prospectively, materially interfere with activities permitted hereunder. If Lessor has any right to select, determine, prohibit or control the location of sites for drilling, exploitation, production and/or exploration of minerals, hydrocarbons, water, gravel, or any other similar resource in, to or under the Lease Premises, then Lessor shall exercise such right so as to minimize interference with any of the foregoing.

19. Environmental Incentives and Tax Credits. Lessee shall be the owner of (i) any and all credits, benefits, emissions reductions, offsets, and allowances, howsoever entitled, attributable to Lessee's geologic storage operations, including any avoided emissions and the reporting rights related to these avoided emissions, such as 26 U.S.C. §45Q Tax Credits, and any other attributes of Lessee's ownership of the Facilities and Lessee's geologic storage operations ("Environmental Attributes"), and (ii) any and all credits, rebates, subsidies, payments or other incentives that relate to the use of technology incorporated into Lessee's geologic storage operations, environmental benefits of such operations, or other similar programs available from any regulated entity or any governmental authority ("Environmental Incentives"). Lessee is further entitled to the benefit of any and all (a) investment tax credits, (b) production tax credits, (c) credits under 26 U.S.C. §45Q credits, and (d) similar tax credits or grants under federal, state

or local law relating to Lessee's geologic storage operations ("Tax Credits"). Lessor shall (i) cooperate with Lessee in obtaining, securing and transferring all Environmental Attributes and Environmental Incentives and the benefit of all Tax Credits, and (ii) shall allow Lessee to take any actions necessary to install additional equipment on the Facilities to comply with all monitoring and reporting obligations, and allow Lessee's personnel to enter the premises and collect any data Lessee requires to satisfy its obligations required in connection with obtaining Tax Credits and Environmental Attributes. Lessor shall not be obligated to incur any out-of-pocket costs or expenses in connection with such actions unless reimbursed by Lessee. If any Environmental Incentives are paid directly to Lessor, Lessor shall immediately pay such amounts over to Lessee.

20. Assignment. The rights of either Party hereto may be assigned in whole or part. The assigning party shall provide written notice of any assignment within sixty (60) days after such assignment has become effective; *provided, however*, that an assigning party's failure to deliver written notice of assignment within such 60-day period shall not be deemed a breach of this Lease unless such failure is willful and intentional. The Lessor's consent shall not be required for an assignment by the Lessee of this Lease, whether by way of a collateral assignment to its financiers or otherwise.

21. Change of Ownership. No change of ownership in the Leased Premises shall be binding on the Lessee for purpose of making payments to Lessor hereunder until the date Lessor, or Lessor's successors or assigns, furnishes Lessee the recorded original or a certified copy of the instrument evidencing the change in ownership. The Lessor's consent shall not be required for a change in the direct or indirect control of the Lessee.

22. Notices. All notices required to be given under this Lease shall be in writing and addressed to the respective Party at the addresses set forth at the beginning of this Lease unless otherwise directed by either Party.

23. No Waiver. The failure of either Party to insist in any one or more instances upon strict performance of any of the provisions of this Lease or to take advantage of any of its rights hereunder shall not be construed as a waiver of any such provision or the relinquishment of any such rights, but the same shall continue and remain in full force and effect.

24. Notice of Lease. This Lease shall not be recorded in the real property records. Lessee shall cause a memorandum of this Lease to be recorded in the real property records of the county in which the Leased Premises are situated.

~~25. Confidentiality. Lessor shall maintain in the strictest confidence, for the benefit of Lessee, all information pertaining to the compensation paid under this Lease, any information regarding Lessee and its business or operations on the Leased Premises or on any other lands, the capacity and suitability of any Reservoir or reservoirs and subsurface pore spaces, stratum or strata unitized or amalgamated therewith, and any other information that is deemed proprietary or that Lessee requests or identifies to be held confidential, in each such case whether disclosed by Lessee or discovered by Lessor.~~

25. [Reserved.]

26. Counterparts. This Lease may be executed in any number of counterparts, each of which, when executed and delivered, shall be an original, but all of which shall collectively constitute one and the same instrument.

27. Severability. If any provision of this Lease is found to be invalid, illegal, or unenforceable in any respect, such provision shall be deemed to be severed from this Agreement, and the validity, legality and enforceability of the remaining provisions contained herein shall not in any way be affected or impaired thereby.

28. Governing Law. This Lease shall be governed by, construed, and enforced in accordance with the laws of the State of North Dakota and the Parties hereby submit to the jurisdiction of the state or federal courts located in the State of North Dakota.

29. Further Assurances. Each Party will execute and deliver all documents, provide all information, and take or forbear from all actions as may be necessary or appropriate to achieve the purposes of this Lease, including without limitation executing a memorandum of this Lease and all documents required to obtain any necessary government approvals.

30. Entire Agreement. This Lease constitutes the entire agreement between the Parties and supersedes all prior negotiations, undertakings, notices, memoranda and agreement between the Parties, whether oral or written, with respect to the subject matter hereof. This Lease may only be amended or modified by a written agreement duly executed by Lessor and Lessee.

31. Cooperation with Financiers. The Lessor hereby acknowledges and consents that Lessee may grant a collateral assignment or leasehold mortgage of Lessee's rights under this Lease to Lessee's debt financiers, it being understood that such collateral assignment or leasehold mortgage would only encumber the leasehold interest created hereunder.

32. Favored Nations. If, at any time within the twelve (12) month period following the Effective Date, Lessee enters into a pore space lease agreement with a third party landowner covering any part of Lessee's storage facility ("Third-Party Lease"), and if any of the payments specified in the Third-Party Lease would have been more favorable to Lessor had Lessor executed a lease agreement similar to the Third-Party Lease, then Lessor and Lessee will amend this Lease so that it reflects compensation terms similar to the Third-Party Lease, and Lessee will pay to Lessor the additional compensation, if any, that Lessor would have been paid had Lessor signed a lease agreement similar to the Third-Party Lease. For the purposes of this Section 32, "Lessee's storage facility" shall mean any storage facility (as such term is defined in ch. 38-22 of the North Dakota Century Code) operated by Lessee within a ten (10) mile radius of the Leased Premises which is subject to a permit is issued by the Commission pursuant to ch. 38-22 of the North Dakota Century Code.

33. Electronic Signatures. This Lease, and any amendments hereto, to the extent signed and delivered by means of electronic transmission in portable document format (pdf) or by DocuSign or similar electronic signature process, shall be treated in all manner and respects as an original contract and shall be considered to have the same binding legal effect as if it were the original signed version thereof delivered in person.

34. Insurance. Lessee shall obtain and maintain in force commercial general liability insurance covering the Facilities and Lessee's activities on the Leased Premises at all times during the term of this Lease, with a minimum occurrence and aggregate limit of one million dollars (\$1,000,000). Such insurance coverage for the Facilities and Leased Premises may be provided as part of a blanket policy that covers other Facilities or properties as well. Any such policies shall include Lessor as an additional insured. Lessee, or its insurer, shall provide thirty (30) days prior written notice (except ten (10) days for nonpayment of premium) to Lessor of any cancellation. Lessee shall provide Lessor with copies of certificates of insurance evidencing this coverage upon request by Lessor. The policy shall be endorsed or include a provision waiving insurer rights of subrogation against Lessor.

IN WITNESS WHEREOF, the Parties have executed this Lease effective for all purposes as of the Effective Date.

### **Royalty Escalation Provision**

This Lease is subject to a Royalty Escalation. The royalty shall increase TEN percent (10.0%) on January 1, 2026, and an additional TEN percent (10.0%) every five years thereafter. For the avoidance of doubt, the royalty to be paid is calculated below:

<u>Date:</u>	<u>Royalty Rate:</u>
Beginning January 1, 2026	\$0.550
Beginning January 1, 2031	\$0.605
Beginning January 1, 2036	\$0.666
Beginning January 1, 2041	\$0.733
Beginning January 1, 2046	\$0.806
Beginning January 1, 2051	\$0.887
Beginning January 1, 2056	\$0.976
Beginning January 1, 2061	\$1.074
Beginning January 1, 2066	\$1.181
Beginning January 1, 2071	\$1.299
Beginning January 1, 2076	\$1.429

I oppose the use of eminent domain

**Comments**

I find it unspeakable, reprehensible, unconstitutional and morally WRONG to force eminent domain on unwilling landowners to seize their land to become a deadly toxic dumpsite that will render that land untouchable/unusable for perpetuity when there are better technologies NOW that will provide financial gain NOW. I don't see the people of North Dakota sanctioning this. I don't see Mother Earth agreeing to do this either. Shame on DMR, the Commission, PSC, Gov Bergum to allow this toxic stain on N. D.'s people. jkg

opposition of use of eminent domain against unwilling landowners towards a CO2 burial site

**Comments**

America needs to wean off oil - coal - fossil fuels NOW not in 2050. This Summit pipeline only kicks that can further down the road rather than deal with it now. Eminent domain whether it be to facilitate the pipeline or the dump site is totally WRONG. There are better technologies now. Do you personally want to live on or near a dump site - or how about future generations? A lot of questions at this point have NO answers. What you decide today will be your legacy - do you wish your grandson to say you made a bad decision and now I have to live with the consequences? Consider your decision as tho your life depended on it BECAUSE IT DOES. YOU MUST DENY!!!! jkg

Good afternoon,

Please find the attached documents, listed below, for filing and service with respect to the above-referenced case numbers.

1. Response to Motion to Compel; and
2. Certificate of Service.

**Bethany Hughes**

**BEFORE THE INDUSTRIAL COMMISSION  
OF THE STATE OF NORTH DAKOTA**

**CASE NOS. 30869–30880**

**In re application of Summit Carbon Storage #1, LLC requesting consideration for the geologic storage of carbon dioxide in the Broom Creek Formation from the Midwest Carbon Express Pipeline in the storage facility located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND**

**In re application of Summit Carbon Storage # 1, LLC to consider the amalgamation of the storage reservoir pore space, in which the Commission may require that the pore space owned by nonconsenting owners be included in the geologic storage, as required to operate the Summit Carbon Storage #1, LLC storage facility located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, in the Broom Creek Formation.**

**In re application of Summit Carbon Storage # 1, LLC for an order of the Commission determining the amount of financial responsibility for the geologic storage of carbon dioxide from the Midwest Carbon Express Pipeline in the storage facility located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1,**

11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, in the Broom Creek Formation.

In re motion to consider establishing the field and pool limits for lands located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, subject to the application of Summit Carbon Storage #1, LLC for the geologic storage of carbon dioxide in the Broom Creek Formation.

In re application of Summit Carbon Storage #2, LLC requesting consideration for the geologic storage of carbon dioxide in the Broom Creek Formation from the Midwest Carbon Express Pipeline in the storage facility located in Sections 27, 28, 29, 32, 33, 34, and 35, Township 143 North, Range 88 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, 35, and 36, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, and 31, Township 142 North, Range 87 West, and Sections 1, 2, and 3, Township 141 North, Range 88 West, Mercer and Oliver Counties, ND

In re application of Summit Carbon Storage # 2, LLC to consider the amalgamation of the storage reservoir pore space, in which the Commission may require that the pore space owned by

**nonconsenting owners be included in the geologic storage, as required to operate the Summit Carbon Storage #2, LLC storage facility located in Sections 27, 28, 29, 32, 33, 34, and 35, Township 143 North, Range 88 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, 35, and 36, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, and 31, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, 31, Township 142 North, Range 87 West, and Sections 1, 2, and 3, Township 141 North, Range 88 West, Mercer and Oliver Counties, ND in the Broom Creek Formation.**

**In re application of Summit Carbon Storage # 2, LLC to consider the application of Summit Carbon Storage #2, LLC for an order of the Commission determining the amount of financial responsibility for the geologic storage of carbon dioxide from the Midwest Carbon Express Pipeline in the storage facility located in Sections 27, 28, 29, 32, 33, 34, and 35, Township 143 North, Range 88 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, 35, and 36, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, and 31, Township 142 North, Range 87 West, and Sections 1, 2, and 3, Township 141 North, Range 88 West, Mercer and Oliver Counties, ND, in the Broom Creek Formation.**

**In re motion of the Commission to consider establishing the field and pool limits for lands located in Sections 27, 28, 29, 32, 33, 34, and 35, Township 143 North, Range 88 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, 35, and 36, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, and 31, Township 142 North, Range 87 West, and Sections 1, 2, and 3, Township 141 North, Range 88 West, Mercer and Oliver Counties, ND, subject to the application of Summit Carbon Storage #2, LLC for the geologic storage of**

**carbon dioxide in the Broom Creek Formation, and enact such special field rules as may be necessary.**

**In re application of Summit Carbon Storage #3, LLC requesting consideration for the geologic storage of carbon dioxide in the Broom Creek Formation from the Midwest Carbon Express Pipeline in the storage facility located in Section 36, Township 143 North, Range 87 West, Sections 19, 20, 21, 28, 29, 30, 31, 32, 33, 34, 35, and 36, Township 143 North, Range 87 West, Sections 19, 20, 21, 28, 29, 30, 31, 32, 33, 34, 35, and 36, Township 143 North, Range 86 West, Sections 1, 2, 11, 12, 13, 14, and 24, Township 142 North, Range 87 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, and 24, Township 142 North, Range 87 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 26, 27, 28, 29, 30, 32, 33, 34, and 35, Township 142 North, Range 86 West, and Sections 6, 7, 17, 18, 19, and 20, Township 142 North, Range 85 West, Oliver County, ND.**

**In re application of Summit Carbon Storage #3, LLC to consider the amalgamation of the storage reservoir space, in which the Commission may require that the pore space owned by nonconsenting owners be included in the geologic storage, as required to operate the Summit Carbon Storage #3, LLC storage facility located in Section 36, Township 143 North, Range 87 West, Sections 19, 20, 21, 28, 29, 30, 31, 32, 33, 34, 35, and 36, Township 143 North, Range 86 West, Sections 1, 2, 11, 12, 13, 14, and 24, Township 142 North, Range 87 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, and 35, Township 142 North, Range 86 West, and Sections 6, 7, 17, 18, 19, and 20, Township 142 North, Range 85 West, Oliver County, ND, in the Broom Creek Formation.**

**In re application of Summit Carbon Storage #3, LLC for an order of the Commission determining the amount of financial responsibility for the**

**geologic storage of carbon dioxide from the Midwest Carbon Express Pipeline in the storage facility located in Section 36, Township 143 North, Range 87 West, Sections 19, 20, 21, 28, 29, 30, 31, 32, 33, 34, 35, and 36, Township 143 North, Range 86 West, Sections 1, 2, 11, 12, 13, 14, and 24, Township 142 North, Range 87 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, and 35, Township 142 North, Range 86 West, and Sections 6, 7, 17, 18, 19, and 20, Township 142 North, Range 85 West, Oliver County, ND, in the Broom Creek Formation.**

**In re motion of the Commission to consider establishing the field and pool limits for lands located in Section 36, Township 143 North, Range 87 West, Sections 19, 20, 21, 28, 29, 30, 31, 32, 33, 34, 35, and 36, Township 143 North, Range 86 West, Sections 1, 2, 11, 12, 13, 14, and 24, Township 142 North, Range 87 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, and 35, Township 142 North, Range 86 West, and Sections 6, 7, 17, 18, 19, and 20, Township 142 North, Range 85 West, Oliver county, ND, subject to the application of Summit Carbon Storage #3, LLC for the geologic storage of carbon dioxide in the Broom Creek Formation, and enact such special field rules as may be necessary.**

### **RESPONSE TO MOTION TO COMPEL**

[¶ 1] Applicants Summit Carbon Storage #1, LLC, Summit Carbon Storage #2, LLC, and Summit Carbon Storage #3, LLC (collectively, “Summit Carbon Storage”) submit this brief in response to the motion to compel filed with the North Dakota Industrial Commission (“Commission”) by the Landowner Intervenor.<sup>1</sup> For the reasons explained below, the Commission should deny the Landowner Intervenor’s motion.

---

<sup>1</sup> Landowner Intervenor are the Swenson Living Trust, Michael Bauman, Glenn and Lisa Gerving, Michael and Bonnie Haupt, John Jochim, Kevin and Kimberly Kraft, Charmayne Liebelt, Kirk and Linda Maize and Allen Maize, Paul and Christy Metz, JoLene M. Rust, and Gary and Cassie Smith.

## FACTS

[¶ 2] Summit Carbon Storage commenced this case to obtain a permit for the geologic storage of carbon dioxide.<sup>2</sup> Prior to May 31, 2024, Landowner Intervenor were not parties to this case. Nevertheless, Landowner Intervenor improperly served Summit Carbon Storage with a deposition notice on May 9, 2024. The notice did not name Summit Carbon Storage as the entity to be deposed. Rather, the notice named “Summit Carbon Solutions”—an entirely different entity.

[¶ 3] On May 31, 2024, the Commission authorized Landowner Intervenor to intervene. On the same day, Landowner Intervenor served Summit Carbon Storage with a second deposition notice. This notice also named “Summit Carbon Solutions” as the entity to be deposed rather than Summit Carbon Storage.

[¶ 4] On June 4, 2024, Intervenor Landowners served Summit Carbon Storage with three more deposition notices. These notices named Summit Carbon Storage as the entity to be deposed.<sup>3</sup> The notices also stated that the deposition would take place on June 6, 2024. Finally, the notices instructed Summit Carbon Storage to designate one or more officers to testify on the following topics:

- I. Summit’s applications and the information contained in and created or submitted in support of the applications and conclusions drawn therefrom in NDIC Case Nos. 30869, 30870, 30871, 30872 (for “Summit Carbon Storage #1, LLC,”); 30873, 30874, 30875, 30876 (for “Summit Carbon Storage #2,”) and 30877, 30878, 30879, 30880 (for “Summit Carbon Storage #3, LLC,”) (all applications hereafter referred to collectively as “Summit’s applications”).

---

<sup>2</sup> According to the North Dakota Legislature, “[i]t is in the public interest to promote the geologic storage of carbon dioxide.” N.D.C.C. § 38-08-01. Doing so (1) “will benefit the state and the global environment by reducing greenhouse gas emissions,” (2) “will help ensure the viability of the state’s coal and power industries, to the economic benefit of North Dakota and its citizens,” and (3) “may allow for [carbon dioxide’s] ready availability if needed for commercial, industrial, or other uses, including enhanced recovery of oil, gas, and other minerals.” *Id.*

<sup>3</sup> The first notice named Summit Carbon Storage #1, LLC. The second notice named Summit Carbon Storage #2, LLC. The third notice named Summit Carbon Storage #3, LLC.

- a. Summit's applications include all documents submitted to the North Dakota Industrial Commission including its Department of Mineral Resources and its Oil and Gas Division (collectively "NDIC") as part of or in support of or in relation to Summit's applications, and all correspondence between Summit and NDIC whether in writing and whether electronic or physical, and whether written or oral. This topic and the scope of Summit's applications as used herein includes all data files, spreadsheets, databases, and models (including loading files necessary to make data files useable with any model) and all of the information, data, documents, calculations, and non-attorney work product that was created in support of Summit's applications or which was necessary to create or is materially supportive of Summit's applications.
- i. Without limiting the generality of the foregoing, this topic includes the following models and associated data:
  1. The data and interpretations and inputs for the geologic model created with SLB's Petrel software (Schlumberger, 2020).
  2. The data and inputs and model referred to in Section 3.1 of the applications as follows:
    - a. "The geologic model and properties served as inputs for numerical simulations of CO<sub>2</sub> injection using Computer Modelling Group Ltd.'s (CMG's) GEM software (Computer Modelling Group Ltd., 2021). Numerical simulations of CO<sub>2</sub> injection were conducted to assess potential CO<sub>2</sub> injection rate, disposition of injected CO<sub>2</sub>, wellhead pressure (WHP), bottomhole pressure (BHP), and pressure changes in the storage reservoir throughout the expected injection time frame and postinjection period. Results of the numerical simulations were then used to determine the project's area of review (AOR) pursuant to North Dakota's geologic CO<sub>2</sub> storage regulations."
  3. United States Geological Survey's PHREEQC geochemical model and both the data files and data inputs used to run this model and bases for using the chosen inputs.
  4. The data and load files and data decks for the SLB Petrel model that was run for Summit's applications.
  5. Computer Modelling Group Ltd.'s GEM model and both the data files and data inputs used to run this model and bases for using the chosen inputs.
  6. 3D numerical reservoir simulation model data decks, output files and graphing files of the Storage Reservoir in original electronic format. Without limiting the

foregoing, such files may commonly be stored in Schlumberger SEclipse format, CMG (Canadian Modeling Group) Imex format, or other similar format.

7. Input files, field and analytical data, and the model geochemical database (and the sources of the foregoing) used to run any modelling or analysis of critical threshold pressures or areal extent of review or impact and pressure buildup, or which was used to do any kind of analysis related to EPA Method 1 or EPA Method 2 or Analytical Solution for Leakage in Multilayered Aquifers ASLMA, or any risk-based area-of-review analysis.
- ii. These models also include the conclusions drawn from the models and the data inputs used, particularly as those conclusions were used to support Summit's applications as referenced in these topics.
  - iii. The identity of the person most familiar with the workflows described in Section 3.2.3 of Summit's application in NDIC Case No. 30869 and how it was performed for purposes of Summit's applications and the identity of the person who wrote this passage.
  - iv. The meaning and context and details of how the various processes and functions described in Section 3.2.3 of Summit's applications and how they were actually performed and the models and calculations used to support them.
- b. The factual documentation and information that might support or that Summit will use to support a finding "[t]hat the storage operator has obtained the consent of persons who own at least sixty percent of the storage reservoir's pore space" as required by N.D.C.C. § 38-22-08(5).
  - c. The factual documentation and information that might support or that Summit will use to support any finding in this proceeding "[t]hat the proposed storage facility will not adversely affect surface waters or formations containing fresh water" as is stated at N.D.C.C. § 38-22-08(7).
  - d. The factual documentation and information that might support or that Summit will use to support any finding in this proceeding that "[t]hat the storage facility will not endanger human health nor unduly endanger the environment" as is stated at N.D.C.C. § 38-22-08(10).
  - e. The factual documentation and information that might support or that Summit will use to support any finding in this proceeding "[t]hat the horizontal and vertical boundaries of the storage reservoir are defined [and] include buffer areas to ensure that the storage facility is operated safely and as contemplated" as is stated at N.D.C.C. § 38-22-08(12).

- f. The factual documentation and information related to or that might support or that Summit will use to support any finding in this proceeding that “all nonconsenting pore space owners are or will be equitably compensated” as that phrase is used in N.D.C.C. § 38-22-08(14) and any documentation, information, data sets, comparable sales, comparable transactions, appraisals, market reports, financial reports, or other documents related to or referencing compensation paid to nonconsenting pore space owners.
- i. This subtopic I.b. includes all amounts paid by Summit to any individual or entity for use of or damages to pore space or property rights associated with or related to its storage facility that is the subject of Summit’s application and the Storage Reservoir, and all agreements for such use or damages or payments.
- ii. This subtopic I.b. includes all reports and agreements in Summit’s possession indicating any amount of compensation paid for any kind of use of or damage to pore space or property for CO2 sequestration. If Summit has in its possession any agreement with any property owner for use of property or damage to property arising from use of pore space or property for storage or sequestration of CO2 it is included in this topic.

[¶ 5] On June 5, 2024, counsel for Summit Carbon Storage sent counsel for Landowner Intervenor a letter. The letter explained that Landowner Intervenor’s deposition notices did not comply with N.D.R.Civ.P. 30 and therefore Summit Carbon Storage would not be designating a witness for the deposition that Landowner Intervenor noticed for June 6, 2024.

[¶ 6] Counsel for Landowner Intervenor responded to this letter with an email. In his email, counsel for Landowner Intervenor did not offer to confer about the deficiencies of his clients’ deposition notices. Instead, counsel for Landowner Intervenor simply stated that he disagreed that the notices were deficient and he intended to move forward with the deposition regardless of whether Summit Carbon Storage produced a witness.

[¶ 7] On June 6, 2024, counsel for Landowner Intervenor held a deposition. Because Summit Carbon Storage was never served with a valid notice of said deposition, Summit Carbon Storage did not produce a witness for said deposition.

[¶ 8] On June 10, 2024, Landowner Intervenor filed a motion to compel. In their motion, they request the Commission to “enter an order compelling the depositions of the three Summit entities” and to “allow procedural due process in this proceeding.”

### ARGUMENT

[¶ 9] The argument section of this brief proceeds in three parts. Part I argues that the Commission should deny Landowner Intervenor’s motion to compel because the motion does not comply with the requirements of N.D.R.Civ.P. 37. Part II argues that the Commission should deny the motion to compel because none of Landowner Intervenor’s deposition notices complied with N.D.R.Civ.P. 30. Part III explains why the Commission denying the motion to compel will not violate Landowner Intervenor’s due process rights.

#### **I. Landowner Intervenor’s motion to compel does not comply with the requirements of N.D.R.Civ.P. 37.**

[¶ 10] This is an adjudicative proceeding. In such a proceeding, “discovery may be obtained in accordance with the North Dakota Rules of Civil Procedure.” N.D.C.C. § 28-32-33(1).

[¶ 11] Rule 37 of the North Dakota Rules of Civil Procedure authorizes a party to file a motion to compel. However, “[t]he motion must include a certification that the movant has in good faith conferred or attempted to confer with the person or party failing to make discovery in an effort to obtain it without court action.” N.D.R.Civ.P. 37(a)(1). When interpreting this Rule, the North Dakota Supreme Court has explained that “a facially valid motion to compel requires two components, an actual certification document and performance.” *Meuchel v. Red Trail Energy, LLC*, 2024 ND 44, ¶ 24, 4 N.W.3d 203.

[¶ 12] As explained below, Landowner Intervenor and their motion to compel did not satisfy either of these requirements. The Commission should therefore deny their motion.

**A. Landowner Intervenor’s motion did not contain an actual certification document.**

[¶ 13] To be valid, Landowner Intervenor’s motion to compel must include “an actual certification document.” *Meuchel*, 2024 ND 44, ¶ 24. Among other information, the certification must include “the names of the parties who conferred or attempted to confer, the manner by which they communicated, the dispute at issue, as well as the dates, times, and results of their discussions, if any.” *Id.* at ¶ 26.

[¶ 14] Landowner Intervenor’s motion to compel clearly did not include a separate certification document. And the motion itself cannot constitute the necessary certification document. Nowhere in their motion do Landowner Intervenor’s “certify” that they attempted to confer with Summit Carbon Storage in good faith. Because Landowner Intervenor’s failed to include an actual certification document with their motion to compel, the motion is invalid.

**B. Landowner Intervenor’s did not confer or attempt to confer with Summit Carbon Storage in good faith.**

[¶ 15] In addition to submitting a document that certifies they conferred or attempted to confer with Summit Carbon Storage in good faith, Landowner Intervenor’s must actually confer or attempt to confer with Summit Carbon Storage in good faith. *Meuchel*, 2024 ND 44, ¶ 24.

[¶ 16] The North Dakota Supreme Court has explained that “[g]ood faith conferral or attempts to confer generally require more than mere demand letters or emails.” *Id.* at ¶ 27. “Conferring requires a party actually communicate by phone or in person, or at least sincerely attempt to do so.” *Id.* “[A] moving party must personally engage in two-way communication with the nonresponding party to meaningfully discuss each contested discovery dispute in a genuine effort to avoid judicial intervention.” *Id.* at ¶ 28.

[¶ 17] Landowner Intervenor’s and their counsel did not “actually communicate by phone or in person” with Summit Carbon Storage and its counsel and they did not “personally engage in

two-way communication with the nonresponding party to meaningfully discuss each contested discovery dispute in a genuine effort to avoid [Commission] intervention.” As set forth above, counsel for Landowner Intervenors responded to this letter with an email indicating that he disagreed that the notices were deficient and he intended to move forward with the deposition regardless of whether Summit Carbon Storage produced a witness.

[¶ 18] Because Landowner Intervenors did not confer with Summit Carbon Storage in good faith, the Commission should deny their motion to compel.

## **II. Landowner Intervenors’ deposition notices did not comply with N.D.R.Civ.P. 30.**

[¶ 19] The Commission should also deny Landowner Intervenors’ motion to compel because Landowner Intervenors still have not served Summit Carbon Storage with a deposition notice that complies with N.D.R.Civ.P. 30. To date, Landowner Intervenors have served five deposition notices. As explained below, not one of these notices complied with the requirements of N.D.R.Civ.P. 30.

### **A. May 9 Deposition Notice**

[¶ 20] The deposition notice that Landowner Intervenors served on May 9, 2024, clearly did not comply with N.D.R.Civ.P. 30. That Rule only allows parties to serve deposition notices. *See* N.D.R.Civ.P. 30(a)(1) (“[A] party may, by oral questions, depose any person ...”) (emphasis added); N.D.R.Civ.P. 30(b)(1) (“A party who wants to depose a person by oral questions must give reasonable written notice to every other party.”) (emphasis added). Landowner Intervenors were not parties to this case when they served their deposition notice on May 9, 2024.

[¶ 21] In addition, Rule 30 requires deposition notices to name the person or entity that is to be deposed. *See* N.D.R.Civ.P. 30(b)(1) (“The notice must state ... the deponent’s name ...”) (emphasis added); N.D.R.Civ.P. 30(b)(6) (“In its notice or subpoena, a party may name as the

deponent [an] ... entity ...”) (emphasis added). The deposition notice that Landowner Intervenor served on May 9, 2024, did not name Summit Carbon Storage as the entity to be deposed. Rather, the notice named Summit Carbon Solutions. Landowner Intervenor cannot use a deposition notice naming Summit Carbon Solutions as a basis for the Commission compelling Summit Carbon Storage to sit for a deposition.

#### **B. May 31 Deposition Notice**

[¶ 22] The deposition notice that Landowner Intervenor served on May 31, 2024, also did not comply with N.D.R.Civ.P. 30. Again, that Rule requires a deposition notice to name the person or entity to be deposed. *See* N.D.R.Civ.P. 30(b)(1); N.D.R.Civ.P. 30(b)(6). Landowner Intervenor’s deposition notice did not name Summit Carbon Storage as the entity to be deposed. Rather, the notice named Summit Carbon Solutions. Again, Landowner Intervenor cannot use a deposition notice that names Summit Carbon Solutions as a basis for the Commission to compel Summit Carbon Storage to attend a deposition.

#### **C. June 4 Deposition Notices**

[¶ 23] Finally, the deposition notices that Landowner Intervenor served on June 4, 2024, also did not comply with N.D.R.Civ.P. 30. That Rule required Landowner Intervenor to give Summit Carbon Storage “reasonable” notice of the deposition. Federal courts interpreting the Federal Rules of Civil Procedure have determined that ten business days is not reasonable notice. *See, e.g., In re Sulfuric Acid Antitrust Litig.*, 231 F.R.D. 320, 327 (N.D. Ill. 2005).

[¶ 24] Landowner Intervenor’s deposition notices gave Summit Carbon Storage two days to designate and prepare one or more officers to be deposed on numerous complicated and broad deposition topics. If ten days’ notice is not reasonable, then two days’ notice is certainly not reasonable.

### **III. Due process does not entitle a party in an administrative proceeding to discovery.**

[¶ 25] Landowner Intervenor asserts that if the Commission does not compel Summit Carbon Storage to sit for a deposition, their due process rights will be violated. *See, e.g.*, Landowner Intervenor's Br. Supp. Mot. Compel ¶ 1 ("The Commission should ... grant Intervenor Landowner's motion to compel and allow procedural due process in this proceeding ..."). At the hearing on the applications of Summit Carbon Storage, one Landowner Intervenor threatened to sue the Commission for violating his due process rights if Summit Carbon Storage is not compelled to sit for a deposition:

We've been highly prejudiced due to the lack of adherence to the North Dakota Rules of Civil Procedure and the State's failure to hold the applicants accountable to our requests. And honestly, Mr. Braaten, they are simply setting themselves up to waste more taxpayer money on a due-process lawsuit pending their decisions made by the people in this room on these permits.

So, as I discussed earlier, the applicant has refused our depositions and our discovery requests. We have had no information provided from them for us to properly prepare for this hearing. While in bed with Summit, the State has denied us as intervenors a fair hearing and our rights of due process guaranteed in law.

Hr'g Recording at 2:53:48 to 2:54:48.<sup>4</sup>

[¶ 26] The Commission should ignore Landowner Intervenor's threats because their due-process arguments are meritless. This is an administrative proceeding. "[T]here is no general

---

<sup>4</sup> A recording of the hearing in this matter can be accessed through the following hyperlink: <https://www.youtube.com/watch?v=LYaG0DKeAe0&t=5s>

constitutional right to discovery in administrative proceedings.” *Jacobson v. Blaise*, 69 N.Y.S.3d 419, 423 (App. Div. 2018).<sup>5</sup>

[¶ 27] At any rate, even if due process somehow entitled Landowner Intervenors to discovery, Landowner Intervenors have already, in effect, deposed Summit Carbon Storage. Landowner Intervenors’ counsel cross-examined Summit Carbon Storage’s witnesses for numerous hours, consuming most of the three day hearing on this matter. It is unclear what information Landowner Intervenors believe they will obtain by questioning these witnesses at a deposition that they did not already obtain by questioning them at length during the hearing.

### CONCLUSION

[¶ 28] For the foregoing reasons, the Commission should deny Landowner Intervenors’ motion to compel.

Dated this 20th day of June, 2024.

<b>Location within Application</b>	<b>Applicable SFP Application</b>	<b>Supplemental Requested</b>
<b>N/A</b>	<b>SCS1; SCS2; SCS3</b>	A listing of all environmental permits, construction approvals, or any other relevant permit received or applied for from the commission or any other federal, state, or local regulatory agency.
<b>Project Summary</b>	<b>SCS1; SCS2; SCS3</b>	Provide the location, including state, of the capture facilities associated with this project.
<b>Section 1.0</b> Land Description Details	<b>SCS3</b>	Revise unit legal descriptions for Tract 23 - Oliver County and Tract 56 - Morton County.
<b>Section 1.0</b> Storage Agreement & Pore Space Lease	<b>SCS1; SCS2; SCS3</b>	<p><b>Revise the following sections of each Storage Agreement:</b></p> <p>Section 2.4 - Typographical error (Mechanical to Mathematical)</p> <p>Sections 3.3 - Amendment of Leases and Other Agreements (no change in terms to existing leases)</p> <p>Section 7.1 - Warranty and Indemnification (limit the warranty requirements consistent with discussion)</p> <p>Section 8.1 - Grant of Easement (easement terms are limited by no surface facilities clauses &amp; and if a lease is in place, the lease shSCS1; SCS2; SCS3 be controlling document)</p> <p>Section 10.2 - Waiver of Rights to Partition (strike partition regarding sale or subdivision of land but keep the no attempts to sever pore space from surface)</p> <p>Section 15.1 - Term. (correct typo - bold and underline "Term.")</p> <p>Section 16.2 - Joinder in Dual Capacity (revise language)</p> <p><b>Revise Pore Space Lease (EXHIBIT D to Storage Agreement)</b></p> <p>18. Warranty of Title and Quiet Enjoyment (revise consistent with 7.1 above)</p> <p>25. Confidentiality - Strike</p> <p>34. Insurance - revise regarding subrogation rights</p>
<b>Section 1.0</b> Storage Agreement	<b>SCS3</b>	Revise Storage Facility Agreement, Section 3.1.2, to incorporate provided Minnkota border agreement language.

## **EXHIBIT A**

<b>Location within Application</b>	<b>Applicable SFP Application</b>	<b>Supplemental Requested</b>
<b>Section 3.0</b>	<b>SCS1; SCS2; SCS3</b>	Provide an explanation on mercury injection capillary pressure data modifications, single sampling performance, and adjustment of the mercury fluid properties to the CO2 fluid properties.
<b>Section 3.0 Appendix C</b>	<b>SCS1; SCS2; SCS3</b>	Provide an explanation on anhydrite precipitation vs dissolution as modeled in the Broom Creek for this permit, as compared to other Class VI permits.
<b>Section 5.0</b>	<b>SCS1; SCS2; SCS3</b>	Identify the distance of the closest dwelling to each flowline and injection site.
<b>Section 5.0</b>	<b>SCS1</b>	Identify the distance of the closest wind turbine to the NDL-327 flowline.
<b>Section 5.3.1</b> Corrosion Prevention	<b>SCS1; SCS2; SCS3</b>	Clarify whether Summit anticipates any cathodic protection boreholes to be drilled or will this system utilize anode beds entirely.
<b>Section 7.5.1</b> Page 7-17	<b>SCS1; SCS2; SCS3</b>	Revise "Assistance has been secured from local emergency..." to "assistance will be secured"
<b>Section 7.0</b>	<b>SCS1; SCS2; SCS3</b>	Provide revised ERRP to DMR prior to injection
<b>Section 8.0</b>	<b>SCS1; SCS2; SCS3</b>	Prior to commencement of injection operations, provide an updated Worker Safety Plan that includes a list of site specific training and the training itself for DMR inspection staff.
<b>Appendix C</b>	<b>SCS1; SCS2; SCS3</b>	Provide clarification on net change calculation of mineral precipitation vs. dissolution as seen in Figure C-13 and confirm if net change is positive or negative.
<b>Appendix C</b>	<b>SCS1; SCS2; SCS3</b>	Provide clarification on net change calculation of mineral precipitation vs. dissolution as seen in Figure C-22 and confirm if net change is positive or negative.

**BEFORE THE INDUSTRIAL COMMISSION  
OF THE STATE OF NORTH DAKOTA**

**CASE NOS. 30869–30880**

**In re application of Summit Carbon Storage #1, LLC requesting consideration for the geologic storage of carbon dioxide in the Broom Creek Formation from the Midwest Carbon Express Pipeline in the storage facility located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND**

**In re application of Summit Carbon Storage # 1, LLC to consider the amalgamation of the storage reservoir pore space, in which the Commission may require that the pore space owned by nonconsenting owners be included in the geologic storage, as required to operate the Summit Carbon Storage #1, LLC storage facility located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, in the Broom Creek Formation.**

**In re application of Summit Carbon Storage # 1, LLC for an order of the Commission determining the amount of financial responsibility for the geologic storage of carbon dioxide from the Midwest Carbon Express Pipeline in the storage facility located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36,**

**Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, in the Broom Creek Formation.**

**In re motion to consider establishing the field and pool limits for lands located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, subject to the application of Summit Carbon Storage #1, LLC for the geologic storage of carbon dioxide in the Broom Creek Formation.**

**In re application of Summit Carbon Storage #2, LLC requesting consideration for the geologic storage of carbon dioxide in the Broom Creek Formation from the Midwest Carbon Express Pipeline in the storage facility located in Sections 27, 28, 29, 32, 33, 34, and 35, Township 143 North, Range 88 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, 35, and 36, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, and 31, Township 142 North, Range 87 West, and Sections 1, 2, and 3, Township 141 North, Range 88 West, Mercer and Oliver Counties, ND**

**In re application of Summit Carbon Storage # 2, LLC to consider the amalgamation of the storage reservoir pore space, in which the Commission may require that the pore space owned by nonconsenting owners be included in the geologic storage, as required to operate the Summit**

**Carbon Storage #2, LLC storage facility located in Sections 27, 28, 29, 32, 33, 34, and 35, Township 143 North, Range 88 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, 35, and 36, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, and 31, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, 31, Township 142 North, Range 87 West, and Sections 1, 2, and 3, Township 141 North, Range 88 West, Mercer and Oliver Counties, ND in the Broom Creek Formation.**

**In re application of Summit Carbon Storage # 2, LLC to consider the application of Summit Carbon Storage #2, LLC for an order of the Commission determining the amount of financial responsibility for the geologic storage of carbon dioxide from the Midwest Carbon Express Pipeline in the storage facility located in Sections 27, 28, 29, 32, 33, 34, and 35, Township 143 North, Range 88 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, 35, and 36, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, and 31, Township 142 North, Range 87 West, and Sections 1, 2, and 3, Township 141 North, Range 88 West, Mercer and Oliver Counties, ND, in the Broom Creek Formation.**

**In re motion of the Commission to consider establishing the field and pool limits for lands located in Sections 27, 28, 29, 32, 33, 34, and 35, Township 143 North, Range 88 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, 35, and 36, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, and 31, Township 142 North, Range 87 West, and Sections 1, 2, and 3, Township 141 North, Range 88 West, Mercer and Oliver Counties, ND, subject to the application of Summit Carbon Storage #2, LLC for the geologic storage of carbon dioxide in the Broom Creek Formation, and enact such special field rules as may be necessary.**

**In re application of Summit Carbon Storage #3, LLC requesting consideration for the geologic storage of carbon dioxide in the Broom Creek Formation from the Midwest Carbon Express Pipeline in the storage facility located in Section 36, Township 143 North, Range 87 West, Sections 19, 20, 21, 28, 29, 30, 31, 32, 33, 34, 35, and 36, Township 143 North, Range 87 West, Sections 19, 20, 21, 28, 29, 30, 31, 32, 33, 34, 35, and 36, Township 143 North, Range 86 West, Sections 1, 2, 11, 12, 13 14, and 24, Township 142 North, Range 87 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, and 24, Township 142 North, Range 87 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 26, 27, 28, 29, 30, 32, 33, 34, and 35, Township 142 North, Range 86 West, and Sections 6, 7, 17, 18, 19, and 20, Township 142 North, Range 85 West, Oliver County, ND.**

**In re application of Summit Carbon Storage #3, LLC to consider the amalgamation of the storage reservoir space, in which the Commission may require that the pore space owned by nonconsenting owners be included in the geologic storage, as required to operate the Summit Carbon Storage #3, LLC storage facility located in Section 36, Township 143 North, Range 87 West, Sections 19, 20, 21, 28, 29, 30, 31, 32, 33, 34, 35, and 36, Township 143 North, Range 86 West, Sections 1, 2, 11, 12, 13, 14, and 24, Township 142 North, Range 87 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, and 35, Township 142 North, Range 86 West, and Sections 6, 7, 17, 18, 19, and 20, Township 142 North, Range 85 West, Oliver County, ND, in the Broom Creek Formation.**

**In re application of Summit Carbon Storage #3, LLC for an order of the Commission determining the amount of financial responsibility for the geologic storage of carbon dioxide from the Midwest Carbon Express Pipeline in the storage facility located in Section 36, Township 143 North, Range 87 West, Sections 19, 20, 21, 28, 29,**

**30, 31 , 32, 33, 34, 35, and 36, Township 143 North, Range 86 West, Sections 1, 2, 11, 12, 13, 14, and 24, Township 142 North, Range 87 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, and 35, Township 142 North, Range 86 West, and Sections 6, 7, 17, 18, 19, and 20, Township 142 North, Range 85 West, Oliver County, ND, in the Broom Creek Formation.**

**In re motion of the Commission to consider establishing the field and pool limits for lands located in Section 36, Township 143 North, Range 87 West, Sections 19, 20, 21, 28, 29, 30, 31 , 32, 33, 34, 35, and 36, Township 143 North, Range 86 West, Sections 1, 2, 11, 12, 13, 14, and 24, Township 142 North, Range 87 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, and 35, Township 142 North, Range 86 West, and Sections 6, 7, 17, 18, 19, and 20, Township 142 North, Range 85 West, Oliver county, ND, subject to the application of Summit Carbon Storage #3, LLC for the geologic storage of carbon dioxide in the Broom Creek Formation, and enact such special field rules as may be necessary.**

**In re application of Summit Carbon Storage # 1, LLC to consider the amalgamation of the storage reservoir pore space, in which the Commission may require that the pore space owned by nonconsenting owners be included in the geologic storage, as required to operate the Summit Carbon Storage #1, LLC storage facility located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, in the Broom Creek Formation.**

**In re application of Summit Carbon Storage # 1, LLC for an order of the Commission determining the amount of financial responsibility for the geologic storage of carbon dioxide from the Midwest Carbon Express Pipeline in the storage facility located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, in the Broom Creek Formation.**

**In re motion to consider establishing the field and pool limits for lands located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, subject to the application of Summit Carbon Storage #1, LLC for the geologic storage of carbon dioxide in the Broom Creek Formation.**

**In re application of Summit Carbon Storage #2, LLC requesting consideration for the geologic storage of carbon dioxide in the Broom Creek Formation from the Midwest Carbon Express Pipeline in the storage facility located in Sections 27, 28, 29, 32, 33, 34, and 35, Township 143 North, Range 88 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, 35, and 36, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, and 31, Township 142 North, Range 87 West, and Sections 1, 2, and 3, Township 141 North, Range 88 West, Mercer and Oliver Counties, ND.**

**In re application of Summit Carbon Storage # 2, LLC to consider the amalgamation of the storage reservoir pore space, in which the Commission may require that the pore space owned by nonconsenting owners be included in the geologic storage, as required to operate the Summit Carbon Storage #2, LLC storage facility located in Sections 27, 28, 29, 32, 33, 34, and 35, Township 143 North, Range 88 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, 35, and 36, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, and 31, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, 31, Township 142 North, Range 87 West, and Sections 1, 2, and 3, Township 141 North, Range 88 West, Mercer and Oliver Counties, ND in the Broom Creek Formation.**

**In re application of Summit Carbon Storage # 2, LLC to consider the application of Summit Carbon Storage #2, LLC for an order of the Commission determining the amount of financial responsibility for the geologic storage of carbon dioxide from the Midwest Carbon Express Pipeline in the storage facility located in Sections 27, 28, 29, 32, 33, 34, and 35, Township 143 North, Range 88 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, 35, and 36, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, and 31, Township 142 North, Range 87 West, and Sections 1, 2, and 3, Township 141 North, Range 88 West, Mercer and Oliver Counties, ND, in the Broom Creek Formation.**

**In re motion of the Commission to consider establishing the field and pool limits for lands located in Sections 27, 28, 29, 32, 33, 34, and 35, Township 143 North, Range 88 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, 35, and 36, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, and 31, Township 142 North, Range 87 West, and Sections 1, 2, and 3, Township 141 North, Range 88 West, Mercer and Oliver Counties, ND, subject to the application of Summit Carbon Storage #2, LLC for the geologic storage of carbon dioxide in the Broom Creek Formation, and enact such special field rules as may be necessary.**

**In re application of Summit Carbon Storage #3, LLC requesting consideration for the geologic storage of carbon dioxide in the Broom Creek Formation from the Midwest Carbon Express Pipeline in the storage facility located in Section 36, Township 143 North, Range 87 West, Sections 19, 20, 21, 28, 29, 30, 31, 32, 33, 34, 35, and 36, Township 143 North, Range 87 West, Sections 19, 20, 21, 28, 29, 30, 31, 32, 33, 34, 35, and 36, Township 143 North, Range 86 West, Sections 1, 2, 11, 12, 13 14, and 24, Township 142 North, Range 87 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, and 24, Township 142 North, Range 87 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 26, 27, 28, 29, 30, 32, 33, 34, and 35, Township 142 North, Range 86 West, and Sections 6, 7, 17, 18, 19, and 20, Township 142 North, Range 85 West, Oliver County, ND.**

**In re application of Summit Carbon Storage #3, LLC to consider the amalgamation of the storage reservoir space, in which the Commission may require that the pore space owned by nonconsenting owners be included in the geologic storage, as required to operate the Summit Carbon Storage #3, LLC storage facility located in Section 36, Township 143 North, Range 87 West, Sections 19, 20, 21, 28, 29, 30, 31, 32, 33, 34, 35, and 36, Township 143 North, Range 86 West, Sections 1, 2, 11, 12, 13, 14, and 24, Township 142 North, Range 87 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, and 35, Township 142 North, Range 86 West, and Sections 6, 7, 17, 18, 19, and 20, Township 142 North, Range 85 West, Oliver County, ND, in the Broom Creek Formation.**

**In re application of Summit Carbon Storage #3, LLC for an order of the Commission determining the amount of financial responsibility for the geologic storage of carbon dioxide from the Midwest Carbon Express Pipeline in the storage facility located in Section 36, Township 143 North, Range 87 West, Sections 19, 20, 21, 28, 29, 30, 31 , 32, 33, 34, 35, and 36, Township 143 North, Range 86 West, Sections 1, 2, 11, 12, 13, 14, and 24, Township 142 North, Range 87 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, and 35, Township 142 North, Range 86 West, and Sections 6, 7, 17, 18, 19, and 20, Township 142 North, Range 85 West, Oliver County, ND, in the Broom Creek Formation.**

**In re motion of the Commission to consider establishing the field and pool limits for lands located in Section 36, Township 143 North, Range 87 West, Sections 19, 20, 21, 28, 29, 30, 31 , 32, 33, 34, 35, and 36, Township 143 North, Range 86 West, Sections 1, 2, 11, 12, 13, 14, and 24, Township 142 North, Range 87 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, and 35, Township 142 North, Range 86 West, and Sections 6, 7, 17, 18, 19, and 20, Township 142 North, Range 85 West, Oliver county, ND, subject to the application of Summit Carbon Storage #3, LLC for the geologic storage of carbon dioxide in the Broom Creek Formation, and enact such special field rules as may be necessary.**

# Geologic Sequestration of Carbon Dioxide

## Underground Injection Control (UIC) Program Class VI Well Area of Review Evaluation and Corrective Action Guidance

LO18

INDUSTRIAL COMMISSION  
STATE OF NORTH DAKOTA  
DATE 6/12/24 CASE NO. 30869-880  
Introduced By Bofto (HydroSolutions)  
Exhibit LO-18  
Identified By Bofto.

## Disclaimer

*The Federal Requirements under the Underground Injection Control Program for Carbon Dioxide Geologic Sequestration Wells (75 FR 77230, December 10, 2010), known as the Class VI Rule, establishes a new class of injection well (Class VI).*

The Safe Drinking Water Act (SDWA) provisions and U.S. Environmental Protection Agency (EPA) regulations cited in this document contain legally-binding requirements. In several chapters this guidance document makes suggestions and offers alternatives that go beyond the minimum requirements indicated by the Class VI Rule. This is intended to provide information and suggestions that may be helpful for implementation efforts. Such suggestions are prefaced by “may” or “should” and are to be considered advisory. They are not required elements of the rule. Therefore, this document does not substitute for those provisions or regulations, nor is it a regulation itself, so it does not impose legally-binding requirements on EPA, states, or the regulated community. The recommendations herein may not be applicable to each and every situation.

EPA and state decision makers retain the discretion to adopt approaches on a case-by-case basis that differ from this guidance where appropriate. Any decisions regarding a particular facility will be made based on the applicable statutes and regulations. Mention of trade names or commercial products does not constitute endorsement or recommendation for use. EPA is taking an adaptive rulemaking approach to regulating Class VI injection wells, and the agency will continue to evaluate ongoing research and demonstration projects and gather other relevant information as needed to refine the rule. Consequently, this guidance may change in the future without a formal notice and comment period.

While EPA has made every effort to ensure the accuracy of the discussion in this document, the obligations of the regulated community are determined by statutes, regulations or other legally binding requirements. In the event of a conflict between the discussion in this document and any statute or regulation, this document would not be controlling.

Note that this document only addresses issues covered by EPA’s authorities under the SDWA. Other EPA authorities, such as Clean Air Act (CAA) requirements to report carbon dioxide injection activities under the Greenhouse Gas Mandatory Reporting Rule (GHG MRR), are not within the scope of this document.

## Executive Summary

EPA's *Federal Requirements Under the Underground Injection Control (UIC) Program for Carbon Dioxide Geologic Sequestration Wells* has been codified in the U.S. Code of Federal Regulations (40 CFR 146.81 *et seq.*), and is referred to as the Class VI Rule. This rule establishes a new class of injection well (Class VI) and sets minimum federal technical criteria for Class VI injection wells for the purposes of protecting underground sources of drinking water (USDWs). This guidance is part of a series of technical guidance documents that EPA is developing to support owners or operators of Class VI wells and UIC Program permitting authorities in the implementation of the Class VI Rule. The Class VI Rule and related documents are available at [http://water.epa.gov/type/groundwater/uic/wells\\_sequestration.cfm](http://water.epa.gov/type/groundwater/uic/wells_sequestration.cfm).

The Class VI Rule requires owners or operators of Class VI injection wells to delineate the area of review (AoR) for the proposed Class VI well, which is the region surrounding the proposed well where USDWs may be endangered by the injection activity [40 CFR 146.84]. The Class VI Rule requires that the AoR be delineated using computational modeling and the AoR must be reevaluated periodically during the lifetime of the geologic sequestration (GS) project [40 CFR 146.84]. Within the AoR, the owners or operators must identify all potential conduits for fluid movement out of the injection zone, including both geologic features and artificial penetrations [40 CFR 146.84(c)(1)(iii)]. The owner or operator must then evaluate those artificial penetrations that may penetrate the confining layer(s) of the injection project for the quality of casing and cementing, and in the case of abandoned wells, for the quality of plugging and abandonment, and perform corrective action on any identified artificial penetrations that could serve as a conduit for fluid movement [40 CFR 146.84(c)(2), 146.84(c)(3), and 146.84(d)]. The Class VI Rule allows, at the discretion of the UIC Program Director, the use of "phased" corrective action, where certain regions of the AoR are addressed prior to injection and other regions of the AoR are addressed during the injection phase of the project [40 CFR 146.84(b)(2)(iv)].

This guidance provides information regarding modeling requirements and recommendations for delineating the AoR, describes the circumstances under which the AoR is to be reevaluated, and describes how to perform an AoR reevaluation. In addition, the guidance presents information on how to identify, evaluate, and perform corrective action on artificial penetrations located within the AoR.

The introductory section reviews the definition of the AoR and regulations pertaining to AoR and corrective action in the Class VI Rule. Following that section:

- Section 2 addresses computational modeling of GS;
- Section 3 addresses AoR delineation using computational models;
- Section 4 addresses identification, evaluation, and performing corrective action on artificial penetrations within the AoR; and
- Section 5 addresses AoR reevaluation.

For each section, the guidance:

- Explains how to perform activities necessary to comply with AoR and corrective action requirements (e.g., performing computational modeling). Illustrative examples are provided in several cases;
- Provides references to comprehensive reference documents and the scientific literature for additional information; and
- Explains how to report to the UIC Program Director the results of activities related to AoR and corrective action.

**Area of Review (AoR)** means the region surrounding the geologic sequestration project where USDWs may be endangered by the injection activity. The area of review is delineated using computational modeling that accounts for the physical and chemical properties of all phases of the injected carbon dioxide stream and displaced fluids, and is based on available site characterization, monitoring, and operational data as set forth in 40 CFR 146.84.<sup>1</sup>

**Boundary condition parameters** refers to the parameters that describe fluid flow rates and/or pressures at the edges of the model domain and in the location of injection/extraction wells.<sup>2</sup>

**Capillary Pressure** refers to the difference of pressures between two phases existing in a system of interconnecting pores or capillaries. The difference in pressure is due to the combination of surface tension and curvature in the capillaries.<sup>2</sup>

**Computational code** refers to a series of interrelated mathematical equations solved by computer to represent the behavior of a complex system. For the purposes of GS, computational models represent, at a minimum, the flow and transport of multiple fluids and components in varying phases through porous media. Computational codes offer the ability to predict fluid flow in the subsurface using scientifically accepted mathematical approximations and theory. The use of computational codes is necessary because the mathematical formulations describing fluid flow are complicated and in many cases, non-linear. Several codes have been specifically developed or tailored for injection activities similar to GS, and can be used for this purpose.<sup>2</sup>

**Computational model** means a mathematical representation of the injection project and relevant features, including injection wells, site geology, and fluids present. For a GS project, site specific geologic information is used as input to a computational code, creating a computational model that provides predictions of subsurface conditions, fluid flow, and carbon dioxide plume and pressure front movement at that site. The computational model includes all model input and predictions (i.e., outputs).<sup>2</sup>

**Confining zone** means a geologic formation, group of formations, or part of a formation stratigraphically overlying the injection zone(s) that acts as barrier to fluid movement. For Class VI wells operating under an injection depth waiver, confining zone means a geologic formation, group of formations, or part of a formation stratigraphically overlying and underlying the injection zone.<sup>1</sup>

**Constitutive relationship** typically means, empirically based approximations used to simplify the system and estimate unknowns in cases where the parameters of the governing equations are not readily available for use in the equation because necessary information is not typically measurable, and thus not directly input into the model. An example of a constitutive relationship is relative permeability-saturation functions. These functions estimate the relative permeability of a particular fluid in a porous media as a function of its saturation at a given location and time. This permeability is then used in the governing equation to predict flow.<sup>2</sup>

**Equation of state** refers to an equation that expresses the equilibrium phase relationship between pressure, volume and temperature for a particular chemical species.<sup>2</sup>

**Geologic sequestration (GS)** means the long-term containment of a gaseous, liquid or supercritical carbon dioxide stream in subsurface geologic formations. This term does not apply to carbon dioxide capture or transport.<sup>1</sup>

**Geophysical surveys** refers to the use of geophysical techniques (e.g., seismic, electrical, gravity, or electromagnetic surveys or well logging methods such as gamma ray and spontaneous potential) to characterize subsurface rock formations.<sup>3</sup>

**Governing equation** refers to the mathematical formulae that form the basis of the computational code are termed governing equations. For GS modeling, they govern the predicted behavior of fluids in the subsurface provided by the code. Governing equations are mathematical approximations for describing flow and transport of fluids and their components in the environment.<sup>2</sup>

**Ground Penetrating Radar (GPR)** refers to a geophysical method that utilizes microwave technology in order to characterize features found in the subsurface.<sup>2</sup>

**Heterogeneity** refers to the spatial variability in the geologic structure and/or physical properties of the site.<sup>2</sup>

**Hysteresis** means the phenomenon where the response of a system depends not only on the present stimulus, but also on the previous history of the medium. For example, in a GS project, relative permeability, capillary pressure, and residual trapping will depend upon the saturation history of the formation.<sup>2</sup>

**Immiscible** refers to the property wherein two or more liquids or phases do not readily dissolve in one another.<sup>2</sup>

**Initial conditions** refers to parameter values at the start of the model simulation.<sup>2</sup>

**Intrinsic permeability** refers to a parameter that describes properties of the subsurface that impact the rate of fluid flow. Larger intrinsic permeability values correspond to greater fluid flow rates. Intrinsic permeability has units of area (distance squared).<sup>2</sup>

**Model calibration** means adjusting model parameters in order to minimize the difference between model predictions and monitoring data at the site.<sup>2</sup>

**Multiphase flow** refers to flow in which two or more distinct phases are present (e.g., liquid, gas, supercritical fluid).<sup>2</sup>

**Numerical Artifacts** refers to model results that are created erroneously based on computational limitations of the model, which may result from improper model development.<sup>2</sup>

**Parameter** means a mathematical variable used in governing equations, equations of state, and constitutive relationships. Parameters describe properties of the fluids present, porous media, and fluid sources and sinks (e.g., injection well). Examples of model parameters include intrinsic permeability, fluid viscosity, and fluid injection rate.<sup>2</sup>

**Relative permeability** refers to a factor, between 0 and 1, that is multiplied by the intrinsic permeability of a formation to compute the effective permeability for a fluid in a particular pore space. When immiscible fluids (e.g., carbon dioxide, water) are present within the pore space of a formation, the ability for flow of those fluids is reduced, due to the blocking effect of the presence of the other fluid. This reduction is represented by relative permeability.<sup>2</sup>

**Sensitivity Analyses** refers to the study of how the output of a model varies based in changes to an input variable or model parameter over a specified range of values. The results of a sensitivity analysis determine the which input variable and model parameter variability have the greatest effect on the model results.<sup>2</sup>

**Stochastic Methods** means the use of probability statistical methods in development of one or more possible realizations of the spatial patterns of the value(s) of a given set of model parameters.<sup>2</sup>

**Underground Injection Control Program** refers to the program EPA, or an approved state, is authorized to implement under the Safe Drinking Water Act (SDWA) that is responsible for regulating the underground injection of fluids by wells injection. This includes setting the federal minimum requirements for construction, operation, permitting, and closure of underground injection wells.<sup>2</sup>

**Underground Source of Drinking Water (USDW)** means an aquifer or its portion which supplies any public water system; or which contains a sufficient quantity of ground water to supply a public water system; and currently supplies drinking water for human consumption; or contains fewer than 10,000 mg/l total dissolved solids; and which is not an exempted aquifer.<sup>4</sup>

# 1. Introduction

Area of review (AoR) evaluations and corrective action are long-standing permit requirements of the Underground Injection Control (UIC) Program of the U.S. Environmental Protection Agency (EPA). The AoR refers to the delineated region surrounding the injection well(s) wherein the potential exists for underground sources of drinking water (USDWs) to be endangered by the leakage of injectate and/or formation fluids. Typically, for injection well classes other than Class VI, the AoR is defined either as a fixed radius around the injection well or by a relatively simple radial calculation. Owners or operators of injection wells are required to identify any potential conduits for fluid movement, including artificial penetrations (e.g., abandoned well bores) within the AoR, assess the integrity of any artificial penetrations, and perform corrective action where necessary to prevent fluid movement into a USDW [40 CFR 144.55, 146.84(d)].

The Class VI Rule introduces enhanced AoR and corrective action requirements for Class VI injection wells that are tailored to the unique circumstances of geologic sequestration (GS) of carbon dioxide projects [40 CFR 146.84]. The purpose of this guidance is to identify appropriate methods for delineating the AoR and performing corrective action for Class VI injection wells. The intended primary audiences of this guidance document are Class VI injection well owners or operators and their representatives conducting AoR delineation modeling or performing artificial penetration identification, assessment, and corrective action activities. The UIC Program staff who are responsible for reviewing and approving Class VI injection well permit applications and related reports concerning AoR delineation and corrective action are another intended audience of this guidance document.

This document is one of a series of technical guidance documents intended to provide information and possible approaches for addressing various aspects of permitting and operating a Class VI injection well. Three of these companion guidance documents focus on site characterization, well construction, and testing and monitoring:

- The *UIC Program Class VI Well Site Characterization Guidance*;
- The *UIC Program Class VI Well Construction Guidance*; and
- The *UIC Program Class VI Well Testing and Monitoring Guidance*.

These guidance documents are intended to complement each other and to assist owners or operators in preparing permit applications that satisfy the requirements of the Class VI Rule. Class VI injection well regulations are tailored to the characteristics of individual sites. For example, the required site characterization data collected will inform the model development for AoR delineation, and AoR models will be reevaluated, and perhaps change, based on the results of site testing and monitoring data (Figure 1-1). Cross-linkages between guidance documents are noted in the text where appropriate. Additional guidance on developing, presenting, and using the required Class VI project plan information as part of a Class VI injection well permit application is provided in the *UIC Program Class VI Well Project Plan Development Guidance*.

### 1.1. Overview of the Class VI Rule AoR and Corrective Action Requirements

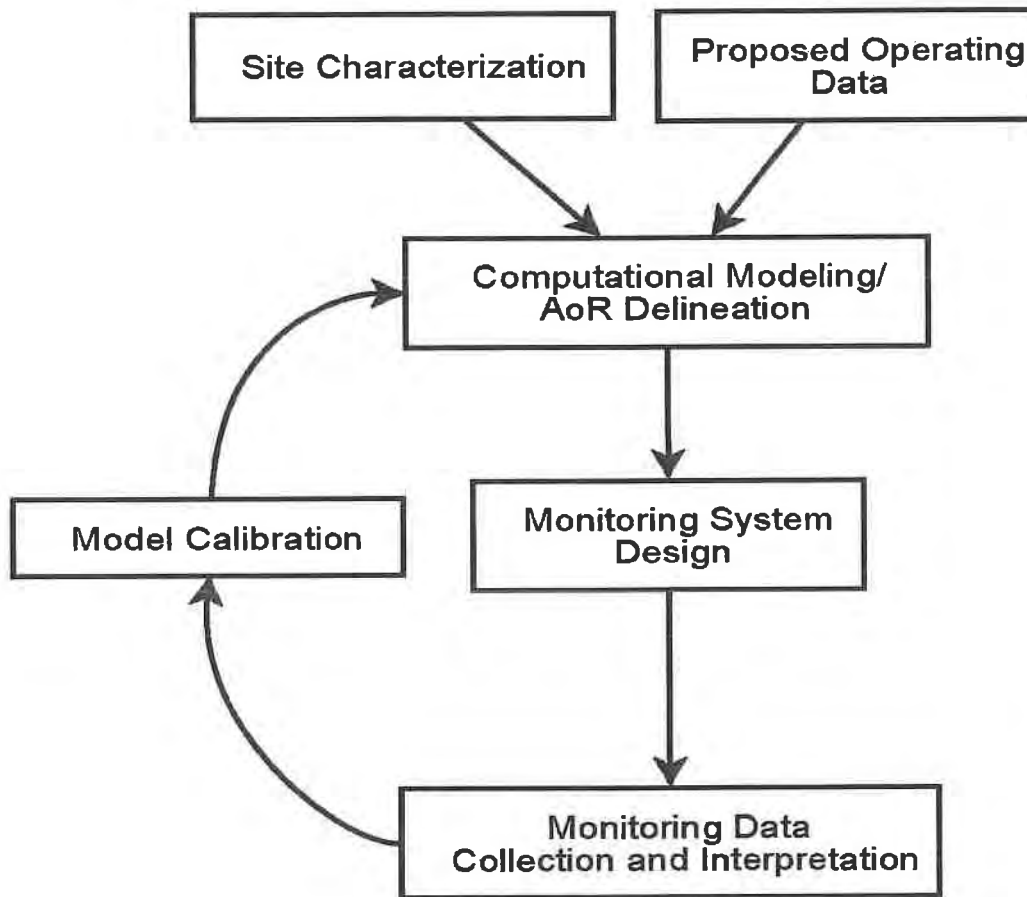

The Class VI Rule defines the AoR as the region surrounding the GS project where USDWs may be endangered by the injection activity [40 CFR 146.84(a)]. The purpose of the AoR and corrective action requirements of the Class VI Rule is to ensure that the areas potentially impacted by a proposed GS operation are delineated, all wells that need corrective action receive it, and that this process is updated throughout the injection project. While the details of all of the requirements are presented in later sections of this guidance, the basic requirements that owners or operators of GS projects must meet include:

- Prepare, maintain, and comply with an AoR and Corrective Action Plan that includes all of the required elements of the plan [40 CFR 146.84(b)];
- Delineate the AoR using computational modeling and identify all wells that require corrective action [40 CFR 146.84(c)];
- Perform all required corrective action on wells in the AoR [40 CFR 146.84(d)];
- Reevaluate the AoR throughout the life of the project [40 CFR 146.84(e)];
- Ensure that the Emergency and Remedial Response Plan and financial responsibility demonstration account for the most recently approved AoR [40 CFR 146.84(f)]; and
- Retain modeling inputs and data used to support AoR reevaluations for 10 years [40 CFR 146.84(g)].

If a vertical leakage pathway out of the injection zone is present, USDWs in the vicinity of a proposed Class VI injection well may be endangered by (1) movement of carbon dioxide into the USDW, impairing drinking water quality through changes in pH, contamination by trace impurities in the injectate (e.g., mercury, hydrogen sulfide), and leaching of metals and/or organics; and (2) movement of non-potable water (e.g., brine) out of the injection formation into a USDW as caused by elevated formation pressures induced by injection. Therefore, the AoR encompasses the region overlying the separate-phase (e.g., supercritical, liquid, or gaseous) carbon dioxide plume and the region overlying the pressure front where fluid pressures are sufficient to force fluids into a USDW. While it may often be the case that the AoR will encompass the boundary of the GS project, within which all project activities will occur, the Class VI Rule does not require that the AoR and overall project boundary be equivalent in all cases.

The Class VI Rule requires that “the AoR is delineated using computational modeling that accounts for the physical and chemical properties of all phases of the injected carbon dioxide stream and is based on available site characterization, monitoring, and operational data” [40 CFR 146.84(a)]. As discussed below, GS computational modeling for Class VI injection wells is complex and requires advanced methods. Additionally, the AoR must be reevaluated at a minimum fixed frequency not to exceed five years, or when monitoring and operational conditions warrant [40 CFR 146.84(e)]. The purpose of Class VI well AoR reevaluations is to

ensure that site monitoring data are used to update modeling results, and that the AoR delineation reflects any changes in operational conditions. The general relationship between site characterization, modeling, and monitoring activities at a GS project is shown in Figure 1-1.

**Figure 1-1: Flow Chart of Monitoring and Modeling at a GS Project.**

An individual Class VI permit must be obtained separately for each injection well, as area permits are not allowed under the Class VI Rule [40 CFR 144.33]. However, EPA anticipates that, in many cases, multiple injection wells will be operated within a single GS project. If approved by the UIC Program Director, AoR delineation and corrective action activities may be performed collectively for all wells included within a single project. All required submittals (e.g., maps of the delineated the AoR and the AoR and Corrective Action Plan) must be submitted separately for each well, however, so that they may be incorporated into each well's Class VI permit. In all cases, EPA recommends that AoR delineation models account for all wells injecting into (including any injection wells associated with other UIC well classes or other Class VI operations) or pumping from the injection zone or any other zones that are hydraulically connected to the injection zone.

The corrective action requirements for Class VI wells are generally similar to those for other injection well classes. However, due to the potentially large AoR of GS projects, EPA has allowed the use of phased corrective action, if approved by the UIC Program Director [40 CFR 146.84(b)(2)(iv)]. If phased corrective action is approved by the UIC Program Director, owners or operators would be allowed to perform corrective action only on the subset of artificial penetrations located within the AoR prior to injection that are located in regions nearest the injection well(s). Corrective action would continue during injection in the remaining regions of the AoR prior to carbon dioxide migration or pressure elevation in that area. EPA encourages owners or operators to perform all necessary corrective action on deficient wells identified during the initial AoR delineation or AoR reevaluations before the end of the injection phase.

As a part of a Class VI permit application, the owner or operator must submit an AoR and Corrective Action Plan that describes the anticipated activities that will be performed to comply with these requirements [40 CFR 146.84(b)]. The AoR and Corrective Action Plan must be approved by the UIC Program Director prior to submittal of the initial AoR delineation and issuance of a permit [40 CFR 146.84(b)]. This plan will facilitate dialogue between the owners or operators and the UIC Program Director to ensure that the UIC Program Director understands and agrees early in the project lifetime with the methods necessary to delineate the AoR and complete all required corrective action. A Class VI AoR and Corrective Action Plan must include the following information [40 CFR 146.84(b)]:

1. The method for delineating the AoR, including the model to be used, assumptions that will be made, and the site characterization data on which the model will be based;
2. The minimum fixed frequency, at least once every five (5) years, that the owner or operator proposes to reevaluate the AoR;
3. The site- and project-specific monitoring and operational conditions that would warrant a reevaluation of the AoR prior to the next routinely scheduled reevaluation;
4. How specific monitoring and operational data (e.g., injection rate and pressure) will be used to inform an AoR reevaluation;

5. How corrective action will be conducted, including what corrective action will be performed prior to injection and what, if any, portions of the AoR will have corrective action addressed on a phased basis and how the phasing will be determined;
6. How corrective action will be adjusted if there are changes in the AoR; and
7. How site access will be guaranteed for future corrective action.

The requirements related to the AoR and Corrective Action Plan are discussed in depth in the *UIC Program Class VI Well Project Plan Development Guidance*.

## **1.2. Organization of this Guidance**

This guidance document is organized to generally follow the sequence of AoR delineation and corrective action activities that an owner or operator will perform over the life of a proposed and later permitted Class VI injection project. These activities will generally proceed as described below.

Prior to the issuance of a permit for the construction of a new Class VI well (or the conversion of an existing well):

1. Collection of relevant site characterization and operational data [40 CFR 146.82(a)(3), 146.82(a)(5), 146.82(a)(6), and 146.83];
2. Determination of relevant operational data that will inform the AoR modeling [40 CFR 146.82(a)(7), and 146.82(a)(10)-(11)];
3. Development of an AoR and Corrective Action Plan [40 CFR 146.82(a)(13) and 146.84(b)];
4. Performing AoR modeling and delineation [40 CFR 146.82(a)(2)]; and
5. Identification and assessment of artificial penetrations within the AoR [40 CFR 146.82(a)(4)].

Prior to granting approval for injection:

6. Collection and/or updating of relevant site characterization and operational data that will inform AoR modeling [40 CFR 146.82(c)(2)-(5), 146.82(c)(7), and 146.83];
7. Identification of any needed updates to the AoR and Corrective Action Plan [40 CFR 146.82(c)(9)];
8. Finalizing AoR modeling and delineation [40 CFR 146.82(c)(1)]; and
9. Performing corrective action on those penetrations that may serve as a conduit for fluid movement [40 CFR 146.82(c)(6) and 146.84(d)].

During injection and post-injection site care (PISC):

10. Reevaluation of the AoR periodically, at least once every five (5) years [40 CFR 146.82(c)(9) and 146.84(e)], and updating the AoR and Corrective Action Plan; and
11. If phased corrective action is approved or when additional corrective action is warranted based on AoR reevaluations, performing corrective action [40 CFR 146.82(c)(6) and 146.84(d)].

Activities (1) through (5) must be performed prior to receiving approval to construct a Class VI injection well and activities (6) through (9) must be performed prior to receiving approval to inject carbon dioxide, and their results must be submitted to the UIC Program Director as part of the Class VI injection well permit application [40 CFR 146.82(a)]. The remaining activities will be performed after a permit application has been approved by the UIC Program Director and the Class VI injection well is actively operating.

This guidance document generally focuses on activities (4), (5), (8), (9), (10), and (11), as follows:

- Section 2 provides background on computational modeling of GS activities;
- Section 3 discusses performing computational modeling to delineate the AoR and comply with permit requirements (activities 4 and 8);
- Section 4 focuses on abandoned well identification, assessment, and corrective action on all artificial penetrations within the AoR (activities 5, 9, and 11); and
- Section 5 focuses on reevaluation of the AoR (activity 10).

Site characterization activities (activities 1 and 6) are discussed briefly in this guidance (Section 3.2), and are covered in more detail in the *UIC Program Class VI Well Site Characterization Guidance*. Preparation of the AoR and Corrective Action Plan (activity 3) and identification of any updates (activity 7) are also discussed briefly herein, and in more detail in the *UIC Program Class VI Well Project Plan Development Guidance*.

## 2. Computational Modeling for Geologic Sequestration

This section discusses the fundamentals of computational modeling for GS to provide the necessary background for owners or operators, and to assist in understanding and complying with the Class VI Rule. While computational modeling for GS may entail a vast amount of complex information, the purpose of this section is to provide a brief introduction to the modeling techniques and fundamentals that may be necessary or significant for satisfying the specific rule requirements. Following an introduction that explains the use of modeling in the context of meeting the requirements of the Class VI Rule:

- Section 2.1 discusses the processes that can be modeled;
- Section 2.2 presents a discussion of the parameters that are included in AoR models;
- Section 2.3 presents available computational approaches, including numerical, analytical, semi-analytical, and hybrid approaches;
- Section 2.4 discusses model uncertainty and sensitivity analyses;
- Section 2.5 discusses model calibration; and
- Section 2.6 provides an overview of existing codes used for development of GS models.

The AoR for a Class VI injection project must be delineated using a computational model that accounts for the physical and chemical properties of all phases of the injected carbon dioxide [40 CFR 146.84(a)]. A computational model is based on available data, and it is a mathematical representation of the GS project and relevant features, including injection wells, site geology, and fluids present. As described below, a site-specific computational *model* is designed by incorporating the GS site and operational characteristics into a computational *code*, which is a computer program that has been designed to simulate multiphase flow and other pertinent processes in geologic media based on scientific principles and accepted mathematical (i.e., governing) equations.

Computational codes that may be used for modeling of GS are necessarily more technically complex than commonly used ground water flow codes because GS modeling considers multiphase (e.g., gas, liquid, supercritical fluid) flow of several fluids (i.e., ground water, carbon dioxide, hydrocarbons), phase changes of carbon dioxide, heat flow, and significant pressure changes. Furthermore, in some cases models consider reactive transport (e.g., chemical reactions between constituents) and geomechanical processes (e.g., induced fault activation). As discussed below, the Class VI Rule requires that the AoR be delineated using models that include multiphase flow [40 CFR 146.84(a)], but not necessarily reactive transport or geomechanical processes. However, inclusion of these processes in the AoR delineation model may be important in some cases and may be required by the UIC Program Director.

Several codes are available that are capable for use in development of adequate models for delineation of the AoR at a GS site and for complying with Class VI injection well permit requirements (Section 2.6). Although available codes are sophisticated and based on the best-available scientific understanding, computational models are approximations and are never perfect representations of reality, and they cannot provide a completely accurate prediction of fluid movement at a GS site. Therefore, the characterization of model uncertainty, using sensitivity analyses, and conducting model calibrations are very important parts of many computational approaches.

Research studies have provided valuable information on the capabilities of available models, what information may be collected in order to properly inform model development, and how the model results may be presented. Importantly, the information and guidance provided here is based on currently available data, scientific research, and project experience. EPA recognizes that data collected from future GS projects may advance GS computational modeling and AoR delineation. EPA is committed to an adaptive approach for regulation of GS projects and may revisit aspects of Class VI federal regulations, and guidance, as new data becomes available.

There is a long history of simulating multiphase flow and transport in porous media using computational models. Comprehensive reviews of multiphase flow in porous media and modeling are provided elsewhere (e.g., Pinder and Gray, 2008; Miller et al., 1998; Gerritsen and Durlofsky, 2005; Finsterle, 2004). These models solve a series of governing equations to predict the composition and volumetric fraction of each phase state (e.g., liquid, gas, supercritical fluid) as a function of space and time for a particular set of circumstances. Governing equations are formulated to describe the flow and transport of several chemical species in several phases, in which interphase mass transfer may be important. Typically, flow equations are derived by substituting a multiphase form of Darcy's Law into continuum balance expressions.

The solution of the continuum balance equations requires that they be supplemented with closure relations that express unknowns in terms of accessible parameters. These include equations of state and constitutive relationships. Equations of state express the equilibrium phase relationship between pressure, volume, and temperature for a particular chemical. Accepted equations of state for carbon dioxide are presented in Figure 2-1, and are discussed in Section 2.2.4. Constitutive relationships are typically empirically based approximations used to simplify the system and estimate unknowns. Examples of constitutive relationships are saturation-relative permeability relationships, interphase mass transfer relations, and solution reaction relations.

## 2.1. Modeled Processes

Computational codes used for GS vary in complexity and may include routines for multiphase flow, reactive transport, and geomechanical processes. Traditionally, codes have been developed as separate entities to simulate these processes. Present-day simulators typically address and couple multiphase flow with geomechanical processes or geochemical processes. However, depending on site-specific characteristics, where the geochemical and geomechanical processes are significant, robust simulation of GS may require interactive coupling of all three processes. The Class VI Rule only requires that multiphase flow be included in computational modeling. However, the owner or operator, or the UIC Program Director, may determine that reactive transport and/or geomechanical modeling should also be included for a particular proposed project. For example, reactive transport could be relevant if permeability and/or porosity are predicted, based on previous testing, to change as a result of precipitation/dissolution reactions. Geomechanical processes could be relevant if previous testing has indicated that pressure and stress changes hydrogeologic properties and/or affects confining unit integrity.

Codes used to simulate multiphase flow generally incorporate some or all of the following processes: phase transition behavior of carbon dioxide (gas, liquid, supercritical fluid) and associated buoyancy; dissolution of carbon dioxide in brine and oil and associated increased density; dissolution of water in carbon dioxide; variable viscosity and density of brine and carbon dioxide phases; thermal effects such as cooling or freezing due to carbon dioxide expansion from supercritical and liquid phases; and reduced fluid permeability due to the presence of several immiscible fluids within a pore space.

Codes used to simulate reactive transport generally incorporate rate-limited intra-aqueous reactions, mineral dissolution and precipitation, changes in porosity and permeability due to these reactions, and multi-component gas mixtures. Reactive transport models can be used to determine the impact of carbon dioxide and its co-injectates (e.g., hydrogen sulfide, sulfur dioxide) on aquifer acidification, the concomitant mobilization of metals, and any mineral trapping of carbon dioxide (e.g., precipitation of carbonate minerals). Reactive transport models can also be used to assess corrosion of well construction materials as influenced by carbon dioxide.

The length scales associated with interfacial geochemistry are very small (e.g., micrometers to millimeters) compared to multiphase flow simulation (meters to kilometers). Small grid spacing around these regions may imply associated small time steps, so that the overall problem becomes computationally demanding when trying to couple these reactions to multiphase flow. Data related to geochemical rate parameters are generally lacking (e.g., Knauss et al., 2005; Xu et al., 2006), and have to be estimated for a wide range of possible environmental conditions and mineralogical interfaces. Several common codes that may be used for AoR delineation, such as ECLIPSE, normally do not include routines for reactive transport.

Geomechanical codes can be used to evaluate the effect of reservoir pressurization and buoyancy on the integrity of geologic confining units, reactivation of existing fractures and faults, and rock properties such as porosity and permeability. The amount and spatial distribution of pressure

buildup in a geologic formation will depend on the rate of injection, the permeability and thickness of the injection formation, the mechanistic properties of the rock matrix, the permeability of the confining units, and the presence or absence of permeability barriers, and boundary conditions of the system. Models used to simulate geomechanical processes generally incorporate effective stress/strain relationships, aperture stiffness and associated closing and widening, and variation in porosity and permeability. Geomechanical modeling may require simulation on both a large and small scale (individual fractures), which can be computationally challenging (i.e., require long model processing times on the order of days). When individual fractures are considered, the spatial grid resolution may need to be on the order of meters or less. Therefore, smaller-domain models may be necessary to investigate migration through individual fractures. Generally, simulation of flow through a fractured reservoir requires codes that have been designed for this purpose.

## **2.2. Model Parameters**

A parameter is a variable in the governing equations of the model that may be of uniform value throughout the domain, or may vary in space and time. While maintaining salient features of the hydrogeologic system, some system aspects are often lumped together in simulation models and described by effective parameters that are estimated or averaged from several data sources. Relevant parameters for multiphase flow modeling of GS are summarized in Table 2-1, and include hydrogeologic characteristics, fluid properties, chemical properties, fluid injection and withdrawal rates, initial and boundary conditions, system orientation (e.g., model domain, grid cell size), and simulation control parameters. Initial conditions describe parameter values at the start of the model run. Boundary condition parameters describe conditions of the system (e.g., fluid flow rates and/or pressures) at the edges of the model domain and at the location of injection and/or extraction wells. While fluid injection and/or withdrawal rates and simulation control parameters are project specific, other particularly important site- and project-specific parameters for GS include formation intrinsic permeability, porosity, relative permeability, compressibility, fluid viscosity, and fluid density. These parameters are discussed in the following subsections.

Parameter values are to be based on site data to the extent possible. However, as discussed below, in cases where detailed site geologic characterization data are unavailable (i.e., if formation testing is not complete or core samples are not available), parameter values may be estimated from standard values or relationships in the scientific literature. Model calibration, which may occur during AoR reevaluation, consists of adjusting a subset of the estimated parameter values to minimize the difference between model simulations and observed monitoring data. Model parameters may also be adjusted based on newly acquired site characterization data. For example, data gathered during well logging may inform updates to parameter values. See the *UIC Program Class VI Well Site Characterization Guidance* for more information.

**Table 2-1: Model Parameters for Multiphase Fluid Modeling of Geologic Sequestration.**

Parameter	Description	Estimation Methods	Dimensions
<b>Hydrogeologic Properties</b>			
Intrinsic Permeability	Represents properties of the subsurface that impact the rate of fluid flow.	See the <i>UIC Program Class VI Well Site Characterization Guidance</i> , and Section 2.2.1 of this guidance	$L^2$
Porosity	The relative volume of void space within a formation. Controls the volume of carbon dioxide that may be stored.	See the <i>UIC Program Class VI Well Site Characterization Guidance</i>	Dimensionless
Capillary Pressure	The pressure difference across the interface of two immiscible fluids (e.g., carbon dioxide and water)	Calculated based on fluid saturations (see Section 2.2.2 of this guidance)	$M/LT^2$
Relative Permeability	Factor that determines the decrease in permeability for a fluid due to the presence of other immiscible fluids	Calculated based on fluid saturations (see Section 2.2.2 of this guidance)	Dimensionless
Fluid Pressure	Force acting on a unit area, measure of the potential energy per volume of fluid	See the <i>UIC Program Class VI Well Site Characterization Guidance</i>	$M/LT^2$
Temperature	Measure of the internal energy of a fluid	See the <i>UIC Program Class VI Well Site Characterization Guidance</i>	Temperature
Formation Compressibility	Measure of change in aquifer volume with a change in fluid pressure	See the <i>UIC Program Class VI Well Site Characterization Guidance</i>	$LT^2/M$
Water Saturation	The percent of system void space occupied by aqueous fluids	See the <i>UIC Program Class VI Well Site Characterization Guidance</i>	Dimensionless
Carbon Dioxide Saturation	The percent of system void space occupied by carbon dioxide	Calculated by the computational model	Dimensionless
Storativity	The volume of fluid released from storage per unit decline in head per unit area of the formation	See Standard References, e.g., Fetter, 2001	Dimensionless
<b>Fluid Properties</b>			
Viscosity	Measure of the internal resistance to flow	Calculated based on equations of state, also influenced by fluid composition (see Section 2.2.4 of this guidance)	$M/LT$

Parameter	Description	Estimation Methods	Dimensions
Density	The mass of a fluid per unit volume	Calculated based on equations of state, also influenced by fluid composition (see Section 2.2.4 of this guidance)	M/L <sup>3</sup>
Composition	Molecular makeup, by volume or mass, of a fluid. Measurement of salinity, concentration of trace compounds	See the <i>UIC Program Class VI Well Site Characterization Guidance</i>	M/L <sup>3</sup>
Fluid Compressibility	The change in volume of a fluid from a unit change in pressure	See Standard References, e.g., Perry and Green, 1984	LT <sup>2</sup> /M
Chemical Properties			
Aqueous Diffusion Coefficient	The rate of chemical transport due to a concentration gradient	See Standard References, e.g., Tamimi et al., 1994	L <sup>2</sup> /T
Aqueous Solubility	The maximum concentration of a chemical (e.g., carbon dioxide) dissolved in the aqueous phase	Salinity, temperature and pressure dependent (see Spycher et al., 2003; Spycher and Pruess, 2005)	M/L <sup>3</sup>
Solubility in Carbon Dioxide	The maximum concentration of a chemical (e.g., water) dissolved in separate-phase carbon dioxide.	Temperature and pressure dependent (see Spycher et al., 2003; Spycher and Pruess, 2005)	M/L <sup>3</sup>
Fluid injection and withdrawal rates			
Injection Rates	Injection rates at each well	Planned site operational data	L <sup>3</sup> /T
Withdrawal Rates	Any fluid withdrawal rates within model domain	Measure rates for wells conducting pumping within the AoR	L <sup>3</sup> /T
Boundary Conditions	Fluid pressures and/or flow rates at the edges of the model domain	Tested in conjunction with model extent, to ensure no artificial influence on model results	Varies
Fluid injection and withdrawal rates (Continued)			
Initial Conditions	Fluid pressures and/or flow rates within the domain at the beginning of the model run	Based on pre-injection site characterization data, see the <i>UIC Program Class VI Well Site Characterization Guidance</i>	Varies

Parameter	Description	Estimation Methods	Dimensions
System Orientation and Simulation Controls			
Model Extent (domain)	The lateral extent of the model in all directions	Tested in conjunction with boundary conditions, to ensure no artificial influence on model results	L
Number of Model Layers	Model vertical discretization	Based on conceptual site model of site stratigraphy, see the <i>UIC Program Class VI Well Site Characterization Guidance</i>	Dimensionless
Layer Thickness	Vertical extent of each model layer	See the <i>UIC Program Class VI Well Site Characterization Guidance</i>	L
Grid Cell Size	Lateral size of each model cell	May vary throughout domain, as dictated by conceptual model and computational necessities	L <sup>2</sup>
Model Timeframe	The complete duration of the model run	Tested to ensure long enough to allow for pressure decline to pre-injection conditions	T
Time Step Size	The duration of each temporal interval during the model timeframe	Often controlled by code, tested to ensure small enough to not artificially influence results	T

L = Length; M = Mass; T = Time

### 2.2.1. Intrinsic Permeability

Intrinsic permeability is a property of the solid phase (i.e., porous medium) in the subsurface that impacts the rate of fluid flow. Larger intrinsic permeability values correspond to greater fluid flow rates. Intrinsic permeability has units of length squared and is often reported in the units of millidarcies (mD); one mD is equal to  $9.9 \cdot 10^{-16}$  square meters (m<sup>2</sup>). Typical permeability values for an injection zone at a GS project range from 1 to 10<sup>2</sup> mD (e.g., Sorensen et al., 2005; Fischer et al., 2005; MGSC, undated; ISGS, 2009). Typical permeability values for a confining unit (e.g., shale) range from 10<sup>-7</sup> to 10<sup>-4</sup> mD (e.g., Soeder, 1988).

Intrinsic permeability incorporates the effects of formation porosity, pore structure, such as pore-size distribution and connectivity, and the presence of fractures or faults. The spatially heterogeneous nature of subsurface materials results in a heterogeneous intrinsic permeability distribution in most formations. Additionally, intrinsic permeability is an anisotropic parameter, in that lateral intrinsic permeability is often significantly larger than vertical intrinsic permeability due to depositional layering. Anisotropy in intrinsic permeability, both vertical and horizontal, may also be an effective property of fractured rock media. Intrinsic permeability is typically estimated from a combination of hydrogeologic field tests (e.g., aquifer tests, pressure

fall-off tests), laboratory core analysis, and geophysical well logging. The *UIC Program Class VI Well Site Characterization Guidance* provides details regarding estimation of formation intrinsic permeability. Intrinsic permeability values are often adjusted during model calibration. See Box 2-1 for more information.

During the development of the computational model, the model developer determines how to estimate values of intrinsic permeability within the entire model domain based on results of site characterization activities at discrete locations. For modeling purposes, the simplest description of intrinsic permeability is a homogenous distribution, which incorporates a single value for the entire subsurface domain based on an average of available data. A model that assumes a homogeneous permeability distribution, however, will not account for heterogeneity (if it exists) that causes preferential flow paths or confining strata, or for the depth dependence of permeability in an updipping formation. Another option is to incorporate a layered distribution, which incorporates a single permeability value for each geologic stratum in the domain, and can be constructed by using geologic maps and cross-sections of the proposed project site.

Alternatively, geostatistical and stochastic methods are available to create a statistical ensemble of possible permeability distributions that incorporate both lateral and vertical heterogeneity based on available site characterization data. Spatial variability of permeability is thus described by a relatively small number of geostatistical parameters. Considering the large areas that are anticipated to be modeled for AoR delineations of proposed Class VI injection well project sites, techniques are among the best methods for incorporating realistic heterogeneity distributions into the computational model with limited data (see inset, Box 3-1).

Compared to homogeneous or layered permeability distributions, depending on the available data, intrinsic permeability fields developed with geostatistical techniques may provide a more realistic representation of conditions within the formation, and resulting models may better represent carbon dioxide migration through high-permeability channels. Commercial software packages are available for use in the development of heterogeneous intrinsic permeability distributions based on available site data (e.g., T-PROGS; Carle, 1999). See Doughty and Pruess (2004), Juanes et al. (2006), Obi and Blunt (2006), and Flett et al. (2007) for examples of the development of heterogeneous profiles based on geostatistical techniques. For more information regarding the use of geostatistical methods, see the *UIC Program Class VI Site Characterization Guidance*.

Several previous studies have evaluated the impact of permeability values on computational modeling results, through the use of parameter sensitivity analyses. Law and Bachu (1996) and Lindeburg (1997) demonstrated that for a homogeneous system, carbon dioxide mobility increases with increased formation permeability. Comparing homogeneous formations and those with layered heterogeneities, Lindeberg (1997) showed that the presence of thin shale layers increases sweep and thus carbon dioxide dissolution. For systems that are heterogeneous in three dimensions, Flett et al. (2007) illustrated that increased heterogeneity resulted in increased lateral migration and therefore dissolution. However, increasing heterogeneity also decreased the rate of residual phase trapping by delaying water imbibition into previously carbon dioxide-filled pore space. Overall, increased heterogeneity resulted in slower carbon dioxide migration and

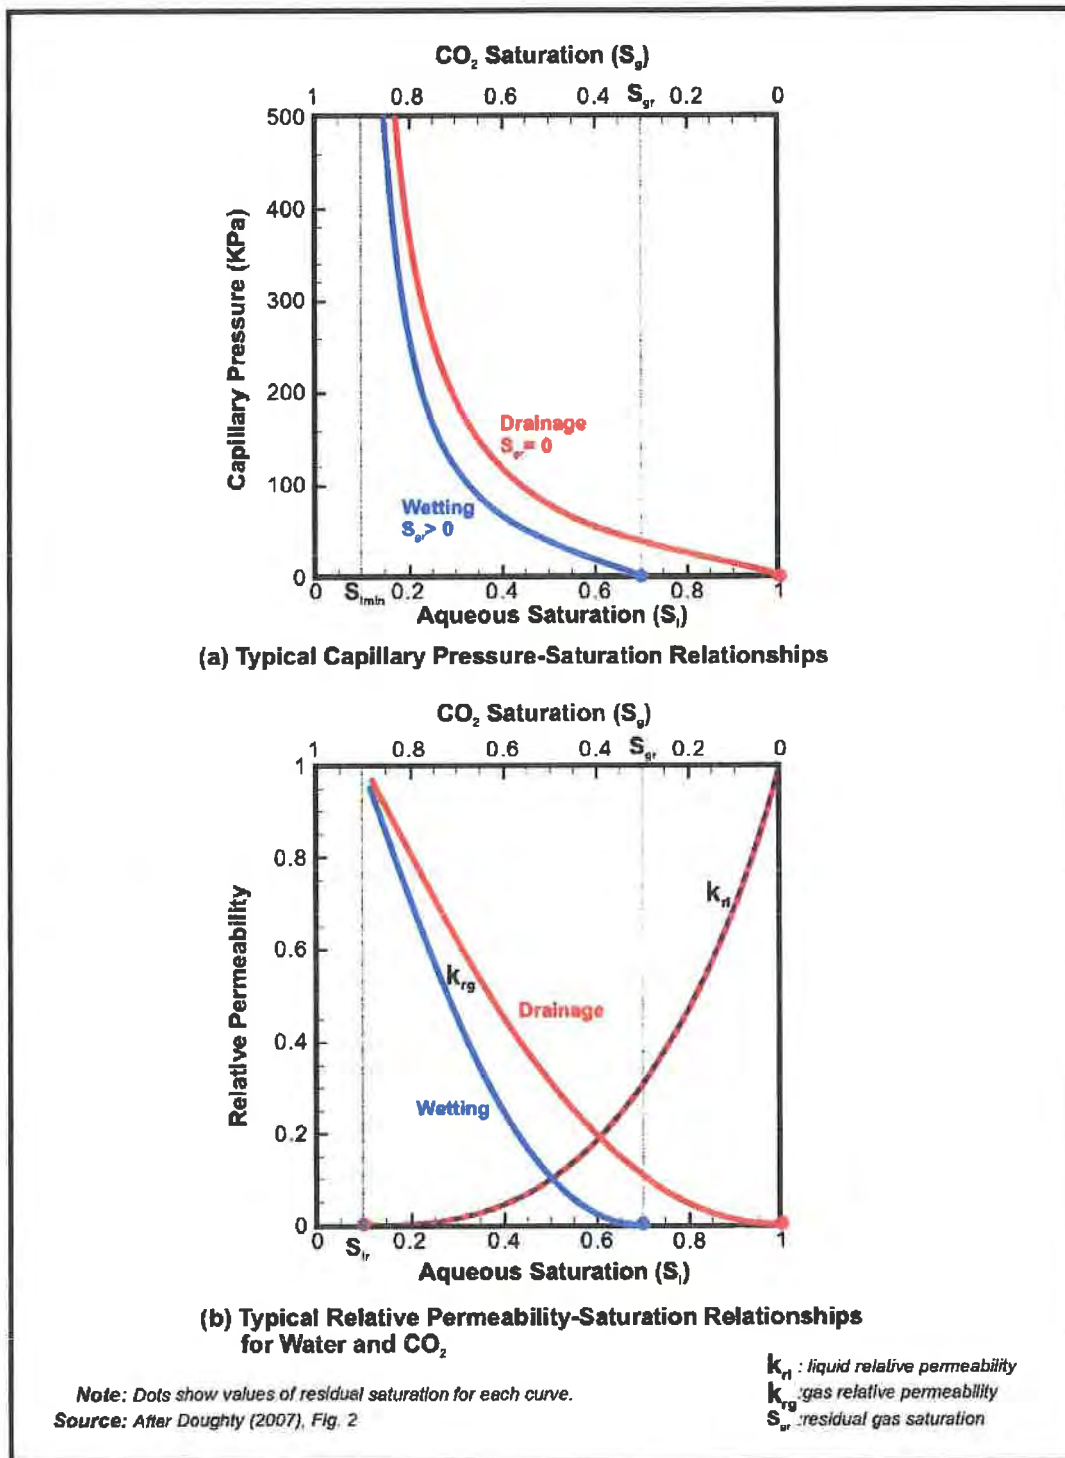

decreased accumulation at the confining layer compared to a homogeneous case. Pruess (2008) showed that for discharge through a fault, decreased fault permeability resulted in delayed leakage to the surface and an increased maximum leakage rate.

Simulations by Zhou et al. (2008) indicate that patterns of formation pressure increase induced by carbon dioxide injection are sensitive to permeability. Larger formation permeability values resulted in less localized pressure increase surrounding the injection well. In addition, larger confining layer permeability resulted in less pressure buildup throughout the formation due to pressure dissipation and associated brine leakage.

### **2.2.2. Relative Permeability and Capillary Pressure**

When immiscible fluids (e.g., carbon dioxide, water) are present within the pore spaces of a geologic formation, the ability for flow of one of those fluids is reduced, due to the blocking effect of the presence of the other fluid. Note that under any reservoir conditions, ground water and carbon dioxide will be immiscible, and ground water and hydrocarbons will be immiscible. Carbon dioxide and hydrocarbons, however, may be miscible or immiscible based on reservoir conditions. The relative permeability is a scaling factor that represents the reduction in the capacity for fluid flow due to the presence of other phases in porous media, with a value between 0 and 1. This value is multiplied by the intrinsic permeability of a geologic formation in order to compute the effective permeability for a fluid in a particular pore space. The relative permeability of a fluid is based on the properties and amounts of all fluids present within the system. The greater the amount of pore space occupied by a particular fluid or phase (measured as fluid saturation), the greater the relative permeability will be for that fluid. Because fluid saturations change over time and location, relative permeability values typically vary during model simulations.

The relative permeability for each fluid is typically calculated as a function of fluid saturations at each location and time within a model. This is achieved via a relative permeability-saturation function. The relative permeability-saturation function shape is based on properties of the porous media and fluids present at a particular site. Residual fluid saturation also impacts the shape of the relative permeability function, and describes the minimum fluid saturation within the porous medium following immiscible fluid displacement. An example relative permeability-saturation function is given in Figure 2-2. Note that this example function has been developed for a specific site (Doughty, 2007) and may not be applicable to other GS sites. Capillary pressure-saturation relationships (also known as characteristic curves) are also of importance because capillary pressure gradients provide a driving force for fluid movement under unsaturated conditions.

**Figure 2-2: Example Relative Permeability-Saturation and Capillary Pressure-Saturation Relationships for Water and Carbon Dioxide.**

Reproduced with permission of Springer Science + Business Media.

Previous research has shown that model predictions are very sensitive to the shape of the relative permeability-saturation functions used. The *UIC Program Class VI Well Site Characterization Guidance* provides details regarding measurement of relative permeability. Ideally, laboratory core-analysis techniques will be used for experimental measurement of the relative permeability-saturation and capillary pressure-saturation functions for a particular site at reservoir conditions, with carbon dioxide and representative native fluids (e.g., Perrin et al., 2008; Bachu and Bennion, 2008; Plug and Bruining, 2007). If this is not feasible, relative permeability-saturation relationships may be estimated from core analysis using other immiscible fluids (e.g., Doughty et al., 2007). Alternatively, previously reported functions may be used, such as those presented in Figure 2-2, if the experimental system was very similar to the site conditions for which the model will be applied. Relative permeability-saturation relationships are also commonly adjusted during model calibration.

Doughty and Pruess (2004) compared site-specific characteristic curves to “generic” curves at the Frio, TX GS pilot project site and found that the choice of characteristic curves had a significant impact on plume size, shape, and mobility. The authors point out that the differences in plume behavior for different sets of characteristic curves had important implications for operation and monitoring of the pilot test. Similarly, Doughty et al. (2007) found that model results were very sensitive to characteristic curve parameters. The authors constrained the value of characteristic curve parameters by calibration to monitoring data.

Pruess (2008) compared the effect of using three-phase characteristic curves developed for organic liquid-water-air systems (Stone, 1970) and simple linear characteristic curves. The choice of characteristic curves was found to have a significant impact on the observed leakage rate of carbon dioxide through a fault system. The linear characteristic curves resulted in simulated earlier leakage of carbon dioxide to the surface and lower leakage rates. Use of three-phase relationships resulted in small fluid permeability at intermediate saturations due to phase-interference effects.

The impact of using hysteretic versus non-hysteretic characteristic curves has also been compared. Hysteresis refers to the dependence of the shape of the characteristic curve on the history of fluid flow within the formation. For example, characteristic curves are often observed to have a different shape when non-wetting fluids (e.g., supercritical carbon dioxide) are displacing wetting fluids (e.g., formation water), than when wetting fluids are displacing non-wetting fluids. Juanes et al. (2006) showed that consideration of hysteresis and capillary trapping resulted in the carbon dioxide being spatially distributed over a larger area with less accumulation at the confining layer. Doughty (2007) found that results from simulations with non-hysteretic curves did a poor job of matching simulations with hysteretic curves in homogeneous and heterogeneous media. Relative to non-hysteretic cases, simulations including hysteresis exhibited a more mobile plume leading edge (where there is no water imbibition) and a slower trailing edge with a significant amount of residual trapping (due to water imbibition).

### **2.2.3. Injection Rate**

The carbon dioxide injection rate at proposed Class VI injection wells is incorporated into the model by assigning the injection rate parameter at a constant or variable-rate boundary condition, or by defining various source terms for specific nodes that correspond to injection location. However, it is important to note that calculated pressure values where injection rates are applied may need to be monitored to identify flow-controlled or pressure-limited cases. Several researchers have reported that increasing the carbon dioxide injection rate results in increased migration rates (e.g., Law and Bachu, 1996; Saripalli and McGrail, 2002; Juanes et al., 2006). Juanes et al. (2006) considered capillary trapping in highly heterogeneous media, and found that increased injection rate resulted in more simulated residual trapping due to invasion of carbon dioxide into a wider range of pore sizes. Therefore, in the long term, increased injection rates actually decreased the final simulated extent of carbon dioxide migration, as more mass was immobilized through capillary forces. Pruess (2008) modeled leakage to the ground surface through a fault system, and simulations indicated that larger injection rates resulted in increased maximum surface discharge rates relative to injection rates.

### **2.2.4. Fluid Properties and Equations of State**

The density, viscosity, and phase-state of the carbon dioxide injectate, ground water, and any other fluids that may be present (e.g., hydrocarbons), are important model input parameters. However, these properties change significantly across the temperature and pressure range that will be encountered at GS projects, and they are also affected by salinity. The equations of state describe these fluid properties and the existence of phases as a function of pressure and temperature; they are used by the model to calculate properties at conditions encountered in the simulation as they change with location and time. Graphs developed from accepted equations of state for carbon dioxide are depicted in Figure 2-1. Previous studies have shown that model results are sensitive to the equations of state used (Pruess et al., 2004; Han and McPherson, 2008).

The composition of the injectate will be reflected in several chemical and physical parameters assigned to the carbon dioxide fluid in the model simulations. Several studies have evaluated the impact of common carbon dioxide stream impurities hydrogen sulfide and sulfur dioxide on geochemical reactions and mineral trapping. Both Knauss et al. (2005) and Xu et al. (2007) showed that the addition of hydrogen sulfide had little impact, whereas the addition of sulfur dioxide resulted in a lower pH in the injection zone, less carbon-bearing mineral precipitation, and more formation-mineral dissolution.

### **2.2.5. Mass-Transfer Coefficients**

Mass transfer coefficients describe the equilibrium concentration of chemical constituents (e.g., water, carbon dioxide) between separate phases. For example, the equilibrium aqueous concentration of carbon dioxide dissolved in ground water in contact with separate-phase (e.g., supercritical) carbon dioxide is described by a partitioning coefficient. Other mass-transfer

coefficients describe the distribution of constituents between the gaseous, aqueous, separate-phase carbon dioxide, and solid phases. For the case of reactive transport modeling, mass-transfer coefficients describe equilibrium concentration of constituents between mineral and dissolved phases. Similar to fluid properties, mass-transfer coefficients are in many cases temperature and pressure dependent. Mass-transfer coefficients may also be dependent on properties of the formation and fluids present, such as ground water salinity. Reference documents are available that provide many necessary mass-transfer coefficients (e.g., Green and Perry, 2008), and several commonly used codes include necessary mass-transfer coefficients (e.g., TOUGH2-ECO2N; Pruess and Spycher, 2007).

### **2.2.6. Mineral Precipitation Kinetic Parameters**

Mineral precipitation is a subset of reactive transport problems and represents a trapping mechanism for carbon dioxide as well as a mechanism for permeability modification. As noted above, the Class VI Rule does not stipulate that reactive transport be considered in AoR delineation modeling. However, the owner or operator, or the UIC Program Director, may determine that reactive transport modeling should be considered for a particular project.

Studies accounting for mineral precipitation typically include precipitation kinetic (i.e., rate) parameters. Although precipitation rates have a large impact on mineral trapping, there is a great deal of uncertainty related to these parameters (Knauss et al., 2005; Xu et al., 2006). Furthermore, complex interrelationships exist between the rates of separate mineral species in a formation. For example, a sensitivity analysis for trapping through dawsonite  $[\text{NaAl}(\text{CO}_3)(\text{OH})_2]$  precipitation showed that decreasing dawsonite kinetics resulted in increased formation of other trapping minerals calcite  $[\text{CaCO}_3]$  and magnesite  $[\text{MgCO}_3]$  (Knauss et al., 2005). Izgec et al. (2008) showed that changes in formation permeability resulting from mineralization reactions were very sensitive to kinetic rate parameters. Several modeling studies have indicated that geochemical equilibrium following injection may not occur for thousands of years (e.g., Xu et al., 2006; Gaus et al., 2005).

### **2.2.7. Model Orientation and Gridding Parameters**

Numerical modeling requires the developer to define the spatial and temporal domains, grid spacing and gridding routine, and domain boundaries. These features of the model are typically designed with an effort to minimize computational demand and therefore processing time. However, there is potential for erroneous results based on grid features of the model (i.e., numerical artifacts), which can mask or enhance the effects of physical processes. A few studies have focused on evaluating the impacts of numerical artifacts for models of GS.

Doughty and Pruess (2004) tested the impact of varying grid cell sizes for a model of the Frio formation pilot GS project site in Texas. They found that the overall pattern of plume movement was similar for different grid sizes, but overly coarse grids were not able to simulate buoyancy-driven flow within individual sand channels. The authors also observed that the choice of grid block sizes and gridding routine could result in preferential flow in the grid axis direction and

numerical dispersion. Similarly, Juanes et al. (2006) observed that overly coarse grid block sizes that did not capture specific migration pathways overestimated carbon dioxide movement and the amount of capillary trapping. Doughty et al. (2007) note that higher-resolution models are needed for understanding of near well-bore effects. Yamamoto and Doughty (2009) demonstrate that grid refinement may have a substantial effect on overall simulated plume extent. Methods have been developed to establish numerical grids with high resolution in areas of interest (e.g., near well bores and fractures), and lower resolution in other areas, such as near the model area boundaries.

### **2.3. Computational Approaches**

Computational codes consist of the set of interrelated mathematical equations (i.e., governing equations, constitutive relationships, and equations of state) that are solved simultaneously in order to predict fluid movement, pressure changes, and other changes, as a function of both location and time. These equations include complex partial differential equations that cannot be easily solved, and require complex estimation techniques. In most cases, numerical approximation methods, discussed below, will be needed to adequately represent the several physical processes necessary to delineate the AoR and comply with the Class VI Rule.

In certain circumstances, simpler analytic and semi-analytic approaches may be used to complement numerical efforts in delineating the AoR. As discussed below, analytic and semi-analytic approaches are not capable of representing several processes and features that are important for predictions of fluid movement, and they often assume simple geometry and homogeneity.

#### **2.3.1. Numerical Approaches**

Computational models used for practical applications typically consist of a numerical formulation of the governing equations applied over a spatially discretized model domain that defines the spatial extent and resolution of the problem (i.e., the model grid). This formulation is solved by a numerical method, such as finite element or finite difference approximation. The model grid is partitioned into grid cells, smaller spatial sub-units within the model. Fluid and heat flow is then solved between adjoining grid cells, while maintaining a mass and energy balance within the model. Phase changes, mass transfer, and chemical reactions can also be calculated for phases and constituents within a cell. Each cell can be assigned unique parameter values for physical properties (i.e., intrinsic permeability, porosity), allowing for three-dimensional, detailed representations of physical heterogeneity. Numerical models may be used for steady-state problems (in which injection and withdrawal rates are constant and the solution is obtained only for infinite time when system variables become constant and the solution becomes independent of the initial condition) and transient problems (in which injection and withdrawal rates may vary in time, and the solution is obtained at several discrete times during the model timeframe while the system variables exhibit change in time and depend upon the initial condition).

In addition to detailed geologic heterogeneity, numerical models are typically capable of representing density-driven fluid flow (e.g., the buoyancy of carbon dioxide) and the dissolution of carbon dioxide into ground water. Numerical models can also represent irreducible (i.e., residual) fluid saturations (i.e., the amount of fluid being “trapped” in geologic formation pore space even after another immiscible fluid has passed through that area), multiphase flow effects, and the concomitant reduced permeability.

The scale of spatial and temporal discretization of the model affects the accuracy of the solutions to these numerical formulations. Finer scales of time and space reduce numerical solution error. However, computational demand increases as the length scale (e.g., grid cell size) and time scale (e.g., time-step size) decrease, and as additional processes are simulated. Methods have been developed to mitigate increases in computational demand, while focusing on regions and times of interest, such as adaptive grid block size (i.e., mesh) refinement. Another possibility is the use of parallel computing, in which a single problem is broken up and distributed among many processors (e.g., Zhang et al., 2007).

### **2.3.2. Analytical, Semi-Analytical, and Hybrid Approaches**

Analytical and semi-analytical models may be used to complement numerical modeling efforts in AoR delineation for Class VI wells. Compared to numerical models, analytical models have much lower computational requirements and therefore lower processing times. Analytical and semi-analytical codes may also be particularly useful for assessing the transport of carbon dioxide through abandoned well bores, which is difficult in numerical models due to the disparity in spatial scales. Analytical and semi-analytical models also may be used as screening tools to quickly assess potential storage sites, or as a relatively simple comparative check on numerical modeling results. Celia and Nordbotten (2009) suggest the use of hybrid numerical-analytical models for cases where a large-scale numerical model could be combined with local analytical models (e.g., describing wells), or the use of semi-analytical solutions where analytical solution is used in the spatial dimension and finite-stepping is used for temporal changes.

However, strictly analytical and semi-analytical models are not able to explicitly account for detailed physical and chemical characteristics of carbon dioxide injected as required under the Class VI Rule. They are also not able to simulate other important processes, such as capillary trapping, or account for varying injection rates or formation heterogeneity. The applicability of these models is limited to simplified cases where an exact function can be found to satisfy the governing equation and boundary and initial conditions. For example, in most cases, these models assume homogenous aquifers (i.e., no variability in physical structure, porosity, or intrinsic permeability). For most formations this is an unrealistic assumption, and it neglects preferential fluid movement through heterogeneous channels within geologic formations.

## **2.4. Model Uncertainty and Sensitivity Analyses**

As discussed above, computational models are an approximate representation of reality, and thus predictions exhibit some degree of uncertainty. Model uncertainty is a result of the uncertainties

related to the underlying science of the governing equations and the uncertainty in the parameter values input to represent the actual system (USEPA, 2003). Uncertainty in governing equations and model framework may arise from incomplete scientific data or lack of knowledge, as well as the necessary simplifications that translate scientific concepts into mathematical equations. Parameter uncertainty results from poor data quality (e.g., measurement errors, analytical imprecision, limited sample size), lack of data, and the inherent variability in natural systems. Model predictions depend largely on the values input for a number of key parameters and thus may be significantly impacted by incomplete knowledge, or they may be process and scale dependent. The predictive accuracy of a model improves with improved data quality, increased data quantity, realistic assumptions that reflect observed conditions and scientific knowledge, and a modeling domain (extent and resolution) that sufficiently and accurately represents the GS project.

Significant uncertainty exists in modeling predictions of GS due to the difficulty in determining the geological formation structure and permeability field throughout the extensive area likely to be impacted by proposed large injection volumes, a relative lack of data on the behavior of supercritical carbon dioxide in the subsurface, the drastic changes in transport behavior of carbon dioxide caused by changes in pressure and/or temperature, and the buoyant nature of carbon dioxide relative to native formation ground water.

The impact of parameter uncertainty on modeling results can be characterized through a model sensitivity analysis, which consists of sequentially varying a single parameter in successive model simulations while keeping all other model features constant. Sensitivity analyses provide an indication of those modeling parameters that are most sensitive (i.e., that most impact predictions of carbon dioxide migration, trapping, and pressure changes), and provide guidance for what parameters to focus on during data collection, parameter estimation, and model calibration. Accepted guides to environmental modeling (e.g., NRC, 2007) recommend the use of sensitivity analyses in submission of modeling results. Parameters that are sensitive for a particular model will be based on case-specific circumstances, and will be identified via sensitivity analyses.

## **2.5. Model Calibration**

Model calibration consists of using the computational model to simulate a past time period for which monitoring data are available and adjusting relevant model parameters to reduce differences between model results and the observed monitoring data. For example, during initial model development, in-situ pressure data of the injection zone may be available for comparison to model predictions of pre-injection fluid pressures. After the initiation of carbon dioxide injection, monitoring data may be available regarding changes in reservoir pressure and fluid properties that may be used to calibrate the model. It is generally understood that model calibration reduces model error in prediction of future conditions.

Examples of observed data that may be used for model calibration include carbon dioxide saturation values and fluid pressures. Model calibration involves adjustment of model parameters, termed “calibration parameters,” in order to minimize the difference between

simulated and observed data values. Calibration parameters for a particular model will be site specific, but they will commonly include intrinsic permeability and relative permeability-saturation function parameters. Calibration may involve incorporating additional heterogeneities or highly-permeable pathways. A case study of model calibration to monitoring data at an early GS research site, the Frio Brine Pilot in Texas, is provided in Box 2-1 of this guidance document.

Model calibration is never perfect, in that simulated and observed values for a computational model will not agree exactly. Calibration statistics are often used to characterize the error difference between model simulations and observed data values. The objective of model calibration is to minimize the value of the calibration statistics to the extent possible, using model parameters values consistent with site data or realistic estimates.

Common calibration statistics include the mean error (ME), mean-absolute error (MAE), and the root-mean squared error (RMSE). The ME is a simple average of the residual error between observed and simulated values and, therefore, positive values will offset negative values. The ME therefore provides an indication of the net bias (positive or negative) of the model simulated values. MAE is similar to the ME, with the important distinction that the sum of the absolute values of the residuals is calculated, thereby eliminating the offset that occurs by adding positive and negative values. The MAE, therefore, is always positive and represents the average difference between observed and simulated values. The RMSE is similar to the MAE, although negative values of the residual between observed and simulated values are eliminated by squaring the difference, and then the square root of the sum is determined prior to computing the average.

Model calibration may be conducted by use of computer programs designed for this purpose (i.e., automated calibration, see Finsterle, 2004), and/or adjusted manually based on best professional judgment. In practice, the automated programs can be cumbersome; therefore, manual parameter adjustment is a more standard practice in the calibration of complex models.

### **Box 2-1. Model Calibration Case Study: Frio Brine Pilot Project**

Pilot projects of GS can provide valuable insight into modeling predictions and monitoring results comparison. The Frio Brine Pilot Project, in Dayton, TX, is an early experimental project conducted primarily by researchers at the Texas Bureau of Economic Geology and Lawrence Berkeley National Laboratory (LBNL). Two carbon dioxide injection and monitoring experiments (Frio I and Frio II) have been conducted at Frio, supplemented by numerical modeling. In this text box, separate-phase carbon dioxide data from monitoring wells, pressure monitoring data, and geophysical monitoring data are presented. These figures and discussion are taken from Doughty et al. (2007) and Ajo-Franklin et al. (2008).

A geologic schematic of the Frio pilot site is shown in Figure 2-3. For the Frio I pilot, 1,600 metric tons of carbon dioxide were injected over 10 days into a steeply dipping brine-saturated later at a depth of 1,500 m. For the Frio II pilot, approximately 350 metric tons of carbon dioxide was injected at a depth of 1,600 m. A number of pre-injection site characterization, and operational and post-injection monitoring activities were conducted along with both injections.

**Figure 2-3: Geologic Schematic of Frio Brine Pilot Project. The arrow at top indicates the north direction.**  
From: Doughty et al. (2007). Reproduced with permission of Springer Science + Business Media.

For the Frio I pilot, a numerical model was calibrated by constraining the value of several parameters to a variety of monitoring data. Key calibration parameters were determined to be multi-phase flow parameters that describe the relative permeability-saturation relationship

### Box 2-1. Model Calibration Case Study: Frio Brine Pilot Project, *continued*

(referred to in the study as the irreducible liquid saturation,  $S_{lr}$ ) and the van-Genuchten (i.e., characteristic curve) parameter ( $m$ ). The value of these parameters was constrained by several types of monitoring data (see Doughty et al., 2007). The researchers focused on calibration to the arrival time of carbon dioxide at the monitoring well, and pressure monitoring at the injection and monitoring wells. The arrival time of carbon dioxide at the injection well was determined based on a reduction of fluid density collected at the observation well using a U-tube sampling apparatus. The observed arrival time was compared to a series of model runs, varying  $S_{lr}$  and  $m$  (Figure 2-4). In addition, the observed pressure increase at both the monitoring and the injection wells were compared to model predictions (Figure 2-5). Based on these results, the value of the parameter  $S_{lr}$  was constrained to a range of 0.15 to 0.30, and the value of  $m$  was constrained to 0.9.

### **Box 2-1. Model Calibration Case Study: Frio Brine Pilot Project, *continued***

Frio II used an initial numerical model to predict the evolution of the carbon dioxide plume over time. Observed seismic geophysical data of plume migration showed that a thin finger of carbon dioxide moved further up-dip than initially predicted by the model. The model was calibrated to the seismic monitoring results by, among other changes, increasing the value of the intrinsic permeability throughout the model, and increasing the thickness of a high-permeability channel at the confining zone-injection zone interface. The initial and data-calibrated model results are shown in Figure 2-6.

**Figure 2-6: Comparison of (a) Initial and (b) Post-Calibration Model Predictions of Carbon Dioxide Plume Evolution. From: Ajo-Franklin et al. (2008).**

## 2.6. Existing Codes used for Development of GS Models

A wide variety of modeling exercises have been reported in the peer-reviewed literature for GS and have been reviewed previously (Schnaar and Digiulio, 2009). Several computational codes have been developed for multiphase flow and transport problems, and a number of these codes are publicly or commercially available for the owners or operators of a GS project to use in AoR delineation modeling. Codes reported in the literature used for modeling of GS include petroleum reservoir codes (STARS, Law and Bachu, 1996; GEM, Kumar et al., 2004; ECLIPSE, Zhou et al., 2004; Juanes et al., 2006; CHEARS, Flett et al., 2007) and codes that have been developed at U.S. Department of Energy (DOE) national laboratories for a range of multiphase flow and transport problems (STOMP, CRUNCH, Knauss et al., 2005; TOUGH-series, Finsterle, 2004; Xu et al., 2006; Doughty and Pruess, 2004; Doughty, 2007). Additionally, DOE provides a summary of available models that have been used to model processes associated with injection for GS at the Regional Carbon Sequestration Partnership (RCSP) project sites. The document presents the types of data that are needed for various models and how to obtain such information (NETL, 2011). These codes vary not only in the physical processes considered, but also in numerical techniques such as the spatial discretization method, iteration approach, and gridding routines. The codes mentioned above are provided as examples that may be used for GS modeling, and the lists given are not meant to include all available codes, or to suggest preference for certain codes over others.

Codes used for modeling GS consider multiphase flow of carbon dioxide in supercritical, liquid, and gaseous phases including miscible and immiscible displacement, dissolution of carbon dioxide in ground water, density-driven flow, and flow of ground water as impacted by injection. Available codes may also be further categorized based on their ability to consider, or to be adjusted to consider, complex three-dimensionally heterogeneous formations, residual phase trapping and characteristic-curve hysteresis, mineral precipitation/dissolution reactions and subsequent mineral phase trapping and leaching of heavy metals, carbon dioxide sorption in coal-bed methane problems, and leakage through abandoned well bores. Models based on the TOUGH-series codes have been widely reported in the literature and are capable of considering three-dimensional heterogeneous formations, carbon dioxide dissolution, residual phase trapping and characteristic-curve hysteresis, coupled fluid flow and geomechanical processes, and mineral precipitation (e.g., Finsterle, 2004; Doughty, 2007; Xu et al., 2006; Rutqvist et al., 2008).

Several codes were compared for identical GS problems in an LBNL study (Pruess et al., 2004) in order to evaluate code comparability. Ten research groups representing six countries participated in the study. The codes evaluated included TOUGH-series codes (LBNL, CSIRO Petroleum, Industrial Research Limited), ECLIPSE 300 (Los Alamos National Laboratory), and STOMP (Pacific Northwest National Laboratory), among others. The problems considered varied in complexity and included mixture of gases in an open system, radial flow from an injection well, discharge along a fault zone, injection with mineral trapping, and injection with enhanced-oil recovery. For the most part, model results for the different codes were found to be in good agreement. Most discrepancies were traced to differences in the calculation of fluid properties (e.g., viscosity). These results emphasize the need for accurate descriptors of carbon dioxide transport properties and equations of state.

The use of proprietary codes (i.e., codes not available for free to the general public) may prevent full evaluation of model results (e.g., NRC, 2007). There are several aspects of a model that can be proprietary, and some may be more important than others for computational model evaluation. For example, use of a proprietary user interface with a publicly available code may not present a significant problem. Several popular codes in the petroleum-reservoir engineering discipline are proprietary (e.g., ECLIPSE). However, these codes have been used in peer-reviewed studies to model GS, and operators of particular GS sites may prefer to use these codes as they have previous experience with them. As discussed below, when using a proprietary model for AoR delineation, site operators of GS projects are encouraged to clearly disclose to the UIC Program Director the code assumptions and, if necessary, governing equations and equations of state with the permit application.

### 3. AoR Delineation Using Computational Models

Determination of the AoR for proposed Class VI wells will consist of data collection and compilation, development of the site computational model, delineation of the AoR based on model results, and submission of the model results and AoR delineation to the UIC Program Director with the Class VI permit application. The AoR and Corrective Action Plan must describe how the owner or operator plans to conduct these activities and is subject to UIC Program Director approval [40 CFR 146.84(b)].

The AoR delineation model must be submitted with the Class VI permit application—i.e., with the proposed AoR and Corrective Action Plan, as required at 40 CFR 146.82(a)(13)—and the modeled AoR will be finalized after all site data are collected and pre-injection testing is complete, per 40 CFR 146.82(c)(1). Therefore, the submittal, evaluation, and approval of the AoR, as part of the AoR and Corrective Action Plan, may be an iterative process, involving multiple drafts, until all the information required is submitted at the appropriate level of detail as determined by the UIC Program Director. See the *UIC Program Class VI Well Project Plan Development Guidance* for more information on the AoR and Corrective Action Plan. Also see the *UIC Program Class VI Implementation Manual* for additional information on how permitting authorities will review the information submitted by owners or operators.

This section describes the AoR delineation process and provides several quantitative examples revolving around a hypothetical GS site. EPA recommends that model development in all cases be conducted by a professional expert with the understanding of multiphase flow processes and experience with application of sophisticated computational models.

#### 3.1. AoR Delineation Class VI Rule Requirements

The following Class VI Rule requirements pertain to AoR delineation:

- 40 CFR 146.84(a): The AoR is the region surrounding the GS project where USDWs may be endangered by the injection activity. The AoR is delineated using computational modeling that accounts for the physical and chemical properties of all phases of the injected carbon dioxide stream and is based on available site characterization, monitoring, and operational data.
- 40 CFR 146.84(c)(1): Owners or operators of Class VI wells must predict, using existing site characterization, monitoring and operational data, and computational modeling, the projected lateral and vertical migration of the carbon dioxide plume and formation fluids in the subsurface from the commencement of injection activities until the plume movement ceases, until pressure differentials sufficient to cause the movement of injected fluids or formation fluids into a USDW are no longer present, or until the end of a fixed time period as determined by the UIC Program Director. The model must:
  - (i) Be based on detailed geologic data collected to characterize the injection zone(s), confining zone(s), and any additional zones; and anticipated operating data,

including injection pressures, rates, and total volumes over the proposed life of the GS project;

- (ii) Take into account any geologic heterogeneities, other discontinuities, data quality, and their possible impact on model predictions; and
- (iii) Consider potential migration through faults, fractures, and artificial penetrations.

### **3.2. Data Collection and Compilation**

Computational modeling utilizes the required site characterization data for a proposed Class VI injection well site and applies scientifically accepted principles to estimate the carbon dioxide plume and pressure front migration. The extent to which site and operational conditions are realistically represented determines the validity of the resulting model predictions. Site characterization data inform model parameterization and the development of the model and, therefore, adequate data collection, analysis, and compilation are integral components of model development. Table 2-1 of this guidance provides a summary of important model parameters, many of which are determined based on site characterization data.

A variety of site characterization data are required to be collected for proposed GS projects [40 CFR 146.82 and 146.83]. These data are required to verify that the proposed injection zone at the characterized site has adequate injectivity to accept the injected carbon dioxide at the proposed rate and adequate volume to store the injectate over the lifetime of the project. Furthermore, site characterization data verify that suitable confining zone(s) are present to restrict the upwards movement of carbon dioxide. Additional features of the site, such as baseline geochemistry and pre-injection fluid pressures, inform the interpretation of future monitoring results and support reactive transport modeling if it is chosen to be used. As discussed below, much of the site characterization data collected at the proposed Class VI injection well site are also necessary to inform computational model development and AoR delineation. Site characterization requirements and methods are discussed in more detail in the *UIC Program Class VI Well Site Characterization Guidance*.

#### **3.2.1. Site Hydrogeology**

Regional and site-specific geology provide the foundations of the computational model used to delineate the AoR. This includes site stratigraphy, including formation elevation and thickness, as presented in cross sections and/or topographic maps. It is recommended that any data regarding structural geology (including folding, and fracture and fault systems) be identified and used when creating the computational model. For each geologic formation at the proposed injection site, hydrogeologic information, including initial fluid pressure, horizontal and vertical gradients, and ground water flow direction and velocity, should be considered. Other important characteristics include intrinsic permeability and porosity of all formations ranging from the uppermost USDW to beneath the injection zone. Where injection depth waiver applications are considered, EPA recommends that these parameters be determined for all formations down to and including the first USDW below the injection zone. See the *UIC Program Class VI Well Injection Depth Waivers Guidance* for additional information. EPA recommends that the

heterogeneity of these characteristics within each formation also be evaluated. Data regarding the heterogeneity of these parameters are of particular importance in representing the injection and confining zone(s). The Class VI Rule requires that AoR computational modeling take into account any geologic heterogeneities and other discontinuities [40 CFR 146.84(c)(1)(ii)].

Thorough characterization of multiphase flow parameters is also recommended to properly inform the computational modeling. These include parameters describing the capillary pressure-saturation and relative permeability-saturation relationships of each formation, with the injection and confining zones being of particular importance. See Figure 2-2 of this guidance for more information. EPA recommends that accepted formulations of these relationships be defined that are as specific to the site and fluids of interest (e.g., brine, carbon dioxide) as possible.

The quantity of data used to inform model development is recommended to be, at least, based on the Class VI Rule site characterization requirements, as discussed in the *UIC Program Class VI Well Site Characterization Guidance*. For pertinent data types, as discussed above, all data collected to comply with site characterization requirements may be considered in the AoR delineation. Furthermore, EPA recommends that any additional pertinent data available in the vicinity of the site, for example from the U.S. Geological Survey (USGS) or other sources, also be included in model development.

Additionally, EPA recommends that the lateral and vertical extents of all formations predicted to exhibit contact with supercritical carbon dioxide or elevated pressure over the lifetime of the proposed GS project be characterized for hydrogeologic properties. This may be an iterative process because initial model estimates of plume and pressure front migration may indicate further migration than previously assumed. In these cases, some additional site characterization in these regions may be requested by the UIC Program Director before a permit is approved.

EPA recommends that adequate data be collected to reasonably estimate site heterogeneity. Collection of sufficient data is always a challenge in geologic studies, and this is compounded by the large areas that may be impacted by GS projects. Use of geophysical site characterization techniques may reduce the burden of site characterization over large areas. See the *UIC Program Class VI Well Site Characterization Guidance* for more information on using geophysical methods to assist with collecting the required site characterization data for a Class VI injection well permit application.

### **3.2.2. Operational Data**

The Class VI Rule requires that the AoR computational modeling for a Class VI injection well be based on existing or proposed operational data including injection pressures, rates, and total volumes over the lifetime of the GS project [40 CFR 146.84(c)(1)(i)]. EPA recommends that operational data also include the location and number of injection wells, and the injection well construction details (e.g., total depth, perforated interval). In the case of GS projects with multiple Class VI injection wells, it is important to note that each Class VI well is required to be permitted separately, as area permits are not allowed [40 CFR 144.33(a)(5)]. However, EPA strongly encourages potential Class VI injection well owners or operators to account for all

injection wells associated with the proposed project, or any other injection or extraction wells in the area, when developing the AoR model. EPA recommends that a single AoR delineation model be used for all Class VI injection wells for a single GS project, and that the model include the influences of all relevant wells. EPA also recommends that overlapping pressure perturbations be evaluated for a given basin or hydraulically connected formations to determine any combined risk to USDWs. The owner or operator may consult the UIC Program Director regarding any existing or planned projects in the vicinity of the proposed well.

### **3.3. Model Development**

Once adequate data are collected, model development consists of the formation of a conceptual site model, design of the mathematical framework and grid, and parameterization (i.e., determination of input parameter values) (USEPA, 2003). The model is then executed to provide predictions of fluid movement and pressure perturbations during the lifetime of the project.

#### **A Note Regarding Hypothetical Examples**

Several informative boxes are included within this guidance that provide examples of the AoR delineation and reevaluation process based on a hypothetical site (Box 3-1, Box 3-2, Box 5-1, and Box 5-2). The hypothetical site presented is not intended to be representative of all GS projects. Assumptions and methods used in hypothetical examples may not be valid in all cases. A length scale has not been included on hypothetical site figures, such that an allowable size of the AoR, or distance between wells, is not unintentionally inferred from the figures.

#### **3.3.1. Conceptual Model of the Proposed Injection Site**

A conceptual site model is a schematic representation of the proposed GS project, including all major geologic elements present in the flow system and any relevant physical processes. In the delineation process, the conceptual model is translated mathematically into a numerical model to be solved for pressure and saturation. The conceptual site model is informed primarily by the collected site characterization data and the proposed operational conditions, such as well-field configuration and injection rates. EPA recommends that descriptions of the conceptual site model present a clear statement and description of each element of the site, as well as any assumptions and hypotheses related to the proposed injection site and the reasoning behind them (e.g., lab experiments, empirical data, or peer-reviewed literature). The conceptual site model also identifies the modeling region in three dimensions. Geologic stratigraphy, any other relevant geologic features, all physical processes that will impact migration of carbon dioxide and ground water, chemical species of interest, location of USDWs and potential conduits, conditions at site boundaries that may inform model boundary conditions, and areas of sparse site characterization data are also identified in the conceptual site model. See Box 3-1 for more information about the conceptual site model.

### **Box 3-1. Hypothetical Example of a Conceptual Site Model**

A conceptual site model describes the general features of the anticipated Class VI project, using one or several schematics and diagrams. EPA recommends that schematics be used to show the general project orientation, both at the surface and at depth, important site features, and known processes that will impact plume and pressure front evolution at the site. Report text accompanying the conceptual site model schematic describes the relevant features at the site. A hypothetical example conceptual site model schematic is shown in Figure 3-1, and the example accompanying text is below.

For this hypothetical project, three injection wells are planned to inject a total of two million tons of carbon dioxide per year for 30 years. The source of carbon dioxide is a coal-fired power plant located approximately 200 miles to the north of the injection site. The injectate will be supplied via pipeline to the site, delivered to a surface facility, and then supplied separately to each of the injection wells. The injectate will be greater than 99% pure carbon dioxide at all times, containing trace amounts of sulfur dioxide and nitrogen oxides.

**Figure 3-1: Hypothetical Conceptual Site Model for Geologic Sequestration.**

### **Box 3-1. Hypothetical Example of a Conceptual Site Model, continued**

Injection will occur into a saline formation (Unit N), with a measured salinity of 50,000 mg/L, at a depth of approximately 1,800 meters below ground surface. The formation dips slightly, and carbon dioxide and pressure front movement are expected to be generally greater in the up-dip direction. The permeability of the injection zone has been measured to range from 1 to 50 mD, with lower permeabilities generally at higher elevations and at the contact between the confining and injection zones.

A shale unit, at least 20 meters thick throughout the vicinity, serves as the primary confining unit (Unit M). The depth of the lowermost USDW (Unit C) varies somewhat throughout the vicinity, but it is generally from 200 to 500 meters below ground surface. Intervening layers of sand, shale, and clay units exist between the confining layer and lowermost USDW. A secondary confining zone (Unit K) has been identified.

The majority of carbon dioxide is expected to migrate upwards through the zones of higher permeability until encountering lower permeability zones within the injection zone, or the injection zone/confining zone contact, and be physically trapped. Capillary trapping, mineral trapping, and dissolution of carbon dioxide into ground water will also occur; however, at this point the rate and total amount expected to be sequestered via the different mechanisms has not been quantified. Currently, ground water in all subsurface formations flows generally to the west. It is expected that pressure increases within the injection zone induced by the project will cause ground water to generally flow radially away from the injection wells.

Two relevant geologic zones with a concentration of fractures are located in the vicinity of the project, as shown on Figure 3-1. Fractures exist primarily in Unit K, the secondary confining unit, but also are potentially identified in the primary confining zone, Unit M. Geologic studies of the fractures and preliminary modeling have indicated that due to the orientation and fracture widths, they will not serve as a leakage pathway during carbon dioxide injection. However, these two relevant geologic zones will likely be locations for enhanced monitoring during the lifetime of the project, based on consultation with the UIC Program Director.

A former oil and gas field is located to the northeast of the project. Further analysis, including modeling, is used to determine if carbon dioxide may migrate into this area. If migration is detected, enhanced corrective action and monitoring will occur within the area of the former oil and gas field in consultation with the UIC Program Director. A fault zone exists far to the east of the proposed site. Carbon dioxide is not expected to migrate as far as the fault zone. However, this feature may also be further evaluated over the course of project, along with the potential for brine migration through the fault zone as a result of pressure buildup in the formation.

### **3.3.2. Determination of Physical Processes to be Included in the Computational Model**

Prior to developing the computational model for a proposed Class VI injection well AoR delineation, the owner or operator will need to determine what physical processes will be considered in the computational model. This determination is based on the most significant processes identified in the conceptual model, as well as those processes that can be realistically included in the computational model. At a minimum, the Class VI Rule requires that the model include multiphase flow of carbon dioxide and formation fluids [40 CFR 146.84(a) and (c)(1)]. Additional processes may be necessary for certain projects. For example, reactive transport could be relevant if permeability and/or porosity are predicted, based on previous testing, to change as a result of precipitation/dissolution reactions. In addition, geomechanical processes could be relevant if pressure and stress may change hydrogeologic properties. If the aqueous carbon dioxide plume is a potential risk factor, carbon dioxide dissolution into ground water may also be considered in the AoR delineation model.

For some model applications, including reactive transport and geomechanical processes may be impractical. Complications can arise from increases in computational demands (i.e., extremely long computer processing times), lack of meaningful data on mineral precipitation/dissolution kinetics, or the inability of preferred computational code. Furthermore, including these processes may be unnecessary in many cases because the impact on plume and pressure front migration may be relatively minor. The Class VI Rule does not require including reactive transport and geomechanical processes in the AoR delineation modeling. However, the UIC Program Director may request that the owner or operator include these additional processes in AoR delineation modeling in cases where doing so would improve the understanding of plume and pressure migration for the project.

### **3.3.3. Computational Model Design**

After a conceptual site model has been developed, and the processes that will be considered have been determined, the next step is to develop the site computational model. This includes the determination of an appropriate computational code, and parameterization (i.e., populating the code with the selected site-specific parameters) in order to develop the model.

#### **3.3.3.1. Computational Code Determination**

To create the computational model, EPA recommends that a code be used that includes routines for the relevant physical processes at the site based on peer-reviewed theory and equations, including equations of state for carbon dioxide and other chemical species of interest. EPA recommends that the code also include accurate mass-transfer coefficients, including solubility of carbon dioxide, as a function of primary thermodynamic variables (e.g., temperature, pressure, phase saturations). If using an independently developed or untested code, EPA also recommends that the developer model test cases found in the literature to verify the accuracy of the model before submitting the Class VI injection well permit application to the UIC Program Director (e.g., see Pruess et al., 2004).

### **3.3.3.2. Model Spatial Extent, Discretization, and Boundary Conditions**

The computational model will be designed by determining the spatial boundaries of the problem and spatial discretization. It is recommended that lateral grid spacing be fine enough to resolve heterogeneities, as discussed above (e.g., Doughty and Pruess, 2004). Vertically, the model is recommended to include the injection zone, with sufficient vertical resolution to properly account for buoyant plume migration, and a sufficient section of the primary confining zone to demonstrate to the satisfaction of the UIC Program Director that no leakage is expected to occur through the confining zone. In some cases, the UIC Program Director may require that additional zones be included in the computational model, such as overlying USDWs. Inclusion of additional zones may allow for estimation of vertical leakage rates and pressure changes above the primary confining zone, which may aid in performing risk assessments and designing the Class VI testing and monitoring program.

Boundary conditions are typically based on hydrogeologic conditions in locations corresponding to the edges of the model domain where the domain extends beyond the pressure front and/or plume. Model testing may be conducted to ensure that grid spacing, gridding routine, and boundary conditions do not result in numerical artifacts that impact the model results. If results of such testing indicate artificial impacts, then adjustment of the model may be necessary prior to running the model for a proposed Class VI injection well AoR delineation.

### **3.3.3.3. Model Timeframe**

The Class VI Rule requires that the model used to delineate the AoR for a proposed Class VI injection well be run from the commencement of injection activities until the plume movement ceases, until pressure differentials sufficient to cause the movement of injected fluids or formation fluids into a USDW are no longer present, or until the end of a fixed time period as determined by the UIC Program Director [40 CFR 146.84(c)(1)]. In order to meet these conditions, it may be necessary for the model simulation of the GS project to extend for several hundred or thousands of years (e.g., Flett et al., 2007).

### **3.3.3.4. Parameterization**

Parameterization is the final step in the initial development of the computational model, and it consists of populating the computational code with the selected site-specific parameters. Key parameters include formation intrinsic permeability, porosity, phase-partitioning coefficients, and relative permeability-saturation parameters. Parameter values are based on the site-specific data as much as possible, but may also be based on values and relationships from the scientific literature. Geostatistical techniques can also be used to create a representation of realistic, three-dimensionally heterogeneous conditions in the subsurface. See Section 2.2 of this guidance for more information on model parameters. In some cases, a reasonable range of parameter values may be identified for the purposes of later sensitivity analyses.

#### 3.3.4. Executing the Computational Model

The computational model is executed (i.e., solved) after parameterization, and this consists of using the code to calculate phase saturations and composition, fluid pressures, and other system aspects within the model domain for each point in time and space separated by specified intervals (i.e., time step, grid spacing). Model results are typically text files that contain modeled data for each grid cell, during each time step. In some cases, the model results will need to be post-processed following execution of the model before they can be easily visualized and interpreted. For example, model results may need to be transformed to produce site coordinates. Model results of particular interest for Class VI injection well AoR delineation include estimation of the extent of the separate-phase carbon dioxide plume migration and changes in fluid pressures within the injection zone over time. See Section 3.4 for more information on AoR delineation.

The use of an *a priori* AoR delineation based on computational modeling predictions highlights the need for uncertainty and sensitivity analyses for the initial prediction. Conservative predictions will be needed prior to the commencement of injection and the availability of any site-specific data on carbon dioxide migration paths and rates. EPA recommends conducting sensitivity analyses as the principal evaluation tool for characterizing the most and least important sources of error in computational models (USEPA, 2003). Based on these results, maximum-risk scenario simulations can be conducted considering plume extent and pressure perturbation predictions that account for uncertainties in the model.

#### 3.4. AoR Delineation Based on Model Results

The planned or predicted AoR submitted with the permit application for a proposed Class VI injection well is required to be based on a delineation of the area where the GS project may cause endangerment of USDWs, which in turn is required to be based on the results of computational modeling [40 CFR 146.84(a) and 40 CFR 146.84(c)(1)]. The boundaries of the AoR are based on simulated predictions of the extent of the separate-phase (i.e., supercritical, liquid, or gaseous) plume and pressure front. As such, EPA recommends that the AoR encompass the maximum extent of the separate-phase plume or pressure front over the lifetime of the project and entire timeframe of the model simulations. The pressure front, as described below, is the extent of pressure increase of sufficient magnitude to force fluids from the injection zone into the formation matrix of a USDW.

In the case of GS projects with multiple Class VI injection wells, the owner or operator must apply for and obtain a Class VI injection well permit for each individual well [40 CFR 144.33(a)(5)]. However, as discussed previously, a single AoR modeling exercise may be conducted for all wells within a single project at the discretion of the UIC Program Director. In all cases, EPA recommends that the AoR delineation boundaries for the cumulative GS project be based on modeling that accounts for the anticipated injection rates from all planned Class VI injection wells.

Box 3-2 provides a hypothetical example of an AoR delineation based on computational modeling results, including the calculation of the threshold pressure that defines the pressure front. The determination of the pressure front in Box 3-2 (Step 2) is consistent with existing standard practices for other well classes of the UIC Program (e.g., Thornhill et al., 1982) and is applicable to any Class VI injection well for which, prior to injection, the injection zone is under-pressurized compared to the lowermost USDW (i.e., Method 1, Section 3.4.1). Determination of the pressure front is discussed in more detail in Section 3.4.1.

### 3.4.1. Determination of Threshold Pressure Front

The pressure front may be defined as the minimum pressure within the injection zone necessary to cause fluid flow from the injection zone into the formation matrix of the USDW through a hypothetical conduit (i.e., artificial penetration) that is perforated in both intervals. Several methods, as described below, are available to estimate the value of the pressure front, and are based on various assumptions. The owner or operator is encouraged to consult with the UIC Program Director to determine which method is appropriate for the proposed GS project. For instance, if an existing aquifer exemption is proposed to be expanded for a GS project, the pressure front may be determined based upon the pressure increase necessary for formation fluids to be displaced into portions of aquifer that are not exempted.

*Method 1. Pressure front based on bringing injection zone and USDW to equivalent hydraulic heads (applicable to under-pressurized case only).*

As stated by Thornhill et al. (1982), the pressure-front component of the AoR is “the area around an injection well where, during injection, the [hydraulic] head of the formation fluid in the injection zone is equal to or greater than the [hydraulic] head of USDWs.” Defined this way, the pressure-front ( $P_{i,f}$ ) may be calculated by the following equation:

$$P_{i,f} = P_u + \rho_i g \cdot (z_u - z_i) \quad [\text{Eq-1}]$$

where  $P_u$  is the initial fluid pressure in the USDW,  $\rho_i$  is the injection-zone fluid density,  $g$  is the acceleration due to gravity,  $z_u$  is the representative elevation of the USDW, and  $z_i$  is the representative elevation of the injection zone. Similarly, the increase in pressure that may be sustained in the injection zone ( $\Delta P_{i,f}$ ) is given by:

$$\Delta P_{i,f} = P_u + \rho_i g \cdot (z_u - z_i) - P_i \quad [\text{Eq-2}]$$

where  $P_i$  is the initial pressure in the injection zone. Eq-1 and Eq-2 are subject to the assumption that the hypothetical open borehole is perforated exclusively within the injection zone and USDW.

A positive value of  $\Delta P_{i,f}$  (Eq-2) corresponds to an injection reservoir that is under-pressurized relative to the USDW and can accommodate an increase in pressure equal to  $\Delta P_{i,f}$  prior to potential fluid migration into the drinking water reservoir. A  $\Delta P_{i,f}$  value of zero corresponds to the hydrostatic case, and a negative value of  $\Delta P_{i,f}$  relates to a situation where the injection zone is

already over-pressurized and thus subject to potential fluid leakage from the injection reservoir to the drinking water aquifer even prior to the planned GS project. Eq-1 and Eq-2 are only applicable for calculating the allowable pressure increase for the under-pressurized case (i.e., positive value of  $\Delta P_{i,f}$ ). Alternative methods may be applicable for the hydrostatic case or over-pressurized cases (see below).

EPA recommends that Eq-1 and Eq-2 be applied using values of pressure and fluid density (i.e.,  $P_u$ ,  $P_i$ , and  $\rho_i$ ) based on direct measurement of fluid properties in the direct vicinity of the proposed project (i.e., see the *UIC Program Class VI Well Site Characterization Guidance*). Notably, the results of Eq-1 and Eq-2 are sensitive to the injection-zone fluid density ( $\rho_i$ ), which is influenced by the pressure, temperature, and salinity of the injection zone. Salinity, pressure, and temperature tend to increase with depth below the ground surface. If site-specific fluid density values at reservoir conditions are not available, injection zone fluid density may be estimated based on measured salinity, temperature, and pressure. Figure 3-2 presents fluid density as a function of depth below ground surface for several different salinities, based on the method of Peng and Robinson (1976).

**Figure 3-2: Fluid Density Functions for Varying Salinities.**

Note also that, in using this method,  $P_{i,f}$  is a function of the fluid density of the injection zone, the elevation of both formations, and the fluid pressure within the USDW. To the extent that these parameters vary spatially in the vicinity of the project, the value of  $P_{i,f}$  may also vary throughout the region of the AoR.

*Method 2. Pressure front based on displacing fluid initially present in the borehole (applicable to hydrostatic case only).*

Under hydrostatic conditions, a pressure increase within the injection zone may be allowable due to the fact that water entering a hypothetical borehole from the injection zone will be more dense than the fluid initially present in that borehole. Fluid from the injection zone will displace the fluid in the borehole, which will flow into the USDW. However, below a calculated threshold pressure, a new pressure equilibrium will be established, and fluid from the injection zone will not intrude into the USDW.

As given by Nicot et al. (2008) and Bandilla et al. (2012), assuming (1) hydrostatic conditions and (2) initially linearly varying densities in the borehole and constant density once the injection-zone fluid is lifted to the top of the borehole (i.e., uniform density approach), the threshold pressure increase ( $\Delta P_c$ ) may be calculated:

$$\Delta P_c = \frac{1}{2} \cdot g \cdot \xi \cdot (z_u - z_i)^2 \quad [\text{Eq-3}]$$

where  $\xi$  is a linear coefficient defined by:

$$\xi = \frac{\rho_i - \rho_u}{z_u - z_i} \quad [\text{Eq-4}]$$

and where  $\rho_u$  is the fluid density of the USDW.

Nicot et al. (2008) also present a solution subject to the assumption of linearly varying densities in the borehole both initially and when the injection zone fluid is lifted to the top of the borehole (i.e., equilibrium approach), rather than the uniform density approach (assumption #2) used to derive Eq-3 (see Nicot, 2008 and Bandilla, 2012). Birkholzer et al. (2011) state that the value of  $\Delta P_c$  calculated using the uniform density approach (Eq-3) may be less precise than the equilibrium approach, but it is easier to apply and also more conservative for protection of the USDW.

At pressure increase less than  $\Delta P_c$ , the fluid originally present in the borehole will leak into the USDW. This fluid leakage from the borehole may be acceptable and not cause degradation of water quality within the USDW, as the volume of water in the borehole may be minor and quickly diluted by water in the surrounding aquifer.

Calculation of the allowable threshold pressure increase using these methods (Eq-3 and Eq-4) is applicable only to the hydrostatic case. In some instances, site-specific fluid pressure and density measurements may not be available at the time of preparing the permit application and initial AoR delineation in order to evaluate if the injection reservoir is over- or under-pressurized. If warranted by previous site knowledge (i.e., no previous large-scale fluid withdrawal or injection from the injection zone), it may be acceptable to initially assume hydrostatic conditions. The owner or operator may choose to use these methods (Eq-3 and Eq-4) for an initial estimate of the

threshold pressure allowable for delineation of the AoR. However, once site-specific data are available for the proposed injection zone following construction of injection or monitoring wells, EPA recommends reevaluation of the hydrostatic assumption. If the reservoir is under-pressurized, the allowable threshold pressure increase may be greater than calculated using Eq-3 (see Method 1, above). However, if the injection reservoir is actually over-pressurized, the allowable pressure increase will be less than calculated using Eq-3.

#### *Methods for over-pressurized cases.*

In some instances, the desired injection zone may already be over-pressurized relative to the USDW prior to the injection project (i.e.,  $\Delta P_{i,f}$  value is negative using Eq-2). In this situation, fluid leakage would occur from the injection zone to the USDW through a borehole perforated within both zones even prior to commencing injection. Additional pressure increase within the injection zone owing to the injection associated with the GS project may increase fluid leakage rates. Determination of the allowable pressure increase to be used in AoR delineation for the over-pressurized case may require more sophisticated methods than the analytical equations described above for Methods 1 and 2.

Possible methods to estimate an acceptable pressure increase for over-pressurized reservoirs include:

1. Using similar methods as described in Nicot et al. (2008), some over-pressurization within the injection zone may be allowable without causing sustained fluid leakage, owing to the density differential between the injection zone and USDW. If the value of  $\Delta P_c$  using Eq-3 is greater than the absolute value of  $\Delta P_{i,f}$  using Eq-2, the difference in magnitude between the two may be used as an estimate of the allowable pressure increase, subject to the assumptions used to derive Eq-3 (see Method 2, above). To date, peer-reviewed research papers on this topic have developed analytical solutions only for the hydrostatic case. Future publications may address the initially over-pressurized case and, if so, these methods may be used to calculate an allowable pressure increase in an over-pressurized reservoir.
2. A multiphase numerical model may be designed to model leakage through a single well bore, or through multiple well bores in the formation (see e.g., Birkholzer et al., 2011). Additional pressure increases up to a certain point within an already over-pressurized injection zone may not cause an appreciable increase in fluid leakage rates through a hypothetical borehole. A sensitivity analysis may be conducted to bound the modeled leakage rates.
3. In conjunction with item #2 above, numerical or analytic ground water modeling may be conducted for the USDW to estimate how additional fluid leakage caused by the injection project is diluted within the USDW and attenuated. Dilution of fluid leakage from a borehole is impacted by the natural background flow rate of water within the USDW, which is turn a function of the hydraulic gradient, aquifer thickness, and hydraulic conductivity. An additional pressure increase may be allowable if it can be demonstrated

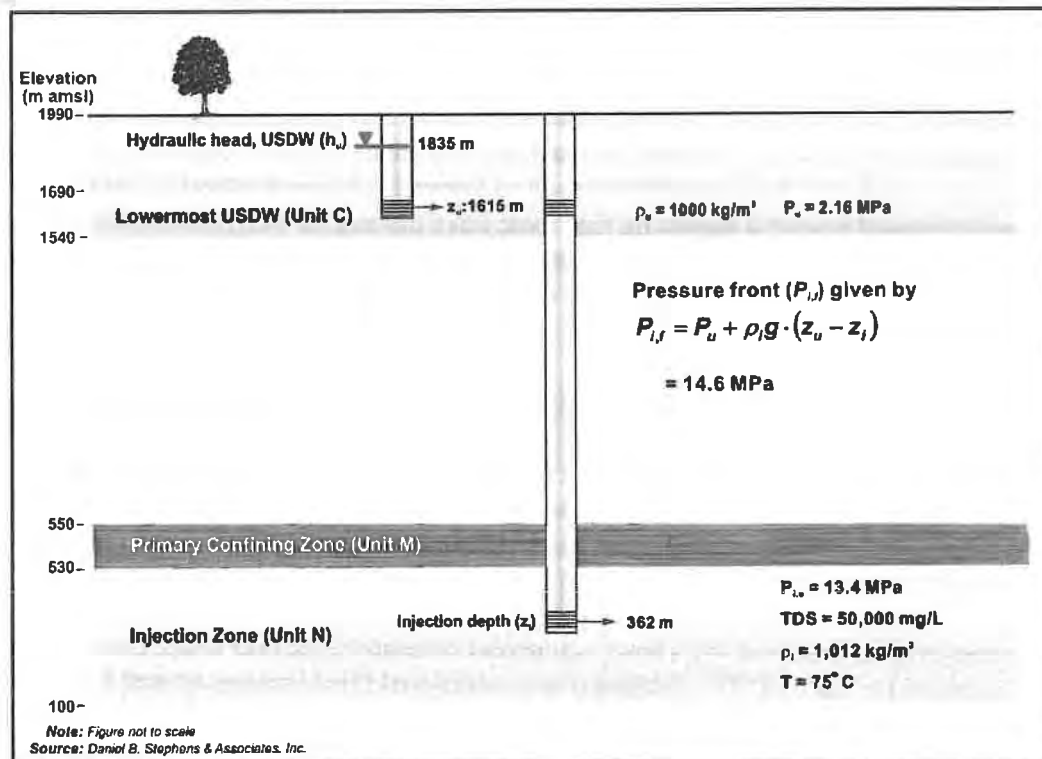

to the UIC Program Director that negligible degradation of the USDW would result from increased fluid leakage rates.

### **Box 3-2. Hypothetical Example of an AoR Delineation**

The AoR is based on the results of computational modeling and encompasses the predicted maximum extent of the separate-phase plume or pressure front over the lifetime of the project. The pressure front is defined as the pressure, within the injection zone, great enough to force fluids from within the injection zone through a hypothetical open conduit into any overlying USDW. This box provides a hypothetical example of an AoR delineation using a stepwise approach. The example scenario is based on the conceptual site model described above (see Box 3-1). First, the threshold pressure that defines the pressure front is determined. Next, maps showing the maximum extent of the plume and pressure front are overlaid and the AoR is delineated.

#### **Step 1. Determine the Pressure Front**

A cross-sectional schematic of the hypothetical scenario is shown in Figure 3-3, which also presents values for fluid density, and pressure (units of megapascals, MPa, equal to  $1 \cdot 10^6$  Pa) for each formation.

**Figure 3-3: Hypothetical Geologic Sequestration Site: Cross Sectional Schematic and Calculations.**

### **Box 3-2. Hypothetical Example of an AoR Delineation, continued**

The methodology used here is consistent with the determination of the pressure front for other well classes within the UIC Program (e.g., USEPA, 2002). As explained above, in Section 3.4 of this guidance, this methodology is applicable to any proposed Class VI injection well for which, prior to injection, the injection zone is not over-pressurized compared to the lowermost USDW (i.e., the injection zone has a lower or equal hydraulic head as compared to the lowermost USDW).

The pressure front is determined by calculating the minimum pressure within the injection zone ( $P_{i,f}$ ) necessary to cause fluid flow from the injection zone into the formation matrix of the USDW through a hypothetical conduit (i.e., artificial penetration) that is perforated in both intervals.  $P_{i,f}$  is calculated using Eq-1 (Section 3.4.1). In this example,  $P_{i,f}$  is 14.6 MPa.

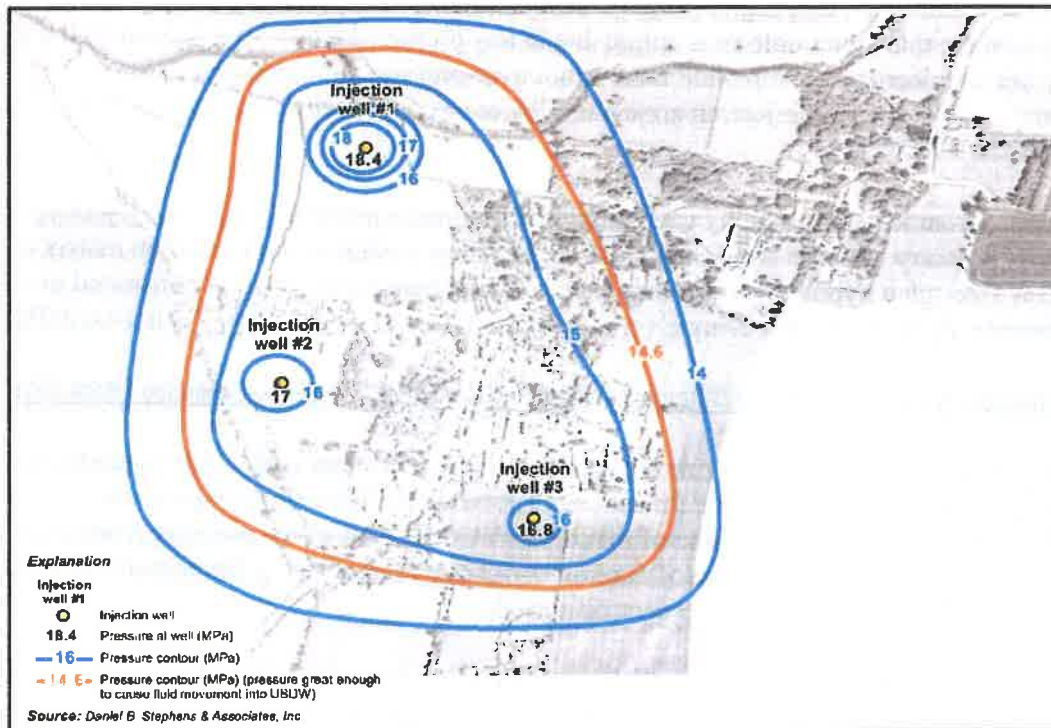

#### **Step 2. Inspect Model Results to Determine the Maximum Extent of the Pressure Front ( $P_f$ )**

The computational model will provide a prediction of the pressures within the injection zone over time. For the purpose of AoR delineation, EPA recommends using the pressure distribution corresponding to the time of maximum lateral extent of the pressure front ( $P_{i,f}$ ). This will likely correspond to a time of maximum injection rates during the operational phase of the project or to the end of a long injection period.

EPA recommends contouring these predictions of pressure increase and providing the predictions on a base map of the proposed project area (Figure 3-4). In this recommended contour map, EPA also recommends highlighting the pressure equivalent to  $P_{i,f}$ . In the hypothetical example provided here, the region encompassed by  $P_{i,f}$  includes the three planned Class VI injection well locations and a significant distance surrounding the area of the proposed injection wells.

**Box 3-2. Hypothetical Example of an AoR Delineation, continued**

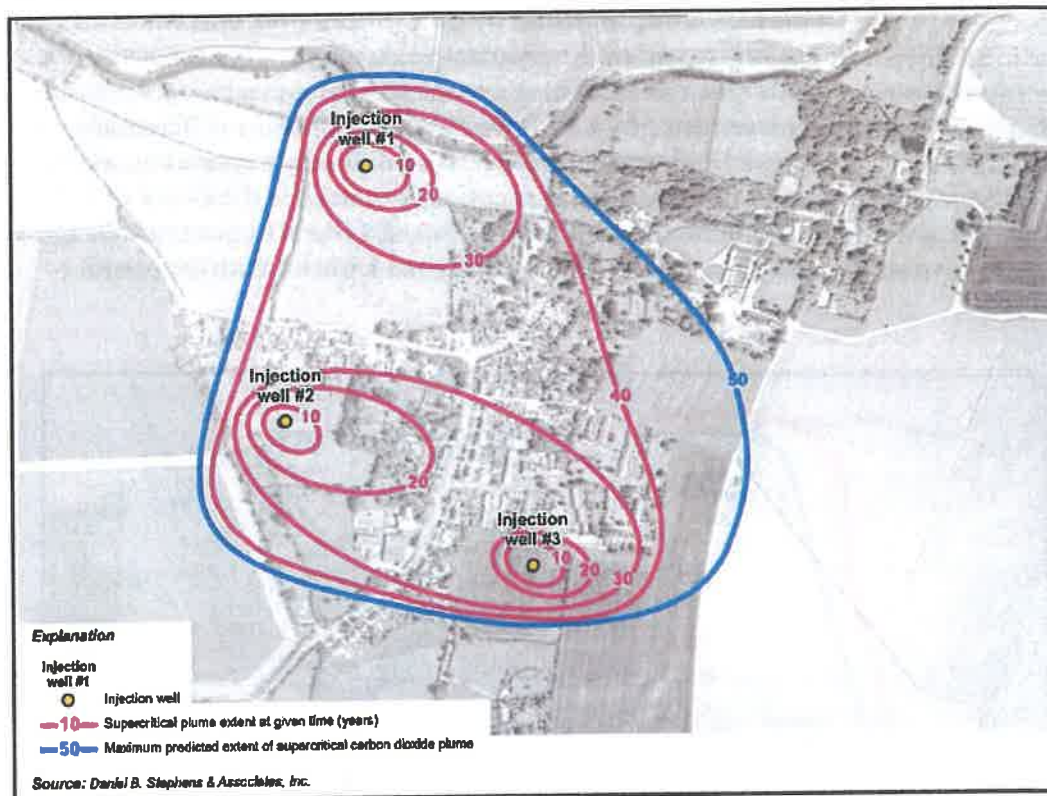

**Figure 3-4: Hypothetical Geologic Sequestration Site: Model Predicted Maximum Pressure Within the Injection Zone.**

**Step 3. Inspect Model Results to Determine the Maximum Extent of the Separate-Phase Plume**

The computational model will also provide a prediction of the extent of the separate-phase plume as it evolves over time. EPA recommends that these data be also contoured and provided on a base map (Figure 3-5). In the example provided here, the maximum extent of the supercritical plume, as predicted by the model, exists at 50 years after carbon dioxide injection commences.

**Box 3-2. Hypothetical Example of an AoR Delineation, continued**

**Figure 3-5: Hypothetical Geologic Sequestration Site: Model Predicted Extent of Supercritical Carbon Dioxide Plume Over Time.**

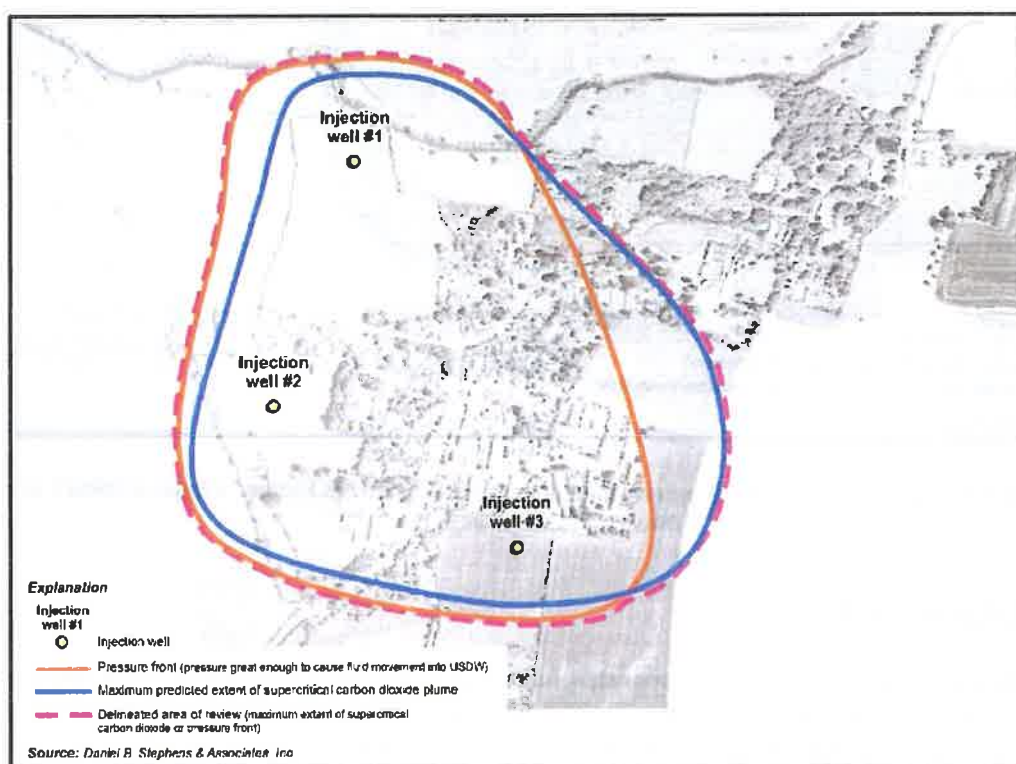

**Step 4. Delineate the AoR**

Lastly, the maximum extent of the separate-phase plume and pressure front is compared and overlaid on the base map (see Figure 3-6). The AoR is delineated by drawing the contour line that encompasses the maximum extent of the separate-phase plume or pressure front (Figure 3-6).

### **Box 3-2. Hypothetical Example of an AoR Delineation, *continued***

It is important to note that the region encompassed by the pressure front will not in all cases be larger in all directions than the extent of the separate-phase plume. This is because the pressure front does not include all areas exhibiting any increase in pressure, only pressure great enough to cause fluid movement into a USDW. Therefore, pressure differentials may still exist outside of the pressure front, and separate-phase fluids may migrate beyond the extent of the pressure front. For this reason, it is necessary to calculate the extent of both the plume and pressure front to delineate the AoR for a proposed Class VI injection well and to submit these separate delineation results to the UIC Program Director with the permit application.

**Figure 3-6: Hypothetical Geologic Sequestration Site: Initial Area of Review Based on Model Results.**

### 3.5. Reporting AoR Delineation Results to the UIC Program Director

The owner or operator is required to submit the AoR and Corrective Action Plan with the initial permit application [40 CFR 146.82(a)(13)]. Information pertaining to how this plan should be submitted is provided in the *UIC Program Class VI Well Project Plan Development Guidance*. The final delineated AoR based on computational modeling is submitted to the UIC Program Director prior to receiving authorization to inject [40 CFR 146.82(c)(1)].

EPA recommends that this permit application submittal include all necessary information for the UIC Program Director to evaluate the AoR delineation results and replicate the computational modeling exercise if he or she elects to do so, as well as all model input and output data and files. This may include providing inputs for the UIC Program Director to use in their verification modeling effort. The owner or operator and the UIC Program Director should discuss the specific needs as the permit application is submitted. For additional information on submitting information to support Class VI permit applications, please see the *UIC Program Class VI Well Recordkeeping, Reporting, and Data Management Guidance for Owners and Operators*.

EPA recommends that the permit application submittal include the following in support of the AoR delineation:

- The conceptual site model and all supporting data on which the model is based, including the description of geologic stratigraphy and any relevant geologic features. See Box 3-1 of this guidance document for more information;
- Attributes of the code used to create the computational model, including the code name, name of developing organization, a full accounting of or reference to the model governing equations, scientific basis, and any simplifying assumptions;
- A description of the model domain, i.e., the model's lateral and vertical extents, geologic layer thickness, and grid cell sizes, as presented on maps and cross-sections;
- An accounting of all equations of state used for all fluids modeled (e.g. ground water, carbon dioxide);
- Any constitutive relationships, such as relative-permeability saturation relationships, and how they were determined;
- Values of all model parameters, as detailed in Table 2-1 of this guidance document, throughout the entire model domain, as a function of time if necessary, including initial conditions and boundary conditions, and a description of how model parameters were determined based on site characterization data. This information may be submitted in tabular or graphical/map formats;
- If required by the UIC Program Director, the owner or operator must also include raw model input and output files [40 CFR 146.82(a)(21)]. These files may be useful in model

verification, or if the UIC Program Director wishes to run alternative simulations/scenarios with the model;

- Model results, including predictions of carbon dioxide and pressure-front migration over the lifetime of the project. EPA recommends that the model results be presented in the form of contour maps, cross sections, and/or graphs showing plume and pressure front migration as a function of time, and that the permit application submittal include the outcome of parameter sensitivity analyses;
- A description of pressure front calculation and delineation of the AoR; and
- If required by the UIC Program Director, the relevant qualifications and professional experience of any individuals and/or consulting firms responsible for model development, AoR delineation, and reevaluation, including examples of previous multiphase modeling studies conducted.

## 4. Identifying Artificial Penetrations and Performing Corrective Action

The purpose of AoR delineation for a proposed GS project is to determine the area where any geologic features or artificial penetrations (e.g., wells) may become conduits for fluid movement out of the injection zone, or additional zones, and potentially cause endangerment to a USDW. Artificial penetrations include any man-made structures, such as wells or mines, which provide a flow path out of the injection zone. The Class VI Rule requires that the owner or operator prepare, maintain, and implement a AoR and Corrective Action Plan that includes a description of how corrective action will be performed on any artificial penetrations through the confining zone and whether such action will be phased [40 CFR 146.84(b)(2)(iv)].

This section discusses the identification and evaluation of artificial penetrations and the performance of required corrective action (if necessary). Monitoring activities necessary for detection of fluid leakage into USDWs are discussed in the *UIC Program Class VI Well Testing and Monitoring Guidance*.

### 4.1. Rule Requirements

The following rule requirements pertain to corrective action within the AoR:

- 40 CFR 146.84(c)(2): Using methods approved by the UIC Program Director, identify all penetrations, including active and abandoned wells and underground mines, in the AoR that may penetrate the confining zone(s). Provide a description of each well's type, construction, date drilled, location, depth, record of plugging and/ or completion, and any additional information the UIC Program Director may require;
- 40 CFR 146.84(c)(3): Determine which abandoned wells in the AoR have been plugged in a manner that prevents the movement of carbon dioxide or other fluids that may endanger USDWs, including use of materials compatible with the carbon dioxide stream;
- 40 CFR 146.84(d): Perform corrective action on all wells in the AoR that are determined to need corrective action, using methods designed to prevent the movement of fluid into or between USDWs, including use of materials compatible with the carbon dioxide stream, where appropriate;
- 40 CFR 146.84(e)(2): During the AoR reevaluation process, identify all wells in the reevaluated AoR that require corrective action in the same manner specified in 40 CFR 146.84(c);
- 40 CFR 146.84(e)(3): Perform corrective action on wells requiring corrective action in the reevaluated AoR in the same manner specified in 40 CFR 146.84(d);
- 40 CFR 146.84(e)(4): Revise the AoR and Corrective Action Plan as necessary whenever the AoR is reevaluated.

## 4.2. Identifying Artificial Penetrations within the AoR

The Class VI Rule requires potential Class VI injection well owners or operators to identify all artificial penetrations located within the delineated AoR, including active and abandoned wells and underground mines, that may penetrate the confining zone, and provide a description of each well's type, construction, date drilled, location, depth, and if applicable, the record of plugging and/or completion, and any additional information the UIC Program Director may require [40 CFR 146.84(c)(2)]. If the identified abandoned wells have been improperly plugged or not plugged at all, such penetrations can provide unimpeded flow conduits out of the injection zone. As such, they must be properly plugged in order to prevent endangerment of USDWs [40 CFR 146.84(d)].

A variety of types of abandoned wells may exist within the delineated AoR of a proposed GS project, including wells constructed prior to federal or state regulation (i.e., in the late 1800s or early 1900s) and any recently decommissioned wells. Wells constructed during early oil exploration, including cable-tool drilled wells, pose the largest risk because these wells may be relatively deep and often consist of an open (i.e., non-cased) well bore over much of their length. These older wells may also not have been documented in state or local records.

Historically, wells no longer in use may not have been plugged and abandoned by today's common standards. Prior to the early 1900s, there were no regulations concerning well abandonment and it is unlikely that those wells were abandoned properly. Even in states regulating well abandonment, it is likely that any wells abandoned before 1952 may have inadequate plugs (Ide et al., 2006). In 1952, the American Petroleum Institute (API) published its standards for cements for oil and gas wells. Prior to that, cement often lacked sufficient additives to achieve the proper cement setting in the conditions experienced in oil and gas wells. As a result, the plugs in many of these older wells failed to set properly and may have experienced channeling and/or cement failure because of fluid intrusion into the improperly set cement. The potential also exists for more recently constructed wells to have been decommissioned improperly. For example, owners or operators may have gone bankrupt and failed to plug their wells or used substandard materials.

Depending on site conditions and corrosion, "properly" plugged wells may also contain zones (i.e., annular spaces) that could serve as a conduit for fluid movement. In other cases, the well plugs may have degraded over time because of a poor cement job and/or corrosive conditions. Even properly plugged wells may have been plugged with types of cement that could degrade when in contact with a carbon dioxide plume. See the *UIC Program Class VI Well Construction Guidance* for information on compatibility of different materials with a carbon dioxide stream.

Detecting abandoned wells can be very challenging in certain locations because of the variety of wells that may exist. In addition, steel casings, the primary detectable portion of the well, were often removed from abandoned wells for recycling and use during World War II (Gochioco and Ruev, 2006). These challenges are compounded by the potentially large AoR delineation determined for a proposed Class VI injection project, and therefore the greater surface area that will have to be evaluated for the presence of artificial penetrations. However, as discussed

below, several methods and sources of information are available to identify those artificial penetrations in a relatively efficient manner. The primary stages of an abandoned well investigation within the AoR include historical research, site reconnaissance, review of aerial and satellite imagery, and one or more geophysical surveys. The reader is referred to additional standard references regarding identification of artificial penetrations for further information (Jordan and Hare, 2002; Frischknecht et al., 1985; ASTM, 2005).

#### **4.2.1. Historical Research**

Most deep wells that may penetrate the primary confining zone of a proposed GS project site are related to oil and gas exploration and production. Deep well drilling for oil and gas exploration dates back to the 1870s. State and local databases of well exploration may include locations of abandoned wells, and EPA recommends conducting a records review as the first step in abandoned well identification within the delineated AoR for a proposed Class VI injection well. In addition, state and local records will provide information on the time period and types of exploration that have been conducted in an area, and they may also provide information on typical completion and abandonment methods in a given field. This records search will provide a list of known abandoned wells, and it may inform additional stages of abandoned well identification.

State well databases will, in most cases, provide valuable information for assistance with the identification of abandoned wells. Prior to well construction, a government permitting authority requires owners or operators to seek a permit to drill from a specific agency, such as a state natural resources agency, environmental quality agency, or geological survey. Most states maintain records of drilled wells, including location, construction, operating, and plugging information. Although these records can take many forms, many states now have comprehensive databases of these well records that have been digitized and made available online. However, when conducting this historical records search, owners or operators of proposed Class VI injection wells should be aware that older well records may not have been entered into databases. In some cases, the records from different time periods may be filed in separate locations or on separate types of media.

For example, the Wyoming Oil and Gas Conservation Commission maintains a digital database, accessible online, of wells within the state. (See <http://wogcc.state.wy.us> for more information on this database.) Basic information is available to the public regarding each well, including geophysical survey results where available. The database can be searched by location, well name, and well number, among other fields. The state also has a “well book” available online, which contains records of older wells not entered in the database.

In addition, county records, including survey maps, ownership records, and chain-of-title and property lease history, maintained by local tax assessors and county clerks, list abandoned wells in many cases. Such records may also indicate land use and indicate areas and timeframes in which drilling activities likely occurred. Private data compilation services often maintain detailed databases for the purpose of oil and gas exploration, including information regarding well locations, plugging, and abandonment. Often these services will maintain maps of known well

locations. While these maps can be out of date, most private services have been known to update their database for a fee.

#### **4.2.2. Site Reconnaissance**

Site reconnaissance includes interviewing local residents and property owners, as well as conducting a physical search for features indicative of abandoned wells. Initial site reconnaissance may be informed by the historical database research. For example, the records search may indicate that, with a great deal of confidence, certain regions of the AoR have never been subject to oil and gas exploration, deep well injection, or any other activity that may result in deep well penetration. In this case, the owners or operators may choose to exclude those areas from any additional well identification efforts.

Local residents that may be well informed regarding abandoned wells include oilfield workers and service company employees, including consultants, and property and drilling-rights ownership brokers. Such informed residents may be able to provide information on the areas and timeframes where past drilling occurred. They may also be able to give additional details in response to specific questions and provide information on locations, completion methods, and plugging of wells.

Surface features that may be indicative of abandoned wells include abandoned well derricks, access roads, brine pits, or vegetation stress associated with brine leakage. Detection of these features at a site indicates the possible likelihood of one or more wells in the area. EPA recommends that, because the AoR is likely to cover a large area, a surface review for such features is most effectively supplemented by use of aerial surveys or photos.

#### **4.2.3. Aerial and Satellite Imagery Review**

EPA recommends that historical aerial photographs and satellite imagery be used in the identification of abandoned wells. Aerial photographic surveys, taken from airplanes, were conducted beginning in the 1930s and are available from a variety of governmental and private information services. All historical aerial photos within the AoR are recommended to be reviewed for evidence of past drilling activity. Surface features that provide a “signature” of drilling activity include drill derricks, rig platforms, brine pits, power sources, and access roads.

Depending on the resolution of the image, satellite (i.e., remote sensing) images may be used to detect wellheads, derricks, and surface features indicative of abandoned wells. These include spatial patterns indicative of a well site, brine pits, modified topography, and vegetation stress associated with brine leakage.

#### **4.2.4. Geophysical Surveys**

Geophysical surveys, including magnetic, ground penetrating radar (GPR), and electromagnetic methods, can be used in the detection of abandoned wells. EPA recommends conducting geophysical surveys throughout regions of the AoR that may have been subject to oil and gas

exploration, deep well injection, or any other activity that may result in deep well penetration. Geophysical methods will supplement other identification methods, discussed above. Geophysical methods can help to pinpoint locations of known wells where surface evidence of the well has been removed or can help to identify abandoned wells that are undocumented. The type(s) of geophysical surveys conducted at a proposed Class VI injection well site are based on known site subsurface and surface conditions. In general, at least two different types of geophysical surveys are recommended in order to parse data background noise and to inform the interpretation of survey results. As discussed below, ground or aerial (e.g., aeromagnetic) surveys may be conducted, depending on the size of the area of interest.

#### **4.2.4.1. Magnetic Methods**

The magnetic method is one of the oldest and most well developed geophysical techniques, and it is the standard method used for abandoned well detection. Magnetic surveys measure a component of the magnetic field near the land surface. Any anomalies in the magnetic field are caused by subsurface features, which could include abandoned well bores with iron or steel casings. Anomalies associated with well casings are typically distinguishable from the background magnetic field.

Magnetic surveys are applicable to abandoned wells with iron or steel casings or to wellheads in areas with relatively low background magnetic signatures. Areas with significant cultural development on the surface or in the shallow subsurface may have high interferences. Airborne magnetic surveys can detect most wells constructed with approximately 200 feet or more of at least 8-inch casing, and in some cases, very large cavities (Frischknecht et al., 1985). However, open well bores, non-steel casings, or severely corroded casings cannot typically be detected with a magnetic survey.

Ground or aerial (i.e., aeromagnetic) surveys may be conducted, depending on the size of the area of interest. Aeromagnetic surveys will likely be more practical for most GS projects due to the anticipated size of the delineated AoR, as they can collect large amounts of data in a relatively short amount of time. Both ground and aerial surveys are conducted along straight-line transects. EPA recommends that that ground survey transect spacing be no larger than 20–30 feet, and aerial survey transect spacing be no larger than 50–100 feet (Jordan and Hare, 2002).

Magnetic surveys may be conducted to measure the total magnetic field, or the vertical or horizontal field gradients. For the purpose of locating abandoned well bores, the total magnetic field measurement type is recommended. During these surveys, EPA recommends that the operator periodically return to a common point to ensure instrument repeatability, continuously measure diurnal variation in the magnetic field, and avoid high magnetic gradients. Data processing of magnetic surveys includes incorporation of spatial positioning data, correction for diurnal variation, and data filtering.

Figure 4-1 compares aeromagnetic survey results for the Coon Creek oil field in Oklahoma to abandoned wells identified from aerial imagery (USGS, 1995). As shown in the figure, magnetic anomalies associated with well casings are typically apparent. However, this figure also reveals

some of the typical challenges that may be faced by owners or operators in abandoned well bore identification. One challenge is that, due to the presence of other buried infrastructure (e.g., pipes), certain regions exhibit larger magnetic field values even if wells are not present. Additionally, some wells may not be identified in the aeromagnetic survey, most likely because of well casing removals. These challenges demonstrate the benefits of using multiple survey techniques in order to properly identify abandoned wells.

**Figure 4-1: Total Field Aeromagnetic Map, Cook Creek Oil Field, Arcadia, Oklahoma.**  
From: USGS (1995).

#### **4.2.4.3. Electromagnetic Methods**

Electromagnetic methods used for abandoned well bore detection include frequency-domain and time-domain electromagnetic surveys. These surveys consist of an electromagnetic transmitter that establishes an electromagnetic field measured by a receiver. Similar to magnetic surveys, electromagnetic surveys are non-invasive, as both the transmitter and receiver are positioned above the ground surface. Both surface and aerial electromagnetic surveys are possible. The depth at which these instruments are able to detect objects depends on the size and geometry of the sensor, the size and conductivity of the target, and the potential interference from other sources, such as fences and pipelines. Generally, object detection at depths ranging from a few meters to several hundred meters is possible. Larger and more complex arrays are required at greater depths. Aerial surveys are not likely able to detect small objects, such as well casings, but may detect brine plumes, which may indicate the presence of abandoned wells (Jordan and Hare, 2002).

Abandoned well bore detection using electromagnetic methods is based on the larger conductivity of steel casings and other well materials compared to surrounding soils and geologic formations. These methods may detect anomalous fluids associated with leakage from an abandoned well. Frequency-domain electromagnetic methods can measure current induced in the subsurface by the electromagnetic field established by the transmitter. Induced current establishes a secondary electromagnetic field detected by the receiver. The magnitude of the induced current is a function of subsurface conditions, including conductivity. Time-domain electromagnetic methods measure the decay of the secondary magnetic field created by the induced current, and they can be especially useful for detection of brine leakage.

#### **4.2.4.4. Ground Penetrating Radar**

GPR may be used in abandoned well bore detection and in finding other artificial penetrations. Unlike other geophysical methods, GPR does not rely on the presence of a steel or iron well bore, so it may be able to detect open boreholes and non-metallic materials. GPR uses high frequency radio waves to measure the transmission of electromagnetic energy. The investigation depth possible depends on the frequency of the radio waves and the conductivity of the ground. The greater the depth, the less resolution the instrument will have. For small objects, such as well casings, depths are limited to a few meters (Jordan and Hare, 2002). This depth limitation may lessen the value of GPR in areas with large topographical changes. GPR is also slower than magnetic or electromagnetic methods. GPR is likely not as practical to use throughout the delineated AoR as an initial larger scale survey method because the distance between transect lines for sufficient resolution is too small. Instead, EPA recommends using GPR to determine the exact location of abandoned well bores within a given area that have already been identified by earlier, larger scale surveys.

### **4.3. Assessing Identified Abandoned Wells**

After all artificial penetrations within the AoR that may penetrate the confining zone have been identified, the owners or operators of a proposed Class VI injection well must evaluate the

potential for each artificial penetration to serve as a conduit for fluid movement. In particular, owners or operators must establish which abandoned wells in the AoR, if any, have not been plugged in a manner that would prevent the movement of carbon dioxide or other fluids that may endanger USDWs [40 CFR 146.84(c)(3)]. To prevent fluid movement, abandoned wells should include a cement plug through the primary confining zone, and/or across the injection zone/confining zone contact, with sufficient integrity to contain separate-phase carbon dioxide and elevated pressures. The type of plugging that is sufficient to contain carbon dioxide and formation fluids from the injection zone will be site specific and should be reviewed with the UIC Program Director. In the absence of an adequate plug across the confining zone, cross-migration may occur where fluids enter a permeable zone below the lowermost USDW and then migrate upward from that zone. See Figure 4-2 for more information. EPA recommends cement surface plugs (typically required by well abandonment regulations), and the UIC Program Director may require additional plugs based on site-specific circumstances.

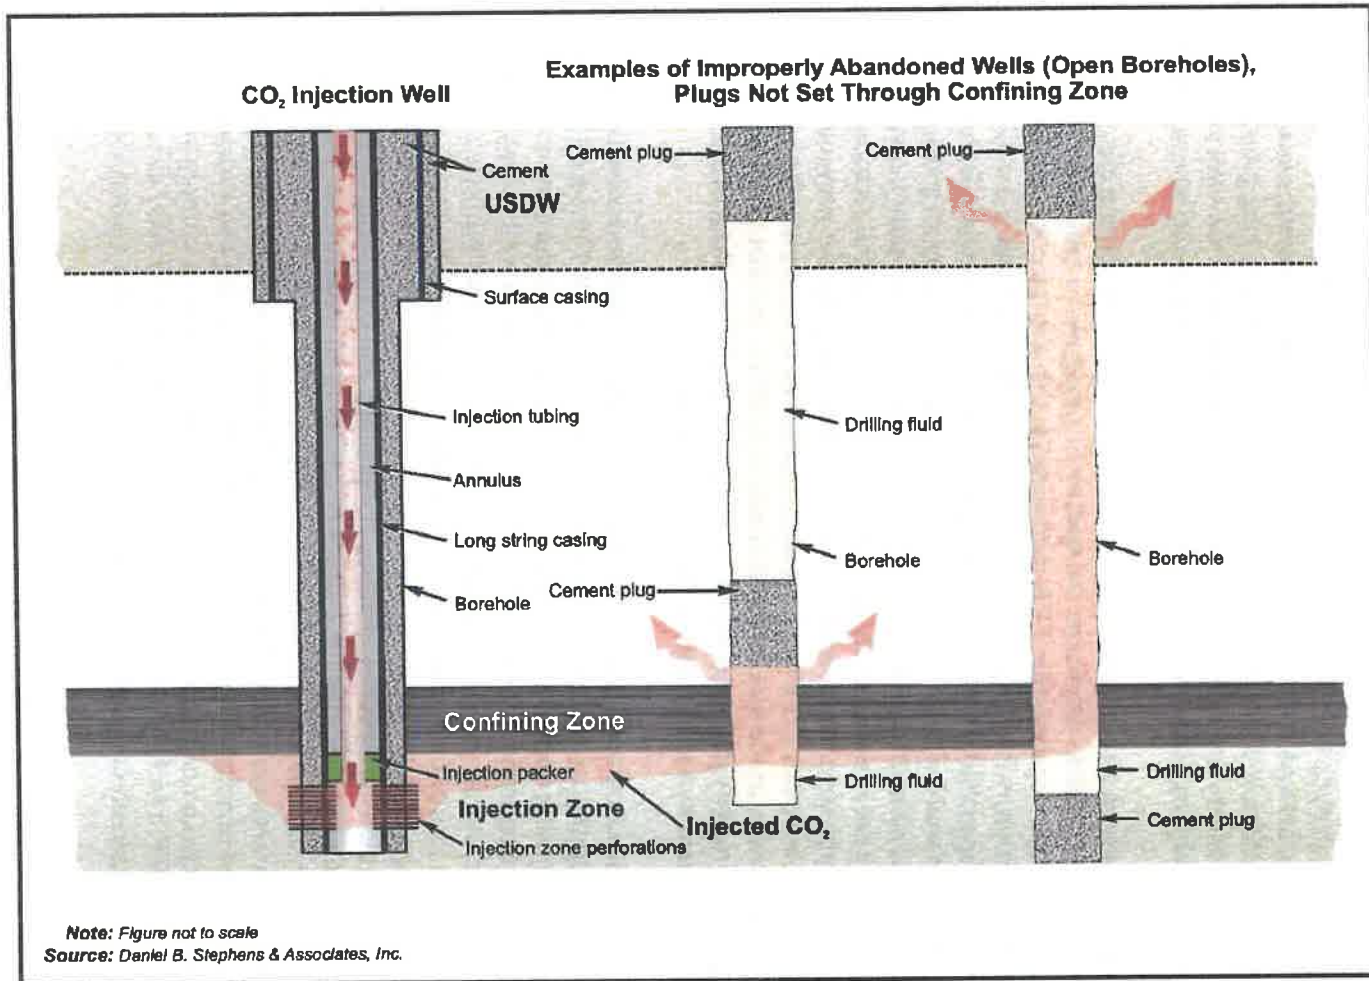

Evaluation of the wells in the AoR requires a two-step approach. The first step is to review whatever records are available, as outlined in Section 4.3.1, for information relevant to proper plugging. The second step is to perform physical tests on wells that are suspect or for which no records are available.

#### **4.3.1. Abandoned Well Plugging Records Review**

A records review can aid in reducing the number of identified wells that may need to be evaluated by future field testing. Records of wells that have been recently abandoned, have no mentions of any difficulties experienced during the abandonment procedure, are cased holes, and have plugs and cement situated to isolate the injection zone from other fluid containing zones may be used to justify reduction in the number of follow-up field investigations. If records are incomplete or indicate that the well has not been plugged or was inadequately plugged, follow-up field investigations should be performed. Identified undocumented wells will have no records and will require field investigation in order to determine the quality of plugging, as required in the Class VI Rule [40 CFR 146.84(c)(3)]. The owner or operator may also choose to plug any questionably abandoned wells rather than go through the expense of evaluating the plugs.

There are many elements in existing reports that can help in determining the adequacy of abandonment procedures for identified wells located within the AoR. Some key elements to review include, but are not limited to:

- Well depth and completion;
- Well abandonment date;
- Open hole or cased hole;
- Location of plugs;
- Casing and cementing records;
- Records of mechanical integrity tests (MITs) or logs performed; and
- Well deviation.

**Figure 4-2: Examples of Carbon Dioxide Leakage Through Improperly Abandoned Wells.**

The well completion depth is important in determining if the identified abandoned well may penetrate the proposed confining zone(s). If the well completion depth is above the confining zone(s), no further action would likely need to be taken. The date of abandonment may also provide information as to the adequacy of the abandonment procedure. Whether the well was abandoned with casing or as an open hole is an important consideration in determining the likelihood that the well might act as a conduit for fluid movement. Open holes are susceptible to cross-migration between aquifers. If the hole is open and there is not a proper plug located at a depth corresponding to the primary confining zone, fluids may migrate out of the injection zone and into a USDW. For cased holes, EPA recommends that integrity of the casing be evaluated.

The location and type of plugs are also important factors, especially in open-hole wells. The plug locations must be reviewed in order to determine the quality of plugging, as required in the Class VI Rule [40 CFR 146.84(c)(3)]. For example, EPA recommends that the injection zone be isolated from all other formations with plugs. This may be especially important if a well was completed in a formation deeper than the proposed injection zone. EPA recommends that any length of the well in the proposed injection zone be properly isolated by means of plugs and casing. Mechanical plugs and cemented casing are not sufficient for the long-term isolation of carbon dioxide, as eventually the metal is likely to corrode and the plug will fail (Randhol et al., 2007). Therefore, cement plugs are considered superior to mechanical plugs for preventing the movement of fluids into or between USDWs. EPA recommends that cement plugs be located across the bottom of any casings, at the base of the lowermost USDW, and that plugging fluid (i.e., composition, specific gravity) characteristics be considered, as drilling fluid of sufficient weight may resist displacement by the injectate or mobilized fluids.

The integrity of any existing casing and cement must be determined in order to assess the quality of well construction and plugging, as required in the Class VI Rule [40 CFR 146.84(c)(3)]. EPA recommends reviewing the casing and cement quality through the proposed injection zone in order to ensure that they are appropriate for contact with carbon dioxide, as well as reviewing any additional well records that may indicate unusual conditions experienced during casing and cementing. Events such as a loss of circulation, well bore stability problems, lack of the use of centralizers, and/or improper removal of drilling mud before cementing can all lead to premature cement or casing failure. Reviewing load calculations, if available, and comparing them to actual events recorded in the drilling log may give the owners or operators an indication of an under-designed casing that may be susceptible to failure. For example, if the casing had a low axial loading stress and stuck pipe was experienced during casing placement, it is possible that the casing may have experienced damage. The materials used for the well casing and cement must also be assessed to see if they are compatible with carbon dioxide, in order to comply with Class VI Rule requirements [40 CFR 146.84(c)(3)]. See the *UIC Program Class VI Well Construction Guidance* for more information on compatibility of different materials with a carbon dioxide stream.

Any tests performed on the well prior to its abandonment can also be useful information. An MIT such as a pressure test, noise log, temperature log, or cement evaluation log can provide information on any known or suspected leaks. If leaks were encountered, EPA recommends determining if the source of the leak was found and repaired. If the leaks were not sealed,

corrective action would be required to be taken to plug the leaks as discussed below [40 CFR 146.84(d)]. Drilling records can yield clues as to areas that might be susceptible to failure. Mud logs and open-hole caliper logs can show areas of weak formations. Weak formations are susceptible to well bore instability and subsequent cement failure. Cement evaluation logs and temperature logs taken at the time of completion can also give an idea of the condition of the cement, although degradation is always possible after well completion. Any corrosion logs will help provide information on the condition of the casing. Results from mechanical caliper logs, electromagnetic thickness logs, or down-hole video can show the casing condition when the well was abandoned. For more information regarding these logs and tests, see the *UIC Program Class VI Well Testing and Monitoring Guidance*.

Evaluation of well records for deviation during drilling may also identify wells more likely to be in need of corrective action, as deviated wells are far more likely to fail than wells with no deviation (Watson, 2009). Events such as well bore collapse during drilling or conditions that placed unusual loads on the casing may also indicate a higher chance of failed well bore integrity. EPA recommends that the design casing load also be checked to ensure adequacy for the actual loads faced by the well.

#### **4.3.2. Abandoned Well Field Testing**

After all the available records have been reviewed, any wells located within the AoR that cannot be proven to have plugs adequate to prevent migration of carbon dioxide or formation fluids out of the injection zone must be evaluated by field tests in order to determine the quality of plugging, as required in the Class VI Rule [40 CFR 146.84(c)(3)]. Evaluation and corrective action for wells which the plume is not expected to reach in the near future may be phased. If the owner or operator chooses and the UIC Program Director agrees, the evaluation may be omitted and the wells re-plugged. If the integrity of the bottom plug or cement is in question, and records cannot prove that the plugging is adequate, EPA recommends that the surface plug and possibly additional plugs down-hole be drilled out and tests conducted to determine the adequacy of abandonment. There are numerous field tests available to evaluate the integrity of abandoned wells. Several of these tests are discussed in detail in the *UIC Program Class VI Well Testing and Monitoring Guidance*. Additionally, the owner or operator must demonstrate guaranteed site access to wells potentially needing corrective action in the future [40 CFR 146.84(b)(iv)]. The owner or operator is encouraged to consult the UIC Program Director regarding any difficulties in gaining site access in order to evaluate and perform corrective action on any identified improperly plugged abandoned wells.

EPA recommends that both the casing and the cement plugs be evaluated. Casing failure is most common at joints and in weak formations where instability around the well bore can lead to failed cement and to casing buckling. Weak formations are also common areas for cement failure, as are high pressure formations, due to fluid intrusion. Tools used to evaluate the cement and casing include, but are not limited to:

- Multi-finger caliper log;
- Sonic scanner;

- Ultrasonic imaging tool;
- Cement evaluation log;
- Radioactive tracer;
- Cased hole dynamic tester;
- Modular sidewall coring tool; and
- Cased hole fluid test.

Multi-finger caliper logs measure the radius of the borehole in a non-destructive way. They can give a 360-degree picture of the inside of the casing and identify any defects caused by corrosion, erosion, or other events (e.g., dropped tools).

A sonic scanner sends out sound waves and measures the returned waves in receivers. The log provides information on the quality of the casing-cement bond and the cement-formation bond. The sonic scanner averages the results for the entire radius and therefore cannot provide three-dimensional pictures of the cement bond, or determine the reasons for a poor quality cement bond. An ultrasonic imaging tool is another non-destructive tool that uses ultrasonic transmitters and receivers to determine information about the casing and cement. The ultrasonic imaging tool can return 360-degree information on casing thickness, cement thickness, and cement bond. More information on these tools can be found in Duguid and Crow (2007) and Close et al. (2009).

A cement evaluation log is another tool used and log results include information on both the cement and the bond quality. This log provides results that are averaged over the circumference of the well, and testing is typically conducted in combination with an ultrasonic imaging tool to provide more complete information on the three-dimensional picture of the well. In some cases, the cement hardens while the well casing is under pressure and, when pressure is released, microannuli can form between the casing and cement. If unconnected to other cracks, these microannuli cannot transmit fluid, but they will appear in logging results as a potential poor bond. This artifact can be evaluated by performing the cement evaluation log under pressure (Randhol et al., 2007). Radioactive tracers also can be used to detect leaks in casing and cement and fluid leaking along channels in the well bore. Radioactive tracers are injected down the well, and gamma detectors are used to detect any fluid flow.

Cased-hole dynamic testers measure mobility or porosity. They can be used to determine the porosity of the cement. They are semi-destructive tests as they do create a small hole in the casing and cement; however, the hole is patched after the test is run. The instrument works well in highly permeable formations or in cement, while performance in lower porosity formations is still under investigation.

Modular sidewall coring tools take small cores of the casing and cement for analysis in the laboratory. Laboratory analyses can include scanning electron microscopy, X-ray diffraction, and measurements of permeability and density. This is a more destructive test that leaves approximately 1-inch diameter holes in the side of the well, which is then patched with a remedial cement squeeze after testing is completed. Cased-hole fluid testers can be run with the

cased-hole mobility tool, using optical instruments to determine what fluids are present in the formation outside the well bore.

In general, EPA recommends that these tests be run sequentially, from the simplest and least destructive tests to the more complicated and destructive tests. This way, if a flaw is found with a simpler test that determines that the well should be plugged or otherwise remediated, the more expensive and destructive tests may be avoided. The typical order of running the tests is caliper log, sonic and ultrasonic tools, cased-hole mobility and fluid tests, and then sidewall cores (Duguid and Crow, 2007). This set of tools can be used to determine the quality of the casing and cement; if flaws such as degraded cement porosity, casing corrosion, microannuli in the cement, channels between the cement and casing or cement and formation, or missing cement are found, the Class VI Rule requires that corrective action be performed on the well [40 CFR 146.84(d)]. A brief summary of the main methods for evaluating cement and casing condition along with major benefits and disadvantages are included in Table 4-1 below.

**Table 4-1: Tools for Assessment of the Integrity of Abandoned Wells.**

Tool	Target	Advantages	Disadvantages
Multifinger calipers	Casing	Non-destructive, relatively simple	Only examines interior, only detects casing damage
Sonic Logs	Cement	Non-destructive, yields information on cement bond	Results averaged over well circumference, can't indicate reasons for poor quality bond
Ultrasonic Logs	Casing, Cement	Non-destructive, can detect flaws in casing and cement, provides three-dimensional images	Sensitive to well fluids
Cement evaluation log	Cement	Non-destructive, yields information on quality of cement bond	Results averaged over well circumference
Tracers	Leak detection	Can pinpoint routes of leaks, channeling	Radioactive tracers require special handling and may have negative public perception
Dynamic Cased Hole Tester	Cement	Can determine porosity of cement	Semi-destructive, untested in low porosity conditions
Sidewall coring	Cement	Can give detailed analysis of cement condition	Destructive

#### 4.4. Performing Corrective Action on Wells Within the AoR

The Class VI Rule requires that owners or operators of Class VI injection wells perform corrective action on all artificial penetrations in the AoR that may penetrate the confining zone and are determined to have been plugged and abandoned in a manner such that they could serve

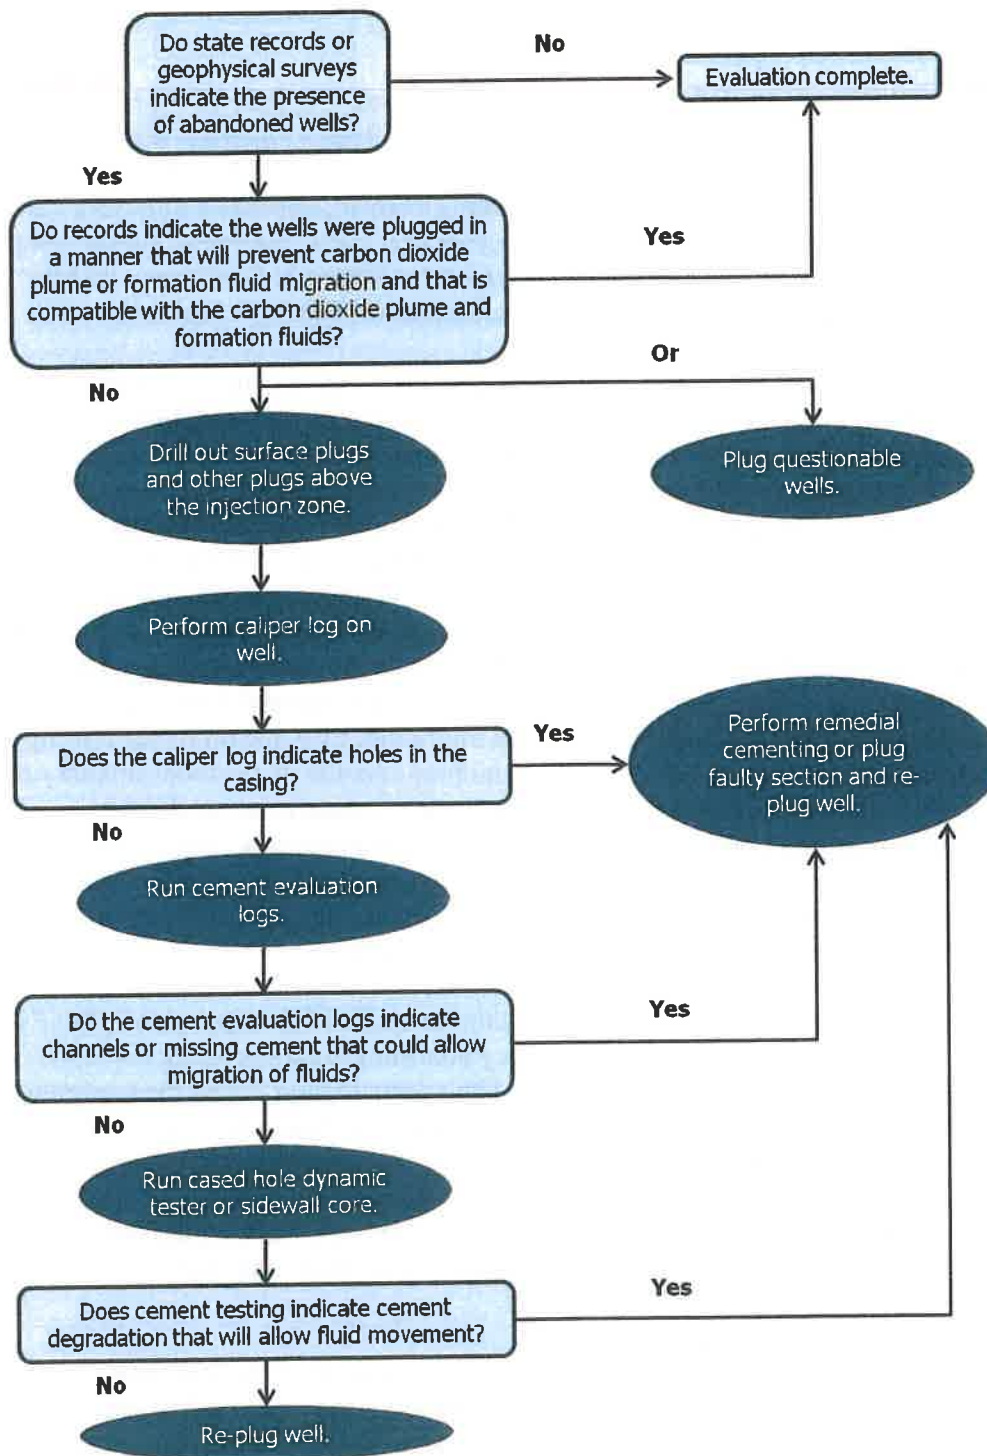

as a conduit for fluid movement and endanger USDWs [40 CFR 146.84(d)]. In performing corrective action, owners or operators must use methods designed to prevent the movement of fluid into or between USDWs, including use of materials compatible with the carbon dioxide stream, where appropriate [40 CFR 146.84(d)]. Figure 4-3 presents a decision tree that illustrates how the various evaluation tools can be used together to evaluate abandoned wells in an efficient and logical manner.

As described above, the Class VI Rule allows owners or operators to perform corrective action on a phased basis, if approved by the UIC Program Director. If a phased approach is approved for performing corrective action for a GS project, EPA recommends that all required corrective action on wells identified as deficient during the permit application process (or AoR reevaluations) receive corrective action prior to the end of the injection phase.

It is possible that some corrective action may be performed during the post-injection phase. For example, if the plume and pressure front movement were to deviate from predictions, this may necessitate corrective action for newly identified artificial penetration during the post-injection phase.

Performing corrective action on improperly abandoned wells is intended to prevent the movement of carbon dioxide or other mobilized fluids into or between USDWs. Acceptable forms of corrective action include well plugging and/or remedial cementing of the improperly abandoned well. In addition to corrective action, EPA recommends performing enhanced monitoring in the vicinity of improperly abandoned wells, including ground water monitoring and using indirect geophysical techniques for obtaining monitoring results. Appropriate monitoring for Class VI injection wells is discussed in the *UIC Program Class VI Well Testing and Monitoring Guidance*.

**Figure 4-3: Well Evaluation Decision Tree.**

#### 4.4.1. Plugging of Wells within the AoR

Plugging of Class VI injection wells at the cessation of the injection phase of the project is discussed in detail in the *UIC Program Guidance on Class VI Well Plugging, Post-Injection Site Care, and Site Closure*. This section focuses on the plugging of improperly abandoned wells within the AoR prior to the commencement of injection. However, because similarities exist in plugging techniques for abandoned wells and former injection wells, the reader should refer to the *UIC Program Guidance on Class VI Well Plugging, Post-Injection Site Care, and Site Closure* for further detail regarding well plugging techniques for Class VI injection wells.

A well requires plugging if records indicate that an abandoned well was not plugged, was plugged and abandoned improperly, or has not been plugged in a manner that prevents movement of carbon dioxide or other fluids that may endanger USDWs [40 CFR 146.84(c) and (d)]. In addition, where records indicate that a well plug does not exist at a depth corresponding to the primary confining layer of the GS project, EPA recommends that the well have an additional plug set at this depth to meet the requirements of the Class VI Rule. Where records indicate that there are no well plugs below USDWs or other permeable formations that may exhibit cross flow of mobilized fluids, additional plugs may be required by the UIC Program Director for proper corrective action in these zones. Also, in wells that were plugged but the evaluation techniques discussed in Section 4.3 of this guidance document reveal cracks, channels, or annuli in the plug that would allow fluid migration, EPA recommends drilling out and replacing the plug. In addition, if the plug material may corrode in a carbon-dioxide rich environment, EPA recommends replacing it. For wells where casing exists at depths corresponding to the injection and/or confining zone and the annular space may serve as a conduit for fluid movement if not properly cemented, remedial cementing may be necessary or the casing may need to be removed and replaced with a cement plug. See Section 4.4.2 of this guidance document for more information on remedial cementing.

For the plugging of improperly abandoned wells within the AoR, EPA recommends that a plug be set at a depth interval corresponding to the primary confining zone overlying the injection zone of the Class VI injection well. In the absence of an adequate plug across the confining zone, cross-migration may occur wherein fluids enter a permeable zone below the lowermost USDW and then migrate upward from that zone. See Figure 4-2 of this guidance document for more information. However, in order to supplement the confining-zone plug, ideal additional plugging zones include the bottom of any casings and across any USDWs. A surface plug would also typically be required by local well abandonment regulations to ensure that there is no risk of anyone physically falling into the well bore.

To provide the best possible barrier to carbon dioxide migration out of the injection zone, EPA recommends that corrective action be conducted in a manner to provide multiple barriers to carbon dioxide migration and avoid underground cross-flow. Materials that are compatible with the carbon dioxide must be used where appropriate [40 CFR 146.84(d)]. Material compatibility with carbon dioxide is discussed further in the *UIC Program Class VI Well Construction Guidance*.

#### **4.4.2. Remedial Cementing**

Properly cementing improperly abandoned wells located within the delineated AoR between any existing well casing and the geologic formation, especially through the injection zone, provides an important fluid migration barrier. EPA recommends performing remedial cementing in order to meet the corrective action requirements of the Class VI Rule if a well has been properly plugged but the records, or any testing such as that described in Section 4.3 of this guidance, indicate that the cement surrounding the well bore has failed or has cracks, channels, or annuli that could allow migration of carbon dioxide. Key areas on which to focus remedial cementing include depths corresponding to the injection zone and through any other permeable zones.

Remedial cementing is performed through squeeze cementing, where the cement is emplaced into the affected area. For more information on cement squeezes, refer to Reynolds and Kiker (2003). Increased pressure on the cement forces water out of the cement slurry leaving behind the partially dehydrated cement. Cement squeezes can either be low pressure or high pressure. Low pressure squeezes are used to set a small amount of cement in a given area and operate at a pressure lower than the fracture pressure of the formation. Higher pressure squeezes are used when channels or disconnected microannuli are to be cemented. The higher pressure squeezes may fracture the formation and then allow the cement to flow into disconnected channels.

Cement squeezes can be performed using either a packer or a bradenhead squeeze. The methods differ in how the treated section is isolated from the rest of the well. In the packer squeeze, packers isolate the area to be treated, and a bridge plug isolates the area below the area to be cemented, while a modified packer with a bypass valve isolates the area above the treated area. Cement retainers are used if significant back pressure is expected. A bradenhead squeeze only isolates the area below the area to be cemented. It is typically used only if the casing above the treated area is strong enough to withstand the squeeze pressure. In cement squeezes, either drillable packers or retrievable packers can be used. Drillable packers allow less freedom in placement but better control of the cement. They are preferred if high pressures are maintained on the cement after the squeeze.

Cements used in squeeze cementing can vary depending on the nature of the defect. The Class VI Rule requires that all materials used for cementing of abandoned wells be compatible with the carbon dioxide stream, where appropriate [40 CFR 146.84(d)]. Traditional cements may be supplemented with or replaced by materials such as polymer gels and acrylic grouts. Acrylic grouts can be used for small casing leaks or cases where pressure leak off is detected. High concentration low molecular weight polymers can be used for small to moderate leaks. High molecular weight polymers are typically used for channeling and lost circulation applications. Cement or cement/polymer blends are typically used for severe leaks (Randhol et al., 2007).

#### **4.5. Reporting Well Identification, Assessment, and Corrective Action to the UIC Program Director**

As discussed in the *UIC Program Class VI Well Project Plan Development Guidance*, the AoR and Corrective Action Plan, submitted with the initial stage of the permit application, must

indicate what well identification and assessments will be used and how corrective action will be conducted [40 CFR 146.84(b)(2)(iv)]. The plan is a condition of the permit and is subject to UIC Program Director approval [40 CFR 146.84(b)].

Owners or operators seeking a Class VI injection well permit are required to report the following information regarding abandoned wells within the AoR that may penetrate the primary confining zone: the well's type, construction, date drilled, location, depth, record of plugging and/or completion, and any additional information required by the UIC Program Director [40 CFR 146.82(a)(4)]. This information may be found in acceptable public and private databases, where available. See Section 4.2.1 for more information. In cases where available records do not provide the necessary information or indicate that the well was plugged improperly, in a questionable manner, or with materials inappropriate for contact with carbon dioxide, then site investigations must be performed to establish the condition of the well, as discussed previously [40 CFR 146.84(c)(3)].

The UIC Program Director will review the submitted well information to ensure completeness and may consult with officials at oil and gas or water agencies to ensure that the well search was thorough. The UIC Program Director will also review well completion records to determine those wells that may penetrate the primary confining zone and will likely compare this list to wells scheduled for corrective action and submitted with the Class VI injection well permit application. For those identified abandoned wells that have been determined by the owner or operator to not require corrective action, the UIC Program Director will likely review the records of plugging and any field testing conducted, to verify that the well does not require corrective action. If information on the depth or condition of the plug(s) is missing, the UIC Program Director may request additional tests or require the well to be re-plugged.

Reports of any tests done on abandoned wells must be submitted to the UIC Program Director with the permit application along with a list of wells for which corrective action will be conducted, as part of the AoR and Corrective Action Plan required at 40 CFR 146.84(b). Before receiving authorization to inject, the owner or operator must submit a report on the status of corrective action [40 CFR 146.82(c)(6)], indicating the number, type, and location of the plugs. EPA recommends that owners or operators also submit any records of remedial cementing with the Class VI injection well permit application, along with cement logs showing the methods used and the results of the remedial cementing. Testing and remedial cementing records for wells which are part of a planned later stage of corrective action may be submitted after that phase is completed.

## 5. AoR Reevaluation

The Class VI Rule requires owners or operators of permitted Class VI injection wells to reevaluate the AoR delineation on a regular basis, at a frequency of at least once every five (5) years [40 CFR 146.84(e)]. The purpose of AoR reevaluation is to ensure that the initial model predictions are adequate for predicting the extent of the separate-phase carbon dioxide plume and pressure front. To this end, AoR reevaluation consists of a comparison of modeling predictions and the required site monitoring data [40 CFR 146.90] and a revision of the model used to delineate the AoR when necessary. Because Class VI injection well permits are granted for the lifetime of the project, AoR reevaluation is the primary opportunity for the owner or operator and the UIC Program Director to assess the project's operation and take additional appropriate actions, if necessary, to protect USDWs. If a revision of the AoR delineation is necessary, a revision of the AoR and Corrective Action Plan is also required [40 CFR 146.84(e)(4)], along with other related project plans that may be dependent on the extent of the delineated AoR, including the Testing and Monitoring Plan [40 CFR 146.90(j)]. It is important to note that a change in the AoR and/or the AoR and Corrective Action Plan after the permit is issued may constitute a modification of the Class VI permit, and would be subject to public notice [40 CFR 144.39(a)(5)(i)].

Reevaluations of the AoR must continue throughout the life of the GS project, including the post-injection phase [40 CFR 146.84(e)]. It is likely that, following cessation of injection, the area of increased pressure will reduce in size as pressures dissipate; therefore, EPA expects that the reviews will entail an examination of monitoring data and confirmation and communication to the UIC Program Director that no modifications to the AoR or amendments to any plans are needed. However, this step is necessary to ensure that USDWs are not endangered and that all of the plans in force (including the PISC and Site Closure Plan and the Emergency and Remedial Response Plan) remain protective of USDWs.

### 5.1. Class VI Rule Requirements Related to AoR Reevaluation

The following Class VI Rule requirements pertain to reevaluation of the AoR:

- 40 CFR 146.84(e): At the minimum fixed frequency, not to exceed five years, as specified in the AoR and Corrective Action Plan, or when monitoring and operational conditions warrant, owners or operators must:
  - (1) Reevaluate the AoR in the same manner specified in 40 CFR 146.84(c)(1);
  - (2) Identify all wells in the reevaluated AoR that require corrective action in the same manner specified in 40 CFR 146.84(c);
  - (3) Perform corrective action on wells requiring corrective action in the reevaluated AoR in the same manner specified in 40 CFR 146.84(d); and
  - (4) Submit an amended AoR and Corrective Action Plan or demonstrate to the UIC Program Director through monitoring data and modeling results that no amendment to the AoR and Corrective Action Plan is needed. Any amendments

to the AoR and Corrective Action Plan must be approved by the UIC Program Director, must be incorporated into the permit, and are subject to the permit modification requirements at 40 CFR 144.39 or 144.41, as appropriate.

## **5.2. Conditions Warranting an AoR Reevaluation**

AoR reevaluation is required at a minimum fixed frequency of at least once every five years, or when monitoring and operational conditions warrant [40 CFR 146.84(e)]. EPA recommends that monitoring and operational conditions that may warrant a reevaluation of the AoR include:

- Significant changes in site operations that may alter model predictions and the AoR delineation;
- Monitoring results for the injected carbon dioxide plume and/or the associated pressure front that differ significantly from model predictions; or
- New site characterization data obtained that may significantly change model predictions and the delineated AoR.

Any site-specific criteria that will trigger an AoR reevaluation for a particular project must be included in the AoR and Corrective Action Plan [40 CFR 146.84(b)(2)(ii)].

### **5.2.1. Minimum Fixed Frequency**

As stated above, the owners or operators of permitted Class VI injection wells must reevaluate the AoR delineation at least once every five years [40 CFR 146.84(e)]. The planned fixed frequency for reevaluation must be included in the AoR and Corrective Action Plan [40 CFR 146.84(b)(2)(i)]. The AoR may need to be reevaluated more frequently than the previously scheduled timeframe based on other factors. In these cases, the schedule for AoR reevaluation may be updated appropriately. At no time may AoR reevaluation occur less than once every five years [40 CFR 146.84(e)].

### **5.2.2. Significant Changes in Operations**

Significant changes in operation of the GS project and/or individual Class VI injection wells mandate an AoR reevaluation [40 CFR 146.84(e)]. The UIC Program Director may require an AoR reevaluation prior to approving any operational changes. If allowed by the UIC Program Director, operational changes may occur prior to reevaluation of the AoR. In these cases, EPA recommends that the AoR reevaluation be submitted to the UIC Program Director within an agreed-upon timeframe of instituting such changes, as described in the AoR and Corrective Action Plan.

EPA recommends that proposed operational changes warranting an AoR reevaluation may include, but are not limited to, a change in the location or number of Class VI injection wells injecting into the same injection zone and/or a change in carbon dioxide injection rates, volumes, or pressures outside of the limits of the original permit and AoR delineation. Additional

operational changes that may warrant an AoR reevaluation, if required by the UIC Program Director, include a change in the composition of the injectate or changes in fluid production rates from the injection or overlying zones. Based on the discretion of the UIC Program Director, short-term routine operational changes (e.g., temporary well shut-ins) may not warrant reevaluation of the AoR.

In addition, the owner or operator may choose to perform an AoR reevaluation based on other operational changes, with the approval of the UIC Program Director. Specific operational triggers for an AoR reevaluation for a particular Class VI injection well must be included in the AoR and Corrective Action Plan submitted with the permit application for that particular injection well [40 CFR 146.84(b)(2)(ii)]. Operational changes that trigger a reevaluation may be associated with the GS project under which the permitted Class VI injection well operates or with separate projects that inject carbon dioxide into the same injection formation.

### **5.2.3. Results from Site Monitoring that Differ From Model Predictions**

EPA recommends that collection of any monitoring data (required under 40 CFR 146.90) that indicate carbon dioxide and/or pressure front migration significantly different than that predicted by the current AoR delineation model warrant an AoR reevaluation. Specific criteria for differences in monitoring data and model predictions that may trigger an AoR reevaluation for a particular project must be included in the AoR and Corrective Action Plan [40 CFR 146.84(b)(2)(ii)]. In such cases, when monitoring data and modeling predictions differ, the owner or operator is encouraged to notify the UIC Program Director and submit an AoR reevaluation within timeframes that have been established in the AoR and Corrective Action Plan. Methods for monitoring the evolution of the carbon dioxide plume and associated pressure front are discussed in more detail in the *UIC Program Class VI Well Testing and Monitoring Guidance*. An example of evaluation of monitoring results during AoR reevaluation is provided in Box 5-1.

The owner or operator is required to perform monitoring to track the extent of the carbon dioxide plume and the presence or absence of elevated pressure [40 CFR 146.90(g)]. Pressure monitoring is required using direct methods (e.g., pressure transducers) within the injection zone, and indirect methods for plume tracking are also required unless the UIC Program Director determines, based on site-specific geology, that such methods are not appropriate [40 CFR 146.90(g)(1) and (2)]. Additionally, the owner or operator is required to perform periodic monitoring of ground water quality and geochemical changes above the primary confining zone that may be a result of carbon dioxide movement through the confining zone [40 CFR 146.90(d)]. On a site-specific basis, the UIC Program Director may require additional geochemical monitoring within the injection zone as a component of carbon dioxide plume tracking [40 CFR 146.90(i)].

EPA recommends that pressure measurements indicative of pressure-front migration further than that predicted by the current computational model warrant an AoR reevaluation. In practice, this would be indicated by an observed increase in pressure at monitoring wells greater than predicted by the computational model. In some cases, pressure measurements may fluctuate, and

short-term temporary pressure increases (e.g., spikes) may not warrant an AoR reevaluation. EPA recommends that the specific pressure monitoring results that would trigger an AoR reevaluation be included in the AoR and Corrective Action Plan. For example, the owner or operator may specify the magnitude and duration of increased pressure that would trigger an AoR reevaluation for each monitoring well.

Results of carbon dioxide plume and pressure-front tracking using indirect methods, such as periodic geophysical surveys, may also be used for comparison to model predictions. Geophysical survey results provide information over relatively large areas, as opposed to “point” measurements provided by monitoring wells. Geophysical survey results are intended to provide an estimate of the extent of the separate-phase carbon dioxide plume and, in some cases, pressure changes. EPA anticipates that results of indirect monitoring that indicate carbon dioxide migration (1) outside of the boundaries of the current AoR delineation, or (2) at rates significantly greater than current model estimates would also warrant an AoR reevaluation.

EPA also recommends performing an AoR reevaluation if the results of the ground water geochemical sampling indicate separate-phase (i.e., supercritical, liquid, or gaseous) carbon dioxide migration outside of the boundaries of the current AoR delineation, or at rates significantly greater than predicted by the computational model. The presence of separate-phase carbon dioxide in the sampled fluids above the confining zone is evidence of carbon dioxide/fluid migration out of the injection zone and is cause to notify the UIC Program Director pursuant to 40 CFR 146.91(c)(1). In addition, elevated carbon dioxide aqueous concentrations may indicate the presence of separate-phase carbon dioxide in the immediate vicinity of the monitoring well.

#### **5.2.4. Ongoing Site Characterization**

Site characterization is not a one-time exercise at GS project sites. As additional site characterization data are collected via geophysical surveys, the drilling of new injection or monitoring wells, or from other sources, the data must be subsequently incorporated into the existing computational model used for AoR delineation [40 CFR 146.84(c)(1) and (e)(1)]. Types of data that may be incorporated into a reevaluation include newly identified potential conduits for fluid movement, updated information regarding injection or confining zone extent and thickness, or further characterization of formation heterogeneity. The UIC Program Director may also require an AoR reevaluation based on any newly available site characterization data that may impact current modeling predictions.

#### **5.3. Performing an AoR Reevaluation**

The first step in performing an AoR reevaluation for a Class VI injection well is a comparison of the available monitoring data and the model predictions. If Class VI owners or operators believe that monitoring and modeling data are consistent and that revision of the model is not necessary, they must demonstrate this to the UIC Program Director in lieu of revising the computational model [40 CFR 146.84(e)(4)]. However, if monitoring data and modeling predictions differ significantly, then the Class VI owner or operator must submit an amended AoR and Corrective

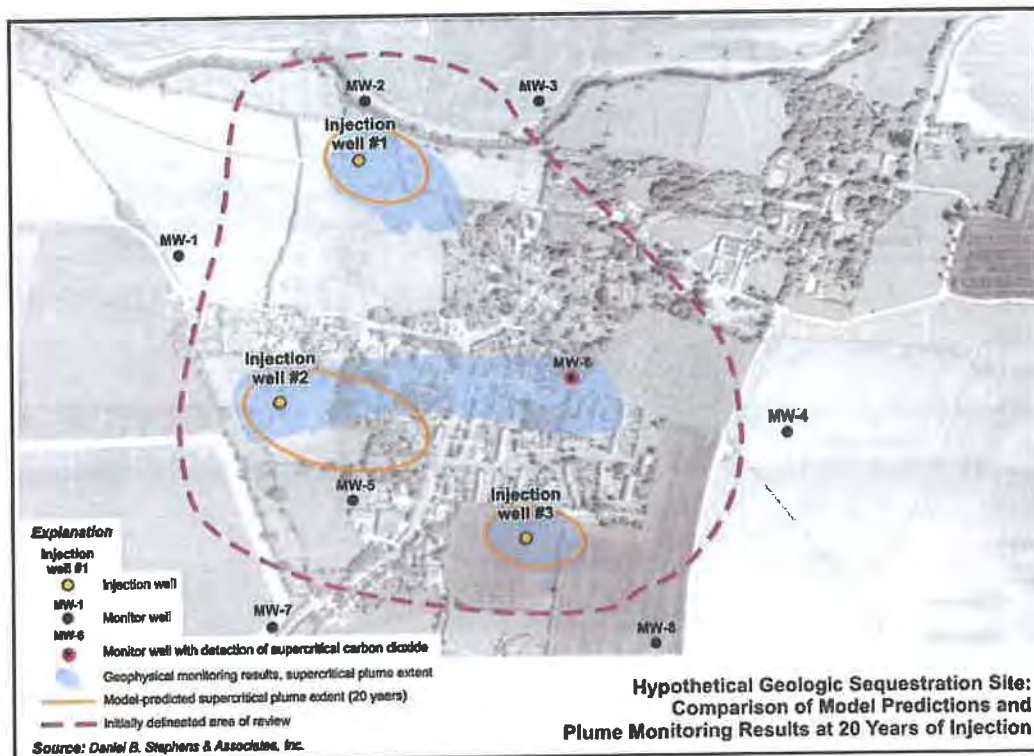

Action Plan and revise both the computational model and the AoR delineation results [40 CFR 146.84(e)(1) and (4)].

### **Box 5-1. Hypothetical Example of an AoR Reevaluation**

An AoR reevaluation consists of comparing monitoring results of plume and pressure-front movement to model predictions. In this hypothetical example, a continuation of the scenario presented earlier in Boxes 3-1 and 3-2, the AoR reevaluation required after 20 years of injection is illustrated below. In this example, the previously required AoR reevaluations at 5, 10, and 15 years did not result in any AoR delineation modifications.

#### **Comparison of Plume Monitoring Data**

In this hypothetical scenario, monitoring data are available from eight monitoring wells screened within the injection zone and from an indirect geophysical monitoring technique. Monitoring well data are used to assess the potential presence of separate-phase carbon dioxide at each location. The data indicate that separate-phase carbon dioxide is present at one of the monitoring wells. These data are compared to initial model predictions of plume evolution for 20 years after the commencement of injection (Figure 5-1). Carbon dioxide is detected at MW-6, outside of the areas predicted by the model to exhibit carbon dioxide.

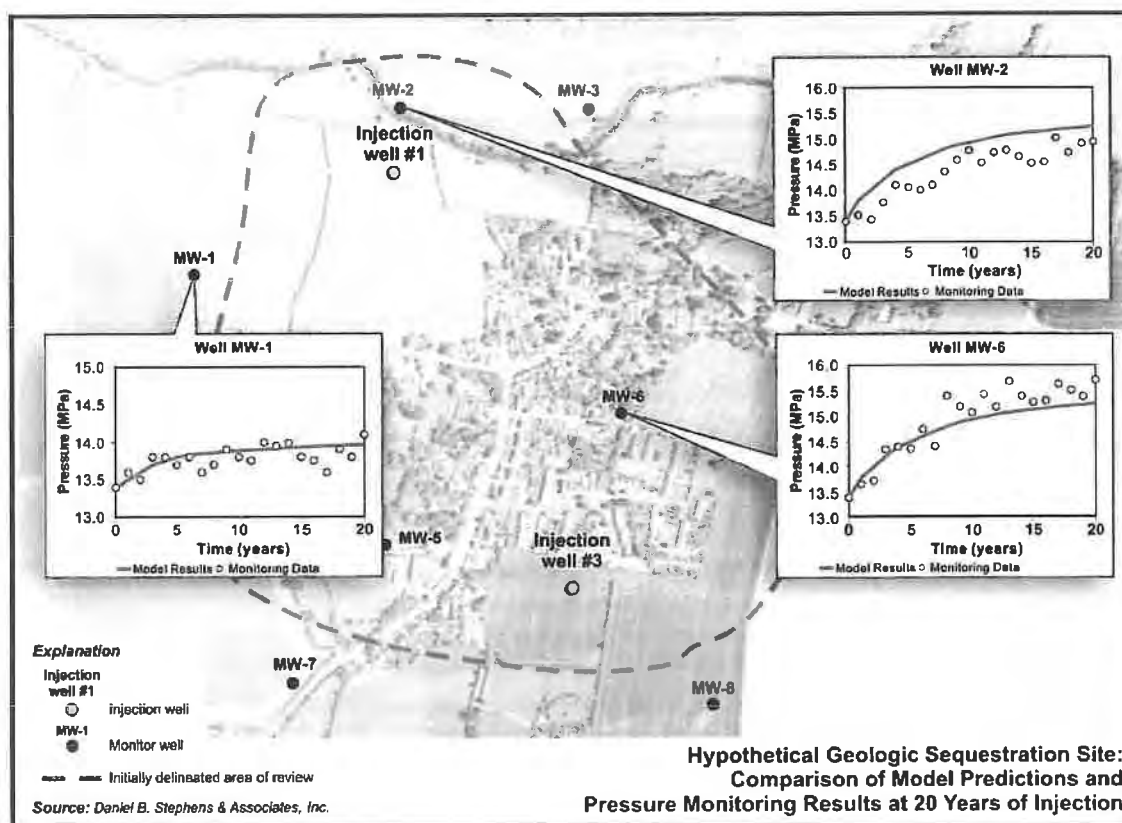

**Figure 5-1: Hypothetical Geologic Sequestration Site: Comparison of Model Predictions and Plume Monitoring Results at 20 Years of Injection.**

### **Box 5-1. Hypothetical Example of an AoR Reevaluation, *continued***

Compared to monitoring well data, geophysical data provide a larger-area estimate of the extent of separate-phase carbon dioxide. The geophysical and monitoring-well data are consistent in their general evaluation of where separate-phase carbon dioxide is present. Geophysical data and model results are generally consistent for the plume emanating from Injection Well #3, and inconsistent for Injection Wells #1 and #2. The carbon dioxide plume may have migrated differently than originally predicted for several reasons, as discussed below.

#### **Comparison of Pressure Monitoring Data**

Bottom-hole pressure data are collected at all of the eight monitoring wells. This example focuses on data collected at three of the wells, MW-1, MW-2, and MW-6. For actual projects, EPA recommends that data from all monitoring wells be considered. Graphs of pressure monitoring data over the first 20 years of the project, compared to modeling results, are presented in Figure 5-2.

**Figure 5-2: Hypothetical Geologic Sequestration Site: Comparison of Model Predictions and Pressure Monitoring Results at 20 Years of Injection.**

#### **Box 5-1. Hypothetical Example of an AoR Reevaluation, continued**

Pressure monitoring data are consistent with modeling predictions on the western edge of the project (MW-1). The general scatter in the monitoring data are expected, and there is no significant bias (i.e., less than, greater than) in comparing the monitoring data and modeling results. Data from the northern portion of the project (MW-2) indicate that actual pressure increases in the injection zone are lower than model predictions. This area has exhibited less of a pressure perturbation caused by injection than originally predicted. In contrast, data from the eastern portion of the site (MW-6) indicate that there has been a larger pressure increase than originally predicted. These data are generally consistent with the plume migration data, presented above, which showed that the plume has migrated further east than originally predicted.

#### **Outcome of Monitoring Data and Model Comparison**

This comparison indicates that, after 20 years of injection, modeling results and monitoring data compare favorably in some regions of the site. However, the plume and pressure front appear to have migrated further to the east than initially predicted. This disparity may be due to several factors. Examples include the presence of a high-permeability pathway within the injection zone that had not been fully characterized during initial site characterization, or the dip angle at the injection zone/confining zone interface being larger than originally assumed. Based on this comparison, the operator of the project site, in consultation with the UIC Program Director, decided to calibrate the AoR model and re-delineate the AoR. See Box 5-2 for more information.

### **5.3.1. Demonstrating Adequate Existing AoR Delineation**

An AoR reevaluation does not necessarily need to result in revisions or updates to the site computational model. If the owner or operator determines that no changes are necessary, the required reevaluation may consist of demonstrating this to the UIC Program Director [40 CFR 146.84(e)(4)]. EPA recommends that demonstrating the adequacy of the current AoR delineation includes verification that existing operational and site characterization data have been incorporated into the model and that existing monitoring data agree with the modeled predictions.

EPA recommends that the Class VI injection well owners or operators submit any new operational, monitoring, or site characterization data that have been received since the last AoR reevaluation to the UIC Program Director. EPA also recommends that details regarding how this information has been incorporated into the site computational model be presented, as newly received operational or site characterization data may impact model input parameter values.

Integral to demonstrating that the current AoR delineation is adequate is the comparison of monitoring data and model predictions. EPA recommends that this comparison take the form of graphics and informative maps showing the general agreement between monitoring results and model predictions, and that all available monitoring data be considered, including fluid geochemistry monitoring, pressure monitoring, and geophysical surveys.

### **5.3.2. Modifying the Existing AoR Delineation**

Any significant differences between operational monitoring results and the existing model predictions that are the basis for the AoR delineation, for example as discussed in Section 5.2.3 of this guidance document, warrant a modification to the existing AoR delineation [40 CFR 146.84(e)]. The steps in revision of the AoR delineation include adjusting the site conceptual model, model calibration (i.e., adjusting model parameters), and presentation of adjusted model results and the newly delineated AoR to the UIC Program Director.

EPA recommends that the site conceptual model be revised based on new site characterization, operational, and, in some cases, monitoring data. The new conceptual site model schematic may be provided to the UIC Program Director along with the AoR reevaluation information, with any changes highlighted. Examples of changes to the conceptual model include new injection wells, newly elucidated geologic features (e.g., stratigraphic layers), or a revised permeability field.

Following revision of the site conceptual model, revision of the existing AoR delineation may require model calibration in order to minimize the differences between monitoring data and model simulations (see Section 2.5 of this guidance). EPA recommends that the relative error difference between monitoring data and model predictions be quantified via the use of calibration statistics (e.g., ME, MAE, RMSE). To the extent possible, the value of the calibration statistics should be minimized during model calibration. The value of the model calibration statistics also informs the expected uncertainty and error in model predictions of future

conditions. Following model calibration, the AoR delineation may be revised using methods described in Section 3.4 of this guidance.

In reporting an AoR computational model and delineation revision, EPA recommends that all model attributes, as given in Section 3.5 of this guidance document, be re-submitted to the UIC Program Director. In addition, EPA recommends that the model calibration process and final AoR delineation results be presented in detail as part of the submission with:

- Adjusted input parameter values listed;
- Graphs comparing observed and modeled values of carbon dioxide migration and fluid pressure;
- Model results showing carbon dioxide and pressure front migration over time included; and
- The value of the model calibration statistics.

The newly delineated AoR may be presented on maps which would highlight similarities and differences in comparison with previous AoR delineations. See Box 5-2, below, for an example of a hypothetical AoR reevaluation.

If a revision of the AoR delineation is necessary, an amendment to the AoR and Corrective Action Plan is also required, along with possible amendments to other related project plans [40 CFR 146.84(e)(4) and (f)]. EPA recommends that the amended AoR and Corrective Action Plan explain any differences in corrective action activities that result from AoR revision, including a demonstration of adequate surface access rights in order to perform the required corrective action activities. See Section 4 for more information on performing corrective action. Furthermore, in some cases, GS project attributes that are outside the scope of the Class VI Rule and the UIC Program, such as pore-space ownership rights, may be related to the size of the AoR. In these cases, the owners or operators are encouraged to consult with the UIC Program Director, or another applicable regulatory agency, following a revision of the AoR in order to proceed.

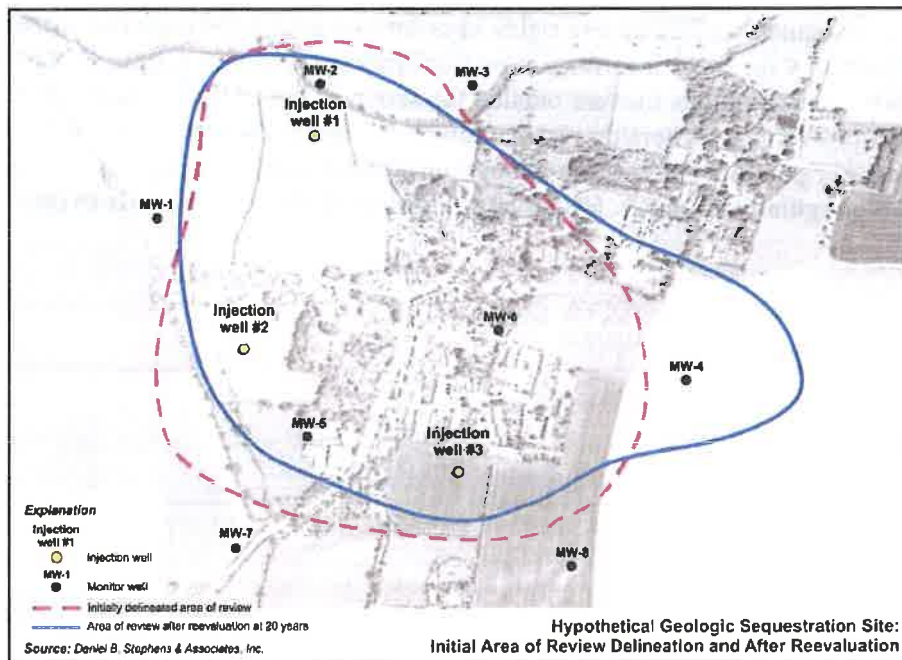

### **Box 5-2. Hypothetical Example of a Presentation of the Revised AoR**

After the site computational model has been revised through model calibration to monitoring data, and/or updating with new operational or site characterization parameters, the AoR must be re-delineated [40 CFR 146.84(e)]. See Box 3-2 for more information on AoR delineation; the same general methods should be used during the reevaluation. Once the AoR has been revised, it may be presented on a site base map in comparison to the former AoR delineation (Figure 5-3).

In this hypothetical example, the AoR reevaluation has resulted in an AoR delineation that extends generally farther toward the east than previously. This is consistent with the monitoring data (Box 5-1) indicating further plume and pressure front migration toward the east. The model was revised to match monitoring data by adjusting intrinsic permeability values within the injection zone and the dip angle at the injection/confining zone interface.

The region newly identified as located within the delineated AoR (between the purple and blue contour lines) must be subjected to the artificial penetration identification, assessment, and corrective action procedures as discussed in Section 4 of this guidance document [40 CFR 146.84(e)(2) and (3)]. Furthermore, the revision of the AoR requires revisions to the AoR and Corrective Action Plan and other project plans, as discussed in the *UIC Program Class VI Well Project Plan Development Guidance*. Changes to the AoR and Corrective Action Plan may demonstrate a need to secure new surface access rights for the newly included area. The owner or operator may also contact the applicable regulatory agency for other project attributes (e.g., new pore space ownership rights) that are outside the scope of the Class VI Rule and the UIC Program.

**Figure 5-3: Hypothetical Geologic Sequestration Site: Initial AoR Delineation and Delineation after Reevaluation.**

# Geologic Sequestration of Carbon Dioxide

## Underground Injection Control (UIC) Program Class VI Implementation Manual for UIC Program Directors

L019

INDUSTRIAL COMMISSION  
STATE OF NORTH DAKOTA  
DATE 6/12/24 CASE NO. 30869-880  
Introduced By Bafto (Hydro Solutions)  
Exhibit L0-19  
Identified By Bafto

## Disclaimer

The Class VI injection well classification was established by the *Federal Requirements Under the Underground Injection Control (UIC) Program for Carbon Dioxide (CO<sub>2</sub>) Geologic Sequestration (GS) Wells* (75 FR 77230, December 10, 2010), referred to as the Class VI Rule, which establishes a new class of injection well (Class VI).

The Safe Drinking Water Act (SDWA) provisions and the United States Environmental Protection Agency (EPA) regulations cited in this document contain legally-binding requirements. While the document recommends basic steps for reviewing project information, it acknowledges and is designed to accommodate potential site-specific considerations and regulatory flexibility inherent in the Class VI Rule. In several sections, this guidance document makes suggestions and offers alternatives that go beyond the minimum requirements indicated by the Class VI Rule. This is intended to provide information and suggestions that may be helpful for implementation efforts. Such suggestions are prefaced by “may” or “should” and are to be considered advisory. They are not required elements of the Rule. Therefore, this document does not substitute for those provisions or regulations, nor is it a regulation itself, so it does not impose legally-binding requirements on the EPA, states, or the regulated community. The recommendations herein may not be applicable to each and every situation.

The EPA and state decision makers retain the discretion to adopt approaches on a case-by-case basis that differ from this guidance where appropriate. Any decisions regarding a particular facility will be made based on the applicable statutes and regulations. Mention of trade names or commercial products does not constitute endorsement or recommendation for use. This guidance may change in the future without a formal notice and comment period.

While the EPA has made every effort to ensure the accuracy of the discussion in this document, the obligations of the regulated community are determined by statutes, regulations, or other legally-binding requirements. In the event of a conflict between the discussion in this document and any statute or regulation, this document would not be controlling.

Note that this document only addresses issues covered by the EPA’s authorities under SDWA. Other EPA authorities, such as Clean Air Act (CAA) requirements to report carbon dioxide injection activities under the Greenhouse Gas Reporting Program (GHGRP), are not within the scope of this document.

## Executive Summary

The United States Environmental Protection Agency's (EPA's) *Federal Requirements Under the Underground Injection Control (UIC) Program for Carbon Dioxide (CO<sub>2</sub>) Geologic Sequestration (GS) Wells* (75 FR 77230, December 10, 2010), and codified in the U.S. Code of Federal Regulations [40 CFR 146.81 *et seq.*], are known as the Class VI Rule. The Rule establishes a new class of injection wells (Class VI) and sets minimum federal technical criteria for Class VI injection wells for the purpose of protecting underground sources of drinking water (USDWs).

This *UIC Program Class VI Implementation Manual for UIC Program Directors* outlines and describes recommended activities to support Class VI permitting authorities in their review and evaluation of Class VI information over the course of a Class VI project. While the document recommends basic steps for reviewing project information, it acknowledges and is designed to accommodate potential site-specific considerations and regulatory flexibility inherent in the Class VI Rule. This Implementation Manual is intended to be used by Class VI permitting authorities in conjunction with a series of technical guidance documents that support Class VI injection well permit applicants/owners or operators as they conduct required activities.

The Manual is organized into the following sections:

- Section 1, Introduction, provides an overview of the Class VI requirements and Class VI projects. It also describes the EPA-developed tools that can support the UIC Program Director.
- Section 2, UIC Program Responsibilities, describes the roles and responsibilities the UIC Program has throughout the duration of a Class VI Project, including reviewing owner or operator submittals, reporting and recordkeeping responsibilities, communicating about the project, and assuring compliance with permit conditions.
- Section 3, Pre-Permitting Considerations, describes recommended steps that the UIC Program Director can take in advance of the formal submittal of a Class VI permit application, including assisting the applicant in gaining access to the Geologic Sequestration Data Tool (GSDT) and addressing specific topics on which pre-application discussions should be focused.
- Section 4, Reviewing Pre-Construction Information, describes recommended steps to facilitate the evaluation of information submitted in a Class VI permit application, issue a draft permit, and authorize construction or conversion of an injection well.
- Section 5, Reviewing Pre-Operation Information, presents recommendations to the UIC Program for reviewing final geologic data and the results of pre-operational testing and, based on this review, authorizing operation of the Class VI well.
- Section 6, Injection Phase Review, presents recommendations for ensuring that the project is protective of USDWs during injection operations by reviewing testing and monitoring data, evaluating area of review (AoR) reevaluations, and reviewing project plan updates.
- Section 7, Post-Injection Phase Review, describes recommendations regarding how the UIC Program Director should evaluate the information that owners or operators submit during the post-injection phase, including well plugging reports, post-injection monitoring data, non-endangerment demonstrations, and site closure reports.

## Acronyms and Abbreviations

AoPI	Area of Potential Impact
AoR	Area of Review
CAA	Clean Air Act
CCS	Carbon Capture and Storage
CERCLA	Comprehensive Environmental Response, Compensation, and Liability Act
CFR	Code of Federal Regulations
CIL	Casing Inspection Log
CROMERR	Cross-Media Electronic Reporting Regulation
EGR	Enhanced Gas Recovery
EJ	Environmental Justice
EOR	Enhanced Oil Recovery
EPA	U.S. Environmental Protection Agency
ESA	Electronic Signature Agreement
GHGRP	Greenhouse Gas Reporting Program
GIS	Geographic Information System
GS	Geologic Sequestration
GSDT	Geologic Sequestration Data Tool
LAS	Log ASCII Standard
mg/L	Milligrams per liter
MIT	Mechanical Integrity Test
MPRSA	Marine Protection, Research, and Sanctuaries Act
NRAP	National Risk Assessment Partnership
OCSLA	Outer Continental Shelf Lands Act
PAM	Program Activity Measure
PISC	Post-Injection Site Care
ppm	Parts per Million
PWSS	Public Water System Supervision Program (under SDWA)
QA	Quality Assurance
QASP	Quality Assurance Surveillance Plan
RCRA	Resource Conservation and Recovery Act
SDWA	Safe Drinking Water Act
SDWIS	Safe Drinking Water Information System
SNC	Significant Noncompliance
STOMP	Subsurface Transport over Multiple Phases
TDS	Total Dissolved Solids
TOUGH	Transport of Unsaturated Groundwater and Heat
UIC	Underground Injection Control
USDW	Underground Source of Drinking Water
USGS	United States Geological Survey

## Definitions

Key to definition sources:

- 1: 40 CFR 144.3.
- 2: 40 CFR 146.81(d).
- 3: 40 CFR 144.6(f) and 144.80(f).
- 4: This definition was developed for the purposes of this document.
- 5: Class VI Rule Preamble (75 FR 77230).

**Administrator** means the Administrator of the United States Environmental Protection Agency, or an authorized representative.<sup>1</sup>

**Area of Review (AoR)** means the region surrounding the geologic sequestration project where USDWs may be endangered by the injection activity. The area of review is delineated using computational modeling that accounts for the physical and chemical properties of all phases of the injected carbon dioxide stream and displaced fluids, and is based on available site characterization, monitoring, and operational data as set forth in 40 CFR 146.84.<sup>2</sup>

**Carbon dioxide plume** means the extent underground, in three dimensions, of an injected carbon dioxide stream.<sup>2</sup>

**Carbon dioxide stream** means carbon dioxide that has been captured from an emission source (e.g., a power plant), plus incidental associated substances derived from the source materials and the capture process, and any substances added to the stream to enable or improve the injection process. This subpart [subpart H of 40 CFR 146] does not apply to any carbon dioxide stream that meets the definition of a hazardous waste under 40 CFR 261.<sup>2</sup>

**Class VI wells** means wells that are not experimental in nature that are used for geologic sequestration of carbon dioxide beneath the lowermost formation containing a USDW; or, wells used for geologic sequestration of carbon dioxide that have been granted a waiver of the injection depth requirements pursuant to requirements at 40 CFR 146.95; or, wells used for geologic sequestration of carbon dioxide that have received an expansion to the areal extent of an existing Class II enhanced oil recovery or enhanced gas recovery aquifer exemption pursuant to 40 CFR 146.4 and 144.7(d).<sup>3</sup>

**Confining zone** means a geologic formation, group of formations, or part of a formation stratigraphically overlying the injection zone(s) that acts as barrier to fluid movement. For Class VI wells operating under an injection depth waiver, confining zone means a geologic formation, group of formations, or part of a formation stratigraphically overlying and underlying the injection zone(s).<sup>2</sup>

**Corrective action** means the use of Director-approved methods to ensure that wells within the area of review do not serve as conduits for the movement of fluids into underground sources of drinking water (USDW).<sup>2</sup>

**Geologic sequestration (GS)** means the long-term containment of a gaseous, liquid, or supercritical carbon dioxide stream in subsurface geologic formations. This term does not apply to carbon dioxide capture or transport.<sup>2</sup>

**Geologic sequestration project** means an injection well or wells used to emplace a carbon dioxide stream beneath the lowermost formation containing a USDW; or, wells used for geologic sequestration of carbon dioxide that have been granted a waiver of the injection depth requirements pursuant to requirements at 40 CFR 146.95; or, wells used for geologic sequestration of carbon dioxide that have received an expansion to the areal extent of an existing Class II enhanced oil recovery or enhanced gas recovery aquifer exemption pursuant to 40 CFR 146.4 and 144.7(d). It includes the subsurface three-dimensional extent of the carbon dioxide plume, associated area of elevated pressure, and displaced fluids, as well as the surface area above that delineated region.<sup>2</sup>

**Geophysical surveys** refer to the use of geophysical techniques (e.g., seismic, electrical, gravity, or electromagnetic surveys) to characterize subsurface rock formations.<sup>5</sup>

**Injection depth waiver** refers to a waiver of the Class VI injection depth requirements by the UIC Program Director pursuant to the provisions at 40 CFR 146.95.<sup>4</sup>

**Injection zone** means a geologic formation, group of formations, or part of a formation that is of sufficient areal extent, thickness, porosity, and permeability to receive carbon dioxide through a well or wells associated with a geologic sequestration project.<sup>2</sup>

**Injectivity** is the pressure differential over existing reservoir pressure required to inject a unit volume of fluid in a given unit of time. It is typically expressed as psi/bbl/day (psi per barrel per day), but can be expressed in any combination of pressure, volume, and time units.<sup>4</sup>

**Mechanical integrity testing (MIT)** refers to a test performed on a well to confirm that a well maintains internal and external mechanical integrity. MITs are a means of measuring the adequacy of the construction of an injection well and a way to detect problems within the well system.<sup>5</sup>

**Phased corrective action** refers to a provision of the Class VI Rule [40 CFR 146.84(b)(2)(iv)] afforded to Class VI injection well owners or operators to defer some identified corrective action needed within the AoR, but farther away from the injection well, until after injection has commenced, but prior to carbon dioxide plume and pressure front movement into that particular area.<sup>4</sup>

**Plug** means a watertight, gastight seal installed in a borehole or well to prevent movement of fluids; it may be mechanical or composed of cement or other materials capable of zonal isolation.<sup>4</sup>

**Post-injection site care (PISC)** means the appropriate monitoring and other actions (including corrective action) needed following cessation of injection to ensure that USDWs are not endangered, as required under 40 CFR 146.93.<sup>5</sup>

**Pressure front** means the zone of elevated pressure that is created by the injection of carbon dioxide into the subsurface. The pressure front of a carbon dioxide plume refers to a zone where there is a pressure differential sufficient to cause the movement of injected fluids or formation fluids into a USDW.<sup>2</sup>

**Site closure** means the point/time, as determined by the Director following the requirements under 40 CFR 146.93, at which the owner or operator of a geologic sequestration site is released from post-injection site care responsibilities.<sup>2</sup>

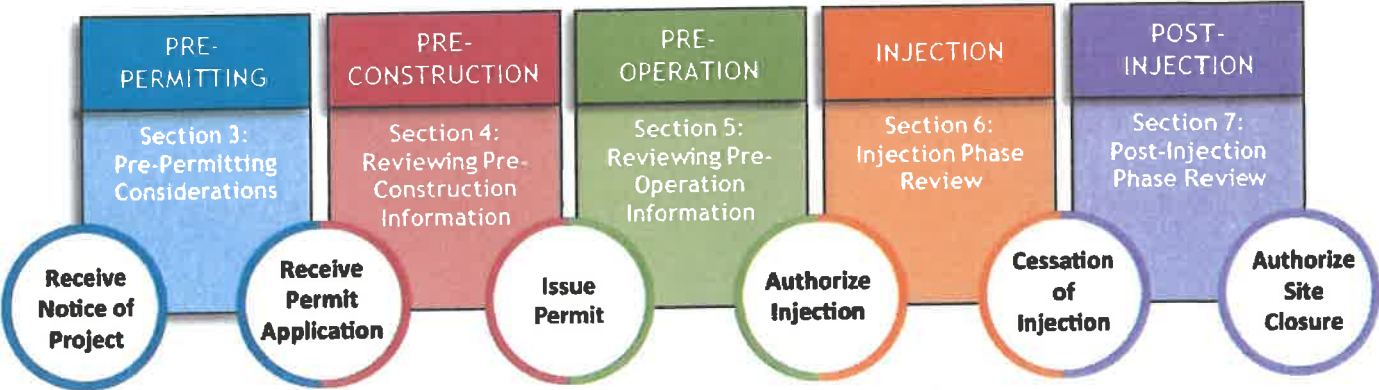

**Transmissive fault or fracture** means a fault or fracture that has sufficient permeability and vertical extent to allow fluids to move between formations.<sup>2</sup>

**Underground Injection Control (UIC) Program** refers to the program the EPA, or an approved state or tribe, is authorized to implement under the Safe Drinking Water Act (SDWA) and that is responsible for regulating the underground injection of fluids by well injection.<sup>4</sup>

**UIC Program Director** refers to the person responsible for permitting, implementation, and compliance of the UIC Program. For UIC programs administered by the EPA, the UIC Program Director is the EPA Regional Administrator or his/her delegatee; for UIC programs in primacy states, the UIC Program Director is the person responsible for permitting, implementation, and compliance of the state, territorial, or tribal UIC program.<sup>5</sup>

**Underground Source of Drinking Water (USDW)** means an aquifer or its portion which supplies any public water system; or which contains a sufficient quantity of groundwater to supply a public water system; and currently supplies drinking water for human consumption; or contains fewer than 10,000 mg/L total dissolved solids; and which is not an exempted aquifer.<sup>1</sup>

# Section 1: Introduction

*This page is intentionally blank.*

# 1 Introduction

The United States Environmental Protection Agency's (EPA's) *Federal Requirements Under the Underground Injection Control (UIC) Program for Carbon Dioxide Geologic Sequestration (GS) Wells*, found at 75 FR 77230, December 10, 2010, and codified in the U.S. Code of Federal Regulations [40 CFR 146.81 *et seq.*], are referred to as the Class VI Rule. The Class VI Rule, promulgated under the authority of the Safe Drinking Water Act (SDWA, 42 U.S.C. §300h *et al.*), outlines federal requirements for the permitting, siting, construction, operation, monitoring, and site closure of Class VI injection wells, which are used to inject carbon dioxide for GS.

The UIC Program Director is responsible for ensuring that owners or operators of Class VI wells properly site, operate, monitor, and close their wells in a manner that protects underground sources of drinking water (USDWs) from endangerment. Throughout the duration of a Class VI project, permitting authorities are responsible for ensuring that:

- Class VI wells are sited and constructed such that USDWs are protected, considering site- and project-specific information collected in the pre-permitting, pre-construction and pre-operation phases;
- Class VI wells operate as planned and in compliance with the regulations as verified by testing and monitoring, in a manner that is protective of USDWs during the injection phase; and
- Post-injection monitoring is conducted until a USDW non-endangerment demonstration is made and approved by the UIC Program Director, the injection well and all monitoring wells are plugged, and the site is closed.

To achieve these goals, UIC Program Directors' activities include: reviewing Class VI permit applications; writing and issuing permits; authorizing injection; documenting decision-making; reviewing testing and monitoring data, the results of Area of Review (AoR) reevaluations, and other reports; responding to emergency situations or violations; addressing compliance issues; authorizing and approving site closure; and providing information about their oversight responsibilities to the EPA.

## 1.1 Document Purpose

This Implementation Manual provides guidance and procedural support to assist UIC Programs in implementing the Class VI Rule and overseeing the activities of owners or operators during the various phases of a Class VI project. Note that, given the complexity and multidisciplinary nature of Class VI projects (i.e., encompassing geology, engineering, modeling, etc.), permitting of Class VI projects will likely necessitate a team approach. In recognition that the activities and recommendations discussed in this Implementation Manual may be undertaken by UIC Program staff, through a team approach, this document refers to the "UIC Program" rather than the "UIC Program Director" unless directly referencing the regulations or specific activities for which a UIC Program Director is uniquely and individually responsible. Section 2 describes the roles of the UIC Program throughout the duration of a Class VI Project. Section 3 provides recommendations for forming a team with the necessary expertise, and Sections 4 through 7 describe the activities the UIC Program (i.e., the UIC Program Director and any team members) should perform during the various phases of a Class VI project.

The EPA encourages readers to review the Executive Summary and Sections 1 and 2 prior to receipt of a Class VI permit application. Sections 3 through 7 can be used as a reference throughout the duration of a Class VI project.

This Implementation Manual is not intended to provide an exhaustive explanation of the technical attributes of Class VI wells or how owners or operators can meet the Class VI requirements, nor does it address every situation that the UIC Program may encounter. Rather, it offers UIC Programs examples of considerations for reviewing Class VI owner or operator submittals, including where the Class VI Rule affords flexibility. In addition, references are made to other technical guidance documents that contain more specific, detailed guidance on these topics. These documents and other tools that support Class VI permitting are described in Section 1.4.

## 1.2 UIC Class VI Program Background

The Class VI Rule requirements at 40 CFR 146 Subpart H are tailored to the unique nature of carbon dioxide injection for GS, including the large volumes of carbon dioxide injected, the relative buoyancy of carbon dioxide, its mobility within subsurface geologic formations, and its corrosivity in the presence of water to ensure the protection of USDWs. Figure 1-1 summarizes the requirements for Class VI wells. For additional, specific information on the Class VI Rule, see the Class VI Rule and Preamble at 75 FR 77230.

**Figure 1-1: Overview of the Federal Class VI Rule Requirements**

**The Class VI permit information** requirements establish the information that owners or operators must submit to obtain a Class VI permit [40 CFR 146.82].

**The minimum criteria for siting** establish that Class VI wells must be located in areas with a suitable geologic system, including an injection zone that can receive the total anticipated volume of carbon dioxide and confining zone(s) to contain the injected carbon dioxide stream and displaced formation fluids [40 CFR 146.83].

**The AoR and corrective action** provisions require the use of computational modeling to delineate the AoR for proposed Class VI wells and the preparation of, and compliance with, an AoR and Corrective Action Plan for delineating the AoR, performing all necessary corrective action, and periodically reevaluating the AoR and amending the plan if needed [40 CFR 146.84].

**The financial responsibility** requirements establish that owners or operators must demonstrate and maintain financial responsibility for performing corrective action on improperly abandoned wells in the AoR, injection well plugging, post-injection site care (PISC) and site closure activities, and emergency and remedial response [40 CFR 146.85].

**The injection well construction** requirements specify the design and construction of Class VI wells using materials that are compatible with the carbon dioxide stream over the duration of the Class VI project to prevent the endangerment of USDWs [40 CFR 146.86].

**The requirements for logging, sampling, and testing prior to operation** outline activities, including logs, surveys, and tests of the injection well and formations, that must be performed before injection of carbon dioxide may commence [40 CFR 146.87].

**The injection well operating** requirements provide operational measures for Class VI wells to ensure that the injection of carbon dioxide does not endanger USDWs, along with limitations on injection pressure and requirements for automatic shut-off devices [40 CFR 146.88].

**The mechanical integrity** requirements specify continuous monitoring to demonstrate internal mechanical integrity and annual external mechanical integrity tests [40 CFR 146.89].

**The testing and monitoring** requirements define the elements that must be included in the required Testing and Monitoring Plan submitted with a Class VI permit application and implemented throughout the project to demonstrate the safe operation of the injection well and track the position of the carbon dioxide plume and pressure front [40 CFR 146.90].

**The reporting** requirements establish the periodic timeframes and circumstances for the electronic reporting of Class VI well testing, monitoring, and operating results and requirements for keeping records [40 CFR 146.91].

**The injection well plugging** requirements specify that a Class VI injection well must be properly plugged to ensure that the well does not become a conduit for fluid movement into USDWs in the future [40 CFR 146.92].

**The post-injection site care (PISC) and site closure** requirements address activities that occur following cessation of injection. The owner or operator must continue to monitor the site for 50 years following the cessation of injection, or for an approved alternative timeframe, until it can be demonstrated that no additional monitoring is needed to ensure that the project does not pose an endangerment to USDWs; following this, they must plug the injection and monitoring wells and close the site [40 CFR 146.93].

**The emergency and remedial response** requirements specify that owners or operators of Class VI wells must develop and maintain an approved Emergency and Remedial Response Plan that describes the actions to be taken to address events that may cause endangerment to a USDW or other resources [40 CFR 146.94].

**The Class VI injection depth waiver** requirements provide a process under which Class VI well owners or operators can seek a waiver from the injection depth requirements in order to inject carbon dioxide into non-USDWs that are located above or between USDWs. Including injection depth waiver provisions in a state's regulation is optional [40 CFR 146.95].

### 1.3 UIC Class VI Project Overview

This Implementation Manual is organized by the phases of a Class VI project, from pre-permit application activities and considerations through pre-construction, pre-operation, injection, and post-injection. Specific sections (i.e., 3 through 7) are dedicated to these Class VI project phases and may be referenced independent of other sections. Color is used in the footers and figures to facilitate navigation through the guidance sections on the various phases.

The phases of a Class VI project, as shown in Figure 1-2, include:

- The **pre-permitting phase**, when the applicant prepares the Class VI permit application. The UIC Program is encouraged to communicate with the prospective applicant as they develop the permit application to ensure that all required activities are performed and that the applicant is aware of any related approvals or permits they may need to obtain. See Section 3.
- The **pre-construction phase**, which follows the submittal of a Class VI permit application. This Implementation Manual provides recommendations for reviewing extensive geologic, modeling, hydrogeologic, engineering, and financial information about a proposed Class VI project in the permit application to confirm site-suitability, identify ways to address or mitigate uncertainties about the project, and develop a permit that protects USDWs from endangerment and allows construction of the well. See Section 4.
- The **pre-operation phase**, when the Class VI well owner or operator submits the results of required pre-operational testing, updated information about site geology, the final AoR, any needed amendments to the project plans, and information about the construction and testing of the well. This Implementation Manual provides recommendations for reviewing this information to ensure that any uncertainties

identified during the course of the permit application review have been addressed, verify site-suitability, confirm that the well was constructed or converted appropriately, and ultimately make a determination regarding authorization to inject. See Section 5.

- The **injection phase**, when Class VI well owners or operators conduct injection activities, perform testing and monitoring, and reevaluate the AoR as described in the Class VI permit and project plans. This Implementation Manual provides recommendations for reviewing this information to confirm that the well and the project are operating in compliance with the permit, the carbon dioxide plume and pressure front are behaving as predicted, and USDWs are not endangered. See Section 6.
- The **post-injection phase**, when the Class VI well owner or operator will plug the injection well, monitor the plume and pressure front, and, after demonstrating USDW non-endangerment, close the site. This Implementation Manual provides recommendations for reviewing the information submitted to verify that the project continues to be protective of USDWs and that, following site closure, the injection and monitoring wells at the site will not endanger USDWs. See Section 7.

#### **1.4 Available Resources to Support Class VI Permitting**

The EPA has developed a series of electronic tools and other resources to support permitting authorities and Class VI well permit applicants/owners or operators in understanding and implementing the requirements of the Class VI Rule.

##### ***The Geologic Sequestration Data Tool and Associated Resources***

The Geologic Sequestration Data Tool (GSDT) can assist the UIC Program in organizing and retaining the large volume of material related to permit application reviews and subsequent project oversight activities. The EPA developed the GSDT to:

- Facilitate compliance with the electronic reporting requirement of the Class VI Rule at 40 CFR 146.91(e), providing reporting modules by which permit applicants/owners or operators can submit required information in an approved electronic format; and
- Support permitting authorities in tracking and managing submissions associated with Class VI reporting, including support for evaluation and oversight activities over the duration of a Class VI project.

Permitting authorities have full access to the GSDT, which allows them to access all submitted materials. They can also use the GSDT to support technical evaluations (including AoR delineation modeling), manage communications with owners or operators, and store all information related to a project. The GSDT allows permitting authorities to review and manipulate information while preserving the integrity of the original submitted data. Permitting authority users are limited to read-only access unless they are assigned to a particular project; however, no users can modify the original, time-stamped files submitted by owners or operators.

See Appendix A for a description of how the GSDT manages information and supports the needs of both permitting authorities and Class VI well permit applicants/owners or operators. See Section 3.1 for additional information on supporting permit applicants with accessing the GSDT.

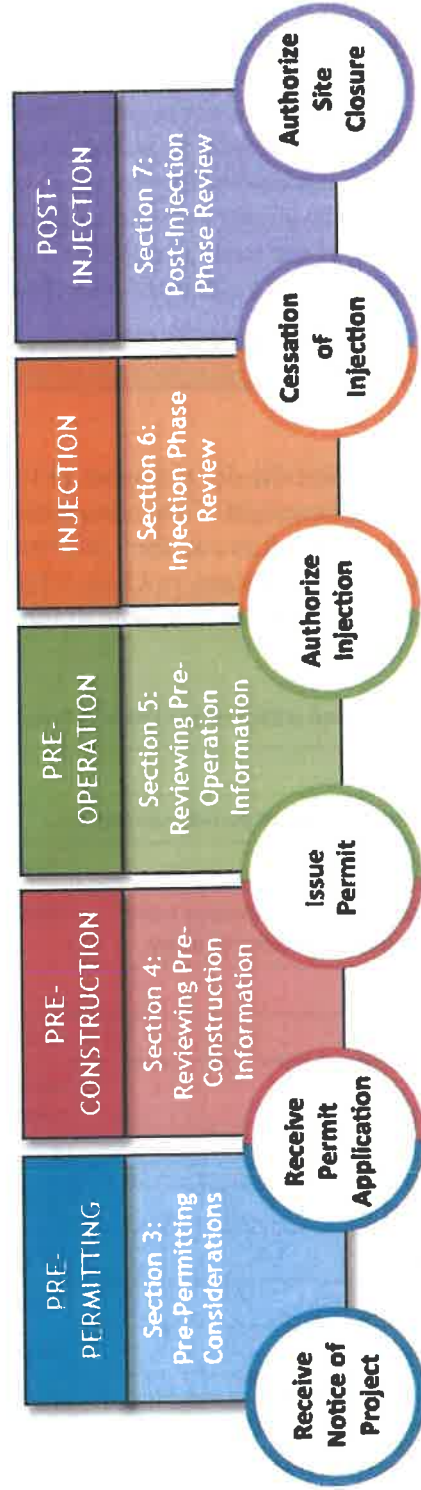

Figure 1-2: The Phases of a Class VI Project

The *UIC Program Class VI Well Recordkeeping, Reporting, and Data Management Guidance for Owners and Operators* provides recommendations for complying with the reporting and recordkeeping requirements of the Class VI Rule. It covers electronic reporting in the context of the Class VI Program, the key components and capabilities of the GSDT's reporting modules, and how permit applicants can register to use and access the GSDT. While the primary audience for that guidance is Class VI permit applicants/owners or operators, it may also serve as a useful resource for permitting authorities. For example, it can help facilitate communicating with owners or operators who are using the GSDT or understanding the types of information that owners or operators might submit. The GSDT user guides provide additional support, with step-by-step instructions tailored to each component of the tool. The GSDT also has a resource library that contains available electronic tools, templates, and guidance (see below).

To register for a GSDT account as a permitting authority user, send an email to [GSDataTool@epa.gov](mailto:GSDataTool@epa.gov) or request an account at <https://epa.velo.pnnl.gov/g3/>.

### ***Templates to Support Class VI Permitting***

The EPA developed a series of templates to support the development of various documents associated with Class VI permitting and project oversight. These templates, for materials to be developed by both permit applicants/owners or operators and the UIC Program, can facilitate compliance with the Class VI Rule and promote consistency in Class VI permits issued nationwide. Table 1-1 presents these templates, which are available in the resource library of the GSDT.

**Table 1-1: Templates to Facilitate Compliance with Federal Class VI Rule Requirements**

Templates	Citation
<b><i>Templates to support the submittal and evaluation of the Class VI permit application</i></b>	
Narratives for permit application and associated submittals	40 CFR 146.82(a); 146.82(c)
Requests for additional information from the applicant/owner or operator and a spreadsheet to support the development of a testing and monitoring strategy	40 CFR 144; 146
<b><i>Templates of Class VI permit package elements</i></b>	
Permit conditions	40 CFR 144; 146
Summary of Requirements	40 CFR 146.82(a)(10); 146.88; 146.91
AoR and Corrective Action Plan	40 CFR 146.82(a)(13); 146.84(b)
Testing and Monitoring Plan	40 CFR 146.82(a)(15); 146.90
Injection Well Plugging Plan	40 CFR 146.82(a)(16); 146.92(b)
PISC and Site Closure Plan	40 CFR 146.82(a)(17); 146.93(a)
Emergency and Remedial Response Plan	40 CFR 146.82(a)(19); 146.94(a)
Quality Assurance Surveillance Plan (QASP) for testing and monitoring activities	40 CFR 146.90(k)
Well Construction Details	40 CFR 146.82(a)(11),(12)
Financial Assurance Demonstration	40 CFR 146.82(a)(14); 146.85(a)
Stimulation Program	40 CFR 146.82(a)(9)

Notice of intent for site closure and site closure report	40 CFR 146.93(d),(f)

### ***Financial Responsibility Cost Estimation Tool and Checklists***

To support the evaluation of cost estimates provided pursuant to 40 CFR 146.85(a)(2), the EPA developed the Cost Estimation Tool for Class VI Financial Responsibility Demonstrations. The spreadsheet-based tool estimates costs for required activities, e.g., corrective action, injection well plugging, and post-injection testing and monitoring, based on site-specific information. The cost estimates for each activity are intended to assist the UIC Program in assessing whether the financial responsibility cost estimates in the permit application are adequate, and guide discussions between the UIC Program and permit applicants during the permit application review process.

The EPA also developed a set of electronic checklists to support the evaluation of proposed financial responsibility instruments by tracking the information necessary to determine the adequacy of the financial responsibility demonstration. The Cost Estimation Tool and the checklists are available in the resource library of the GSDT. See Section 4.1.3 for additional information on evaluating financial responsibility demonstrations.

### ***Geologic Sequestration Guidance Documents and Fact Sheets***

The EPA developed a series of guidance documents and fact sheets to support Class VI well owners or operators and UIC permitting authorities in meeting the requirements of the Class VI Rule. These documents, described below, are available on the EPA's website at <https://www.epa.gov/uic/class-vi-guidance-documents>.

The EPA developed the following technical guidance documents to provide recommendations and considerations for meeting the Class VI Rule requirements:

- The **UIC Program Class VI Well Site Characterization Guidance** provides recommendations regarding how to perform activities that will enable an owner or operator to comply with the geologic siting requirements of the Class VI Rule.

- The **UIC Program Class VI Well Area of Review Evaluation and Corrective Action Guidance** describes recommended approaches to apply computational modeling to delineate the AoR, perform corrective action at GS sites, and reevaluate the AoR.
- The **UIC Program Class VI Financial Responsibility Guidance** provides recommendations regarding demonstrating and maintaining financial responsibility for a Class VI well.
- The **UIC Program Class VI Well Construction Guidance** describes recommended procedures and materials for designing and constructing injection wells that address the unique nature of carbon dioxide injection for GS.
- The **UIC Program Class VI Well Testing and Monitoring Guidance** provides recommended approaches for meeting the testing and monitoring requirements of the Class VI Rule, including well testing, groundwater quality monitoring, and carbon dioxide plume and pressure front tracking.
- The **UIC Program Class VI Well Project Plan Development Guidance** describes the elements of the five required Class VI project plans and provides recommendations regarding how an owner or operator might consider the site-specific elements of a Class VI project in developing the plans.
- The **UIC Program Class VI Well Recordkeeping, Reporting, and Data Management Guidance** provides recommendations to owners or operators for complying with the reporting and recordkeeping requirements of the Class VI Rule and using the GSDT.
- The **UIC Program Class VI Well Plugging, Post-Injection Site Care, and Site Closure Guidance** presents recommendations related to plugging the injection and monitoring wells, performing post-injection testing and monitoring, petitioning for an alternate PISC timeframe, making a non-endangerment demonstration, and closing a Class VI site.
- The **UIC Program Class VI Primacy Manual for State Directors** provides procedural support to UIC Program Directors preparing the required UIC primacy application materials to submit to the EPA for review and approval.

The EPA also developed a set of fact sheets and quick reference guides to support the UIC Program on several aspects of Class VI permitting:

- **Additional Tools for UIC Program Directors on Incorporating Environmental Justice (EJ) Considerations into the Class VI Injection Well Permitting Process.** This quick reference guide describes available tools and considerations for incorporating EJ into the Class VI permit application review and approval process.
- **Additional Considerations for UIC Program Directors on Interstate Coordination Requirements for the Class VI Injection Well Permitting Process.** This quick reference guide provides considerations for notifying other state, tribal, and territorial agencies if a Class VI AoR crosses (or comes close to) jurisdictional boundaries.
- **Additional Considerations for UIC Program Directors on the Public Participation Requirements for Class VI Injection Wells.** This quick reference guide presents a series of steps for meeting the public participation requirements of the Class VI Rule.

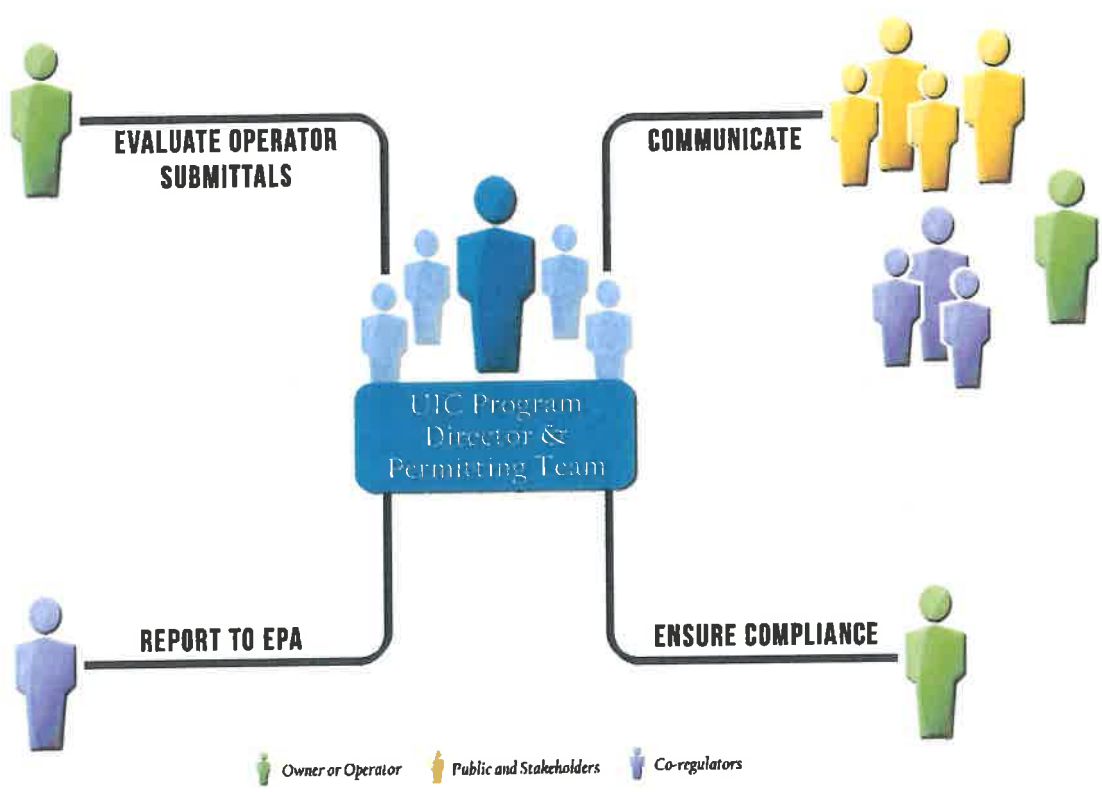

- **Public Participation Considerations for Geologic Sequestration Projects.** This fact sheet is designed to assist UIC Program Directors and Class VI well permit applicants/owners or operators in developing a plan to educate and engage the public on Class VI projects.

### ***Useful Websites***

The EPA compiled a list of websites that may support the UIC Program in reviewing Class VI permit applicant and/or owner or operator submittals or performing activities associated with evaluating permit applications or Class VI project data. Some of the websites may also support owners or operators as they prepare permit applications and perform activities required under the Class VI Rule. This list of EPA and other federal agency websites is presented in Appendix B.

*This page is intentionally blank.*

# Section 2: UIC Program Responsibilities

***This page is intentionally blank.***

## **2 UIC Program Responsibilities**

Throughout the duration of a Class VI Project, the UIC Program will likely conduct many activities and fill many roles associated with implementing the Class VI Rule. This section describes these roles, including:

- Reviewing permit applicant/owner or operator submittals and making risk-based decisions to ensure that USDWs are not endangered (see Section 2.1);
- Reporting to the EPA about Class VI permitting and projects (see Section 2.2);
- Communicating with the Class VI well owner or operator, the public, and co-regulators about Class VI projects (see Section 2.3); and
- Ensuring compliance with permit conditions and the Class VI Rule (see Section 2.4).

### **2.1 Reviewing/Evaluating Submittals and Decision-Making**

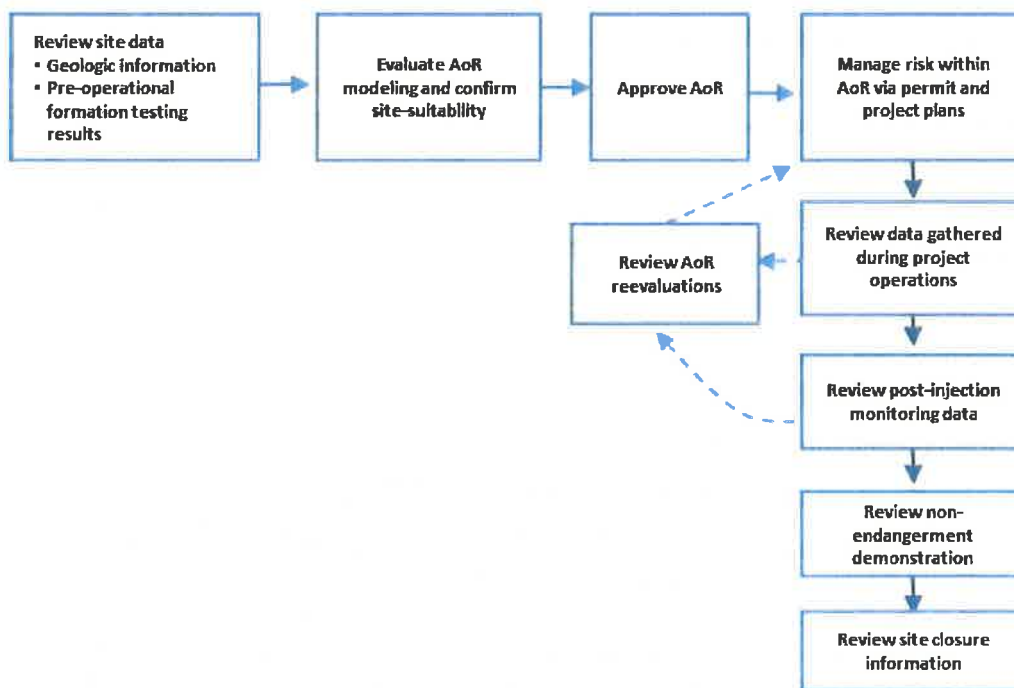

The permitting, operation, and closure of Class VI projects are guided by a permit that includes enforceable Class VI project plans. Effective oversight of a Class VI project involves identifying the site-specific potential for endangerment to USDWs associated with the injection activity and setting permit conditions to reduce or manage this potential endangerment. Oversight during the injection and post-injection phases involves verifying, through the review of testing and monitoring data, that endangerment to USDWs is being managed (or mitigating the impacts of any unforeseen events).

The UIC Program should consider how various aspects of the site (as presented in the permit application) will ensure non-endangerment of USDWs and, following issuance of the permit, confirm this based on the testing and monitoring data that will be collected throughout all phases of the project. All the information collected and reviewed—and the documentation of that review—will collectively form a robust, defensible permit record.

The review of Class VI project information is likely to be an iterative process (See Figure 2-1). For example, it is possible that not all information needed to make a final permitting decision will be available when the permit application is submitted. Therefore, the UIC Program is encouraged to identify uncertainties to be addressed via required pre-operational testing and/or through permit conditions. Also, during the course of project operations, as testing and monitoring data are collected and AoR reevaluations are performed, the UIC Program should review this information to ensure that the project is in compliance with the permit and USDWs are not endangered—or consider whether any changes to the permit are needed. Finally, the testing and monitoring results and other geologic data collected over the duration of the project should support the eventual goal of a non-endangerment demonstration and enable the UIC Program Director to authorize the owner or operator to perform site closure activities.

While the specific activities vary based on the project phase or the type of information submitted, some basic steps should be followed throughout every phase of the project to ensure the adequate and thorough evaluation of data. These include, as described below: receiving information and confirming that it is complete, evaluating the information submitted, setting or modifying permit conditions, and documenting the evaluation.

**Figure 2-1: Data Evaluations and Decision-Making**

### ***Receiving Information and Confirming Completeness***

The EPA encourages the UIC Program to discuss information needs with the applicant/owner or operator throughout the permit application review process and the duration of the project. Permit applicants/owners or operators should be encouraged to submit all required information electronically via the GSDT (see Section 1.4), as this will facilitate information management and review. The UIC Program should perform a completeness review to confirm that all of the required or needed information was submitted—in sufficient detail and in the right format—to inform the evaluation. If additional information or clarification is needed, the UIC Program should request the information from the owner or operator via the GSDT; this request and the responses will then become part of the permit’s administrative record.

### ***Conducting a Technical Evaluation***

The UIC Program should carefully review information submitted for compliance with Class VI Rule requirements and to confirm that USDWs are not endangered.

- In the pre-construction and pre-operation phases, the UIC Program should review site-specific information to support a risk-based determination that USDWs will not be endangered by the proposed injection activity. In the pre-construction phase, the UIC Program should review the permit application to confirm that the site is suitable for carbon dioxide injection for GS or identify uncertainties to be addressed via pre-operational testing. In the pre-operation phase, the UIC Program should review updated geologic data and the results of pre-operational testing as described in the permit. This review process is similar to the initial permit application review, but is streamlined to focus on newly acquired information to confirm that identified uncertainties have been addressed and the site is suitable for GS.

- During the injection and post-injection phases, the UIC Program should review site testing and monitoring results, along with the results of AoR reevaluations or amended project plans (and, during post-injection, well plugging and site closure-related information). The purpose of these reviews is to confirm that the project continues to be in compliance with the permit or to identify needed changes to the permit to address changes from predicted site behavior. If unforeseen or emergency events occur, the UIC Program may also need to work with the owner or operator to implement appropriate remedial actions to return the project to compliance and prevent or mitigate endangerment to USDWs (see Section 2.4).

Technical evaluations should involve the input of all members of the permit application review team (see Section 3.1) and the applicant/owner or operator as needed. This approach, recommended throughout this Implementation Manual, will ensure that each aspect of the project is managed appropriately and with consideration to site-specific aspects of the project to ensure USDW protection from endangerment. This Implementation Manual recommends basic steps for performing the review and provides potential site-specific considerations.

### ***Setting or Modifying Conditions of the Permit and Project Plans***

The UIC Program should prepare a Class VI permit based on the site-specific information reviewed. Class VI permit packages will likely consist of a permit that includes a set of site- and project-specific plans, including: the required Class VI project plans, a summary of requirements, construction details, financial responsibility information, and a stimulation program (if needed). This permit package will guide well construction, injection operations, and collection of the information necessary to ensure compliance with Class VI requirements and prevent USDW non-endangerment, or, when necessary, guide steps to manage/mitigate endangerment to USDWs. Templates of each piece of the permit package, which include recommended language and places to fill in project-specific details, are available in the resource library of the GSDT. While using the templates is not required, the EPA encourages their use because they are organized to ensure that the information required by the applicable Class VI Rule requirements is included while providing the flexibility to tailor submissions to particular permits.

The permit and plans should be considered “living documents” that can be modified over the duration of the project as new information becomes available, such as during pre-operational testing, via injection or post-injection phase testing and monitoring, or as a result of AoR reevaluations.

Pursuant to the requirements at 40 CFR 124, 144 and 146, the UIC Program Director will perform a series of steps associated with issuing or modifying a Class VI permit. These include: developing Class VI permit conditions, preparing a fact sheet and/or statement of basis about the project and the evaluation, compiling an administrative record for the permitting decision, soliciting and responding to public comments, and finalizing the permit conditions, if needed based on public input.

### ***Documenting the Evaluation***

Written materials that document the review of a permit application or project data will support transparent permitting decisions and promote consistency in permitting and project oversight.

Additionally, if the permit is challenged or an enforcement action is necessary, an administrative record that contains thorough documentation of the review would support a response.

The EPA recommends that the UIC Program document the decision-making process for all Class VI permits, including evaluating Class VI permit applications, preparing Class VI permits and authorizing injection, reviewing data submitted during the injection and post-injection phases, making compliance and enforcement determinations, and modifying Class VI permits when needed. This documentation could describe: the evaluation process; any deficiencies, uncertainties, or data limitations identified in the course of the review; issues raised and discussed with the applicant/owner or operator; and how the final (or modified) permit conditions and associated plans reflect the resolution of these issues. The GSDT can support the development of the administrative record for the permitting decision; see Section 1.4 and Appendix A for additional information.

## **2.2 Reporting to the EPA**

UIC Program Directors must report to the EPA on the status of their programs [40 CFR 144.8]. The EPA uses this information to respond to information requests and perform analyses for EPA management, the Office of Management and Budget, the U.S. Government Accountability Office, Congress, and the public.

These reports are submitted to the EPA Regional Administrator if a state agency is the permitting authority or to EPA Headquarters where the EPA is the permitting authority. This section discusses the types of reporting for which UIC Program Directors are responsible.

### ***Compliance Reporting***

Reporting on noncompliance and significant noncompliance (SNC) is required for UIC Program compliance evaluation, per 40 CFR 144.8. Instances of noncompliance to be reported include: failure to complete construction elements, modifications to schedules of compliance, failure to complete or provide compliance schedule or monitoring reports, deficient reports, noncompliance with other permit requirements, and all other instances of noncompliance. Specific information to be reported about permittees who are out of compliance with the Class VI Rule includes:

- Noncomplying permittees' names, locations, and permit numbers [40 CFR 144.8(a)(1)(ii)(A)];
- A brief description and the date of each instance of noncompliance [40 CFR 144.8(a)(1)(ii)(B)];
- The date(s) and description(s) of each enforcement action taken by the UIC Program Director [40 CFR 144.8(a)(1)(ii)(C)]; and
- The date compliance was achieved [40 CFR 144.8(a)(1)(ii)(D)].

### ***Annual Reporting***

The UIC Program Director submits annual reports to the EPA about Class VI permit review and issuance, mechanical integrity testing and remedial actions, and well inventory. The EPA tracks the following types of information on all injection wells, including Class VI wells:

- Information on permit determinations (e.g., the number of permits issued and not issued, and permit modifications) and permit file reviews;
- Enforcement actions, including administrative actions and civil and criminal actions;
- Operators of injection wells identified as being in SNC with statutory and regulatory requirements, enforcement actions against SNCs, and return of wells to compliance;
- Contamination of USDWs and well closures; and
- Wells that have remained in SNC for two or more consecutive quarters and have not been returned to compliance or have been subject to a formal enforcement action.

Annual well inventory reports are submitted in February; all remaining annual reports are submitted at the end of the federal fiscal year.

### 2.3 Communicating about Class VI Projects

The UIC Program Director plays a central role in communicating with a Class VI permit applicant/owner or operator, the public and interested stakeholders, and with co-regulators. See Figure 2-2.

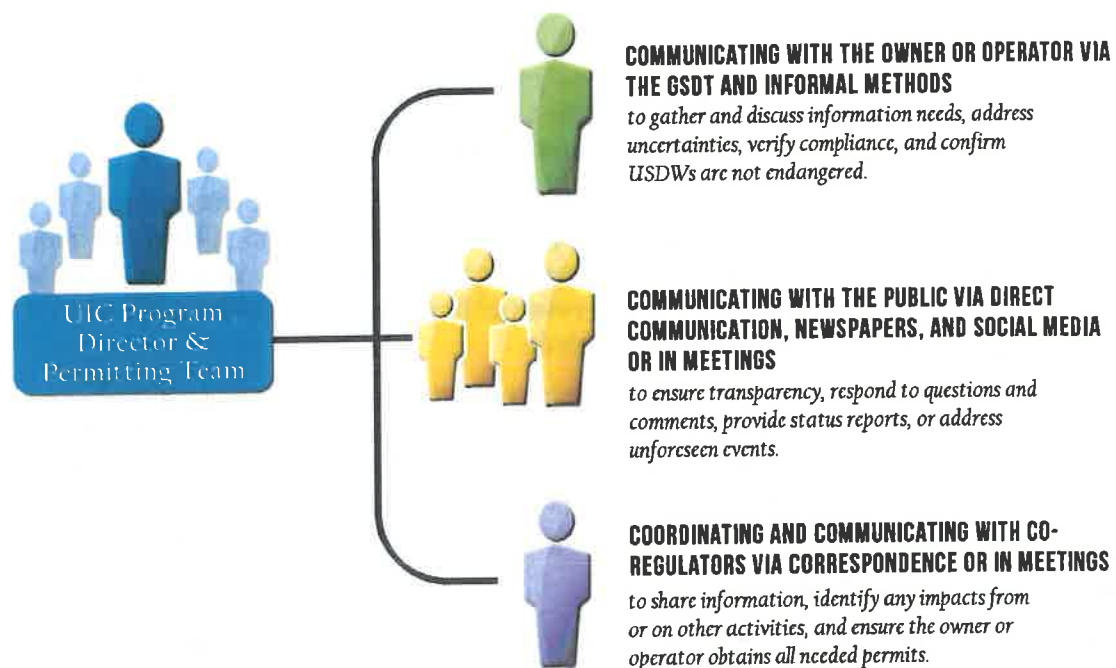

Figure 2-2: Class VI Project Communications

Proactive communication with various stakeholders is important, since GS has potentially high public interest and connections to other initiatives (e.g., carbon capture). Transparency in the permitting process and effective communication on Class VI permitting will facilitate information sharing and encourage protective projects.

### ***Communicating with the Owner or Operator***

Written and verbal communication between the UIC Program and a Class VI permit applicant or an owner or operator is a key component of setting and implementing protective permit conditions. The GSDT can support this by providing a way to share files and by serving as a record of all communications, including requests for information and the applicant's or owner or operator's response (see Section 1.4 and Appendix A). The EPA recommends that the UIC Program document all verbal communication, such as calls and meetings with the applicant, by uploading meeting notes, call logs, or other records to the GSDT.

This Implementation Manual provides specific recommendations for communication throughout the duration of the Class VI project. For example:

- *Before injection commences*, permit application reviews will necessitate communication with the applicant throughout the evaluation. The UIC Program may need to request clarifying information, hold periodic conversations or meetings with the applicant, and share draft materials in the course of performing the review and writing a draft Class VI permit.
- *During and following well construction and pre-operational testing*, interaction with the owner or operator will likely continue as the UIC Program reviews updated information and, if necessary, revises the Class VI permit or project plans.
- *During injection operations*, regular communication can help ensure that project operations are proceeding according to the permit, that testing and monitoring is being performed, and that the results confirm expectations. If an unexpected event or violation were to occur, prompt communication is essential to ensure that USDWs are not endangered and/or any impacts are mitigated.
- *Following cessation of injection*, the owner or operator and UIC Program should coordinate and communicate to ensure that well plugging activities and site closure proceed as planned. Additionally, communication with the owner or operator as post-injection monitoring is performed can help identify whether sufficient data are being generated to support a non-endangerment demonstration (see Section 7.6).

### ***Communicating with the Public***

The unique and complex nature of Class VI wells and GS highlights the importance of communicating with the public and stakeholders about these projects. Communication and outreach is important throughout the duration of a Class VI project. For example:

- *Before the permit application is submitted*. The EPA recommends that the UIC Program Director and the permit applicant provide information to the public about the proposed project and the pending permit application as early as possible in the site characterization and permit application development process. Targets of this outreach should include the public, including nearby residents and landowners. See Section 3.3 for additional information on communicating during the pre-permitting phase.

- *During the public comment period for the Class VI permit.* Public notice of the permit application is required at 40 CFR 124 (see Section 4.2). In addition to providing a copy of the draft permit and a fact sheet and/or a statement of basis, the UIC Program may conduct outreach or need to answer questions about the project. For example, the public may be interested in the geology of the site, injection technology, and how the Class VI requirements or specific permit conditions will protect USDWs from endangerment. If the applicant seeks an injection depth waiver or an expansion of the areal extent of an aquifer exemption, a separate, but related public notice is required for these actions (see Sections 4.1.11 and 4.1.12).
- *During well construction.* The period between issuance of a permit (after which the owner or operator may construct or convert the well) and commencement of injection may vary, depending on how long it takes the owner or operator to drill the well and perform pre-operational testing and the UIC Program to evaluate updated information. Providing updates on the status of well construction activities and interactions between the owner or operator and the permitting authority can keep the public informed and address any questions that may arise as the project site is developed. Furthermore, if, following the review of updated information, the permit or any project plans need to be revised, public notice of the draft revised permit is required at 40 CFR 124. During this period, the public may have questions about the reason for the modification or how the permit has changed.
- *During the injection phase.* The EPA recommends providing periodic status updates during injection operations to keep the public informed about the project. Other opportunities for communication with the public may occur during permit modifications or in the unlikely event of a violation or emergency. This communication might take the form of:
  - *Periodic updates on the status of the project.* Status reports can assure the public and stakeholders that the project is progressing as planned, that monitoring and oversight procedures are in place, and that there is no endangerment to USDWs. These updates could provide information on the location of the plume, the most recent results of water quality monitoring or well testing, or the findings of compliance reviews and recent inspections. Such reports could be timed to follow receipt and review of owner or operator submitted reports.
  - *Notice of a permit modification.* If a permit modification is required (e.g., because one or more project plans were modified following an AoR reevaluation), the public may have questions about the reason for the modification. The UIC Program should be prepared to provide information or answer questions about the AoR reevaluation process and results; what monitoring or operating data prompted any project plan revisions; and which plans or other permit conditions were revised. Public notice of non-minor permit modifications is required at 40 CFR 124 (see Section 5.2).
  - *Communication regarding a violation or emergency response.* If any event at the project results in a violation or necessitates an emergency response, the EPA encourages the UIC Program to coordinate with the owner or operator to communicate information about the situation to the public as soon as possible.

Information might include: an explanation of what occurred and whether there is evidence of USDW endangerment; a description of the responses taken; and when the well/project returned to compliance (or when a return to compliance is anticipated). If there is evidence of USDW endangerment, the UIC Program should inform customers of local water systems, nearby land owners, and the public about the event. Alternatively, if the incident did not endanger USDWs, communication can assure stakeholders that the UIC protective measures worked and that their water source was not endangered.

- *After injection has ended.* The EPA encourages the UIC Program to inform the public after the well is plugged or the site is closed to alert interested parties. At this time, the UIC Program should be prepared to provide information or answer questions about injection well plugging procedures, non-endangerment demonstrations, or the conditions that must be met to authorize the owner or operator to perform site closure activities pursuant to 40 CFR 146.93(b).

Available outreach tools include: direct communication, newspapers, and social media, such as blogs, social networks, podcasts, and webcasts. Note that outreach efforts cannot be performed in lieu of meeting the public participation requirements at 40 CFR 124. For additional information on public involvement, see the UIC Quick Reference Guide *Additional Tools and Considerations for UIC Directors on the Public Participation Requirements for Class VI Wells*.

### ***Coordinating and Communicating with Co-Regulators***

Coordination with co-regulators of other injection well classes, public drinking water utilities, and other federal, state, tribal, or local authorities may be essential at various stages of a Class VI project. Such coordination and transparency among agencies can also help the UIC Program ensure that the owner or operator applies for and receives any other permits (i.e., beyond the Class VI permit) that may be required. Below are examples of the types of coordination about a Class VI project that may be needed:

- The Class VI Rule, at 40 CFR 146.82(b), requires the UIC Program Director to notify, in writing, any states, tribes, or territories within the AoR of the Class VI project based on information provided in a Class VI permit application.
- If the project is anticipated to have an AoR that crosses (or comes close to) boundaries with other states or tribes, the UIC Program should communicate early with other UIC Programs or environmental protection officials in those states or tribes. Such officials might be affiliated with other state/tribal agencies (e.g., health departments). See the *Quick Reference Guide on Interstate Coordination Requirements* on the EPA's website for additional information.
- If the project will operate under an injection depth waiver, the Class VI Rule, at 40 CFR 146.95 requires consultation with the Directors of the Public Water System Supervision Programs of all states, territories, and tribes having jurisdiction within the AoR of the well for which an injection depth waiver is sought. The UIC Program should also inform the EPA Regional Administrator early in the process of reviewing a project's application for an injection depth waiver, as their concurrence regarding the waiver is required (40 CFR 146.95(d)). See Section 4.1.11.

- If the owner or operator applies to expand the areal extent of an existing aquifer exemption, the UIC Program should alert the appropriate EPA regional office, as the EPA must approve all aquifer exemptions, even if the state has Class VI primacy [40 CFR 144.7(d)]. Informal communication early in the process, while not required, is recommended to ensure that all parties are prepared to discuss and/or respond to the aquifer exemption application. See Section 4.1.12.
- If a pre-existing well (e.g., an injection well, a stratigraphic test well, or a site characterization well) is being re-permitted as a Class VI well, coordination with the authority that originally issued the permit for the well may help the UIC Program Director understand any previous actions taken or conditions established under a previous permit.

Additionally, the UIC Program Director can serve as a liaison with staff in other state or federal agencies that have authority over activities that are related to or may affect or be affected by Class VI injection. Specific activities may vary by region, but might include: other injection activities that could interact with the carbon dioxide plume and pressure front; drilling associated with oil and gas exploration that may reveal new information about the geology of the area; or land use changes that could affect water needs or bring resources/populations into the AoR of the Class VI project. Likewise, the UIC Program Director may seek out the expertise of other permitting authorities to corroborate information submitted in a Class VI permit application or to ensure that a Class VI permitting decision does not interfere with or adversely impact other ongoing injection activities within the area. The EPA encourages the UIC Program Director to reach out to other regulators as needed.

The UIC Program Director can also encourage Class VI permit applicants to consider other potentially applicable statutes and regulations. UIC Programs are encouraged to communicate with these co-regulators who have authority over activities addressed under other applicable statutes, including the Clean Air Act (CAA), Resource Conservation and Recovery Act (RCRA), the Marine Protection, Research, and Sanctuaries Act (MPRSA), and the Outer Continental Shelf Lands Act (OCSLA). See Section 3.4 for information on these authorities and their implementing programs.

## 2.4 Ensuring Compliance with the Class VI Rule

If, during the course of the project, there is an indication that a Class VI project or injection well may be out of compliance with permit conditions or endangering USDWs, appropriate actions to prevent USDW contamination or mitigate any adverse impacts are needed. Examples of Class VI violations include a loss of mechanical integrity, an exceedance of permit limits, or an excursion of carbon dioxide or formation fluids out of the injection zone. Identifying and addressing violations in a timely manner can avoid or reduce impairment to USDWs and ensure that the circumstances that led to a violation do not recur. These situations may be identified in a variety of ways, including:

- *Reviewing project data.* Much of this review involves the comparison of testing and monitoring results to permit limits and project predictions during the injection and post-injection phases. See Sections 6.1 and 7.2.2 for additional information on reviewing testing and monitoring results. Monitoring and operational data must also be evaluated at least once every five years as part of the Class VI permit reviews required at 40 CFR 144.36(a).

- *During site inspections*, which may be performed by permitting agency staff or authorized agents to verify or witness operations, testing and monitoring, or maintenance procedures. Inspections may involve observing the injection well and monitoring wells; reviewing records to determine performance and compliance history; witnessing mechanical integrity tests (MITs), other tests of the well, workovers, or maintenance activities; or evaluating progress on required remedial procedures.
- *Based on complaints alleging improper operation or maintenance of a Class VI project*. Investigative activities should include establishing the nature and authenticity of the complaint, reviewing records and reports, contacting the owner or operator to discuss the complaint and appropriate remedial actions or responses, and inspecting the site to determine if a problem exists.

The EPA recommends that the UIC Program take the following steps to document, address, and resolve violations of a Class VI permit.

**Document the violation, if one has occurred.** If reviews of project information, site inspections, or complaint investigations indicate that a violation has occurred, document the nature of the violation. If the violation has endangered a USDW, require the owner or operator to take appropriate action to remove or mitigate the threat pursuant to 40 CFR 146.94(b). (See Section 6.5.2 for additional information on responding to USDW endangerment.) Proper documentation of violations is important to define the type and cause of the violation and provide a basis for any enforcement actions that may be needed. All permitting authority staff should be made aware of agency procedures for issuing notices of violation.

**Determine and implement appropriate enforcement action(s), if needed.** Responses may be informal (e.g., technical discussions or correspondence with the owner or operator) or formal (e.g., notices of violation, administrative orders, or judicial actions). Informal actions may be appropriate for one-time or very intermittent exceedances of a permit limit that do not affect carbon dioxide containment, compromise the integrity of the well (e.g., the triggering of a shutdown device that is not related to a loss of mechanical integrity), or endanger any USDWs. However, a pattern or trend in exceedances may be more illustrative of a problem with the Class VI project's operation and may warrant more formal actions.

Document any formal enforcement actions taken using a notice of violation, administrative order, or judicial action, and the owner or operator's response, as applicable. EPA's enforcement authority for UIC wells is contained in SDWA Section 1423. For State Programs, the specific enforcement actions available will depend on the authorities or maximum civil penalties set forth in state regulations. Select actions based on the severity of the violation, its impact on the environment, or the compliance history of the owner or operator. If appropriate, consider modifying, revoking, or suspending the UIC permit, imposing a civil penalty or fine, or initiating criminal prosecution.

**Follow up on violations and enforcement actions.** If a compliance schedule for implementing remedial responses is developed (see Section 6.5.2), check in periodically with the owner or operator to verify that the remedial actions are progressing and that the owner or operator is meeting all milestones. If remedial actions are not progressing, discuss this with the owner or operator or consider whether more formal or additional enforcement is needed.

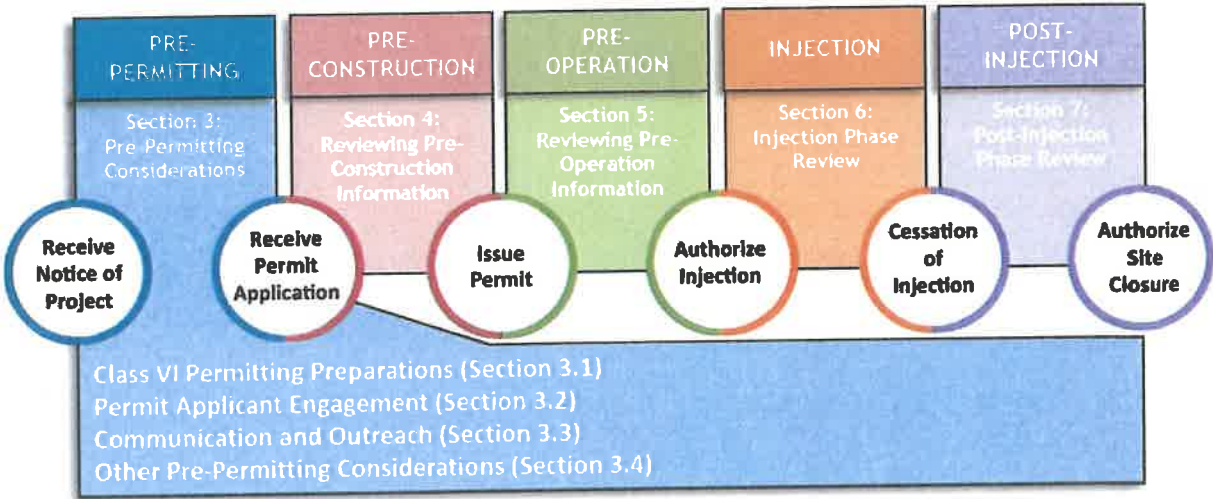

**Communicate with the public and other stakeholders** about any investigations and their outcome. Explain the nature of the event that led to a compliance investigation, the information reviewed or tests/inspections that were performed, responses taken (including any violations or penalties), any environmental impacts, and when the well/project returned to compliance (or when a return to compliance is anticipated). For more information on public involvement and communication, see Section 2.3.

Additionally, the EPA recommends that the permitting authority document the data generated as a result of inspections or enforcement actions. This information may include: information on inspections (including the date of the inspection and the results), compliance or enforcement actions conducted, and any response and/or remedial action that resulted from inspection and enforcement actions.

**Report information on noncompliance and violations to the EPA**, i.e., in quarterly noncompliance reports. See Section 2.2 for additional information on the timing and requirements at 40 CFR 144.8 for reporting this information.

*This page is intentionally blank.*

# Section 3: Pre-Permitting Considerations

***This page is intentionally blank.***

### 3 Pre-Permitting Considerations

Coordination between the UIC Program and the permit applicant prior to submittal of the permit application is an important step for efficient and effective permitting. Early discussions will ensure that the applicant is aware of the permit application requirements at 40 CFR 146.82(a) and is able to electronically submit the permit application and other required information. These discussions may also benefit the applicant as they plan how to invest time and resources in site characterization, modeling, and other activities necessary to develop a comprehensive Class VI permit application. Such coordination may also help the UIC Program anticipate the information they will receive and review and assist the applicant in submitting all required information in the appropriate format and level of detail.

The EPA encourages prospective Class VI permit applicants to notify their Class VI permitting authority of their intent to apply for a permit. However, if the UIC Program becomes aware of a potential new project, e.g., in the course of conversations with industry representatives, through the media, or at meetings, permitting authority staff should reach out to the prospective Class VI permit applicant.

This section describes actions that the EPA recommends that the UIC Program take in advance of a formal submittal of a Class VI permit application. This section addresses: assembling the permit review team, specific topics on which pre-application discussions should be focused, recommendations for outreach and communication, and other considerations.

#### 3.1 Class VI Permitting Preparations

Internal planning within the permitting agency can ensure an expedient response as soon as the Class VI permit application is formally submitted. This section presents recommendations for this planning step.

**Assemble a permit application review team.** Class VI projects are complex, and a holistic permit application review process that considers each element of the multi-faceted permit application will support the development of a protective Class VI permit and associated project plans. Assemble a team that collectively has the skills and expertise in the technical areas needed to evaluate the information in a Class VI permit application, including areas such as:

- Site characterization, e.g., geologists, hydrogeologists, geochemists, and log analysts/experts to review geologic data submitted with the permit application;
- Modeling, e.g., hydrogeologists and environmental/reservoir modelers to evaluate the models that will be used to delineate the AoR;
- Well construction and testing, e.g., well engineers, log analysts/experts, and geologists to review well construction information and the results of well testing that will be performed during construction of the injection well;
- Finance to review the financial responsibility demonstration, including cost estimates and the proposed financial instruments, e.g., UIC personnel who are familiar with financial responsibility as well as accountants and economists;
- Risk analysis to evaluate emergency and remedial response scenario probabilities and remediation cost estimates submitted with the Emergency and Remedial Response Plan; and
- Policy, legal, and regulatory expertise related to the UIC Program and the Class VI Rule to evaluate compliance with Class VI Rule requirements.

A team approach involving staff with expertise in these areas can help ensure that each piece of the permit application is evaluated on its own merit. Furthermore, effective communication among the team members will ensure that all elements of the Class VI project (i.e., well, geology, proposed operations) are complementary and that USDWs are not endangered. Sections 4 and 5 provide specific recommended cross-team consultations during the permitting process.

Given the scope of information that supports a permit application, the detailed decisions involved in the permit application evaluation process, and the potentially decades-long duration of some Class VI projects, it is likely that permitting authority staff will change over the course of the project. Documenting the review process and maintaining good records of all decisions and supporting data are important to ensure that historical knowledge of the project, justification for permit conditions, and project data are maintained and accessible following any staffing changes within the permitting agency. The GSDT can support such recordkeeping (see Appendix A).

**Review available resources.** As noted above, reviewing a Class VI permit application is a complex process that will involve experts across a variety of disciplines. Thus, it is important to begin assembling a review team as soon as there is indication that a permit application will be submitted. Work within the Class VI permitting agency to identify appropriate staff (see above). Ensure that all of the staff are able to make the time commitment to review materials (i.e., over several months). The EPA acknowledges that a team approach may require retaining contractor support to assist in any activities where in-house staff do not have the necessary expertise.

Also, the EPA encourages UIC Program managers to ensure that all staff on the review team have the resources they need to accomplish the review, including a GSDT account (see Section 1.4) or specialized software (e.g., to review AoR delineation modeling). Encourage team members to review GS guidance documents, GSDT user guides, or other relevant documents to become familiar with the Class VI permitting process. See Section 1.4 for a list of available tools and resources.

### 3.2 Permit Applicant Engagement

Working with the permit applicant early in the process will help initiate a collaborative relationship and facilitate information sharing and cooperation that will benefit the permit application review. Below are suggested ways in which the UIC Program can engage prospective Class VI permit applicants early in the permitting process.

**Assisting the applicant with obtaining a GSDT account.** Permit applicants should register for a GSDT account before submitting information to the EPA, to ensure that they meet the Class VI electronic reporting requirements at 40 CFR 146.91(e). Permitting authorities can direct applicants to <https://epa.velo.pnnl.gov/operators>, where a registration form is available for download. GSDT accounts are assigned on a per-project basis irrespective of the number of Class VI wells that will be used for injection at the proposed project. This means that the registration form only needs to be completed once for each project, and that only one set of credentials will be issued to an organization for a particular project. (It is the permit applicant/owner or operator's responsibility to ensure that only authorized individuals or their designees have access to the username and password.)

Following receipt of project-specific user credentials, each individual that will be authorized to formally submit information via the GSDT should complete, notarize, and submit a project-specific Electronic Signature Agreement (ESA). The ESA form (which contains additional

instructions regarding this process) is available for download on the operator landing page of the GSDT. As soon as they receive GSDT credentials, permit applicant users may log into the GSDT, review the user guides, and even begin populating the forms in the GSDT modules. However, information submittal is contingent on completion of the ESA process. The EPA will keep the completed ESAs on file and use them to designate authorized users for each project within the GSDT. Additional details on GSDT registration, ESAs, and designating authorized users are available in the user documentation for the GSDT.

**Discussing the permit application process.** The EPA recommends that the UIC Program ensure that the applicant is aware of the requirements that Class VI well permit applicants/owners or operators must meet. Encourage applicants to use the technical guidance documents for owners or operators posted on the EPA's website and other available resources such as templates available within the GSDT.

Encourage applicants to collect as much site-specific data as possible before submitting the initial Class VI permit application to facilitate the permit modification process (i.e., between conducting the pre-construction activities required at 40 CFR 146.82(a) and the pre-operation phase activities required at 146.82(c)). This type of proactive planning early in the process helps ensure that the current and potential future conditions at the proposed site have been considered and helps resolve issues related to incomplete or inaccurate information as expeditiously as possible.

If the Class VI project will eventually involve more than one injection well, the EPA recommends that the UIC Program confirm that the applicant is aware of the requirement that a separate Class VI permit application must be submitted for each Class VI well, per 40 CFR 144.33(a)(5). Note that, while the Class VI Rule precludes the use of area permits for Class VI wells, there may be ways to achieve economies of scale where certain aspects of several Class VI projects' permit applications are common. For example, the permit applicant may conduct a single site characterization study, model a single AoR that accounts for the total volume of carbon dioxide to be injected into all injection wells (even if some are planned to come online in the future), or submit common well schematics if each injection well is to have similar construction. Encourage Class VI permit applicants to consider these economies of effort and leverage the GSDT to ensure that each permit application contains all the information at 40 CFR 146.82(a) to allow for a complete review of each permit application.

**Reviewing key pre-permitting considerations.** Some aspects of the planned project may necessitate early discussions prior to preparation and submittal of the permit application. The paragraphs below provide some recommendations for early discussion with a prospective permit applicant related to site characterization, modeling to delineate the AoR, permitting of wells that will be converted to Class VI, and the potential need for an injection depth waiver or aquifer exemption.

### ***Site Characterization***

When possible, the EPA encourages the UIC Program to discuss planned site characterization activities with the applicant before they commence. These discussions should highlight the importance that the permit application include sufficient and site-specific geologic data. In addition to informing an understanding of the geologic suitability of the site, the geologic data provides inputs for the AoR delineation model and supports development of the Class VI project plans. Because the Class VI project plans become enforceable conditions of the Class VI permit,

any significant changes to these based on the final geologic data would require a modification of the Class VI permit before injection can be authorized [40 CFR 144.39].

If the applicant plans to use existing data about the site (e.g., data collected in the course of prior hydrocarbon exploration or other activity in the area), discussion regarding the quality and age of the available data may be beneficial. Such a discussion may also inform whether additional data (e.g., over a wider areal extent or in additional formations) might be needed to provide a complete and accurate representation of the site and provide all needed inputs for the AoR delineation model.

If the applicant plans to drill stratigraphic test wells or groundwater sampling wells that may eventually be used for carbon dioxide injection for GS, the UIC Program should inform the applicant that the wells would need to meet Class VI requirements at that point. This discussion should focus on how the stratigraphic or sampling wells might be constructed to facilitate later conversion per 40 CFR 146.81(c), i.e., by using materials that are compatible with carbon dioxide. Refer the applicant to the *UIC Program Class VI Well Construction Guidance* for additional information on carbon dioxide-compatible design.

In discussions with the applicant, the EPA encourages the UIC Program to emphasize the importance of synthesizing geologic data to inform a determination of site-suitability, i.e., that there is sufficient capacity in the injection zone to receive all carbon dioxide to be injected or that the geologic structure is suitable for GS. Encourage the applicant to consult Section 4 of the *UIC Program Class VI Well Site Characterization Guidance* and perform the level of analysis detailed in that document to facilitate the UIC Program's review of the permit application and evaluation of site-suitability.

If sufficient information is available (e.g., based on available information about the proposed site) to make a determination that additional confining zone(s) are needed, the UIC Program should discuss this with the applicant early in the site characterization process. These additional zones may be needed to impede vertical fluid movement, allow for pressure dissipation, or provide additional opportunities for monitoring, mitigation, and remediation, per 40 CFR 146.83(b). Characterization of a secondary confining zone may be needed if:

- The primary confining zone does not exhibit sufficient strength to allow injection at the proposed pressures;
- Known or suspected faults or fractures transect the primary confining zone and would interfere with containment of carbon dioxide;
- The primary confining zone is not sufficiently extensive to cover the entire maximum extent of the carbon dioxide plume and pressure front or it is not sufficiently thick and homogeneous over the entire area; or
- There is insufficient information or conflicting data about the primary confining zone.

Identifying the need for information about additional confining zone(s) as early in the permitting process as possible (ideally during pre-permit application communications) will expedite approval of the site and save resources for the applicant and the permitting authority.

The *UIC Program Class VI Well Site Characterization Guidance* provides additional recommendations on collecting and submitting geologic data.

### ***Plans for AoR Delineation Modeling***

The EPA encourages the UIC Program to discuss the applicant's planned approach for computational modeling and AoR delineation to verify that the model will meet the Class VI requirements at 40 CFR 146.84(c)(1)(i)-(iii). The AoR delineation model chosen by the permit applicant should have the capability to account for multiphase flow, the relative buoyancy of carbon dioxide, and three-dimensional geologic heterogeneity. If the applicant plans to use a proprietary model, discuss how they plan to provide sufficient information to inform a complete evaluation of their modeling activities.

A discussion of the AoR and Corrective Action module of the GSDT, including its structure and the types of information that it collects, may support the applicant's compliance with the AoR and corrective action requirements of the Class VI Rule. It may also be helpful to discuss how a prospective Class VI permit applicant can generate and document inputs to facilitate efficient and effective population of the GSDT. See the GSDT user guides for additional information on using the GSDT as part of the AoR delineation/modeling evaluation.

The UIC Program should ask the applicant about the geologic data on which the AoR delineation model will be based (e.g., distributions of rock properties). Discussing modeling needs in advance can ensure that the modeling process will be based on information of a sufficient quantity, quality, and scope (both laterally throughout the AoR and vertically through all relevant subsurface formations). Additionally, these discussions are an opportunity to emphasize the importance of consistency between the geologic information, the information used to develop the model, and the inputs used in model simulations. Designing the model with consideration to planned injection and post-injection phase monitoring can support future model validations associated with AoR reevaluations and non-endangerment demonstrations.

If the Class VI project will eventually involve more than one injection well or if other wells are in close proximity within hydraulically connected formations, the UIC Program should also discuss the merits of modeling the impact of all injection activities as part of the AoR delineation process with the applicant.

The EPA recommends that the UIC Program refer the applicant to the *UIC Program Class VI Well Area of Review Evaluation and Corrective Action Guidance* for recommendations on performing AoR delineation modeling that will meet the requirements of the Class VI Rule.

### ***Well Conversion and Re-Permitting***

The EPA recognizes that some owners or operators may elect to use existing, previously constructed infrastructure for GS. Such infrastructure may include previously constructed injection wells (e.g., Class I, II, or V wells), stratigraphic test wells, production wells, or monitoring wells in the project area. The Class VI regulations accommodate this approach pursuant to requirements at 40 CFR 146.81(c), provided the applicant meets all applicable Class VI requirements.

To facilitate re-permitting, the UIC Program should explain to a prospective Class VI well owner or operator that they must apply for and obtain a Class VI permit, per 40 CFR 146.81(c). Such discussions should focus on what existing information about the well or the site may be used in the Class VI permit application (e.g., geologic data on an oil and gas field; construction schematics), and what information required at 40 CFR 146.82(a) will need to be prepared specifically for a Class VI permit application (e.g., project plans). Additionally, this is an

opportunity to discuss whether the construction of the well would meet the goals of 40 CFR 146.86 and can be converted and what the owner or operator must do to demonstrate that the well meets these goals.

The UIC Program should also explain that, following re-permitting, the Class VI requirements apply, and these wells will be subject to the operational, testing and monitoring, reporting, well plugging, PISC and site closure, and other requirements that apply to all Class VI wells. The EPA recommends that the UIC Program refer the applicant to the *UIC Program Class VI Well Construction Guidance* for additional information on re-permitting existing wells as Class VI wells.

### ***Injection Depth Waivers***

The requirements at 40 CFR 146.95 allow a Class VI permit applicant to seek a waiver from the Class VI injection depth requirements to allow injection into non-USDW formations while ensuring that USDWs above and below the injection zone are protected from endangerment.

If a proposed project is in a region known to have deep USDWs, the UIC Program should work with the applicant to determine early in the site characterization process whether a USDW lies below the injection zone and, therefore, would require an injection depth waiver.

Identifying USDWs may happen as part of the regional evaluation of the site in the early phases of site characterization.

Otherwise, if information were to become available after the Class VI permit is issued, suggesting that previously unknown USDWs occur below the injection zone, it would be necessary for

the owner or operator to apply for an injection depth waiver and modify the Class VI permit.

If the applicant intends to inject into a non-USDW formation that is above or between USDWs, the EPA recommends that the UIC Program confirm that the applicant is aware of the requirement to submit the waiver application concurrently with the Class VI permit application, and that the waiver application must contain all of the information identified at 40 CFR 146.95(a). Class VI permit applications and waiver application reports are distinct but complementary [40 CFR 146.82(d)]. That is, much of the information in the waiver application report is similar to or an expansion of information required in the Class VI permit application. However, the applicant should include the information in both submittals so that the injection depth waiver application and the permit application can each be evaluated in its entirety. The UIC Program should encourage the applicant to describe the proposed site as completely as possible, addressing USDWs above and below the injection zone—that is, it is not the EPA’s intent that the permit application describes only USDWs above the injection zone and the

#### **The Need for Injection Depth Waivers**

The injection depth waiver is a limited use option to allow for injection of carbon dioxide for GS where no alternatives exist for GS below the lowermost USDW. The waiver provisions and the additional requirements at 40 CFR 146.95 serve several purposes, including:

- Addressing concerns about local and regional geologic storage capacity limitations;
- Allowing injection into different formation types and avoiding a blanket prohibition on injection into any types of shallow formations;
- Eliminating the need to establish a minimum injection depth; and
- Ensuring that high quality water remains available in sufficient quantities to meet drinking water needs.

The additional requirements for projects operating under an injection depth waiver ensure the protection of all USDWs above and below the injection zone.

injection depth waiver application address those below. Rather, both documents should describe USDWs above and below the injection zone to ensure a holistic review of all pertinent information in the context of the applicable requirements.

Figure 3-1 shows how the injection depth waiver and Class VI permit application reviews are parallel. The UIC Program Director's review of the Class VI permit application should consider USDWs above and below the injection zone. The information in the waiver application report should be corroborated by geologic information and the AoR delineation modeling evaluation for the permit application review.

Information about both applications must be made available for public comment [40 CFR 124; 146.95(c)]. Requesting public input on both applications at the same time can help ensure that the public understands that the Class VI permit application involves injection under an injection depth waiver. This also offers efficiencies in evaluating public comments. The waiver application is also subject to review by the PWSS director(s) and must also be reviewed by the EPA Regional Administrator per 40 CFR 146.95(b).

If both applications meet site-suitability and other Class VI requirements, public input is addressed, and the EPA Regional Administrator concurs with issuance of the injection depth waiver, then the UIC Program Director may issue a permit and post waiver information on the EPA's website.

(Adoption of the waiver process is at the discretion of individual UIC primacy programs. If a state or tribe chooses not to make this process available to Class VI well owners or operators under their jurisdiction, the UIC Program should inform applicants that they must inject below the lowermost USDW.)

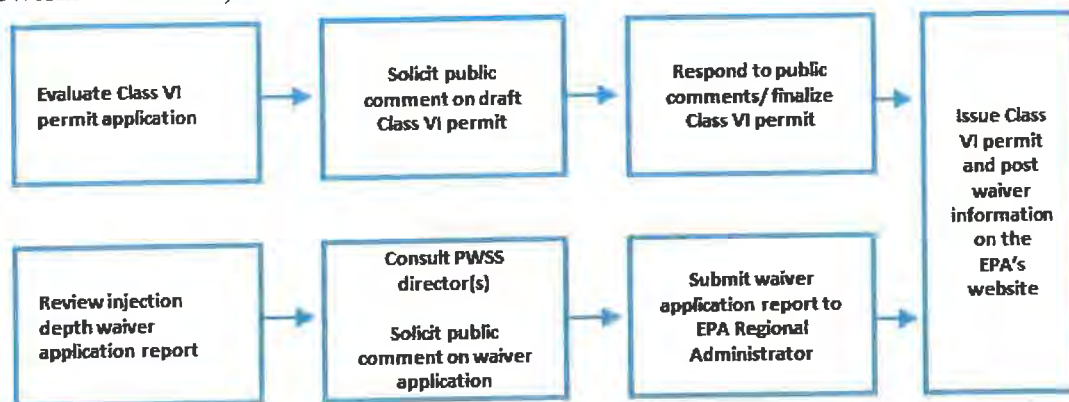

Figure 3-1: Reviewing Class VI Permit Applications and Injection Depth Waiver Applications

### *Aquifer Exemptions*

The Class VI Rule and aquifer exemption requirements at 40 CFR 144.7(d) and 146.4(d) enable the use of aquifer exemptions for Class VI projects only in limited circumstances. Aquifer exemptions are not available for new Class VI wells or projects that are re-permitted from well classes other than Class II EOR/EGR. The Class VI Rule establishes the criteria under which

aquifer exemption expansions may be granted for owners or operators of Class II EOR/EGR wells that elect to transition to Class VI injection wells for GS.

If a Class II well owner or operator has made a decision to re-permit their well as a Class VI well and the injection zone has an existing Class II aquifer exemption, discuss the potential need to expand the areal extent of this exemption.

The UIC Program should explain the aquifer exemption application process and the information needed to demonstrate that the aquifer exemption meets the criteria at 40 CFR 146.4; and confirm that the applicant knows that they will need to apply for an aquifer exemption expansion separate from, but concurrent with, the Class VI permit. For additional information, see Section 4.1.12.

### 3.3 Communication and Outreach

Early communication with the public and other regulatory agencies can support awareness of the Class VI project and help meet public notification requirements. The EPA encourages the UIC Program to work with the applicant to identify information about the proposed project and in the permit application that can be shared with the public. Below are recommendations for communications and outreach related to prospective Class VI projects that the UIC Program might consider on a project-specific basis:

- Include residents and landowners near the proposed site in project-related public meetings or hearings as early as possible in the permit application development and review process. Begin to plan for the required public notification procedures at 40 CFR part 124 as well, e.g., by identifying newspapers of general circulation near the proposed site, stakeholders, etc.
- Work with the applicant to develop a communication plan that describes potentially affected parties, potential audiences, communication methods, and key messages. For more guidance on public involvement, see the EPA's UIC Quick Reference Guide *Additional Tools and Considerations for UIC Directors on the Public Participation Requirements for Class VI Wells*.
- If the applicant plans to construct additional injection wells in the future, ensure that the public is aware of planned future developments at the site, including the locations of any monitoring wells. Similarly, if the current Class VI permit application is for a new injection well at the site of an existing Class VI project, explain any relevant information about the project, e.g., compliance history.
- If, based on early information, there is reason to believe that disadvantaged communities (i.e., areas with minority populations, populations below the poverty level, or potentially vulnerable subpopulations) may be within or near the AoR of the project, the UIC Program should plan to perform an environmental justice (EJ) analysis consistent with EJ 2020 Action Agenda priorities. An EJ analysis will help identify whether any portions of the AoR encompass disadvantaged communities. The EJScreen Tool (available on the EPA's website) can support this review; for additional information see Section 1.4 and Appendix B. Where the EJ analysis indicates that the proposed site may be near disadvantaged populations that are also exposed to environmental risks, it may be appropriate to incorporate additional mitigation measures into the Class VI permit, such as monitoring in areas with identified disadvantaged communities. For additional

information, see the *UIC Quick Reference Guide - Additional Tools for UIC Program Directors Incorporating Environmental Justice Considerations into the Class VI Injection Well Permitting Process*. The Guide describes seven steps for performing an EJ analysis and mapping tools that are available to identify disadvantaged communities within the AoR of a Class VI project.

### 3.4 Other Pre-Permitting Considerations

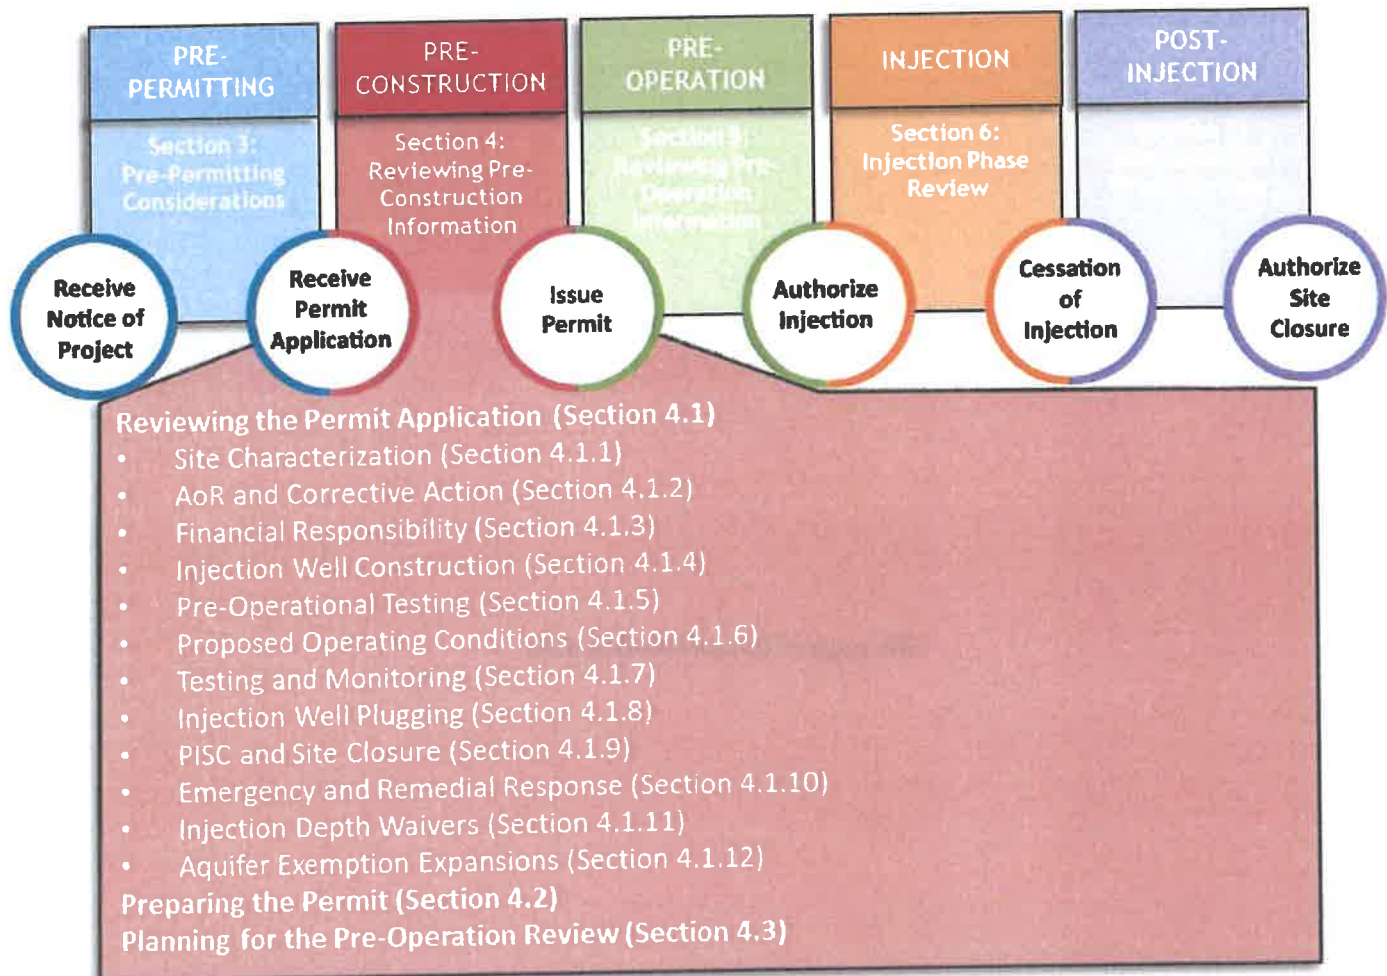

Some Class VI permit applicants may be subject to other requirements outside of the Class VI Rule. The EPA encourages the UIC Program to: ensure that the applicant is aware of these other requirements (discussed briefly below) that may apply; and work with co-regulators as needed so that permit applications under other regulatory programs are submitted and processed in a timely manner (e.g., optimally before injection is scheduled to commence). For example, a UIC Program may need to alert a Class VI permit applicant regarding the following:

- *Greenhouse Gas Reporting Program (GHGRP) Subpart RR*. GHGRP Subpart RR is complementary to UIC Class VI requirements and provides a mechanism to quantify the amount of carbon dioxide that is sequestered. Monitoring to comply with UIC Class VI requirements can provide the basis for satisfying certain GHGRP Subpart RR monitoring, reporting and verification plan requirements. For more information, see 40 CFR Part 98, Subpart RR.
- *The Conditional Exclusion under RCRA Subtitle C at 40 CFR 261.4*. If a Class VI permit applicant anticipates that the carbon dioxide stream may meet the definition of a RCRA hazardous waste, discuss the applicability of a conditional exclusion under RCRA Subtitle C at 40 CFR 261.4. The RCRA regulations conditionally exclude carbon dioxide streams that are hazardous from the definition of hazardous waste provided that the carbon dioxide stream is intended to be injected into a Class VI well and meets other specific criteria. The regulations exclude these hazardous carbon dioxide streams provided they are captured from emission sources, injected into Class VI wells for purposes of GS, and meet certain other conditions at 40 CFR 261.4(h). If the RCRA regulations are applicable, pursuant to the RCRA regulations, the applicant will need to provide the information necessary to demonstrate that the carbon dioxide streams they will be injecting will be managed in accordance with the conditions at 40 CFR 261.4(h).
- *State/Tribal Permits*. If the applicant plans to drill stratigraphic test wells or groundwater sampling wells that may eventually be used for carbon dioxide injection for GS, confirm that they are aware that they must get the appropriate permits from state/local authorities to drill any such wells.
- *Offshore Authorities*. If the well will be offshore, discuss with the applicant whether permits under the Marine Protection, Research, and Sanctuaries Act (MPRSA) or the Outer Continental Shelf Lands Act (OCSLA) are needed:
  - Under MPRSA, sub-seabed carbon dioxide injection for GS via Class VI wells, may, in certain circumstances, represent ocean dumping subject to regulation under the MPRSA. Application of the MPRSA would entail coordination of the permitting processes under SDWA and MPRSA, pursuant to MPRSA Sections 106(a) and (d).

- Under OCSLA, Class VI wells injecting offshore (on the outer continental shelf) but within state territorial waters may be subject to requirements under the OCSLA in addition to the Class VI regulations. The Bureau of Ocean Energy Management, Regulation, and Enforcement, an agency within the Department of the Interior, administers the OCSLA.
- *Other Permits.* Discuss with the applicant any other permits that may be needed for other aspects of the facility. This may include permits under the National Pollution Discharge Elimination System Program under the Clean Water Act.

## Section 4: Reviewing Pre-Construction Information

***This page is intentionally blank.***

## 4 Reviewing Pre-Construction Information

To apply for a Class VI permit, applicants must develop and submit to the UIC Program Director a range of geologic, hydrogeologic, modeling, engineering, and financial information about a proposed Class VI project [40 CFR 146.82(a)]. Because all of the information needed to evaluate the suitability of a proposed GS site will not be available at the time the permit application is submitted, there will likely be uncertainties regarding some aspects of the proposed site or the injection operation.

### Permit Application Reviews where the Well is Converted for Class VI Injection

If the owner or operator plans to convert an existing well (pursuant to 40 CFR 146.81(c)), the permit application evaluation will incorporate elements of both the pre-construction and pre-operation phase reviews. The EPA encourages the UIC Program to consider the recommendations in Sections 4 and 5 together. See Section 3.2 for additional information.

The goal of the UIC Program's review of the permit application is to evaluate the suitability of the site based on the available information and to identify ways to address or mitigate any uncertainties about the site. Permitting decisions are technically complex and risk-based, and the UIC Program should consider how various components of the permit application and the data collected throughout all project phases will address site-specific conditions (including identified uncertainties) to ensure non-

endangerment of USDWs. All the information collected and reviewed in the course of the permit application evaluation—and the documentation of that review—should collectively form a robust, defensible record of the decision.

During the pre-construction phase, Class VI permit applicants should submit the following types of information to the UIC Program as part of their Class VI permit applications:

- Site characterization information about the local and regional geology and hydrogeology (see Section 4.1.1);
- An AoR delineation based on computational modeling and information on wells in the AoR and their corrective action status (see Section 4.1.2);
- Information demonstrating financial responsibility for corrective action, injection well plugging, post-injection site care (PISC), site closure, and emergency and remedial response (see Section 4.1.3);
- Proposed well construction plans and schematics, a planned pre-operational testing program, and proposed operating data (see Sections 4.1.4 through 4.1.6);
- A series of proposed project plans presenting the applicant's approach to testing and monitoring, plugging the injection well, PISC, site closure, and addressing emergency or unforeseen events (see Sections 4.1.7 through 4.1.10); and
- Supplemental information related to injection depth waivers or aquifer exemption expansions, if applicable (see Sections 4.1.11 and 4.1.12).

Following the UIC Program's review of all information in the permit application and confirmation that the site will be protective of USDWs, a Class VI permit can be issued. See Section 4.2.

#### 4.1 Evaluation of Pre-Construction Information

Class VI permit applications contain a wide range of information, including geologic data, an AoR delineation based on computational modeling, a financial responsibility demonstration, proposed project plans, proposed well construction plans and schematics, a planned pre-operational testing program, and proposed operating data [40 CFR 146.82(a)]. In addition, some permit applicants may need to submit supplemental information related to injection depth waivers [40 CFR 146.95] or aquifer exemption expansions [40 CFR 144.7].

All of this information is inter-related, and the information collected to meet one requirement may inform or be informed by other required submittals or analyses. Therefore, permit writers should ensure that, collectively, all of the information in the permit application is consistent and supports a determination of site-suitability. This necessitates a multi-disciplinary, team-based approach to the permit application review (see Section 3.1). Table 4-1 illustrates some of these relationships and provides examples of how they may affect the pre-construction evaluation process.

**Table 4-1: Examples of Cross-Submittal Checks for Conducting Technical Evaluations of Class VI Permit Applications**

Required Submittals	Recommended Cross-Submittal Checks for Evaluating the Permit Application
Site characterization data [40 CFR 146.82(a)(2),(3),(5),(6); 146.83]	<ul style="list-style-type: none"> <li>Geologic and hydrogeologic data collected during site characterization serves as, and should be consistent with, the <b>AoR delineation modeling</b> inputs.</li> <li>Identified uncertainties should inform data collection during <b>pre-operational testing</b>.</li> <li><b>Well construction</b> should be suitable to, and compatible with, geologic data; the appropriate well depth should be informed by information on the depth to the lowermost USDW (unless an injection depth waiver is requested).</li> <li><b>Proposed operating procedures</b> (e.g., injection rates and volumes) should be appropriate to the storage capacity of the injection zone and the fracture pressure of the confining zone.</li> <li>The <b>AoR delineation modeling</b> can be used to verify the storage capacity of the injection zone.</li> <li>Monitoring locations and depths in the <b>Testing and Monitoring Plan</b> and <b>PISC and Site Closure Plan</b> should consider fluid geochemistry/mobilization of contaminants and the presence of fluid migration pathways (e.g., faults or fractures) identified via site characterization.</li> </ul>
AoR and Corrective Action [40 CFR 146.82(a)(4),(13); 146.84]	<ul style="list-style-type: none"> <li>The AoR delineation model inputs should be consistent with and incorporate <b>site characterization</b> data and <b>proposed operating data</b>; data gaps should be addressed during <b>pre-operational testing</b>.</li> <li>Monitoring locations in the <b>Testing and Monitoring Plan</b> and the <b>PISC and Site Closure Plan</b> should encompass the entire delineated AoR and be informed by the AoR delineation modeling; they should also account for all wells identified via the corrective action review.</li> <li><b>Financial responsibility instruments</b> should be adequately funded to address all needed corrective action.</li> <li>AoR delineation modeling can inform the <b>site characterization</b> review, including storage capacity evaluation and an evaluation of the potential for induced seismicity.</li> <li>The review of an <b>alternative PISC timeframe demonstration</b> should consider the AoR delineation modeling.</li> </ul>

Required Submittals	Recommended Cross-Submittal Checks for Evaluating the Permit Application
Financial responsibility [40 CFR 146.82(a)(14); 146.85]	<ul style="list-style-type: none"> <li>• Sufficient funds must be available to cover all needed <b>corrective action</b> and well plugging, based on the proposed <b>construction</b> of the well and the <b>Injection Well Plugging Plan</b>.</li> <li>• Financial instruments should be adequately funded to address vulnerabilities and/or endangerment to USDWs identified during <b>site characterization</b>, including the potential for induced seismic events.</li> <li>• The financial resources must also cover all activities identified in the <b>PISC and Site Closure</b> and <b>Emergency and Remedial Response plans</b>.</li> </ul>
Proposed well construction [40 CFR 146.82(a)(11)(12); 146.86]	<ul style="list-style-type: none"> <li>• The well materials should be compatible with all fluids with which they may come into contact and the design should consider the depth of all porous formations, as identified during <b>site characterization</b>.</li> <li>• The well's design and materials should be appropriate to the <b>proposed operating parameters</b>.</li> <li>• The <b>Injection Well Plugging Plan</b> should be appropriate to the well as designed and built (e.g., depth).</li> </ul>
Proposed pre-operational testing [40 CFR 146.82(a)(8); 146.87]	<ul style="list-style-type: none"> <li>• The planned formation testing should be sufficient to fill any gaps in available <b>site characterization</b> data and address key uncertainties in <b>AoR delineation modeling</b>.</li> <li>• The planned well testing should inform and confirm the <b>well construction</b> specifications and schematics.</li> </ul>
Proposed operating data [40 CFR 146.82(a)(7),(9),(10); 146.83(a)(1); 146.88]	<ul style="list-style-type: none"> <li>• The operating parameters should be suitable to the <b>site's geology</b>, i.e., to demonstrate that the injection zone has sufficient capacity to store the proposed carbon dioxide volumes.</li> <li>• The <b>AoR delineation</b> results should incorporate and support the proposed operating parameters.</li> <li>• The <b>well's construction</b> should be adequate to the proposed operating conditions.</li> </ul>
Testing and Monitoring [40 CFR 146.82(a)(15); 146.89; 146.90]	<ul style="list-style-type: none"> <li>• The Testing and Monitoring Plan should describe a monitoring strategy that is suitable to the <b>site's geology</b> and <b>proposed operating conditions</b> and addresses the entire <b>AoR</b>.</li> <li>• Appropriate well testing procedures are informed by <b>well construction, operating conditions</b>, and carbon dioxide composition as informed by <b>site characterization</b>.</li> <li>• Monitoring locations should consider the locations of any wells identified during the <b>corrective action review</b>.</li> <li>• The Testing and Monitoring Plan should collect the data needed to support a <b>non-endangerment demonstration</b>.</li> </ul>
Injection Well Plugging [40 CFR 146.82(a)(16); 146.85; 146.92]	<ul style="list-style-type: none"> <li>• The Injection Well Plugging Plan should be suitable to the proposed <b>well construction</b> and the <b>site geology</b>, including predicted composition of carbon dioxide-water mixtures.</li> <li>• Plugging procedures should be considered in developing <b>financial responsibility</b> cost estimates.</li> </ul>
PISC and Site Closure [40 CFR 146.82(a)(17); 146.93]	<ul style="list-style-type: none"> <li>• The PISC and Site Closure Plan should include predictions of post-injection plume movement based on the <b>modeled AoR</b>.</li> <li>• Post-injection phase groundwater and carbon dioxide monitoring should be an extension of activities in the <b>Testing and Monitoring Plan</b>.</li> <li>• The alternative PISC timeframe and criteria for the non-endangerment demonstration should be based on <b>AoR delineation modeling</b> and site-specific <b>geologic information</b>.</li> <li>• Post-injection monitoring and site closure activities should be considered in developing the <b>financial responsibility</b> cost estimates.</li> </ul>

Required Submittals	Recommended Cross-Submittal Checks for Evaluating the Permit Application
Emergency and Remedial Response [40 CFR 146.82(a)(19); 146.94]	<ul style="list-style-type: none"> <li>• The Emergency and Remedial Response Plan should address the risk characteristics of the site as informed by the <b>site characterization</b> (e.g., of induced seismicity) throughout the extent of the <b>modeled AoR</b>.</li> <li>• The <b>Testing and Monitoring Plan</b> and <b>PISC and Site Closure Plan</b> should collect sufficient data to detect all identified emergency scenarios.</li> <li>• <b>Financial responsibility</b> instruments should be adequately funded to address all risks and response actions identified in the Emergency and Remedial Response Plan.</li> </ul>

The following sub-sections describe the evaluation of discrete types of program element information and the suggested outcomes of each review for the pre-construction phase evaluation. Each section describes: the types of information applicants are likely to submit and how the UIC Program can evaluate their completeness; the activities that the EPA recommends that permit writers take to evaluate the information submitted including, where necessary, discussing the information with the applicant or requesting additional or clarifying information; and the suggested outcomes or products of the review.

Because each permit application will be unique and the appropriate activities will be specific to the application being reviewed, the activities described below outline a recommended course of action to accomplish the goal of writing a protective, defensible permit. Therefore, this section also explains where the Class VI Rule affords flexibility to address site-specific circumstances and where exercising authority to request additional information per 40 CFR 146.82(a)(21) or otherwise exercising Director's discretion may be appropriate.

#### 4.1.1 Site Characterization

Class VI permit applicants must provide extensive information about the local and regional geology and hydrogeology of the proposed site [40 CFR 146.82(a)(2),(3),(5),(6)].

The purpose of the UIC Program's evaluation of this information is to inform a determination that the Class VI well will be sited in an area with a suitable geologic system, consisting of an injection zone with sufficient capacity to receive the carbon dioxide to be injected and a confining zone that is free of transmissive faults or fractures per 40 CFR 146.83. The EPA recommends a two-phase approach to reviewing site characterization information (i.e., a review of the geologic information submitted per 40 CFR 146.82(a) and a comprehensive evaluation of that geologic information to confirm site-suitability, per 40 CFR 146.83), as described in the *UIC Program Class VI Well Site Characterization Guidance* and outlined below. The purpose of the UIC Program's review of the geologic information is to verify that the information submitted is accurate and that it provides appropriate and accurate inputs and considerations for AoR delineation modeling, well construction, and planned operation. Figure 4-1 provides an overview of the site characterization review process.

#### Completeness Review

Class VI permit applicants will likely submit geologic information about the site in a narrative document that describes: regional geology and hydrogeology; the thickness, mineralogy, porosity, and permeability of the proposed injection zone and overlying formations; suspected faults and fractures; geomechanical properties; seismic history; and the locations and baseline geochemistry of USDWs. This site characterization should be supported by maps, logs, cross

sections, the results of water quality sampling, and analyses of core samples. It may include a mix of published literature about the area and the results of research by the applicant. Maps and cross sections should be legible and include the names, lithologies, and depths of the injection and confining zones, and illustrate any regional structural features (e.g., folds, faults, domes, etc.). If the applicant is seeking an injection depth waiver, the site characterization should address formations below the injection zone, including the lower confining zone; see Section 4.1.11 for additional information on evaluating these projects.

The applicant's demonstration of site-suitability should be supported by research, modeling, bench top analyses, or geophysical and geologic data that are consistent with information presented elsewhere in the permit application. If, during pre-permit application discussions, an agreement was made regarding the need to characterize additional confining zones to impede vertical fluid movement, allow for pressure dissipation, and provide additional opportunities for monitoring, mitigation, and remediation, per 40 CFR 146.83(b), a UIC Program reviewer should verify that information on these additional zones is submitted.

The EPA encourages UIC Programs to perform a preliminary evaluation of the geologic information to confirm that it contains sufficient information on which to demonstrate that the site is comprised of formations that provide a suitable geologic system. During this preliminary evaluation, the permit writer should verify that the data collected and submitted are complete, that the methods used for analyses and calculations are described in adequate detail, and that quality assurance (QA) procedures are described where appropriate. Additionally, the UIC Program reviewers should confirm that secondary data are from reliable sources (e.g., federal or state agencies) and are recent and representative of the proposed site. The geologic data should represent all formations of interest, from the land surface to the injection zone (or to the lower confining zone, if the applicant is seeking an injection depth waiver). Data should be representative of the entire AoR and optimally provide some information on the general area surrounding the AoR. There should also be background information describing the regional geologic setting.

If any information is missing or is not presented in sufficient detail to inform an evaluation of site-suitability, the EPA recommends initiating a request for additional information or asking clarifying questions to inform and expedite the review.

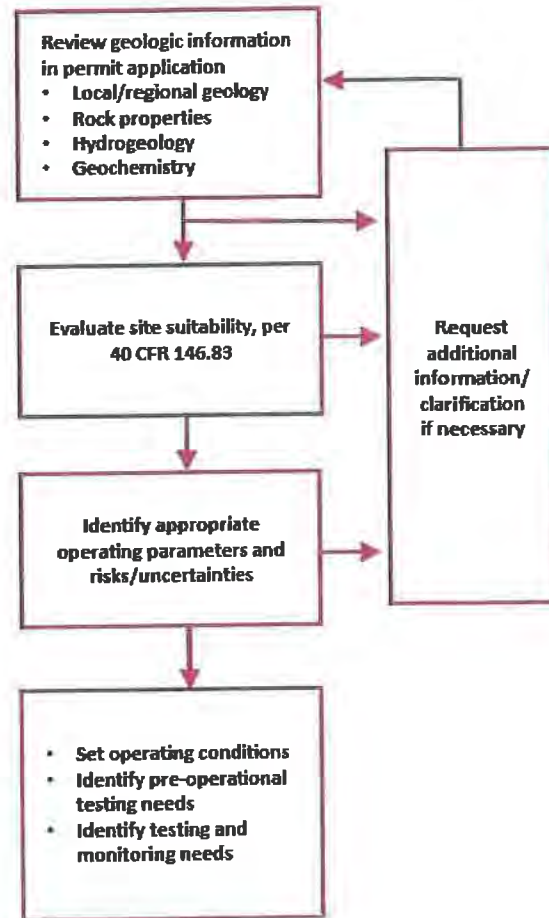

Figure 4-1: Site Characterization Review

## ***Evaluation***

Some of the geologic information submitted is fairly “straightforward,” e.g., maps and cross sections, the results of testing and sampling, or research about the site to meet the requirements of 40 CFR 146.82. Conversely, some aspects of the permit application and its review reflect synthesis and integration of site-specific geologic data to support a determination of site-suitability per 40 CFR 146.83.

It may be appropriate to review the more basic information first to verify its accuracy and that it meets the Class VI Rule requirements (e.g., that faults and fractures are non-transmissive) as well as to consider how this information will inform more integrative analyses of site-suitability. Likewise, while the more comprehensive aspects of the review cannot be finalized until the geologic data are verified, the UIC Program should begin to plan for the comprehensive review early in the process to ensure that all of the required information—in appropriate types and levels of detail—will be available to support the review. Some aspects of this more comprehensive review will also need to be performed in coordination with the AoR delineation modeling review (see Section 4.1.2).

Members of the permit application review team are encouraged to work collaboratively, as appropriate, to ensure that a sufficient amount of geologic information will be collected and reviewed to support all aspects of the permit application review. Throughout the course of the review, alerting other members of the review team in a timely manner if there is concern about any aspect of the site’s geology that may impact well construction or operations, or other components of the project, will benefit the comprehensive review and the schedule.

The bolded and italicized text below outlines a suggested approach that a UIC Program might employ to evaluate site characterization information, submitted by a Class VI permit applicant, to confirm that an applicant’s submittal meets the requirements of the Class VI Rule and informs the establishment of protective permit conditions.

***Review geologic information submitted per 40 CFR 146.82(a).*** Review this information to confirm that the geologic site characterization is based on appropriately collected site-specific information or relevant existing data or literature about the proposed site; identify any potential site attributes that may affect its suitability for GS; and identify uncertainties to be addressed via pre-operational testing, operational changes, targeted testing and monitoring, or other permit conditions.

***Review information on regional geology and geologic structure.*** Review the maps and cross sections that the applicant has provided to verify that they are at a scale that shows the location of the project site and places it in a regional context. Verify that the geophysical methods used to characterize the site are suitable for the geologic environment and data needs. Table 2-1 in the *UIC Program Class VI Well Site Characterization Guidance* summarizes the utility of various geophysical survey methods to various types of investigations (e.g., of porosity, thickness). Verify that the surveys were performed at a sufficient resolution such that the size of subsurface features can be distinguished. Geophysical surveys should complement, but not replace information such as logs, outcrop data, or core samples. Verify that delineation of stratigraphic units indicated by geophysical survey data is consistent with maps and well logging information.

***Evaluate information on faults and fractures.*** Verify the extent/areal coverage of any pre-existing or public information (e.g., from the U.S. Geological Survey (USGS) or state geologic

surveys) to confirm whether or not the information is inclusive of the injection and confining zones throughout the AoR.

If information on faults is based on two-dimensional geophysical surveys, assess whether the location, geometry, depth, or displacement of the faults or fractures can be ascertained. Assess whether units juxtaposed by faulting can be determined based on geophysical surveys along with other information. If faults cannot be definitively identified or ruled out based on the images submitted, or exist but are not adequately characterized, consider requesting additional supporting information. This may include a need for higher resolution geophysical studies, updated processing and imaging from existing surveys, or information from additional sources. If the applicant does not address ambiguous features in geophysical surveys (e.g., seismic reflectors that might represent small faults), request clarifying information. Note that gravity methods are less useful than other geophysical methods for detecting small faults or faults with large displacement occurring in discrete steps; vertical faults are especially difficult to detect using surface gravity methods.

Verify that any demonstration that faults are non-transmissive is supported by adequate data and information about the site (e.g., analyses of core samples, results of geophysical surveys, pore pressure data, maps, and cross sections). Confirm that the methods for any relevant calculations (e.g., calculation of shale gouge ratio or assessment of fault slip tendency) are adequately described. Verify that the applicant's demonstration of fault stability is supported by the information submitted on downhole stresses and reflects anticipated injection pressures. Communicate any concerns about the existence of faults to the AoR delineation modeling team and to the staff reviewing the planned injection and post-injection phase testing and monitoring so that monitoring can target areas of potential concern for carbon dioxide migration.

***Review information about the depth, areal extent, and thickness of the injection and confining zones.*** Evaluate geologic maps, cross sections, and any other maps submitted to ensure that they demonstrate that the identified confining zone extends throughout the AoR and is continuous with no pinchouts. If cross sections do not include all formations of interest (i.e., from the surface to at least the injection zone) or a sufficient extent of the preliminary AoR is not represented, request additional cross sections.

Confirm that any seismic or other geophysical data are of appropriate resolution and lateral extent to provide information on the injection and confining zones throughout the AoR. Ideally, at least two perpendicular profiles that pass close to the proposed injection well will be presented for general site description. Because two-dimensional seismic surveys are not optimal in settings where significant lateral heterogeneity is expected, three-dimensional surveys may be preferable when characterizing sites with complex or variable subsurface geology. If such surveys are performed, consider using them as a baseline for the Testing and Monitoring Plan (see Section 4.1.7).

Verify that geophysical data, core data, well logging data, and other information support consistent conclusions about the properties of the injection and confining zones. Verify that the applicant's interpretation and discussion of stratigraphy, depositional features, and environments incorporate all relevant information. If these are not representative of the entire geographic area or of all depths, incorporate the collection and analysis of additional cores or logs into the pre-operational formation testing program.

If there is variability in the thickness of the injection or confining zones, verify that this would not adversely affect storage or confinement. If the confining zone does not extend throughout the AoR or there is any uncertainty about whether it is sufficiently thick and homogeneous over the entire area, consider requesting information on an additional confining zone(s).

**Review hydrologic and hydrogeologic information.** Verify that information from existing data sources is reliable and accurate. For example, state water centers, water surveys, or departments of water resources or health are likely to have the most comprehensive databases of water well locations and depths. The USGS and state and local agencies may have the most complete information on USDWs and springs within the AoR.

Coverage from public sources may not be complete. Consider asking the applicant to fill in any information gaps using on-the-ground surveys or hand searches of health or environmental department records, especially if the proposed project is in a populated area.

Verify that the level of detail and the geographic scope of the available information will allow identification and characterization of all USDWs in the AoR. This submittal should also agree with any information submitted with the permit application (or that is otherwise available) on the depths, extent, and groundwater flow patterns of regional USDWs.

If there is a USDW in the AoR, coordinate with staff reviewing the Testing and Monitoring Plan to ensure that the groundwater sampling plan targets USDWs in the area. Also verify that the Emergency and Remedial Response Plan and the financial responsibility cost estimates address the potential contamination of the USDW. Communicate any updates to this information to review team staff evaluating the AoR and Corrective Action Plan.

**Examine geochemical data** that may have been submitted to meet the requirements at 40 CFR 146.82(a)(6). If the applicant collected fluid samples in advance of drilling the injection well (i.e., via a stratigraphic test well or in existing nearby wells) to provide baseline geochemical data, verify that they conducted a thorough geochemical analysis. A thorough suite of analyses should address basic fluid chemistry and any contaminants that could potentially be mobilized based on available information about the composition of the rock matrix and the composition of the injectate. At a minimum, the analytes should be consistent with those identified in the proposed Testing and Monitoring Plan.

Verify that fluid samples were collected using techniques that preserve downhole pressure conditions at the depths from which they were sampled or that downhole pressure and temperature estimates were available to support modeling of water chemistry speciation under conditions in the injection zone. Also verify that samples were analyzed at accredited or certified labs or at academic/university labs. If unaccredited or uncertified labs were used, it may be appropriate to request additional information about the labs to verify that they are qualified to perform the analyses (i.e., that appropriate QA controls were in place when the analyses were performed); if no information about the lab's accreditation and/or qualifications is available, consider requesting analysis/testing of new samples.

If historical geochemical data are provided, verify that the samples represent formations and locations of interest. If they do not, or the origin of the information is unclear, consider requesting that the applicant perform additional sampling to confirm the information. Also assess any available information on sampling and analytical techniques (including QA information) to verify the quality of the historical data. If data quality is in question, the values may not be

reliable for assessment of site-suitability, although they may provide some basic context for site or regional geology. If data quality is poor, consider requesting that new samples be taken, if feasible. If there has been injection or production in the area since the samples were taken, consider requesting additional or more recent analyses as part of the pre-operational formation testing program to confirm that the geochemistry has not been significantly altered as a result of these activities.

Verify that fluid chemistry data were obtained from all appropriate formations (i.e., from at least the injection zone and the lowermost USDW above the confining zone) as close to the injection well and in as many locations in the AoR as practicable. Confirm that samples were taken at wells with a sufficient yield to represent the water chemistry of the formations to be sampled. If an insufficient geographic area (e.g., less than the extent of the AoR) is represented and data points are far from the injection well, or the chemical data are extremely limited, consider asking the applicant to conduct additional sampling. If the applicant is seeking an injection depth waiver, review geochemical information from samples taken from below the lower confining zone; see Section 4.1.11 for additional information on evaluating these projects.

If there is a concern that trace metals may be liberated due to changes in pH and affect USDWs, examine (or, if necessary, request) an analysis of formation solids in the injection and confining zones. Verify that appropriate solid phase chemical analytical techniques (i.e., EPA-approved methods) were used, or consider requesting analyses using such techniques. Coordinate with the reviewer of the Testing and Monitoring Plan to ensure that any contaminants that could potentially be liberated/mobilized are monitored as part of the groundwater monitoring program in the plan. Additionally, ensure that all of the chemicals in the baseline analysis are included as groundwater monitoring parameters throughout the duration of the project.

Review water quality sampling information to confirm the location and depth of the lowermost USDW. Verify that the reported lowermost USDW is identified based on total dissolved solids (TDS), and not on other permitting or regulatory requirements related to water resources in the area, such as aquifer usage or the depth to which surface casing must be set in oil and gas wells in the area. Section 2.3.9 of the *UIC Program Class VI Well Site Characterization Guidance* provides information on baseline geochemical characterization.

***Evaluate geomechanical and petrophysical information.*** Verify that the applicant submitted sufficient information to characterize all required geomechanical and petrophysical parameters throughout the project area. This includes porosity, permeability, capillary pressure, and information on fractures, stress, ductility, rock strength, and in situ fluid pressures within the confining zone. Verify that the applicant presented information on and discussed the variability in measurements for the various types of geomechanical and petrophysical data. Because this information should provide the inputs for the AoR delineation modeling, coordinate with the AoR delineation modeling reviewer to verify that the inputs of the applicant's model match this information and that the inputs of the independent modeling incorporate this information. Also confirm that the modeler is aware of any changes to or uncertainties about the geologic data (see Section 4.1.2).

Ideally, any core samples that were taken (or will be taken) should be geographically distributed and of a sufficient number to represent areas close to the proposed well *and* areas that are representative of the entire AoR, accounting for any heterogeneities in the injection and confining zones. (It is likely that core samples may not be taken and analyzed until after

construction is authorized; verify that the pre-operational formation testing program will fill in any information gaps or address uncertainties. See Section 4.1.5.) If there is any indication that samples were damaged during drilling, assess whether that damage was likely to affect the analytical results. If available data are of low quality or inadequate to establish the suitability of the site, consider asking the applicant to collect and analyze new cores under the pre-operational formation testing program.

Confirm that measured permeabilities and porosities are consistent with what is known about the lithologies of the injection and confining zones and that they are reasonable values for injection and confining zones at the proposed operating conditions. Note any discrepancies between laboratory and field or well log-based values and assess whether such discrepancies are expected based on geologic and lithologic features or the methods used. If the applicant used log- and core-based porosity and permeability values to develop estimated permeability distributions, verify that the method used is fully explained and that the choices made in executing the calculations are clear and reasonable. Compare estimated values with log- and core-based values and consider the magnitude of any discrepancies and whether such discrepancies are explained. Coordinate with staff performing the AoR review to compare these data with those used in the AoR delineation. Uncertainties in estimates of formation properties (e.g., porosity, permeability) may be addressed by incorporating this information into sensitivity analyses in the AoR delineation modeling.

Verify that the method used to measure capillary pressure allows measurement at pressures and temperatures representative of the injection zone. Assess the number of samples used and verify that they are representative of any variability in lithology and that there are a sufficient number of samples to assess method variability within a lithology. Assess spatial variability and compare the values against expected pressure at the base of the confining zone should a column of separate-phase carbon dioxide develop. Also verify that measurements of ductility and rock strength are based on appropriate laboratory tests that are suitable for simulating downhole stress conditions.

Verify that information on in situ stress incorporates measurements of vertical stress, maximum horizontal stress, and minimum horizontal stress. Also verify that the applicant used appropriate methods to measure stresses (e.g., integrating density above the point of measurement to estimate vertical stress; ASTM Method D 4645-08 to measure minimum horizontal stress and maximum horizontal stress).

Verify that data submitted for any borehole logs used (e.g., fracture finder/microseismogram logs, caliper logs, or acoustic logs to detect fractures or formation testers to measure pore pressure) are complete and that measurements were taken in locations that are representative of the injection and confining zones.

If seismic data were used to obtain pore pressure estimates or used in conjunction with well logs and other data to develop porosity and permeability distributions, verify that the survey was performed at a sufficient resolution for those purposes and that data processing steps were described and are appropriate. Verify that any assumptions and uncertainties are noted.

***Review information submitted on the mineralogy, petrology and lithologies of the injection and confining zones.*** Verify that the cores on which this information is based were collected from locations representative of the project site and that they include the injection and confining zones—or that cores will be taken as part of the pre-operational formation testing program.

Assess whether adequate core descriptions are provided and whether the cores and samples are likely to provide an indication of variability in mineralogy and overall lithologic heterogeneity that will inform the AoR delineation modeling. For example, other information, such as borehole imaging or the results of other research in the region, can be used to determine the appropriate number of samples to take.

Verify that proper analytical techniques were (or will be) used to characterize core samples. Polarized light microscopy and scanning electron microscopy may be used on thin sections, and powdered samples may be subject to X-ray diffraction. Information should include both macroscopic (hand sample for core descriptions) and microscopic (e.g., percentages of minerals present) analyses.

Note whether the mineralogy suggests any potential for release of trace metals through mineral dissolution when pH is lowered. Also take note of any likely geochemical reactions (e.g., dissolution of carbonates in or near the well or precipitation of carbonates in distal areas) that would affect injectivity, containment, and/or overall performance of the project.

Lithologic and mineralogic information based on analyzed samples should be consistent with other sources, such as information in the scientific literature, maps and cross sections prepared by the USGS or state geological surveys, and well logs. Request additional information if descriptions and analyses are incomplete, inaccurate, or not in agreement with other research.

***Review the seismic history of the site and information on the presence and depths of seismic sources and seismic risk.*** It is likely that the applicant will rely on existing data (e.g., from USGS, the National Oceanic and Atmospheric Administration, state databases, or data generated by state seismic monitoring regimes, if the state has complete coverage) to determine the location and depth of any identified seismic sources. Confirm that the applicant used such reliable sources to compile seismic history data. Verify that the research covers the AoR of the Class VI project over an appropriate historical time period and includes sufficient information on the magnitudes and hypocenters of previous seismic events.

If the data are inconclusive or there have been earthquakes in the past, consider asking the applicant to model or otherwise determine, using documented methods, that seismic activity from identified sources will not endanger USDWs. Consider coordinating with the AoR delineation modeling reviewer to evaluate the extent of pressure increase due to injection and whether such an increase could possibly reach any faults or impact fault stability. This evaluation may also include an assessment of potential fluid migration rates if a transmissive fault were intersected by the plume and/or the area affected by the pressure increase.

#### Addressing Seismicity in the Class VI Permit

If there was recent seismicity near the proposed site (either natural or injection-induced), consider requiring passive seismic monitoring. The Testing and Monitoring Plan should describe a passive seismic monitoring network across the AoR that can detect seismic events.

Additionally, the Emergency and Remedial Response Plan could include an action plan to address seismic events. Several states and the EPA have developed "stoplight" approaches, in which the response varies based on the magnitude or location of the event and whether it was felt. Responses range from documenting the event to gradually shutting injection operations and investigating the event to immediately shutting the well and performing necessary corrective and/or remedial actions.

If any of the geologic or seismic data indicate a substantial likelihood of seismic activity, a fault stability analysis may be needed to demonstrate that seismic activity will not compromise subsurface containment. If there is the potential for seismic activity that may reactivate faults that transect the confining zone(s) and compromise containment, consider whether operational changes can be made and/or passive seismic monitoring can be incorporated into the Testing and Monitoring Plan to manage the risk.

***Review surface air and/or soil gas monitoring data (if submitted).*** If surface air and/or soil gas monitoring will be required as part of the project's testing and monitoring regimen, verify that baseline data have been collected according to established methods. Verify that sampling locations have been established in locations that are representative of the entire AoR and that monitoring will provide information on any areas with potential for carbon dioxide migration (e.g., areas with faults or fractures or abandoned well bores).

***Comprehensively evaluate all geologic information to determine whether it supports a demonstration of site-suitability, per 40 CFR 146.83.*** Section 3 of the *UIC Program Class VI Well Site Characterization Guidance* recommends approaches and analyses that applicants can perform to support this determination. This comprehensive evaluation involves reviewing all geologic data (including the information described above) along with any additional analyses, such as the AoR delineation modeling, to support a determination regarding the site's suitability for GS or to identify uncertainties about the site. Some approaches to addressing uncertainties about the site that the UIC Program may consider include: collecting additional data as part of the pre-operational formation testing program, performing sensitivity analyses as part of the independent AoR delineation modeling, adjusting operational parameters, or requiring tailored or increased monitoring during the injection and post-injection phases of the project.

As noted above, while this evaluation depends on the outcome of the geologic data review, planning for this comprehensive review should begin as soon as the permit application is received. Also, it is likely that the final determination of site-suitability will not be made until site-specific pre-operational testing is complete. See Section 5.1.1.

The paragraphs below provide recommendations for this comprehensive determination of suitability including evaluating: facies changes in the injection or confining zones, injection and confining zone structure, compatibility of the carbon dioxide stream with subsurface fluids and minerals, the storage capacity of the injection zone, and integrity of the confining zone(s).

***Determine whether facies changes in the injection or confining zones may impact storage or confinement of carbon dioxide.*** Assess the information on the major facies present and any descriptions regarding their role in storage and confinement of carbon dioxide. Verify that facies interpretations referenced in the permit application are consistent with available geologic data for the site, including geologic and isopach maps, stratigraphic columns, well logging data, available core samples or outcrop data, and seismic data. Verify that information from all of these sources agree and support similar conclusions about the site. This information should also be consistent with the geologic site conceptual model used in the AoR delineation modeling.

Assess whether the facies interpretations are consistent with a determination that the confining zone(s) is sufficiently thick and continuous throughout the AoR to provide confinement. A confining zone of adequate lateral extent is particularly important where there are no structural traps and the carbon dioxide may migrate long distances. Take note of any indication of possible major facies changes that would provide potential preferential flow paths that could result in

movement of the plume in a particular direction or at an accelerated rate. Consider whether the data suggest that there may be high permeability zones within the confining zone that would provide a potential carbon dioxide migration pathway. If any portions of the AoR are not well characterized or the data suggest heterogeneities in the confining zone, discuss whether a secondary confining zone can be identified and, if appropriate to ensure USDW protection, request that the applicant characterize it.

Also assess whether facies interpretations are consistent with the properties of the injection zone and the injection formation as a whole. Consider the stratigraphy, degree of homogeneity or heterogeneity in lithologies, and petrophysical properties described in the permit application. Note if any features may affect migration of carbon dioxide or brine (e.g., low-permeability zones or potential preferential flow paths).

If the confining zone generally appears to be acceptable, but there are minor uncertainties about homogeneity or facies changes that may allow preferential flow paths for fluid migration, consider including targeted groundwater monitoring and carbon dioxide plume tracking in the Testing and Monitoring and PISC and Site Closure plans. If appropriate, consider requesting additional pre-operational testing (e.g., well logs or core samples for areas other than the injection well).

***Examine the structure of the injection and confining zones.*** Examine data (including maps, cross sections, well logs, and seismic or other geophysical data) to confirm that local and regional geologic structures are conducive to GS and form an adequate confining system.

Verify that the applicant's understanding of the site's structural geology is based on a sufficient amount of data that are representative of the entire project area and encompass major features, especially where the local geology is complex. Also verify that the various data sources provide a consistent portrayal of the presence, types, sizes, and orientations of structural features. Verify that these features (e.g., dip, folds, and faults) are accounted for in, and are consistent with, the geologic conceptual model upon which the AoR delineation is based.

If a structural trap is present (e.g., fold, dome, fault trap), verify that its size and orientation are consistent with the anticipated direction and extent of plume migration. Assess this information in conjunction with AoR delineation modeling results to verify that the trap is sufficiently large to contain the proposed volume of carbon dioxide without evidence of pressure buildup that could fracture the confining zone. Steeply dipping folds or high domes may allow unacceptable stress on the confining zone from buoyant forces, while unfolded, gently-dipping sequences may allow carbon dioxide to migrate long distances. In the latter case, the AoR may be larger, and the potential effects of facies changes should be considered. If trapping is based on the presence of faults that juxtapose the injection zone with low-permeability units, verify that the stability and sealing properties of such faults have been assessed by the applicant.

Where data are incomplete or there is uncertainty regarding the geometry of the structural features or the tops and bottoms of the various units, discuss these uncertainties with the applicant. If necessary, request additional or higher resolution seismic surveys, or ask the applicant to perform additional logging (e.g., logging within wells other than the injection well) as part of their pre-operational testing procedures to refine the geologic conceptual model of the site. Also, consider incorporating additional plume monitoring in areas of concern into the Testing and Monitoring and PISC and Site Closure plans.

*Assess the compatibility of the carbon dioxide stream with subsurface fluids and minerals.* If the applicant's demonstration of compatibility is based on literature reviews or existing data, these data should closely reflect conditions at the site. For example, the supporting information should be based on earlier studies of the area or of geologic settings that are very similar to the proposed project site. Literature reviews may be appropriate for the pre-drilling characterization of compatibility and should be used to guide formation testing objectives for gathering information to support experimental or modeling studies.

Review the results of any geochemical or reactive transport modeling performed. Verify that the modeling inputs represent: the mineralogy of the injection formation; the results of formation fluid analyses; pressure, temperature, and pH conditions at depth; and injectate composition. Verify that the modeling allows for appropriate precipitation and dissolution reactions and that the thermodynamic and kinetic datasets used are suitable to project-specific conditions. Models should be robust, reproducible, and supported by inputs that are well documented and representative of the site. See Section 3.3.1 of the *UIC Program Class VI Well Site Characterization Guidance* for additional information on the use of modeling to evaluate carbon dioxide compatibility.

Review the results of any benchtop laboratory experiments performed. Confirm that the rock and fluid samples used in the experiments were from the site (ideally near the well) or are similar in composition to those at the site; also confirm that experimental conditions represent the downhole pressure and temperature conditions near the well. Verify that the experiments involved samples that represent any lithologic heterogeneities known to exist in the AoR. If grinding of rock samples or other changes were made to increase reaction rates so as to complete experiments in a feasible amount of time, note whether the implications of this are discussed. Verify that the experiments ran for a sufficient duration to allow the establishment of steady state conditions and that porosity and permeability changes were evaluated post-experiment using appropriate laboratory methods (see also the discussion of porosity and permeability above and Sections 2.3.4 and 2.3.5 of the *UIC Program Class VI Well Site Characterization Guidance*).

Identify whether the results of models or experiments indicate potential interactions between the injected carbon dioxide and native fluids that could affect operational parameters, plume migration, or storage capacity. For example, if potential changes in porosity and permeability (particularly in a reactive formation with a high carbonate content) could affect injectivity during the project, work with the modeling team to ensure that these changes are incorporated into the AoR delineation modeling and that storage capacity estimates and their potential effects (both positive and negative) have been explored. If mineral precipitation or dissolution could liberate trace elements of concern, consider requiring tailored testing and monitoring using appropriate analytical procedures to provide evidence of trace metal contamination of USDWs.

If there are any uncertainties about modeling or experimental results, ensure that appropriate information will be collected during pre-operational testing to provide more site-specific inputs for updating the experiments or re-running the model prior to authorizing injection. If the site is not homogeneous, verify that modeling or experimental work appropriately captured variability throughout the AoR, including information from any core and fluid samples collected from different locations within the AoR.

For information on considerations for evaluating the compatibility of the carbon dioxide stream with well materials, see Section 4.1.4.

**Evaluate estimates of injection zone storage capacity.** Evaluate the methods used for estimating storage capacity. See the *UIC Program Class VI Well Site Characterization Guidance* for additional information on static models or dynamic models. For site-specific estimates where the geologic data are available and numerical reservoir models are already developed for AoR delineation, dynamic methods are preferred.

Review any modeling the applicant used to estimate storage capacity. Verify that the inputs used in models to estimate storage capacity are representative of the site (e.g., injection zone properties and site-specific trapping mechanisms). Also verify that the inputs reflect the proposed operation (e.g., injection volume, rate, and duration). If the data used are not site-specific, verify that they are representative of site characteristics, particularly in settings where heterogeneity may significantly affect the performance of the project.

If a static method was used to estimate storage capacity, review the information used for consistency with other site and project information and identify any limitations (e.g., lack of heterogeneity or other unaccounted features, such as injectivity, pressure development, or effects of trapping mechanisms). Discuss these limitations with the applicant and consider whether a more refined estimate of storage capacity can be obtained prior to injection or early in the injection phase in conjunction with an AoR reevaluation (see Section 6.2). Compare the resulting storage capacity estimates to the delineated AoR (see Section 4.1.2) and any additional analysis included in the AoR delineation modeling evaluations.

Independent verification of the storage capacity estimates can be performed as part of the AoR delineation modeling. Coordinate with the staff performing the modeling evaluation so that the basis for estimating the storage capacity of the injection zone (i.e., the model inputs used) is consistent with the operational plans for the project and other geologic data submitted with the permit application. The estimated storage capacity should be greater than the total planned carbon dioxide volume, with a safety margin that is commensurate with the level of uncertainty in the estimation method or the inputs on which the estimate was based or any uncertainties about the site geology. Also confirm that the pressures predicted to occur within the geologic system will not exceed 90 percent of the fracture pressure of the injection zone. If additional injection wells are planned or there are other operations in the region injecting into or producing from the same formation or any hydraulically connected formations, confirm that storage capacity estimates incorporate any effects of such operations.

If the storage capacity of the injection zone is less than the total anticipated volume of carbon dioxide to be injected, discuss planned injection operations with the applicant and adjust the permit conditions (i.e., for injection rates and volumes) accordingly.

**Evaluate the integrity of the confining zone(s).** Compare the pressure distributions predicted by the AoR delineation modeling to the fracture pressure of the injection zone to verify that the proposed injection conditions will not cause an exceedance of the fracture pressure. Also verify that there is an adequate margin of safety or, if appropriate, adjust the operating conditions (e.g., injection rates or total volumes to be injected over the duration of the project).

Consistent with the intent of 40 CFR 146.83, it is important that the confining zone is sufficient to provide a barrier for fluid movement without relying on additional formations (e.g., “thief zones”) to receive carbon dioxide were it to migrate out of the injection zone and into formations between the injection zone and the lowermost USDW. While such zones may provide additional protection, they should not be relied upon for confinement. If the applicant discusses such zones

without providing sufficient detail on the confining zone, request additional information about the proposed confining zone or consider recommending that the applicant characterize an additional confining zone.

Verify that the capillary entry pressure of the confining zone is greater than pressures anticipated to occur in the separate-phase carbon dioxide plume, based on proposed operating data and modeling (with appropriate safety margins, particularly in heterogeneous formations). Such determinations should be made throughout the AoR.

Assess whether information was presented to indicate that any faults within the confining zone are sealing. See Section 3.5.5 of the *UIC Program Class VI Well Site Characterization Guidance* for examples of how fluid migration along faults can occur. Verify that any faults in the area are not expected to adversely impact confinement, are identified based on site-specific data, and have been evaluated at various scales as data and samples allow (e.g., thin section, hand sample, and outcrop). Additionally, verify that any faults in the confining zone will not be reactivated under the proposed operating conditions. For example, verify that a fault stability analysis was based on reliable data and was well documented.

If the primary confining zone does not exhibit sufficient thickness or strength to allow injection at the proposed pressures and volumes with an appropriate safety margin, the UIC Program might consider one of the following options: requesting information on an additional confining zone, adjusting the operating conditions in the permit, or discussing with the applicant the need to select another site. Likewise, if there is uncertainty about the evaluation of confining zone integrity, discuss with the applicant whether additional data can be gathered during pre-operational formation testing or during injection and post-injection monitoring to target areas where fluid migration may be a concern.

### ***Outcomes***

Following the evaluation of geologic information in the permit application, the UIC Program should consider documenting the review for inclusion in the permit file. An administrative record for the permitting decision that contains documentation of the review could support a response to comments on the permit, a response if the permit were challenged, and future decisions made on the project by either the permit writer or new/different permitting authority personnel. This documentation could include the following:

- A report that confirms the suitability of the site for GS (pending the results of the pre-operational formation testing program) and describes any identified deficiencies, uncertainties, or data limitations and how these limitations or uncertainties will be addressed (e.g., via modifications to operating procedures or testing and monitoring); and
- A document that summarizes the evaluation of seismic risk, including the site-specific information reviewed and the permit conditions designed to minimize the risks associated with seismic events. This type of document is particularly recommended if there is a concern about induced seismicity in the area of the project. The EPA developed an “Injection-Induced Seismicity Decision Model” for Class II oil and gas disposal wells that can be adapted to summarize evaluations of Class VI permit applications.

Any supporting documents should be uploaded to the project’s permit package area in the GSDT.

#### **4.1.2 AoR and Corrective Action**

The Class VI Rule requires owners or operators to develop and submit an AoR and Corrective Action Plan as part of their permit application [40 CFR 146.82(a)(4),(13); 146.84(b)]. The plan must document the owner or operator's compliance with the AoR delineation requirements (including the AoR delineation modeling approach), present a comprehensive strategy for AoR reevaluations over the duration of the project, and describe how any necessary corrective action will be conducted.

The purpose of the UIC Program's evaluation of the AoR delineation approach is to assess whether the AoR, as modeled, appropriately represents the area in which USDWs may be endangered by the injection operation, as specified by the Class VI Rule requirements. The delineation of the AoR relies on site characterization and proposed operational data (and the evaluation of the AoR delineation should consider this information). It also informs and supports the development and evaluation of other components of the permit application (such as the determination of site-suitability and strategies for compliance with the testing and monitoring, financial responsibility, and emergency and remedial response requirements).

The UIC Program should also review all corrective action information to ensure that all artificial penetrations that may allow fluid movement into USDWs in the AoR are identified and appropriately addressed by corrective action to ensure that they do not serve as conduits for fluid movement.

##### ***Completeness Review***

Class VI permit applicants will submit a draft AoR and Corrective Action Plan, including detailed modeling information supporting the AoR delineation and information about wells in the AoR. The AoR and Corrective Action Plan should be a narrative document that describes how the AoR delineation was conducted, identifies how the input parameters for the model were selected, and presents proposed strategies for reevaluations and corrective action. Permit applicants will also submit detailed modeling data (e.g., data inputs, information on processes modeled and the simulator used, assumptions, and outputs) to support a full evaluation of the AoR delineation. The UIC Program should verify that the plan provides an accurate and complete benchmark of the initial AoR delineation process, documenting the modeling process at a sufficient level of detail and clarity. Permit applicants should also provide detailed data on the wells in the AoR, information about their condition and depth, and, if necessary, the status of corrective action.

The UIC Program should perform a preliminary assessment of the plan and the modeling information to determine whether the submitted information is sufficient to evaluate: compliance with the rule requirements for computational modeling, AoR reevaluation procedures, and corrective action. As described below, this evaluation may involve conducting semi-independent or independent computational analyses (e.g., multiphase flow simulations of the proposed injection project). Therefore, when performing the preliminary assessment, the UIC Program should ensure that the permit applicant has submitted all information necessary for the comprehensive/technical evaluation. If the applicant used a proprietary model to delineate the AoR, the UIC Program should verify that the applicant provided sufficient information, including the code assumptions, relevant equations, and other information necessary to allow an independent review of the modeling effort. If any additional information or clarification is

needed, the UIC Program may need to request additional information or clarification to inform a completeness determination.

### ***Evaluation***

The bolded text below outlines a suggested approach that a UIC Program might employ to evaluate the AoR delineation and information on corrective action, submitted in a Class VI permit application, to confirm that an applicant's submittal meets the Class VI Rule requirements and informs the establishment of protective permit conditions.

**Conduct a comprehensive technical evaluation of the AoR delineation.** This evaluation of the applicant's AoR delineation modeling effort will involve a combination of qualitative and quantitative assessments. The recommendations below apply to a typical evaluation process; however, it is important to note that the evaluation process will need to be tailored to each project's specific conditions and each applicant's computational approach.

There will likely be no site-specific testing and monitoring data for model validation at this stage of a project. Therefore, the evaluation process aims at achieving three main goals:

1. An assessment of the conceptual model to verify that it is consistent with the site characterization component of the permit application (see Section 4.1.1) and that it provides an accurate representation of the geologic and operational systems.
2. An assessment of the computational/numerical model used to delineate the AoR to verify that it: accounts for all applicable chemical and physical characteristics of the injected carbon dioxide and displaced fluids; is constructed to reasonably and accurately represent the geologic and operational systems; and yields the necessary information to delineate the AoR.
3. An evaluation of the methodology used to delineate the AoR, based on the modeling results, to ensure that the AoR accurately represents the area where USDWs must be protected from endangerment.

Because every computational approach is only an approximation of an actual system, ensure that all simplifying assumptions used in the model and the AoR delineation are clearly stated. Furthermore, ensure that the modeling data and the information submitted in the AoR and Corrective Action Plan are sufficiently reproducible and accurate to ensure continuity and consistency in project operations and decision-making, given the typically long duration of Class VI projects. Recommendations for achieving these three goals are provided below.

**Evaluate the conceptual model and model inputs/assumptions** using qualitative methods and/or statistical evaluations (e.g., summary statistics, histograms, etc.) to verify that the model accurately represents the geologic and operational systems. If the project is to operate under an injection depth waiver, this assessment would extend to include information on the lower confining zone.

The data to evaluate include:

- **Model Domain, Coordinates, Boundaries, and Other Properties:** Evaluating model domain data and relevant figures (e.g., plan and cross-sectional views of the model domain) to ensure that submitted data files (e.g., grid data files) include the extent of the model in all dimensions and accurately represent the project site and injection/confining

formations, that the domain is sufficiently large to contain the predicted plume and pressure front, and that boundaries reflect the true hydrogeologic setting.

- **Rock Properties:** Determining whether the rock property data used in the model—such as rock type(s), porosity/permeability/rock type distributions, and constitutive relationships (e.g., relative permeability functions)—are consistent with the geologic data in the permit application. It is also important to ensure that the method for assigning the properties is clearly described and supported by relevant figures (e.g., cross-sectional/plan views of property distributions, graphs of functional forms of constitutive relationships).
- **Other Structural Properties:** Reviewing model inputs for any structural features that may affect containment of the plume, such as faults, folds, fractures, and permeability barriers. Ensure that all such structures identified during site characterization have been appropriately represented in the model.
- **Initial Conditions:** Determining if the initial conditions selected in the model accurately represent the baseline conditions established during site characterization. For example, these include the aqueous pressure, temperature, and salinity conditions in the injection formation.
- **Operational System:** Evaluating injection well construction and operational information to ensure that it is consistent with the relevant components of the permit application and that it incorporates any nearby injection/production operations in the injection formation.
- **Model Outputs:** Ensuring that the submitted data files adequately represent the extent of the plume and pressure in time-series (i.e., plan view or cross section) and that the submission includes associated images and descriptive time/location information. Other information needed to assess compliance with the rule requirements may include: certain pressure profiles (at injection and/or monitoring wells), carbon dioxide saturation profiles, an assessment of carbon dioxide partitioning into different phases (including trapped carbon dioxide) over time, and flux profiles along model boundaries.
- **Sensitivity Analyses:** Determining whether sensitivity analyses that are necessary to provide an understanding of model uncertainties were conducted. Note that sensitivity analyses are required to support a demonstration of an alternative PISC timeframe pursuant to 40 CFR 146.93(c)(2)(vi); see Section 4.1.9.

**Assess the applicant's computational/numerical modeling effort** to verify compliance with the rule requirements and appropriateness for the project. This may involve both qualitative evaluation of certain modeling aspects and independent or semi-independent quantitative modeling. Qualitative approaches used in this assessment may include evaluation of the following:

- **Simulator:** Ensuring that the simulator and references to equations of state present an approach consistent with the requirements of the Class VI Rule.
- **Processes Modeled:** Evaluating the subsurface processes in the applicant's model to verify that the model accurately accounts for all phases of the carbon dioxide and phase changes, and that the processes modeled are appropriate for the project. This may also include determining whether additional modeling approaches, such as reactive transport or geomechanical simulations, are necessary to accurately represent flow performance

over time, such as in carbonate or basalt formations where reactions with minerals may be significant.

- **Model Outputs:** Ensuring that the submitted output data files are consistent with the model results given in the narrative portion of the AoR and Corrective Action Plan, and evaluating AoR delineation modeling results to determine compliance with Class VI requirements, such as plume containment in the injection zone or fracture pressure limitations.
- **Sensitivity Analyses:** Determining whether sensitivity analyses (if used) include appropriate parameters and variabilities.

The quantitative component of the evaluation involves conducting independent or semi-independent modeling to assess the numerical/computational model used by the applicant. Note that the purpose of this effort is not to reproduce the applicant's procedures and arrive at the exact same results. Instead, the goal is to understand and evaluate the applicant's modeling activities and to confirm the general behavior of the system shown in their results. This approach would also allow additional numerical investigations/assessments, if needed. This evaluation may include the following steps:

- **Identifying the Independent or Semi-independent Modeling Approach:** Select methods and a tool or collection of tools that are appropriate for modeling the geologic and operational system at hand and account for the multiphase nature of carbon dioxide injection operations. Some examples of numerical simulators include Subsurface Transport over Multiple Phases (STOMP) and Transport of Unsaturated Groundwater and Heat (TOUGH). Analytical tools, such as the Area of Potential Impact (AoPI) modeling and mapping tool, may be more suitable to preliminary evaluations or understanding the general behavior of the plume and/or pressure front. More information on modeling tools is available in the *UIC Program Class VI Well Area of Review Evaluation and Corrective Action Guidance*.
- **Constructing the Model:** Construct a model that accurately represents the geologic and operational system. If the applicant's conceptual model has been confirmed to accurately represent the system, it can be used for this assessment. In some instances, it may be appropriate to use a modified version of the applicant's conceptual/geologic model; for example, to test the effects of certain geologic features, include additional subsurface processes, adjust rock property distributions, or develop an upscaled model for quicker simulation times.
- **Independent or Semi-independent Modeling Output and Comparison:** Run simulations and produce model outputs to assess plume size/shape, reservoir pressures, carbon dioxide saturation, and other relevant parameters. It may be appropriate to analyze changes in parameter values in time or assess spatial distributions of parameter values at certain times (depending on the results submitted by the applicant). Additional analyses that can be conducted include evaluating the pressure changes within the system to confirm that it never reaches the fracture pressure value or assessing carbon dioxide trapping and dissolution. Identify any significant discrepancies between the results submitted by the applicant and results from the new simulations. It is important to note that identical distributions cannot be expected from two different simulators or with

different inputs or processes. Therefore, evaluate the results for general consistency and in the context of ensuring non-endangerment of USDWs.

Based on the results of the qualitative and quantitative evaluation, review the AoR delineation modeling proposed by the permit applicant to ensure that it meets the requirements at 40 CFR 146.84. In addition, review the calculations that estimate the critical pressure and evaluate the AoR delineation based on the extent of the plume and pressure front estimates. See the *UIC Program Class VI Well Area of Review Evaluation and Corrective Action Guidance* for more details on methods that could be used for these calculations.

**Review information on the artificial penetrations identified within the AoR.** Confirm that the applicant used appropriate methods to identify all artificial penetrations throughout the AoR using database searches or other means and that the list of artificial penetrations is complete. If the list of artificial penetrations appears to be incomplete, ask the applicant to augment the list (e.g., by conducting more detailed surveys or database searches). See Section 4 of the *UIC Program Class VI Well Area of Review Evaluation and Corrective Action Guidance* for more details on methods that can be used for identifying artificial penetrations.

If any corrective action has already been performed, evaluate whether it was conducted in a manner that will prevent the movement of fluids into or between USDWs. Available forms of corrective action include well plugging and/or remedial cementing of an improperly abandoned well. Verify that corrective action was performed using carbon dioxide-resistant materials that are appropriate to project-specific geochemical conditions and of sufficient strength.

Also, discuss with the applicant which wells will have corrective action performed prior to commencing injection to gain agreement on an appropriate schedule for phased corrective action that is based on a well's location relative to predicted plume movement or well condition (and the corrective action methods they propose to use). If there is any indication that USDWs would be endangered by a phased corrective action approach, require that all corrective action be performed prior to injection; consider planned operating conditions, the physical and chemical characteristics of the carbon dioxide stream, the number of wells that need corrective action, or the rate of movement of the carbon dioxide plume and pressure front. (See Section 2.2 of the *UIC Program Class VI Well Project Plan Development Guidance* for additional considerations regarding Director's discretion to allow phased corrective action.)

**Verify that the applicant's proposed AoR and Corrective Action Plan meets the requirements of 40 CFR 146.84(b) and that it reflects the most up-to-date information on the AoR delineation and the review of corrective action information.** The AoR and Corrective Action Plan incorporated into the Class VI permit will include the results of the initial AoR delineation, the methods and schedule for all planned corrective action, and the results of any corrective action that has been performed. The plan is an important enforceable condition of the permit that will be used as a benchmark to guide AoR delineation modeling for reevaluations over the duration of the project and provide procedures and a justifiable schedule for performing all remaining corrective action on deficient wells. Therefore, the plan will need to be evaluated simultaneously with both the AoR delineation evaluation and the review of corrective action procedures, as described above.

The approved plan should describe the modeling and delineation that define the permitted AoR and incorporate relevant site-specific geologic, well construction, and operational data. Depending on the amount of interaction with the applicant and revisions to the delineation

approach in the course of the permit application review, it may be significantly revised from the initial plan submitted in the permit application.

Evaluate the proposed AoR reevaluation strategy to ensure that it is appropriate to the modeled predictions, operational conditions, and anticipated monitoring schedule. Confirm that the plan describes the conditions that would warrant a change in the AoR reevaluation schedule (e.g., based on the monitoring data that will be collected under the Testing and Monitoring Plan and the PISC and Site Closure Plan, operational changes, or induced seismicity or other unanticipated events). If there are substantial uncertainties in the determinations/models in the permit application that will not be addressed by pre-operational testing activities, consider requiring more frequent reevaluations. This approach may be particularly appropriate early in the injection phase (when unexpected results are most likely to arise), followed by a reduced reevaluation frequency in the out-years of the injection phase if the carbon dioxide plume and pressure front prove to move as predicted. Verify that the AoR delineation model considers planned post-injection phase testing and monitoring to facilitate a comparison of monitoring data and model predictions.

Verify that the corrective action strategies proposed in the AoR and Corrective Action Plan describe a reasonable effort to locate all artificial penetrations in the AoR, establish the condition of each, and identify any improperly plugged wells or other artificial penetrations that may endanger USDWs. Also assess whether planned remedial techniques and materials are appropriate. If phased corrective action is approved, confirm that the plan describes a suitable schedule and that there is adequate financial responsibility coverage for all corrective action (see Section 4.1.3).

**Before finalizing the AoR delineation modeling evaluation and approving the final AoR and Corrective Action Plan, confer with other members of the permit application review team** to determine whether any issues identified in the course of the permit application review may necessitate a revision to the modeling approach. For example, confirm that the most up-to-date geologic information and final operating conditions match the inputs to the AoR delineation model. Ensure that data to be collected under the pre-operational formation testing program will provide geologic information to fill in any data gaps and uncertainties associated with the modeling or the plan. Also, confirm that the final findings of the AoR delineation modeling are reflected in the evaluations of storage capacity and induced seismicity (see Section 4.1.1). If site characterization and modeling investigations suggest that induced seismicity is a concern, ensure that it is addressed in the Emergency and Remedial Response Plan. Confirm, in coordination with others on the review team, that the testing and monitoring strategies proposed for the injection and post-injection phases will produce the necessary data to support AoR reevaluations and the non-endangerment demonstration. A change in the size of the AoR may also necessitate revision of the Testing and Monitoring, PISC and Site Closure, and Emergency and Remedial Response Plans.

Communicate any changes to the AoR delineation or the final plan related to corrective action to the staff reviewing financial responsibility cost estimates to ensure that sufficient resources are set aside to fund corrective action on all wells in the AoR. For example, changes to the corrective action plan (e.g., the number of wells needing corrective action, the depth of newly identified wells, or any changes to the phased corrective action schedule) may affect cost estimates. Additionally, a larger AoR may affect the number of monitoring wells that would need to be

constructed (and therefore plugged), the resources for which emergency or remedial response may be needed, or the presence of a USDW in the AoR.

If the AoR delineation evaluation for a transitioning Class II project with an existing aquifer exemption results in a larger AoR that includes areas with TDS below 10,000 mg/L, discuss with the applicant the need to expand the areal extent of the aquifer exemption and the need to coordinate an aquifer exemption request with the AoR delineation modeling.

### ***Outcomes***

Following the review of the AoR delineation, evaluation of corrective action information, and approval of the AoR and Corrective Action Plan, the UIC Program should develop information about the review for inclusion in the permit file. Relevant materials include the following:

- Permit conditions for AoR and corrective action, including the corrective action activities that must be performed prior to injection;
- The approved AoR and Corrective Action Plan as an enforceable condition of the permit;
- A map of the approved delineated AoR; and
- A report documenting the evaluation of the AoR delineation and the corrective action efforts that documents/describes:
  - The approach used for the evaluation and its results;
  - Interactions and communication with the applicant;
  - The independent modeling and the results of the effort;
  - A determination regarding the appropriateness of the modeling approach and how it complies with the Class VI Rule; and
  - Any additional information requested as part of the pre-operational testing program to address identified uncertainties at the project site.

Any supporting documents (e.g., the AoR and Corrective Action Plan and completed reports) should be uploaded to the project's permit package area in the GSDT.

#### ***4.1.3 Financial Responsibility***

Class VI permit applicants must submit information to demonstrate financial responsibility for corrective action, injection well plugging, PISC and site closure, and emergency and remedial response [40 CFR 146.82(a)(14); 146.85(a)].

The purpose of the UIC Program's review of financial responsibility information is to verify that the proposed instruments are sufficiently funded to cover all applicable activities, in consideration of specific information about the project. The UIC Program should also review the financial instruments to ensure they have appropriate wording and provisions as described at 40 CFR 146.85. The goal of this review is to ensure that, in the event that owners or operators experience financial difficulties, financial resources are available for a third party (i.e., one that is retained by the EPA) to carry out activities related to closing and, if needed, remediating GS sites to ensure that USDWs are not endangered, without the use of taxpayer monies.

### ***Completeness Review***

Pursuant to 40 CFR 146.85, the permit applicant will submit cost estimates for corrective action, injection well plugging, PISC and site closure, and emergency and remedial response. Initially, as part of the permit application, applicants may submit only the cost numbers (as itemized tables and narratives about what is included in the cost estimates) and information about the types of financial instruments. (Banks, insurers, or other financial institutions may not provide the specific financial instruments until the UIC Program Director requires the instrument to be active, which may occur very late in the permitting process, i.e., close to the time that construction is authorized.)

To confirm that the submission is complete, the UIC Program should:

- Verify that the cost estimates address each of the covered activities and that the applicant plans to use one or more of the qualifying instruments at 40 CFR 146.85(a)(1) to cover the full amount of the cost estimates.
- Confirm that the applicant provided sufficient detail about what activities, equipment and materials, and assumptions about the project supported the cost estimates, along with information about the “dollar year” in which the estimate was presented and whether discounting was applied to the estimates for any activities.
- Confirm that these activities are consistent with information in other submittals, e.g., the number of wells that need corrective action as described in the AoR and Corrective Action Plan, procedures in the Injection Well Plugging Plan, the number and depth of monitoring wells in the Testing and Monitoring Plan that will need to be plugged, or potential response activities in the Emergency and Remedial Response Plan.

If any information is missing or unclear, the UIC Program should consider requesting additional information or posing clarifying questions.

### ***Evaluation***

The bolded text below outlines a suggested approach that a UIC permit writer might employ to evaluate financial responsibility cost information and draft financial instruments, submitted in a Class VI permit application, to confirm that an applicant’s submittal meets the requirements of the Class VI Rule and informs the establishment of protective permit conditions.

**Review the applicant’s cost estimates for each covered activity** to verify that the costs are accurate and sufficient to cover the actual costs of contracting an independent third party to conduct the activities and all related costs. (Note that such estimates may differ from the cost to the applicant of performing these activities using the owner or operator’s staff and equipment.) The EPA’s Financial Responsibility Cost Estimation Tool can support this evaluation by calculating an acceptable range of costs for relevant GS activities based on information submitted with a Class VI permit application. A copy of the Cost Estimation Tool is available in the resource library of the GSDT.

- Review the cost estimate for performing corrective action to confirm that the estimate is sufficient to cover the costs of the activities outlined in the AoR and Corrective Action Plan and accounts for the number, condition, and depths of all deficient wells in the AoR. It should also address the cost of completing any proposed phased corrective action.

- Verify that the cost estimate for plugging the injection well is sufficient to cover the cost of plugging an injection well of the proposed depth, including providing adequate amounts and types of cement and plugs to seal off all relevant subsurface layers. If the applicant plans to convert the well to another use following GS activities (e.g., for EOR/EGR), confirm that the costs estimated are for the cost of plugging the injection well to the surface (see Section 4.1.8). See Section 4.1.11 for information on financial responsibility for projects operating under injection depth waivers.
- Review the cost estimate for post-injection site care and verify that the estimate properly accounts for performing groundwater monitoring and carbon dioxide plume and pressure front tracking throughout the extent of the AoR. The estimate should account for the depth and proximity of USDWs or other formations that will need to be sampled and the number, frequency, and types of post-injection testing and monitoring that are described in the PISC and Site Closure Plan.
- Review the site closure cost estimate and verify that it accounts for completing all site closure activities described in the PISC and Site Closure Plan, particularly for plugging all of the monitoring wells described in the Testing and Monitoring Plan. Note that, even if the applicant plans to convert any monitoring wells for another use, the site closure cost estimate should cover the cost to plug these wells to the surface.
- Review the cost estimate for emergency and remedial response and verify that it accounts for the presence of all potentially affected resources within the AoR, all known endangerment scenarios, and proximity to nearby USDWs, communities, residences, and drinking water systems, as described in the Emergency and Remedial Response Plan.

#### The Financial Responsibility Cost Estimation Tool

The EPA's Cost Estimation Tool for Class VI Financial Responsibility Demonstrations is designed to provide an "acceptable range of costs" for GS financial responsibility activities based on information submitted with a permit application. The spreadsheet-based tool requests inputs about the proposed site, e.g., well depth, planned duration of the project and PISC timeframe, and size of the AoR. Based on this, it generates a range of cost estimates for required activities, e.g., corrective action, injection well plugging, PISC and site closure and emergency and remedial response. The cost estimates for each activity are intended to be accurate enough for UIC Programs to assess whether the financial responsibility cost estimates in the permit application are likely to be adequate, and can guide discussions between the UIC Program and the applicant during the permit application review process.

If any of the cost estimates do not appear to cover all aspects of the activities they are required to cover, discuss this with the applicant and, if necessary, request updated cost estimates. Verify that cost estimates for activities that will be performed many years into the future (e.g., phased corrective action, well plugging, PISC, or site closure) are appropriately inflated. For additional information on evaluating financial responsibility cost estimates, including whether they are appropriately inflated, see Appendix C of the *UIC Program Class VI Financial Responsibility Guidance*.

**Evaluate the financial instruments the applicant proposes to use.** Confirm that each financial responsibility instrument is suitable to the activities it will cover. Table 4-2 presents the preferred financial instruments for each activity based on the recommendations of the *UIC Program Class VI Financial Responsibility Guidance*.

**Table 4-2: Financial Instruments Recommended in the UIC Program Class VI Financial Responsibility Guidance**

Activity	Financial Instruments
Corrective action	Trust funds, letters of credit, surety bonds, escrow accounts, and financial tests and corporate guarantees.
Injection well plugging	Trust funds, letters of credit, surety bonds, insurance, and financial tests and corporate guarantees.
Post-injection site care and site closure	Trust funds, insurance, and financial tests and corporate guarantees.
Emergency and remedial response	Insurance and financial tests and corporate guarantees. (Letters of credit and surety bonds are well-suited to emergency and remedial response during the injection phase.)

Note that the above lists are not exhaustive of all options available for each GS activity or of all considerations for evaluating the adequacy of the financial instruments. If the applicant proposes instruments that are not included in the list of qualifying instruments at 40 CFR 146.85(a)(1), determine whether these alternative instruments adequately demonstrate financial responsibility and minimize the risk of costs being passed to the public, or what assurances of solvency the applicant can provide.

Confirm that the instruments the applicant proposes to use are secure and meet the requirements for qualifying instruments at 40 CFR 146.85(a) to facilitate enforceability and prevent gaps in coverage over the duration of the project. For example:

- For trust funds, confirm that the third-party administrator has a proven track record of effective management and is financially stable, and that the agreements include a description of the acceptable ways in which the trustee can invest the fund. Verify that the conditions under which payments can be authorized are identified.
- For surety bonds, confirm that the applicant has established a standby trust to receive any funding necessary to address the cost of covered activities. Also, verify that the applicant has demonstrated the financial stability of the surety, i.e., that the surety company is tested and approved under the U.S. Department of Treasury Circular 570.
- For payment bonds, confirm that the agreement specifies that the surety company will pay the bond's face value if the applicant does not provide a substitute demonstration of financial responsibility. For performance bonds, ensure that the agreement specifies that the surety company will pay a qualified third party to complete the activities covered by the bond.
- For a letter of credit, confirm that the letter is issued by a bank or other regulated financially stable institution, requires the issuing institution to provide notice if it does not plan to reissue the letter of credit, and includes a provision for automatic renewal. Confirm that the applicant has established a standby trust to receive any funding necessary to address the cost of covered activities.
- For independent third-party insurance, confirm that the policy has a face value that is at least equal to the estimated cost of the covered GS activities. If necessary, require the applicant to provide a certificate of insurance identifying general policy information and

a statement indicating that the insurer is providing financial assurance for the insured. Also, review the third party's credit rating or most recent bond rating and calculated financial ratios. If the third-party provider does not have a top credit rating (i.e., AAA, AA, A, or BBB for Standard & Poor's or Aaa, Aa, A, or Baa for Moody's), ensure that the applicant can demonstrate the equivalency of the rating with the recommended ratings.

- For an escrow account, confirm that the escrow agent will submit statements with the value of the escrow account at least annually, has demonstrated appropriate financial stability, and received concurrence on any additional deposits or release funds. Confirm that the trust is invested according to relevant legal requirements and the established agreement. Confirm that the applicant has established a standby trust to receive any funding necessary to address the cost of covered activities. In addition, as needed, approve requests for release of excess funds or ensure that deposits of additional funds will occur if the value of the account falls below GS activity cost estimates.
- For self-insurance, confirm that the applicant has met the required financial coverage criteria and has passed the required financial steps at 40 CFR 146.85(a)(6)(v). Also, review the supporting statements provided (e.g., 10-K report, auditor's opinion on the financial data provided by the Chief Financial Officer or Federal Energy Regulatory Commission Form 2 report) and evaluate the adequacy of the audit conducted.

Verify that the proposed financial instrument(s) have protective conditions of coverage, i.e., with cancellation, renewal, and continuation provisions and other conditions identified at 40 CFR 146.85(a)(4)(i). If any aspects of the proposed instruments are determined to be insufficient or do not meet the Class VI Rule requirements for qualifying instruments, request revisions or replacements to some or all of the instruments. For additional information on financial instruments, see the *UIC Program Class VI Financial Responsibility Guidance*. Additionally, the resource library of the GSDT contains a set of checklists to support the evaluation by tracking the information necessary to determine the adequacy of the applicant's financial responsibility demonstration.

#### Financial Responsibility needs for Long-Duration Class VI Projects

The long duration of some Class VI projects, in particular the long post-injection timeframe, may pose challenges for securing a financial instrument for the duration of the phase or project at the time of permitting. Third-party insurance providers typically issue insurance policies for a relatively short time (e.g., 3 to 5 years), and they may not be willing to issue an insurance policy for a phase that begins ten years in the future. In these situations, it may be necessary to work with the applicant and the third-party provider to establish an instrument that is flexible enough to accommodate the specific situation while adequately meeting the financial responsibility requirements. Provisions such as cancellation and renewal notification are important to ensure adequate time to establish and approve an alternative instrument should the original instrument fail to renew for the duration of the project or phase. For phases that occur far into the future, the applicant may also establish an interim instrument to meet the financial responsibility requirements at the time of permitting if it is not possible to secure the specific instrument at that time.

**Before approving the final cost estimates, coordinate with those performing other aspects of the permit application review** to ensure that the final cost estimates incorporate any changes identified in the course of the review. For example, if the AoR is determined to be larger than initially modeled or predictions about plume behavior change, this may impact the costs

associated with: the number of wells that require corrective action, the number of monitoring wells that would need to be constructed (and therefore plugged), resources for which emergency or remedial response may be needed, or the presence of a USDW in the AoR.

The presence of a USDW in the AoR can significantly affect potential emergency and remedial response costs, as these must address the potential for groundwater treatment per 40 CFR 146.85(a)(2)(iv). (Although the likelihood of any Class VI project encountering an emergency or contamination event is low, all project operators need to be financially capable of addressing an emergency. As such, financial responsibility cost estimates and the value of the instruments will likely be larger than the actual costs incurred at most sites.)

Modifications to the Testing and Monitoring Plan or the PISC and Site Closure Plan in the course of permitting discussions may necessitate revisions to the monitoring well plugging cost estimates. For example, the addition of more or deeper monitoring wells or increases to the length of the post-injection monitoring phase (or modifications to the alternative PISC timeframe) can affect the PISC cost estimate. Changes to the injection well's construction may affect the cost of well plugging. The final approved cost estimates should reflect any such changes to the project.

### ***Outcomes***

Following the review, the EPA recommends that the UIC Program develop the following financial responsibility information and upload it to the project's permit package area in the GSDT:

- Permit conditions for financial responsibility, including:
  - The type and value of the financial instrument(s) for all required activities based on the approved cost estimates;
  - Requirements to maintain financial resources for each activity until the relevant phase of the operation is complete or site closure is completed; and
  - A schedule for adjusting cost estimates and revising the financial instrument(s);
- A description of the enforceable financial responsibility conditions of the Class VI permit that includes: a summary of cost estimates by activity; copies of the instrument(s) to be used; and a pay-in schedule (if applicable); and
- A report summarizing the evaluation of the applicant's financial responsibility determination. The report might address the independent evaluation of whether the cost estimate is complete and sufficient and an evaluation of the language in the financial instruments.

#### ***4.1.4 Injection Well Construction***

Class VI permit applicants must submit proposed schematics and construction procedures for the injection well [40 CFR 146.82(a)(11),(12); 146.86].

The purpose of the UIC Program's evaluation of well construction information is to ensure that the injection well will be constructed in a manner that is appropriate to planned operations, is compatible with the carbon dioxide and subsurface chemistry, and will maintain integrity throughout its duration. Reviewing proposed injection well construction plans is necessary to ensure that the proposed well materials and cement have adequate strength and design

appropriate to the site-specific conditions; and to confirm injectate and formation fluid compatibility.

In addition, the EPA recommends reviewing the procedures for constructing monitoring wells with similar considerations for subsurface conditions to ensure that the monitoring wells will not become conduits for fluid movement. See Section 4.1.11 for additional information on evaluating the construction of wells for projects operating under injection depth waivers.

### ***Completeness Review***

Class VI permit applicants will submit proposed injection well construction procedures and schematics. The submittal will likely be in the form of a narrative document with associated schematics that describes how the applicant will construct the injection well to meet the goals of 40 CFR 146.86.

The UIC Program should perform a preliminary review of the proposed construction procedures to verify that they provide a sufficient level of detail to inform an evaluation. The applicant should describe the materials and cement to be used and demonstrate that they are compatible with the injectate and formation fluid geochemistry; the construction procedures should also identify the depths of the injection zone, any production zones, any formations with USDWs and other water-bearing formations.

The applicant should demonstrate that the proposed well materials, including casing, tubing, and cement, have sufficient strength to withstand the forces to which they will be subjected. The cementing plan should be sufficiently detailed to demonstrate that a continuous cement sheath will be provided from the injection zone to the surface. The locations of the packer and perforation intervals should be indicated. The applicant should also demonstrate that the well will be equipped with a continuous injection (i.e., injection rate and pressure) and annulus monitoring system, safety valves, and shut-off devices as required at 40 CFR 146.88(e).

If the applicant plans to convert an existing well to a Class VI well, confirm that they have provided information to demonstrate that the well was engineered and constructed to meet the requirements at 40 CFR 146.86(a) to ensure protection of USDWs (per 40 CFR 146.81(c)). They should submit as-built schematics; the results of tests performed during the well's construction; recent MIT results; and other information demonstrating the mechanical integrity, material strength and compatibility, and corrosion resistance of the well.

If any information is missing or is not presented in sufficient detail to inform an evaluation of the well construction or conversion plan, consider the need to request the missing information or send the applicant clarifying questions to inform the review.

### ***Evaluation***

The bolded text below outlines a suggested approach that a UIC Program might employ to evaluate well construction information, submitted in a Class VI permit application, to confirm that an applicant's submittal meets the requirements of the Class VI Rule and informs the establishment of protective permit conditions.

**Ensure that the materials planned for all well components are compatible with the planned injectate and formation fluids that may be encountered**, and that they can resist corrosion for the duration of the project. Compare the chemical resistances of all proposed well materials to the chemical composition of any fluids with which they may come into contact, including the

injectate (based on information provided in the permit application), formation fluids (based on any available geochemical data as informed by the site characterization), and resultant mixtures of carbon dioxide and subsurface fluids. Standard construction materials, such as carbon steel and Class G or H cement, may be adequate above the packer if the injectate is dry, i.e., containing less than 50 parts per million (ppm) water. However, if the injectate contains greater than 50 ppm water, corrosion-resistant materials should be used for any components that will contact the injectate, such as casing, tubing, packer, and cement. If sulfide, sulfate, or nitrate is present in either the injectate or formation fluids, confirm that well materials that will contact these fluids are resistant to those chemicals. Consider requiring cement additives or non-Portland cements to increase cement resistance if any of the following conditions are present in the injection well: wet carbon dioxide; high temperatures; presence (or potential presence) of sulfate, nitrate, or sulfide; or high flow rates of formation fluids (containing injected carbon dioxide) contacting the exterior of the well.

If the chemical resistance of any material is in doubt, request that the applicant provide certifications from the manufacturers of those materials or the results of corrosion tests, or consider specifying more frequent, ongoing corrosion testing during the injection phase (this should be described in the Testing and Monitoring Plan). If any of the materials are not compatible with the fluids they will contact over the duration of the project, require that the applicant resubmit construction plans that include materials with the appropriate chemical resistance.

Compare the inside diameter of the casing to the diameter of all equipment that is proposed to be lowered into the well for purposes of logging, monitoring, sampling, or performing workovers as described in the proposed operating plan or Testing and Monitoring Plan. If any piece of equipment is not small enough to fit in the well casing without getting stuck, require the logging equipment to be changed or a larger casing be installed. If the well is proposed to be constructed at an angle departing from vertical, compare the radius of curvature of the well to the length of each piece of equipment. If a deviated well is proposed, consult with the team reviewing geologic information and the AoR delineation modeling reviewer to ensure that the well's design is being considered in their reviews.

**Review the strength of all proposed well materials to ensure that they can resist all of the forces they will encounter.** These forces include burst pressure, collapse pressure, axial loading, compressive forces during installation, thermal stresses, and cyclic stresses caused by cycling injection on and off. For example, compare formation (external) pressure to collapse strength of the materials. Verify that formation pressures are based on, or are consistent with, the geologic characterization or ensure that this information will be collected as part of the pre-operational well testing program. Also, compare the planned injection pressure to the burst strength of the well materials and verify that the tensile strength of all well materials is adequate to sustain anticipated axial loads. If injection will not be continuous, consider the effects of cyclic changes in stress and temperature on well components. If the permit will include gradual shutdown procedures (see Section 4.1.6), verify that these procedures are appropriate to known information about the well's strength.

If it is not clear what stresses the well materials will experience, consider asking the applicant to provide stress calculations or models for the well component(s). If the well materials are not capable of resisting the stresses they will experience during the project, request that the applicant

propose stronger, alternative materials. Section 2.4 of the *UIC Program Class VI Well Construction Guidance* contains more details on stresses to consider in this review.

**Review the proposed cementing procedures** to ensure that they will provide a continuous sheath of cement from the bottom of each casing string to the surface. Ensure that the cement for the long-string casing will extend into the injection zone. Review the cementing plan to confirm that the cement will ensure external mechanical integrity across all fluid-containing zones in the well bore, especially the injection zone and any USDWs. Verify, in consultation with the reviewer of the geologic information, that all such fluid-containing zones are identified in well schematics and addressed in the cementing plan. Ensure that the surface casing extends below the depth of the lowermost USDW (unless an injection depth waiver is requested).

If necessary, require that cement additives be used. Cement additives may be necessary to ensure chemical compatibility, reduce cement loss, improve resistance to cyclic stress, or increase strength.

If cement staging is proposed, review the cementing plan to ensure that the cement will provide a continuous sheath for the length of the casing. If necessary, ask the applicant to provide information to support these reviews. Verify the necessity of staged cementing by comparing the weight of the cement column to the fracture pressure of relevant subsurface formations. Check records of nearby wells for records of lost cement to determine depths at which stage intervals might be necessary. Review the cementing plan to verify proper setting of each stage, proper bonding between the stages, and that cement ports will not be plugged by prior stages of cementing. Verify that the cement staging plan includes proper procedures, such as temperature logs, to locate each stage in order to form good bonding between stages and confirm that these are documented in the pre-operational well testing program. Refer to Section 2.5.1 of the *UIC Program Class VI Well Construction Guidance* for additional information on staged well cementing.

If the cementing plan as submitted will not provide a sheath of cement covering the entire casing length and provide external mechanical integrity to the well as required at 40 CFR 146.86(b), ask the applicant to submit a revised plan that includes proper cementing procedures.

**Review the submitted well schematics to ensure proper placement of the perforations and packer.** Ensure that the proposed perforations are entirely within the proposed injection zone. Verify that the packer is set within the confining layer and will be constructed of material that is compatible with carbon dioxide and carbon dioxide-water mixtures.

**Check that the well will be equipped with safety valves and shut-off devices** and verify that these devices will be linked to the continuous injection and annulus monitoring system and are designed to shut-in when injection or annulus pressures exceed specified parameters, as described in the operating conditions of the permit. See Section 4.1.6 for additional information about gradual or immediate shutdown of the well. If the well is offshore, verify that the construction plans include downhole shut-off devices. Consider requiring downhole shut-off devices for any onshore wells that have one or more of the following risk factors: high temperature, high pressure, presence of hydrogen sulfide, proximity to populated areas, or high likelihood of damage to the wellhead. Wells without downhole shut-off devices should have surface shut-off devices. Confirm with other members of the review team that activation of these devices is tied to operating requirements and that appropriate responses are described in the Emergency and Remedial Response Plan. Check that pressure gauges and flow meters have

adequate range and sensitivity to properly measure the planned flow rates and pressures. Confirm that the location of the devices is appropriate (e.g., bottomhole versus wellhead) to yield useful information.

**If an existing well is to be re-permitted as a Class VI well,** ensure, in consideration of requirements at 40 CFR 146.81(c), that the applicant has demonstrated the mechanical integrity, material strength, and material compatibility/corrosion resistance of the well, the ability of the well to accommodate testing and workover equipment, and that appropriate remedial actions have been or will be taken to address any deficiencies. Particular attention is needed to assess the condition of the well materials and cement at or above any USDWs, given the requirement at 40 CFR 146.86(a) that Class VI wells must be constructed to protect all USDWs. Below the lowermost USDW, there is less potential for unacceptable fluid movement to USDWs, so additional flexibility, e.g., the presence of cement across certain intervals, may be appropriate.

This evaluation will likely involve reviewing existing information about the well to ensure that it satisfies the requirements at 40 CFR 146.86(a) or to identify additional testing or repair that may be needed, given that injection pressures and volumes will likely be increased following re-permitting as a Class VI well. For example:

- Consult recent well logs and internal MIT results to verify that the well has retained its original integrity. If recent well logs or MIT results are not available, logs and MITs may need to be performed as part of the pre-operational well testing program.
- Review cementing records and external MIT results to ensure that the cement will prevent migration of all fluids out of the injection zone or between formations. While continuous cement to the surface is not required in converting wells, all subsurface layers containing fluids, such as water or hydrocarbons, should be isolated with cement.
- Review material strength and compatibility in the same manner as with new wells (see above). If any well materials are incompatible with carbon dioxide or the anticipated composition of carbon dioxide-water mixtures, request that they be replaced.

If it cannot be demonstrated that the well has the ability to maintain both internal and external mechanical integrity (i.e., to ensure that the well meets the requirements at 40 CFR 146.81(c)), the well should be repaired and retested. If the well cannot be satisfactorily repaired to meet the requirements, it cannot be used for Class VI injection.

### ***Outcomes***

Following review of information related to the Class VI well, the UIC Program should develop:

- Permit conditions for well construction that include:
  - Casing of suitable, carbon dioxide-compatible materials;
  - The name of the formation (i.e., the lowermost USDW) to which the surface casing must be cemented and the name of the injection zone to which the long-string casing must be cemented;
  - Construction details, e.g., open hole diameters and intervals, casing specifications, and tubing and packer specifications;
  - Cement materials and volumes and cement emplacement procedures (e.g., circulation of cement, if appropriate);

- Continuous injection pressure, rate, volume, and temperature and annulus pressure monitoring devices and automatic shut-off systems; and
- Any conditions for construction relevant to operating under an injection depth waiver to ensure that USDWs above and below the injection zone are protected.
- A summary of the enforceable construction conditions of the Class VI permit;
- Final approved well construction schematics;
- A document that identifies any deficiencies in the proposed construction plan and how the UIC Program worked with the applicant to address these, including additional testing or data collection to be performed during well construction; and
- Documentation of the evaluation that the applicant provided sufficient information on which to approve certain components of an existing injection well and a description of these components (if applicable).

Any supporting documents should be uploaded to the project's permit package area in the GSDT.

#### ***4.1.5 Pre-Operational Testing***

Permit applicants must submit a proposed pre-operational formation and well testing program that describes how they will test the well and analyze the chemical and physical characteristics of the injection and confining zones [40 CFR 146.82(a)(8); 146.87].

The purpose of the UIC Program's review of the proposed pre-operational testing program is to confirm that all tests required at 40 CFR 146.87 are planned and designed to collect the information needed to verify that the well is properly constructed; gather information on subsurface formations and fluid geochemistry; and address identified uncertainties. The UIC Program should also confirm that the pre-operational formation testing program, as proposed, will provide information to support the setting of operating conditions of the permit, provide inputs for modeling to delineate the final AoR (or confirm the assumptions on which the preliminary AoR delineation modeling was based), and establish a baseline for parameters that will be measured during the injection and post-injection phases.

#### ***Completeness Review***

The Class VI permit applicant's proposed pre-operational formation and well testing program will likely be a narrative description of the specific well and geologic tests that the applicant plans to perform to meet the requirements of 40 CFR 146.87.

The UIC Program should perform a preliminary review of the proposed pre-operational formation and well testing program to verify that it describes the specific testing procedures that will be performed, including their timing relative to well construction (i.e., before installation of surface casing and long-string casing). During this review, the UIC Program should confirm that the applicant documented QA procedures (e.g., water quality sampling protocols and custody procedures for core collection and analysis) and provided information about the qualifications of log and core analysts.

## ***Evaluation***

The bolded text below outlines a suggested approach that a UIC Program might employ to evaluate planned pre-operational testing information, submitted by a Class VI permit applicant, to confirm that the applicant's submittal meets the Class VI requirements and informs the establishment of protective permit conditions.

**Verify that the applicant plans to conduct all tests needed to evaluate that the well is properly drilled and constructed.** Confirm that the applicant plans to employ the best available techniques (as described in industry standard practices and technical guidances) and perform a full suite of logs and tests. Available logs and tests include: deviation checks, cement evaluation, caliper, cement bond, and temperature logs and video inspections. Confirm that the tests are planned to be performed at appropriate phases of well construction (i.e., after the cement for each casing string has been emplaced and allowed to set for the appropriate amount of time). Confirm that internal and external MITs are planned; arrange to witness these tests as necessary.

If the well has already been constructed (i.e., it is to be converted from an existing injection well or a stratigraphic test well), request that the applicant provide documentation of prior logs, MITs, or other tests to inform a demonstration that the well was engineered and constructed to meet the goals of 40 CFR 146.86. Additionally, confirm that the well has mechanical integrity, and that approving the well's construction is appropriate and will not allow injection of carbon dioxide that will endanger USDWs. See the *UIC Program Class VI Well Construction Guidance* for additional information on pre-operational well testing methods.

Additionally, consider the merits of requesting that the applicant tests deep monitoring wells (i.e., those that penetrate the confining zone) prior to project operation, in a similar manner to the pre-operational testing performed on the injection well.

**Verify that the pre-operational formation testing plan includes all logs necessary to evaluate and understand the subsurface geology** of the injection and confining zones, including their thicknesses, lithologies, porosities, and permeabilities. These logs include resistivity, spontaneous potential, porosity, gamma ray, and fracture finder logs. Evaluate the proposed testing in consultation with reviewers of the site's geology and the AoR delineation modeling to ensure that any identified uncertainties about site-specific conditions will be addressed. Section 4 of the *UIC Program Class VI Well Site Characterization Guidance* provides additional information on pre-operational formation testing methods.

**Confirm that the applicant plans to take cores of the injection and confining zones.** If the applicant proposes to submit information on cores previously taken near the injection well, confirm that they represent the properties of the injection and confining zones near the well and provide sufficient and representative information on their porosities, permeabilities, petrologies, and mineralogies to inform the geology review, AoR delineation modeling evaluation, and an assessment of the potential for mobilization of contaminants. Additionally, if there is evidence of heterogeneity (or uncertainty as to the homogeneity of the injection or confining zones), consider whether it would be beneficial to use the discretion afforded at 40 CFR 146.87(b) to request that additional cores be taken and analyzed to characterize the site geology as thoroughly as possible. If necessary to fully characterize the site, consider whether to request that cores be taken from layers in addition to the injection and confining zones and analyzed.

**Confirm that the applicant plans to determine fracture pressure and analyze the physical and chemical characteristics of the injection and confining zones and the fluids within these formations.** Ensure that the chemical analytes in the fluid analyses will provide sufficient data to assess the compatibility of the well with formation fluids, particularly when the carbon dioxide mixes with formation waters, and to fully characterize subsurface geochemistry and fluid chemistry. Verify that pressure fall-off tests and injectivity tests will provide sufficient data to evaluate that the proposed operations are suitable or to set the injection pressure limit in the permit. Confirm that a step-rate test to determine fracture pressure will be conducted under the appropriate conditions.

**Evaluate any additional testing that is necessary to ensure the integrity of the confining zone and protection of USDWs.** Additional testing may include seismic monitoring to determine if seismic activity may impact the confining zone. Monitoring may also be appropriate to determine whether there are faults that might be activated by injection activities. If surface air and/or soil gas monitoring is identified as part of an approach to monitor for potential carbon dioxide leaks, determine whether this is feasible given site conditions.

If an injection depth waiver is requested, confirm that sufficient formation testing is planned to provide adequate fracture pressure and geochemical data on the confining zones above and below the injection zone. Also ensure that testing of the well during construction will address the need to protect USDWs above and below the injection zone.

**Review a QASP or other documentation of QA procedures** that address the sampling and analysis of fluids or logging procedures in the pre-operational formation testing program. Verify that the appropriate parameters will be measured, including pH, temperature, pressure, and conductivity. Evaluate the equipment the applicant plans to use to conduct the tests (e.g., subsurface pressure gauges).

**Before approving the pre-operational well and formation testing program, consult with other members of the review team,** including the individuals reviewing the geologic information, to determine if there are significant uncertainties or data gaps about the site that could be addressed through well or formation testing. Additionally, confirm that the modelers have complete data inputs to characterize site geology and geochemistry in the model. If any such information is missing or incomplete, consider how the pre-operational formation and well testing program can address the data gaps or uncertainties.

### **Outcomes**

Following review and approval of the pre-operational testing program, the UIC Program should incorporate the following information into the permit file:

- Permit conditions for pre-operational testing that must be performed prior to authorizing injection, including requirements to report the results within 60 days after completion of the injection well;
- A pre-operational testing program as an enforceable part of the Class VI permit (if applicable); and
- Documentation of any reviews/evaluations that resulted in changes to or confirmed the appropriateness of the applicant's proposed pre-operational testing.

Any supporting documents (e.g., the pre-operational testing program) should be uploaded to the project's permit package area in the GSDT.

#### ***4.1.6 Proposed Operating Conditions***

Permit applicants must submit information on the proposed injection well operating conditions [40 CFR 146.82(a)(7),(9),(10); 146.88].

The purpose of the UIC Program's review of the proposed injection pressure, annulus pressure, and planned down-hole shut-off systems is to ensure that injection rates and volumes are appropriate to the site geology (considering any uncertainties identified in the course of site characterization) and the well's construction.

#### ***Completeness Review***

The applicant's proposed operating procedures will likely be a narrative document supported by tables and equipment schematics that identifies the proposed injection rates and pressures, the total volume of carbon dioxide to be injected over the duration of the project, and the physical and chemical characteristics of the carbon dioxide stream. The applicant should also present information about the proposed annulus pressure and the fluids to be used to fill the annulus between the casing and tubing. If the applicant proposes that the annulus pressure be less than the injection pressure, the UIC Program should confirm that they provided information to support the need for this condition. If well stimulation is anticipated, the applicant should also submit proposed stimulation procedures.

The UIC Program should perform a preliminary review of the proposed operating procedures to verify that the applicant provided information at a sufficient level of detail to inform an evaluation. During this review, the UIC Program should:

- Confirm that the permit application includes information demonstrating how the operating procedures were developed. For example, a reviewer should ensure that the maximum injection pressure is based on the fracture pressure of the injection zone (or any available information on fracture pressure) and that annulus pressure is suitable to the well's design and will not impact the well's integrity or induce formation fractures.
- Confirm that information about the carbon dioxide stream is based on chemical analyses that were performed pursuant to appropriate QA procedures and represent the source of the carbon dioxide.

If any information is missing or is not presented in sufficient detail to inform an evaluation of the proposed operations, the UIC Program should consider the need to request the missing information or send the applicant clarifying questions to inform the review.

#### ***Evaluation***

The bolded text below outlines a suggested approach that a UIC Program might employ to evaluate planned operational information, submitted by a Class VI permit applicant, to confirm that an applicant's submittal meets the requirements of the Class VI Rule and informs the establishment of protective permit conditions.

**Review the proposed maximum injection pressure** to confirm that it is no more than 90 percent of the fracture pressure of the injection zone. If information on the fracture pressure of the injection zone is pending the completion of formation testing, the draft permit conditions will

need to be reviewed and finalized before injection commences (see Section 5.1.5). If the proposed maximum fracture pressure is greater than 90 percent of the fracture pressure of the injection zone, require a change in the injection pressure to ensure compliance with 40 CFR 146.88(a). If there is uncertainty about the geologic characterization of the site or concerns about induced seismicity, consider whether setting an injection pressure that is less than 90 percent of the fracture pressure of the injection zone is appropriate. Also confirm that the well is designed to be of suitable strength to withstand anticipated pressures and maintain mechanical integrity.

**Review the proposed volume of carbon dioxide to be injected.** Confirm, in consultation with others on the permit application review team, that the injection zone has adequate capacity to receive the total anticipated volume of carbon dioxide (see 40 CFR 146.83(a)(1)) and that the confining zone is appropriately characterized and demonstrated to contain the carbon dioxide (see 40 CFR 146.83(a)(2)). This review should be coordinated with the geologic site characterization evaluation and the AoR delineation modeling review.

**Review the proposed annulus pressure** to ensure that it is greater than the injection pressure. If the applicant proposes that the annulus pressure be less than the injection pressure, verify that this is necessary by confirming that an annulus pressure above the injection pressure could impact the well's integrity or fracture the formation. Compare the annulus pressure to the burst pressure of the casing and the collapse pressure of the tubing and the formation fracture pressure. If the annulus pressure is close to any of these values, consider either requiring stronger tubular materials or reducing the required annulus pressure to a positive value that will not exceed the rated strength of the well casing or tubing or fracture the formation. If the proposed annulus pressure is not greater than the injection pressure and there is no danger to the well integrity caused by raising the pressure, require the annulus pressure to be increased to a pressure greater than the injection pressure. Also, verify that the fluid with which the applicant proposes to fill the annulus between the casing and tubing is compatible with all well components and is non-corrosive.

**If well stimulation is anticipated, review the proposed procedures** to ensure that well integrity will be maintained and that the confining zone will not be fractured. Compare proposed stimulation pressures to well material strength and formation fracture pressures and compare the composition of any stimulation chemicals proposed to the chemical resistance of the well materials. If it appears that any proposed stimulation procedures might harm the well or fracture the confining layer, require that the stimulation plan be revised or do not allow stimulation. If it is not clear whether stimulation procedures might damage the well or confining layer, consider requesting modeling of the stimulation activity and resultant fracture patterns or increased monitoring of pressure and other variables with appropriate safeguards during stimulation.

**Review information about the physical and chemical characteristics of the carbon dioxide stream.** Verify, in consultation with others on the permit application review team, that there are no concerns related to potential interactions with subsurface fluids based on available information about their geochemical composition or implications for the suitability of the well materials. If the carbon dioxide is anticipated to contain any hazardous components, work with the applicant to determine whether they plan to meet applicable requirements under RCRA related to obtaining a conditional exclusion from the definition of hazardous waste under 40 CFR 261.4(h); see Section 3.4.

**Consider including injection well shutdown procedures in the permit's operating conditions.** The Class VI Rule requires, under certain circumstances, that operators immediately cease injection. However, there may be circumstances where immediately ceasing injection could pose greater endangerment potential (i.e., by placing additional stresses on the well) than a gradual reduction in the injection rate over a number of hours or days. Describing the gradual shutdown procedures in advance can help ensure expeditious implementation of a shutdown process that is appropriate to the well's construction and the situation if the need arises. Either the operating conditions or the Emergency and Remedial Response Plan should specify under what circumstances immediate vs. gradual shutdowns would be employed and the specific procedures to be followed. Consult with the engineer reviewing the well's design to confirm that installation of required automatic shut-off equipment is planned.

**Before establishing the operating conditions in the permit, confer with other members of the permit application review team** to determine whether any issues identified in the course of the review may necessitate revisions. For example, verify that any revised information about the site's geology (i.e., fracture pressure, injection zone storage capacity, seismic history, or the presence of faults or fractures)

does not affect the assumptions on which limits on injection pressures or the total carbon dioxide volumes are based. Also, verify that the proposed well construction materials can withstand the stresses that will be imposed by injection at anticipated pressures and the planned well testing procedures. Verify that the proposed injection pressure and volumes are consistent with the inputs of the AoR delineation modeling (or are revised as needed based on adjustments in the approved final AoR delineation model) and any analyses of geologic suitability (particularly storage capacity estimates). Section 4 of the *UIC Program Class VI Well Construction Guidance* provides additional information on operating requirements for Class VI wells.

#### **Incorporating Project-Specific Startup Procedures**

As with shutdown procedures, there may be situations where gradual startup of injection could help address site-specific uncertainties, e.g., pressure at the well immediately after the start of injection. A gradual or "step-wise" startup of injection could help manage pressure development and ensure that the project does not violate any permit conditions during this period. Consider specifying a schedule (i.e., a number of days or weeks) over which injection rates would gradually increase to permitted levels. Increased monitoring and reporting of operating data or other parameters during the first few days of injection can help verify that startup was successful. Alternatively, reporting of initial monitoring results in advance of the first semi-annual report can help to confirm that the project is operating as anticipated.

#### **Outcomes**

Following the evaluation and approval of operating requirements, the UIC Program should develop the following:

- Permit conditions for injection well operation, including:
  - Injection limits, including maximum injection pressure and maximum and average daily injection volume and rate limits;
  - The source, location, and percentages of constituents in the carbon dioxide stream;
  - Prohibition of injection between the outermost casing and the well bore;

- A requirement that a positive pressure be maintained on the annulus and mechanical integrity be maintained at all times;
- Requirements for the use and maintenance of an automatic warning and automatic shut-off system; and
- Procedures for gradually shutting down the well and situations where the owner or operator must cease injection (if appropriate).
- A summary of the enforceable operating requirements in the Class VI permit; and
- Documentation of any reviews/evaluations that resulted in changes to the applicant's proposed operating conditions or confirmed the appropriateness of the operating limits.

Any supporting documents should be uploaded to the project's permit package area in the GSDT.

#### **4.1.7 Testing and Monitoring**

The Class VI Rule requires Class VI permit applicants to develop and implement a comprehensive testing and monitoring plan for their projects that includes injectate monitoring, corrosion monitoring of the well's tubular, mechanical, and cement components, mechanical integrity testing, pressure fall-off testing, groundwater quality monitoring, carbon dioxide plume and pressure front tracking, and, at the UIC Program Director's discretion, surface air and/or soil gas monitoring [40 CFR 146.82(a)(15); 146.89; 146.90].

The purpose of the UIC Program's evaluation of the applicant's proposed Testing and Monitoring Plan is to ensure that the testing and monitoring procedures will be appropriate to planned operations, the well's construction, and site-specific geologic conditions. The UIC Program should ensure that the Testing and Monitoring Plan is designed to generate information over the duration of the project to:

- Demonstrate that the well is maintaining mechanical integrity, the site is operating as planned, and the carbon dioxide plume and pressure front are behaving as predicted;
- Provide essential points of comparison for modeled predictions, allowing for validation of the AoR delineation model and helping to address uncertainties during AoR reevaluations; and
- Form the basis of the non-endangerment demonstration that must be made before the owner or operator may proceed with site closure.

The UIC Program should also ensure that planned monitoring locations, methods, frequencies, parameters, etc., contribute to a comprehensive, tailored strategy for evaluating the performance of the project against modeled predictions and determining how other required activities will be implemented.

See the *UIC Program Class VI Well Testing and Monitoring Guidance* for additional information on testing and monitoring procedures for Class VI projects; also see the *UIC Program Class VI Well Project Plan Development Guidance* for additional information on evaluating Testing and Monitoring Plans.

### ***Completeness Review***

Class VI permit applicants will submit a draft Testing and Monitoring Plan, which will likely be in the form of a narrative document that describes the proposed testing and monitoring activities, and be accompanied by any supplemental materials related to or supporting the plan. Ideally, the Testing and Monitoring Plan should explain the purpose of each proposed activity and how its results will contribute to the data needs of the project to inform review of the plan and justify associated permitting decisions. The applicant must also submit a Quality Assurance Surveillance Plan (QASP) for all testing and monitoring activities, per 40 CFR 146.90(k).

The UIC Program should perform a preliminary review of the draft Testing and Monitoring Plan to verify that it provides a sufficient level of detail to inform an evaluation. For example, the plan should describe the methods to be used to perform all required testing and monitoring. The testing frequency, parameters/detection limits, and locations should be clearly described, and the monitoring locations should be representative of the entire delineated AoR in three dimensions. Furthermore, the UIC Program should verify that the plan includes a proposed schedule for all testing and monitoring, ideally with specific dates on or by which various tests will be performed each year. If any information is missing or is not presented in sufficient detail to inform an evaluation of the Testing and Monitoring Plan, the UIC Program should consider the need to request the missing information or send the applicant clarifying questions.

### ***Evaluation***

The bolded text below outlines a suggested approach that a UIC Program might employ to evaluate a Class VI permit applicant's proposed Testing and Monitoring Plan, to confirm that the submittal meets the requirements of the Class VI Rule and informs the establishment of protective permit conditions.

It is important to note that the post-injection phase groundwater, plume, and pressure front monitoring in the PISC and Site Closure Plan (see Section 4.1.9) is an extension of the injection phase testing and monitoring, and the results from both monitoring programs contribute to the non-endangerment demonstration that the applicant must perform pursuant to 40 CFR 146.93(b). The EPA recommends that the review of the injection and post-injection phase testing and monitoring be done concurrently. To facilitate this type of review, the EPA developed a spreadsheet-based template to summarize a testing and monitoring strategy that complies with 40 CFR 146.90(d) and (g), and that includes baseline, injection, and post-injection activities. The template, which is available in the resource library of the GSDT, can serve as a point of discussion between the applicant and the UIC Program. Figure 4-2 presents an overview of the content of the template (and examples of some, but not all, types of monitoring that could be employed). For additional information and considerations for reviewing testing and monitoring results, see Section 6.1.

**Review the proposed plan to ensure that all of the testing and monitoring activities that are required in the Class VI Rule are included and are appropriate to site-specific geologic and operating conditions.** Throughout the course of the review, consider how the Testing and Monitoring Plan will be implemented over the duration of the project (particularly for long-term projects), and whether any aspect of the plan would need to be modified to address anticipated changes to the site or operations. Discuss with the applicant whether incorporating the deployment of future monitoring technologies into the plan (e.g., bringing additional monitoring wells online after injection commences) may be appropriate. If so, incorporate a deployment

schedule into the plan to avoid the need for future modifications of the plan and permit. The plan should include specific, quantitative triggers for increasing or decreasing monitoring frequency or adjusting other aspects of the testing and monitoring program.

**Review plans to analyze the carbon dioxide stream.** Verify that the parameters for which the carbon dioxide stream will be analyzed—and the associated analytical procedures—are consistent with those analyzed by the applicant to meet the requirement to characterize the carbon dioxide stream per 40 CFR 146.82(a)(7)(iv). Ensure that these analyses will provide the necessary information for any components of the testing and monitoring strategy that may rely on them—for example, if the owner or operator plans to use a certain constituent of the carbon dioxide stream to help track the migration of the plume, it should be included in the carbon dioxide stream analysis at an appropriate level of precision. If the applicant anticipates that the source of the carbon dioxide will vary over the duration of the project, more frequent carbon dioxide stream analyses may be necessary, and flexibility may be needed to revise the analytical parameters (and associated QA procedures) in the plan.

**Verify that all planned well testing is appropriate to the well's construction and the proposed operating conditions.** The Testing and Monitoring Plan must include plans for quarterly corrosion monitoring; continuous recording of injection pressure, rate, and volume to evaluate internal mechanical integrity; and annual external MITs, including an approved tracer survey (such as an oxygen-activation log) or a temperature or noise log [40 CFR 146.90(b),(c),(e)]. Confirm that corrosion monitoring will be performed using materials representative of the casing, tubing, and packer. If the applicant proposes the use of alternative MITs, evaluate these in the context of the planned construction of the injection well and inform the applicant that the MIT must be approved by the EPA Administrator [40 CFR 146.89(g)]. If appropriate to ensure that an adequate amount of corrosion monitoring is performed, consider requesting that the plan include performing casing inspection logs. Available logging techniques include caliper log, electromagnetic thickness survey, pipe analysis survey, or ultrasonic imaging surveys.

Ensure that the plan includes the sampling and recording frequencies for all continuous monitoring methods. In addition, ensure that the proposed operational monitoring program will detect any triggers for responses specified in the Emergency and Remedial Response Plan (e.g., exceedances of annulus or injection pressures).

**Confirm that the applicant plans to conduct a pressure fall-off test at least once every five years.** Any procedures for pressure fall-off tests that are specified in the Testing and Monitoring Plan should be consistent with the needs of Class VI projects; standardized procedures used for other well classes may not be appropriate.

**Figure 4-2: Examples of Class VI Groundwater Monitoring and Plume and Pressure Front Tracking Activities**

Monitoring Category/ Class VI Rule Citation	Target Formation	Monitoring Activity	Data Collection Location(s)	Spatial Coverage or Depth	Frequency (Baseline)	Frequency (Injection Phase)	Frequency (Post-Injection)
<b>Groundwater Monitoring Above Confining Zone</b> [40 CFR 146.90(d)]	USDW	Fluid sampling					
	Formation above confining zone	Fluid sampling					
<b>Indirect Monitoring Above Confining Zone</b> [40 CFR 146.90(d)]	Formation above confining zone	2D seismic survey					
<b>Direct Plume Monitoring</b> [40 CFR 146.90(g)]	Injection zone	U-tube fluid sampling

<b>Direct Pressure Front Monitoring</b> [40 CFR 146.90(g)]	Injection zone	Pressure monitoring					
<b>Indirect Pressure Front Monitoring</b> [40 CFR 146.90(g)]	Injection zone	InSAR with continuous GPS					
<b>Other Related Monitoring</b> [40 CFR 146.90(i)]	Multiple	Passive seismic monitoring					

**Evaluate the applicant's groundwater quality monitoring.** Confirm that planned groundwater monitoring is sufficient to ensure non-endangerment to USDWs throughout the delineated AoR, considering site-specific conditions, baseline conditions, AoR delineation modeling results, operational parameters, and the presence of artificial penetrations in the AoR. Monitoring wells should be located in the predicted direction of plume movement and in the vicinity of any known or potential fluid migration pathways for carbon dioxide or mobilized fluids. Also, the groundwater monitoring plan should include sampling and analysis for TDS or any contaminants of concern (e.g., mercury or hydrogen sulfide) that could be mobilized. Also confirm that samples will be taken at appropriate depths. In general, the EPA recommends that owners or operators sample in the first reasonably permeable formation above the confining zone (i.e., the first formation from which fluids can be extracted at appreciable volumes for sampling and analysis). Sampling in other zones, such as shallow USDWs used as drinking water sources, can help to demonstrate that USDWs are protected. If the applicant is requesting an injection depth waiver, confirm that the first USDW below the injection zone will be monitored.

Review the schematics of the monitoring wells to ensure that they are sited and constructed such that they will not corrode or provide a conduit for fluid movement that could endanger USDWs. It may be appropriate for those reviewing the injection well construction information to also evaluate the monitoring wells' construction to ensure that the monitoring well materials are suitable to the anticipated composition of the carbon dioxide and carbon dioxide-water mixtures. Ensure that the owner or operator has made arrangements to access the monitoring wells, particularly in cases where the project is anticipated to last for many years.

Because groundwater quality data will eventually support the demonstration of non-endangerment, consider whether the groundwater monitoring plan will collect a sufficient amount of data at/with appropriate locations, methods, frequencies, and parameters to inform the demonstration. If the applicant proposes an alternative PISC timeframe, consider whether the proposed groundwater monitoring frequency will ensure the collection of sufficient data to support the non-endangerment demonstration. To allow comparison of injection and post-injection phase water quality to baseline conditions, sampling and analysis methods and target parameters should be consistent with those used to collect baseline data, either submitted with the permit application or to be gathered during pre-operational testing (see Section 4.1.5). In addition to the direct groundwater sampling required by 40 CFR 146.90(d), indirect methods such as seismic surveys may also be used to monitor conditions above the confining zone.

**Review plans for tracking the extent of the carbon dioxide plume and pressure front.** Verify that plans for carbon dioxide plume and pressure front tracking include the use of both direct methods for tracking the pressure front within the injection zone [40 CFR 146.90(g)(1)] and indirect geophysical techniques to track the extent of the carbon dioxide plume unless, based on site-specific geology, such methods are not appropriate [40 CFR 146.90(g)(2)]. Where possible, a strategy consisting of both direct and indirect plume and pressure front tracking methods is recommended to facilitate comparisons with modeled predictions, allow early identification of unanticipated subsurface behavior or potential impacts to USDWs, and provide data to support a non-endangerment demonstration.

Direct carbon dioxide plume monitoring is performed via geochemical sampling in monitoring wells in the injection zone, while direct pressure front monitoring may be achieved using downhole pressure transducers. As with groundwater monitoring, direct plume and pressure front monitoring strategies should reflect site-specific characteristics and AoR delineation model

predictions. For example, the frequency and timing of sampling in the injection zone should be sufficient to capture the arrival of the plume at specified monitoring locations at the arrival times predicted by the model. Analytical parameters and methods used for injection zone fluid monitoring should be appropriate for the subsurface fluids described during site characterization. Indirect geophysical methods to monitor the plume and pressure front may include seismic, electrical, gravity, electromagnetic, or other techniques. If the applicant submits a plan that does not include indirect plume tracking methods, evaluate the site-specific geology to verify that such methods are not appropriate.

**Review plans for surface air and/or soil gas monitoring (if applicable).** The rule affords the UIC Program Director discretion at 40 CFR 146.90(h) to require surface air and/or soil gas monitoring to detect movement of fluid that could endanger USDWs within the AoR. The need for this monitoring may be informed by or considered to address uncertainties identified during the geologic characterization of the site, e.g., in areas where there may be potential for carbon dioxide movement to the surface. If surface air and/or soil gas monitoring is needed, the applicant may be able to demonstrate that monitoring employed under Subpart RR of 40 CFR Part 98 meets the requirements for the Class VI Testing and Monitoring Plan (additional information on Subpart RR monitoring is presented in Section 3.4).

**Review any additional monitoring proposed by the applicant.** Additional monitoring that an applicant may propose includes passive seismic monitoring, the use of tracers, or surface deformation measurement techniques (such as satellite-based elevation measurements or tiltmeters). If, based on site-specific conditions, additional monitoring is needed to sufficiently assess the behavior of the Class VI project, address uncertainties identified during site characterization, or protect USDWs from endangerment, request that the plan include appropriate additional monitoring using the authority provided at 40 CFR 146.90(i).

**Verify that the plan includes a QASP** that describes the standard procedures and practices that will be employed to ensure data quality for all testing and monitoring procedures. The QASP should describe sampling methods; sample handling and custody; analytical methods; quality control; instrument/equipment testing, inspection, and maintenance; data management, e.g., recordkeeping and tracking practices; and data review, verification, and validation procedures. The QASP does not need to re-state monitoring timing, frequency, location, analytes, etc. (except specifically in the context of quality assurance) or other information that is included in the Testing and Monitoring Plan. Verify that all of the testing activities, analytes, etc., included in the QASP are consistent with the body of the Testing and Monitoring Plan.

**Discuss whether any issues or changes identified by others on the permit application review team might necessitate changes to the Testing and Monitoring Plan.** Most significantly, the locations, frequencies, and analytical parameters tested pursuant to the Testing and Monitoring Plan should allow comparisons against baseline data and/or modeled predictions to support an evaluation of project operations, confirm modeled predictions of the carbon dioxide plume and pressure front movement, and contribute to AoR reevaluations and a non-endangerment demonstration. Therefore, the Testing and Monitoring Plan should be reviewed in conjunction with, and in consideration of, the AoR delineation modeling effort and associated reviews, e.g., a demonstration of an alternative PISC timeframe.

Additionally, changes to the well construction and operating conditions from those described in the initial permit application may have implications for corrosion testing, continuous monitoring,

and mechanical integrity testing procedures. Concerns about seismicity or uncertainties about the seismic history of the site raised during site characterization may also necessitate the inclusion of passive seismic monitoring.

### ***Outcomes***

Following the evaluation and approval of the Testing and Monitoring Plan, the UIC Program should incorporate the following information into the permit file:

- Permit conditions for testing and monitoring and MITs;
- The approved Testing and Monitoring Plan as an enforceable condition of the permit;
- An approved QASP that addresses all activities in the Testing and Monitoring Plan;
- Approved plans for construction of all monitoring wells; and
- A report documenting the review of the Testing and Monitoring Plan, including how the approved plan addresses any identified deficiencies in the proposed plan or uncertainties about the site, supports AoR reevaluations and the non-endangerment demonstration, and considers what is known about site geology and the behavior of the carbon dioxide plume and pressure front.

Any supporting documents (e.g., the Testing and Monitoring Plan, the QASP, and any reports documenting the review) should be uploaded to the project's permit package area in the GSDT.

#### ***4.1.8 Injection Well Plugging***

Class VI permit applicants must submit a plan to plug the injection well in a manner that protects USDWs [40 CFR 146.82(a)(16); 146.92].

The purpose of the UIC Program's evaluation of the proposed Injection Well Plugging Plan is to ensure that the proposed materials and procedures for injection well plugging are appropriate to the well's approved construction and the site's geology and geochemistry. This evaluation is important to ensure that the injection well will not serve as a conduit for fluid movement that could endanger USDWs following cessation of injection.

#### ***Completeness Review***

The draft Injection Well Plugging Plan will likely be a narrative document with associated schematics that describes how the applicant will plug the injection well in accordance with the requirements at 40 CFR 146.92.

The UIC Program should perform a preliminary review of the draft Injection Well Plugging Plan to verify that it provides information at a sufficient level of detail to inform an evaluation. For example, the plan should describe the plugs and the cement to be used and demonstrate that they are compatible with the injectate, formation fluid geochemistry, and subsurface geology. Plugging schematics should identify the depths of the injection zone, any production zones, any formations with USDWs, and other water-bearing formations. The method of plug placement and preliminary cement volume calculations should also be included. If any information is missing or is not presented in sufficient detail to inform an evaluation of the Injection Well Plugging Plan, the UIC Program should consider the need to request the missing information or send the applicant clarifying questions to inform the review.

## Evaluation

The bolded text below outlines a suggested approach that a UIC Program might employ to evaluate the proposed Injection Well Plugging Plan, submitted by a Class VI permit applicant, to confirm that the submittal meets the requirements of the Class VI Rule and informs the establishment of protective permit conditions.

**Confirm that the proposed Injection Well Plugging Plan meets the requirements at 40 CFR 146.92.** The review should be done in coordination with reviewing the well's construction and schematics.

Verify that the proposed plugs and cement are suitable to the injectate and formation fluid geochemistry, including any geochemical changes anticipated during the injection phase as informed by an evaluation of geochemistry.

Also verify that the plugging is appropriate to the planned construction of the well, e.g., to the sizes and depths of the various casing strings.

Review the Injection Well Plugging Plan against data on subsurface formations to verify that the placement of the plugs and cement are at appropriate depths. Consider the depths of the injection zone, any production zones, any formations with USDWs and other water-bearing formations, or other geologic features.

Review the cement calculations to confirm that the planned cement is sufficient to cover all relevant hydrocarbon- or water-bearing formations. Check that the plug placement procedures are adequate to properly clean the well bore, prevent contamination of the plugging fluid, allow proper fluid stability, and allow for sufficient setting time.

While not required under the Class VI Rule, evaluating monitoring well plugging procedures in conjunction with the same considerations for the review of the Injection Well Plugging Plan will help ensure that the monitoring wells will be plugged in a manner that is appropriate to the subsurface geochemical conditions of the Class VI project and ensure USDW protection.

**Before approving the final Injection Well Plugging Plan, consult with other members of the permit application review team** to determine whether any questions identified in the course of other aspects of the permit application review may necessitate a revision to the plan. In particular, verify that the final Injection Well Plugging Plan is consistent with the well's approved construction. Additionally, any revised information about the site's geology (e.g., the

### Conversion of the Class VI Well Following Injection

If the applicant intends to convert the injection well to use it for another purpose following cessation of Class VI injection (e.g., to another UIC well class or a monitoring or production well), it may be appropriate to address this in the Injection Well Plugging Plan. For example, if the well will be used for injection into another, shallower formation, such as for enhanced oil or gas recovery (EOR/EGR), the Injection Well Plugging Plan should describe how the well would be plugged from the carbon dioxide injection zone to the hydrocarbon-bearing formation in a way that ensures proper cementing across any intervening porous or water-bearing formations. The plan should also describe procedures for plugging the well to the surface to address the possibility that the planned EOR/EGR operation does not commence or the applicant experiences financial difficulties and is unable to continue the injection operation (in this event, sufficient financial resources would be needed to plug the well, and the financial responsibility cost estimates for well plugging to the surface must be adequate). If the applicant plans to convert the injection well to a monitoring or production well, the Injection Well Plugging Plan should describe how this conversion would be implemented, including flushing the well and removing or changing equipment; procedures for eventual plugging per 40 CFR 146.92 must also be described in the Injection Well Plugging Plan.

depth of subsurface water- and hydrocarbon-bearing formations) and changes to, or uncertainties about, the predicted composition of carbon dioxide-water mixtures may affect the appropriateness of well plugging procedures.

If the applicant is requesting an injection depth waiver, confirm that the proposed well plugging will protect USDWs above and below the injection zone. If any aspects of the proposed Injection Well Plugging Plan change based on the review, alert the staff reviewing the financial responsibility cost estimates that the estimates to plug the well may need to be revised.

For additional information on evaluating Injection Well Plugging Plans, see the *UIC Program Class VI Well Project Plan Development Guidance*. See Section 2 of the *UIC Program Class VI Well Plugging, Post-Injection Site Care, and Site Closure Guidance* for additional information on Class VI injection well plugging procedures.

### **Outcomes**

Following the review and approval of the Injection Well Plugging Plan, the UIC Program should develop and upload the following to the project's permit package area in the GSDT:

- Permit conditions for injection well plugging and requirements for advance notice of, and reporting following, plugging the injection well;
- The approved Injection Well Plugging Plan as an enforceable condition of the permit; and
- A report documenting the review of the Injection Well Plugging Plan that describes any deficiencies identified, issues raised and discussed with the applicant, and how the final plan addresses these issues.

#### **4.1.9 Post-Injection Site Care and Site Closure**

Class VI permit applicants must submit a PISC and Site Closure Plan that outlines the proposed post-injection monitoring strategies and how non-endangerment of USDWs will be ensured throughout the PISC phase [40 CFR 146.82(a)(17); 146.93]. The applicant may also submit a demonstration of an alternative post-injection site care timeframe per 40 CFR 146.82(a)(18).

The purpose of the UIC Program's review of the PISC and Site Closure Plan is to ensure that planned post-injection phase activities are appropriate to the project and address known uncertainties or data gaps. If the applicant submitted a demonstration of an alternative PISC timeframe, the UIC Program should evaluate the demonstration to ensure that it is suitable to the site-specific conditions, of an appropriate duration, and informed by modeling predictions.

The UIC Program can also use the review as an opportunity to ensure, in coordination with the owner or operator, that the PISC and Site Closure Plan includes appropriate monitoring to validate modeled predictions, inform AoR reevaluations during the post-injection phase, and demonstrate non-endangerment. For additional information on evaluating the PISC and Site Closure Plan, see the *UIC Program Class VI Well Project Plan Development Guidance*.

### **Completeness Review**

The draft PISC and Site Closure Plan should be a narrative document that describes how the applicant will meet the requirements at 40 CFR 146.93, including performing post-injection groundwater monitoring and plume and pressure front tracking, plugging the monitoring wells, and closing the site. It should be supported by maps and cross sections depicting the plume and

pressure front and schematics showing how the monitoring wells will be plugged. The applicant should also submit a QASP or otherwise provide QA procedures for post-injection phase testing and monitoring; for example, by incorporating the necessary information about post-injection monitoring into the Testing and Monitoring Plan's QASP.

If the applicant submits a demonstration of an alternative PISC timeframe as part of the permit application, the UIC Program should verify that it includes the specific technical information required to support an alternative PISC timeframe demonstration at 40 CFR 146.93(c). This may include a combination of new files and references to other components of the permit application, as applicable and appropriate.

Additionally, the UIC Program should perform a preliminary review of the draft PISC and Site Closure Plan to verify that it provides information at a sufficient level of detail to inform an evaluation. For example, the plan should describe the methods the applicant will use to perform all required post-injection testing and monitoring, a schedule for performing all planned testing, analytes/detection limits, and locations that are representative of the entire delineated AoR. The plan should also describe how monitoring wells will be plugged, and include schematics and a description of plugging and cementing procedures. If any information is missing or is not presented in sufficient detail to inform an evaluation of the PISC and Site Closure Plan, consider the need to request the missing information or send the applicant clarifying questions about the plan.

### *Evaluation*

The bolded text below outlines a suggested approach that a UIC Program might employ to evaluate a Class VI permit applicant's proposed PISC and Site Closure Plan, to confirm that the submitted information meets the requirements of the Class VI Rule and informs the establishment of protective permit conditions.

**Verify that the predictions of pressure decline and fluid movement in the PISC and Site Closure Plan are consistent with AoR delineation modeling,** reflecting site characterization

and proposed operating data. The Class VI Rule requires that the plan describe the pre- and post-injection pressure differential and the predicted position of the carbon dioxide plume and associated pressure front at site closure [40 CFR 146.93(a)(2)(i),(ii)]. Verify that this information is incorporated into the plan and that it is consistent with the outputs of the modeling performed for AoR delineation as verified by those reviewing the AoR information.

**Review the applicant's plans for post-injection monitoring.** The Class VI Rule does not specify monitoring methods that must be used during the post-injection phase; instead, the monitoring program should be tailored to the project-specific characteristics, identified risks, and data needs for the non-endangerment demonstration. The

EPA anticipates that, in many cases, post-injection monitoring activities will be an extension of

#### **Reducing Monitoring Frequency during PISC**

It is possible that, as pressures decline and the plume and pressure front begin to equilibrate and plume movement slows, less frequent monitoring may be needed. If any decreases in monitoring frequency are proposed, it may be appropriate for the PISC and Site Closure Plan to identify specific quantitative triggers that would result in decreased monitoring activities or frequency. For example, the plan may specify that the frequency of certain monitoring activities could decrease from monthly to semi-annually when pressure (as measured at a certain location) returns to a certain percent above baseline levels. Providing this level of specificity would allow the applicant to reduce the monitoring frequency without needing to amend the plan (and possibly modify the permit). If such triggers are specified, baseline measurements should be taken as part of the pre-operational testing procedures.

those performed during the injection phase (and described in the Testing and Monitoring Plan). Although, the agency acknowledges that the Class VI regulations are designed to accommodate new technologies or site-specific monitoring changes (e.g., frequency) on a project-specific basis. (See Section 4.1.7 for additional information on evaluating testing and monitoring strategies for Class VI projects.) Verify that the post-injection monitoring strategy is suitable to track the location of carbon dioxide and other mobilized constituents within the injection zone, track fluid pressures, and monitor the integrity of monitoring wells and former injection wells. As with injection phase monitoring, this monitoring should target any areas of potential USDW endangerment identified in the site characterization process and reflect any contaminants of concern that may be mobilized as a result of geochemical changes. If surface air and/or soil gas monitoring or passive seismic monitoring will be required during the injection phase, consider whether this should continue during part or all of the post-injection monitoring phase.

Verify that the proposed injection and post-injection phase testing and monitoring programs will, as an overall strategy, generate a sufficient amount of data to support AoR reevaluations and a non-endangerment demonstration. This is particularly important if the applicant submits a demonstration of an alternative PISC timeframe. If the applicant plans to request an alternative PISC timeframe, ensure that they understand that the PISC and Site Closure Plan will need to include the collection of a sufficient amount of monitoring data on which to base a non-endangerment demonstration. Because there will be fewer years over which to collect data, more frequent groundwater monitoring or plume and pressure front tracking may be appropriate to ensure collection of sufficient data to validate modeled predictions of pressure decline and reductions in the rate of plume movement. For example, verify that a sufficient number of monitoring samples will be taken at appropriate locations and the number of geophysical surveys will generate a sufficient amount of data on which to base a non-endangerment demonstration. Verify that the QASP addresses all post-injection testing and monitoring activities.

**Review the alternative PISC timeframe demonstration if the applicant submits one.**

Evaluate the information provided to ensure that an alternative timeframe would be protective of USDWs, according to the requirements at 40 CFR 146.93(c). Verify that the demonstration agrees with predictions of plume and pressure front movement in the AoR delineation model. However, note that 40 CFR 146.93(c)(2) contains additional requirements for alternative PISC timeframe demonstrations that are not specified for AoR delineations, such as the use of sensitivity analyses to address key areas of uncertainty. Also verify that the geologic data on which the demonstration is based agree with the site characterization component of the permit application, the planned operating data, the physical and chemical characteristics of the carbon dioxide stream, and predicted interactions between carbon dioxide and formation fluids.

If the alternative PISC timeframe demonstration is not sufficient, does not meet the requirements and criteria at 40 CFR 146.93(c), or the modeling effort does not appropriately address uncertainty, discuss these findings with the permit applicant. Options may include:

**Plans for Carbon Dioxide Production and the PISC Timeframe**

If the applicant plans to eventually produce the carbon dioxide from the formation, they may base a demonstration that an alternative PISC timeframe is appropriate on subsurface pressure reductions associated with withdrawal of the carbon dioxide. Such a demonstration would be acceptable; however, PISC will need to continue until the carbon dioxide is withdrawn and reductions in pressures and the rate of plume movement are observed.

- Discussing the information submitted and revising the alternative PISC timeframe demonstration during the pre-construction phase; or
- Using the 50-year default PISC timeframe and relying on operational and monitoring data generated during the injection or post-injection phases to support a stronger demonstration, at a later time, that an alternative timeframe is appropriate. A future change to the PISC timeframe may necessitate an amendment to the PISC and Site Closure Plan.

For additional information on the alternative post-injection site care timeframe, see Section 3.2.2 of the *UIC Program Class VI Well Plugging, Post-Injection Site Care, and Site Closure Guidance*.

**Encourage the applicant to submit proposed non-endangerment demonstration criteria.**

While there are no requirements for providing the criteria for the non-endangerment demonstration with the permit application, describing and agreeing upon the criteria that will be used for the non-endangerment demonstration reduces future uncertainty. This can also help ensure that the operator plans to collect the types and amounts of data that are needed to inform a demonstration that site closure is appropriate (per 40 CFR 146.93(b)(3)), particularly if an alternative PISC timeframe is anticipated.

The Class VI Rule does not specify the content of the non-endangerment demonstration. However, the EPA recommends that the non-endangerment demonstration address: available groundwater and plume monitoring data; comparison of monitoring data to model predictions; evaluation of the carbon dioxide plume and reservoir pressure; and an evaluation of any unanticipated events that occurred during the project. See Section 3.4 of the *UIC Program Class VI Well Plugging, Post-Injection Site Care, and Site Closure Guidance* for additional information on non-endangerment demonstrations.

In coordination with the applicant, identify specific criteria on which the non-endangerment demonstration would be made and ensure that the criteria can be supported by the data the applicant proposes to collect during injection and post-injection testing and monitoring. For example, verify that the monitoring data will be able to be compared with baseline data on fluid chemistry collected during the site characterization process and validate modeled predictions of plume and pressure front behavior. Consider specifying these criteria—and what will happen if a demonstration of non-endangerment cannot be made—in the PISC and Site Closure Plan. Additionally, ensure that baseline data have been, or will be, collected prior to commencing injection.

**Review plans for monitoring well plugging and site closure.** Confirm that the applicant proposes to use proper plugs and cement in all monitoring wells and that they are of suitable construction and at appropriate depths. As with injection well plugging, the monitoring well plugging plans should consider the depth of water and hydrocarbon-bearing formations, subsurface geochemistry, and the predicted composition of carbon dioxide-water mixtures. Review the schematics of the monitoring wells' construction and plugging concurrently to ensure consistency.

Confirm that the plan describes site closure and site restoration activities. These may include removing all surface equipment and restoring the site to its prior condition (e.g., planting vegetation).

**Before approving the final PISC and Site Closure Plan, discuss the plan with other members of the permit application review team** to determine whether any issues identified in the course of the permit application review may necessitate changes to the plan. For example, changes to operating procedures or updated geologic information may affect predictions of pressure decline and the position of the plume. Additionally, the non-endangerment demonstration criteria or evaluation of a demonstration of an alternative PISC timeframe should reflect any changes to the evaluation of site geology and the findings of the AoR delineation modeling, account for the approved operating conditions, and reflect data to be gathered during injection and post-injection phase testing and monitoring. Monitoring well plugging procedures should reflect any revised information about the site's geology and predictions about the composition of carbon dioxide-water mixtures.

As with injection-phase testing and monitoring, ensure that the proposed post-injection monitoring program will detect any triggers for responses specified in the Emergency and Remedial Response Plan.

If any aspects of the PISC and Site Closure Plan change based on the review, alert the staff reviewing the financial responsibility cost estimates that the estimates for PISC and/or site closure may need to be revised.

### ***Outcomes***

Following the review and approval of the PISC and Site Closure Plan and related information, the UIC Program should develop the following information:

- Permit conditions for PISC and site closure;
- The approved PISC and Site Closure Plan as an enforceable condition of the permit;
- An approved QASP for all post-injection testing and monitoring activities;
- A report documenting the review of the PISC and Site Closure Plan that summarizes the review process and how the approved plan addresses any uncertainties about the site and ensures non-endangerment of USDWs; and
- A report that documents the alternative post-injection site care timeframe review, including how the information provided meets the criteria at 40 CFR 146.93(c)(1) and (2) and supports the determination that an alternative post-injection site care timeframe is appropriate.

Any supporting documents (e.g., the final PISC and Site Closure Plan) should be uploaded to the project's permit package area in the GSDT.

#### ***4.1.10 Emergency and Remedial Response***

The Class VI Rule requires owners or operators to develop and maintain an Emergency and Remedial Response Plan that describes actions to be taken to address events that could potentially cause endangerment to a USDW during the construction, operation, and PISC phases of a project [40 CFR 146.82(a)(19); 146.94].

The purpose of the UIC Program's evaluation of the Emergency and Remedial Response Plan is to ensure expeditious and appropriate responses to protect USDWs from endangerment should an emergency event occur. The UIC Program should ensure that procedures are in place to address

the potential endangerment to all identified resources near the well, based on site-specific information including site geology, the extent of the AoR, and operating conditions.

### ***Completeness Review***

The draft Emergency and Remedial Response Plan should be a narrative document supported by maps and images that describes how the permit applicant will meet the requirements at 40 CFR 146.94, including how they plan to address any potential emergency or unforeseen event at the well and all resources within the AoR.

The UIC Program should perform a preliminary review of the draft Emergency and Remedial Response Plan to verify that it provides information at a sufficient level of detail to inform an evaluation. For example, the plan should describe all potentially impacted resources throughout the geographic extent of the AoR and include detailed and event-specific procedures to address emergency events. It should also identify response personnel and include a plan to communicate with the public. If any information is missing or is not presented in sufficient detail to inform an evaluation of the Emergency and Remedial Response Plan, the UIC Program should consider the need to request the missing information or send the applicant clarifying questions about the plan.

### ***Evaluation***

The bolded text below outlines a suggested approach that a UIC Program might employ to evaluate a Class VI permit applicant's proposed Emergency and Remedial Response Plan to confirm that the submittal meets the requirements of the Class VI Rule and informs the establishment of protective permit conditions.

**Review the proposed Emergency and Remedial Response Plan to ensure that it meets the requirements at 40 CFR 146.94,** it accounts for all risks identified within the AoR, and that planned responses will be adequate for mitigating any adverse events that may arise. Some considerations include the following:

- Confirm that, for all resources throughout the approved AoR, the Emergency and Remedial Response Plan identifies potential risk scenarios and adverse events. Special consideration should be given to events with the highest potential of occurring or that may have the highest impacts.
- Verify that planned response activities are appropriate to the risk scenarios and their potential impacts. While the specific details of response planning are not included in the Class VI Rule, the EPA recommends that, for each scenario identified, the plan describe: the anticipated severity of the event, the phase during which the event could occur (i.e., injection and/or post-injection phases), proposed avoidance measures, detection methods, and response actions, including the personnel and equipment that would be employed.
- Confirm that response equipment and trained personnel are available to respond to adverse events. The plan should include contact information for response personnel, a communications plan, and a description of staff training and exercise procedures.

For additional information on evaluating Emergency and Remedial Response Plans, see the *UIC Program Class VI Well Project Plan Development Guidance*.

**Before approving the final Emergency and Remedial Response Plan, discuss whether any issues identified by others on the permit application review team may necessitate a revision to the plan.** For example, changes reflected in the final approved extent of the AoR may impact what resources should be addressed in the Emergency and Remedial Response Plan. Any uncertainties or new information about the site's geology may necessitate consideration of additional carbon dioxide migration or groundwater contamination scenarios. Concerns about seismic history, the presence of faults in the AoR, or induced seismicity may impact the final procedures for responding to seismic activity. See Section 4.1.11 for additional information on emergency and remedial response planning for projects operating under injection depth waivers.

Confirm that the Testing and Monitoring and PISC and Site Closure plans include procedures for quickly detecting situations that may endanger USDWs, particularly where there is uncertainty about any aspects of the project. Communicate any changes to the final Emergency and Remedial Response Plan to staff reviewing financial responsibility cost estimates to ensure that sufficient resources are set aside for emergency actions.

### ***Outcomes***

Following review and approval of the Emergency and Remedial Response Plan, the UIC Program should develop the following information for inclusion in the permit file:

- Permit conditions for emergency and remedial response;
- The approved Emergency and Remedial Response Plan as an enforceable condition of the permit; and
- A report documenting the review of the Emergency and Remedial Response Plan that describes any deficiencies identified, issues raised and discussed with the applicant, and how the final plan addresses these issues.

Any supporting documents (e.g., the Emergency and Remedial Response Plan and any reports documenting the review) should be uploaded to the project's permit package area in the GSDT.

### ***4.1.11 Injection Depth Waivers***

Class VI permit applicants seeking to inject above the lowermost USDW must submit a request for an injection depth waiver [40 CFR 146.82(d); 146.95(a)]. The injection depth waiver provisions of the Class VI Rule afford flexibility to allow injection into non-USDW formations while ensuring that USDWs above and below the injection zone are protected from endangerment where the lowermost USDW is very deep.

Figure 4-3 illustrates the type of geologic setting under which injection depth waivers would be necessary. The panel on the left presents a "typical" Class VI injection scenario (i.e., where an injection depth waiver would not be needed) and the panel on the right shows injection into a non-USDW that lies above the lowermost USDW, where an injection depth waiver could be needed to allow injection at that site.

The purpose of the UIC Program's evaluation of an injection depth waiver application is to ensure that USDWs above and below the injection zone are protected from endangerment if the project operates under an injection depth waiver. The UIC Program should work with the owner or operator to consider, on a site-specific basis, the implications, benefits, and challenges associated with GS, water availability, and USDW protection where an injection depth waiver is

being considered. Following the review, the UIC Program Director will forward information to the EPA Regional Administrator, who must concur on the issuance of an injection depth waiver [40 CFR 146.95(d)].

Figure 4-3: Geologic Scenarios for Injection Depth Waivers

### ***Completeness Review***

Class VI permit applicants seeking an injection depth waiver will likely submit a narrative report that addresses each element at 40 CFR 146.95. The report should include information on the upper and lower confining zones; the storage capacity of the injection zone; information on drinking water resources and water supply needs and plans for securing alternative water resources or treating USDWs; and hydrocarbon or mineral resource exploitation. The waiver application should be supported by maps, logs, model outputs, and other relevant data.

The injection depth waiver application is a separate submittal from the Class VI permit application. Because the permit application and the waiver application report serve different purposes, the applicant must, per 40 CFR 146.95(a), include a demonstration in the injection depth waiver application that is complete and provides the appropriate context (i.e., describes confinement above and below the injection zone). However, the waiver application report may

reference background information in the permit application, provided it is readily available to the reviewer and its relevance to the injection depth waiver is clearly explained in the waiver application report.

The UIC Program should perform a preliminary review to verify that the waiver application includes all of the information required at 40 CFR 146.95(a) and that it is based on the site-specific geology, modeling, and operational data described in the Class VI permit application, with information and data about the lower confining zone at the same level of detail as information in the Class VI permit application. If information provided in the waiver application about the injection zone, the modeled AoR, planned construction, or planned testing and monitoring does not agree with the Class VI permit application, the UIC Program should discuss any discrepancies with the applicant and consider requesting that the waiver application and/or the permit application be revised accordingly.

### ***Evaluation***

The review of the injection depth waiver application should parallel the review of the Class VI permit application. However, where injection depth waivers are sought, this information will be evaluated in the context of protecting USDWs above *and* below the injection zone.

In addition to evaluating the injection depth waiver application, permitting authorities must consult with the Directors of the PWSS Programs of all states, territories, and tribes, having jurisdiction within the AoR, about the proposed waiver; notify the public; and forward the injection depth waiver application to the EPA Regional Administrator for approval, per 40 CFR 146.95(b) and (c) and as described below.

The bolded text below outlines a suggested approach that a UIC Program might employ to evaluate a Class VI injection depth waiver application, to confirm that an applicant's submittal meets the requirements of the Class VI Rule and to inform: a decision on whether to grant an injection depth waiver, and the establishment of permit conditions that protect USDWs above and below the injection zone.

**Review the injection depth waiver application.** The elements defined at 40 CFR 146.95(b)(1) that the UIC Program Director must document in referring the injection depth waiver to the EPA Regional Administrator are described below. A list of websites and databases that could support the review of information required at 40 CFR 146.95 (b) and (c) is available in the resource library of the GSDT.

- **Review information on the integrity of the upper and lower confining zones** [40 CFR 146.95(b)(1)(i)]. Review the geologic maps, geophysical survey results, geomechanical data (including information on faults and fractures), and permeability and porosity data that were submitted to confirm the presence of laterally continuous, impermeable confining units above and below the injection zone. Verify that adequate data have been submitted, including appropriate data collection/testing methods, number of samples, etc., to characterize confining zones above and below the injection zone.
- **Evaluate the suitability of the injection zone** [40 CFR 146.95(b)(1)(ii)]. Consider whether the injection zone outcrops within the AoR or is hydraulically connected to a USDW above or below the injection zone that could be impacted by the injection. Verify that the injection zone is laterally continuous based on maps, cross sections, and geophysical survey results, and whether confining units above and below it form a clear

separation between the injection zone and any other formations. Evaluate whether porosity and permeability data support a determination that the injection zone will be suitable for the proposed injection activities and will not allow for unacceptable pressure buildup. Review analyses of formation solids and fluid geochemistry to verify that dissolution or precipitation reactions will not affect injectivity or liberate contaminants.

- **Evaluate the capacity of the geologic formation to sequester carbon dioxide,** considering information submitted on the availability of alternative sites, including their capacity, depth, and location [40 CFR 146.95(b)(1)(iii)]. Review the information submitted by the applicant to ensure that it is consistent with other information about the proposed site provided elsewhere in the injection depth waiver application and in the Class VI permit application, including storage capacity estimates as confirmed by the independent AoR delineation modeling. (The applicant's modeling must also demonstrate that USDWs above and below the injection zone will not be endangered as a result of fluid movement, per 40 CFR 146.95(a)(3).) If alternative injection zones below the lowermost USDW exist, discuss with the applicant whether such formations are more suitable than injection zones above or between USDWs. See Section 4.1.1 for additional information on evaluating confining zone integrity, the suitability of the injection and confining zones, and storage capacity estimates.
- **Verify that the applicant's proposed Emergency and Remedial Response Plan addresses all risks** in the AoR, including any endangerment to USDWs below the injection zone. Also, **review the financial responsibility demonstration** to ensure that the applicant has sufficient resources to respond to potential endangerment to USDWs below the injection zone, including the cost of securing alternative water resources or treating USDWs in the event of contamination [40 CFR 146.95(b)(1)(iv)]. This evaluation should consider the applicant's description of how the Testing and Monitoring Plan and other plans will ensure protection of USDWs above and below the injection zone.
- **Evaluate information regarding community needs, demands, and supply from drinking water resources** and planned needs, and potential and/or future use of USDWs and non-USDWs in the area [40 CFR 146.95(b)(1)(v),(vi),(vii)]. Confirm that the applicant provided information on all drinking water supplies within the AoR. Verify that projections of future uses of USDWs and non-USDWs consider anticipated land use changes over the duration of the Class VI project and that the information provided is consistent with other geologic data presented in the injection depth waiver application and the Class VI permit application. Note that some information that could support an evaluation of water resources (e.g., related to public or private drinking water wells) may not be publicly available for the applicant to access; if so, consider whether UIC Program staff should request this information from the appropriate agency as part of the waiver evaluation.
- **Evaluate information submitted related to any planned or potential hydrocarbon or mineral resource exploitation** near the proposed site [40 CFR 146.95(b)(1)(vii)] to determine if there are any plans to drill through the formation to access resources above or beneath the proposed injection zone(s). Consider mineral rights leases in formations above and below the injection zone, information on current (and potential future) resource exploitation, and whether such activities could provide potential conduits for fluid migration to USDWs.

- **Evaluate the applicant's proposed plan for securing alternative water resources or treating USDWs** in the event of contamination [40 CFR 146.95(b)(1)(viii)]. Verify that the submitted plans for obtaining alternative drinking water resources are technologically and economically feasible and include adequate quantities of water to address current and projected needs. These plans should be reflected in the Emergency and Remedial Response Plan.

**Review the construction plans for the well to confirm that it will be protective of USDWs above and below the injection zone**, as required at 40 CFR 146.95(f)(2). Confirm that the casing and cement are designed to prevent movement of fluid into unauthorized zones, including USDWs, above and below the injection zone [40 CFR 146.95(f)(2)(ii)]. Verify that any penetrations through the upper or lower confining zone will be plugged or cased and cemented with materials that are compatible with injected and native fluids. Also confirm that the surface casing will extend below any USDWs that lie above the injection zone and be cemented to the surface [40 CFR 146.95(f)(2)(iii)]. See Section 4.1.4 above for additional information on reviewing the construction of Class VI wells.

If the information presented in the waiver application supports a determination that operating under an injection depth waiver will be protective of USDWs above and below the injection zone, initiate consultations and notifications as described below. If there is inadequate information in the application, work with the applicant to determine whether additional information can be provided or to identify other suitable injection zones.

**Consult with the Directors of the PWSS Programs** of all states, territories, and tribes having jurisdiction within the AoR of a well for which an injection depth waiver is sought per 40 CFR 146.95(b)(2). The purpose of this communication is to ensure that water system interests are considered in a waiver application review. While there is no required format or process for the consultation, a recommended template of a letter to a PWSS Director is available in the resource library of the GSDT. Respond to any questions from the PWSS Directors about the project. These questions may cover topics such as: how potential contamination has been considered and expeditious responses will be ensured, the relationship of the injection well to all public water systems and USDWs, or the composition or volumes of carbon dioxide to be injected. Document the results of the consultation.

**Notify the public that an injection depth waiver application has been submitted** per 40 CFR 146.95(c). The public notification of the injection depth waiver can occur concurrently with notification of the Class VI permit application; however, the notice should make it clear that the site, if permitted, would be operating under an injection depth waiver. Include information on the depth of the injection zone; the location of the well; the name and depth of all USDWs; a map of the AoR; the names of any public water supplies affected, reasonably likely to be affected, or served by USDWs in the AoR; and the results of the consultation with the PWSS Director(s). Evaluate and respond to all public comments about the injection depth waiver.

**Provide all relevant information to the EPA Regional Administrator** for concurrence regarding the injection depth waiver. Provide the results of the evaluation of the information listed in 40 CFR 146.95(b)(1), documentation of the PWSS Director consultation, and responses to public comments on the proposed waiver. The EPA Regional Administrator will review all of the information about the project collected during the waiver application and the public notice process and make a final decision regarding the waiver [40 CFR 146.95(d)].

If necessary to support a determination regarding the protectiveness of injection above or between USDWs, the EPA Regional Administrator has the authority to request that additional

information be provided [40 CFR 146.95(d)(1)]. If the EPA Regional Administrator requests additional information, ask the permit applicant for more details. If substantially more or different information is provided and the EPA Regional Administrator requests re-initiation of the public notice process, notify the public of the revised waiver application.

Based on the information provided, the EPA Regional Administrator will provide written concurrence or non-concurrence regarding the waiver. Four outcomes of the review of the injection depth waiver application are possible:

1. If the EPA Regional Administrator concurs with the waiver (and all other aspects of the permit application are acceptable), prepare a draft Class VI permit that identifies the proposed injection zone and includes additional permit conditions for projects operating under injection depth waivers related to well construction and testing and monitoring (see the “outcomes” discussion below for additional information).
2. If the application for a waiver is acceptable in most respects, e.g., the site is generally suitable, but there are deficiencies in the waiver application report (e.g., insufficient data or detail are present to support a determination), work with the applicant to determine whether the waiver application can be updated and resubmitted for approval. Discuss the specific information needs with the owner or operator to determine whether the waiver application can be updated (and, if so, which portions require revision). Re-initiation of the public notification process may be necessary, as determined by the EPA Regional Administrator.
3. If available information indicates that another suitable injection formation exists, the owner or operator may apply for a Class VI permit to inject into that formation. In such cases, the owner or operator would need to resubmit a Class VI permit application, providing specific information about the alternate formation.
4. If an injection depth waiver application is denied because, based on the review, injection above or between USDWs would endanger USDWs and there is no suitable target injection formation for which a waiver would not be required or other injection options exist, then a Class VI permit cannot be issued at the proposed site.

An injection depth waiver may not be issued without written concurrence by the EPA Regional Administrator [40 CFR 146.95(d)(2)].

### ***Outcomes***

Following the evaluation of the injection depth waiver application, the UIC Program should develop the following information:

- Permit conditions related to operation under the injection depth waiver, such as:
  - Conditions for designing the casing and cement to prevent fluid movement into unauthorized zones, including USDWs, above and below the injection zone [40 CFR 146.95(f)(2)(ii)], including surface casing that extends through the base of the lowest USDW above the injection zone and is cemented to the surface [40 CFR 146.95(f)(2)(iii)];
  - Conditions for additional direct monitoring during the injection and post-injection phases in the first USDW above and the first USDW below the injection formation [40 CFR 146.95(f)(3)(i); 146.95(f)(4)(i)];

- Conditions for additional indirect monitoring during the injection and post-injection phases unless, based on site-specific geology, such methods are not appropriate for the specific site [40 CFR 146.95(f)(3)(ii); 146.95(f)(4)(ii)]; and
- Other conditions that may be necessary, based on site-specific geology, to ensure protection of USDWs above and below the injection zones [40 CFR 146.95(f)(5)], which may include:
  - Injection pressure limits that address the fracture pressures of the confining zones above and below the injection zone;
  - Additional monitoring that may be necessary to identify endangerment of USDWs;
  - Injection well plugging conditions that are necessary to protect USDWs above and below the injection zone; or
  - Emergency and remedial response considerations for impacts on public water supplies affected, likely to be affected, or served by USDWs in the AoR and plans for securing alternative resources or treating USDWs in the event of contamination.
- A report documenting the evaluation of the injection depth waiver application that describes any identified deficiencies or concerns with the waiver application, how uncertainties are being addressed, and a determination that the site is suitable for operating under an injection depth waiver;
- Documentation of consultation with applicable PWSS Director(s), including a copy of the letter and/or other materials sent to the PWSS Director and any information related to the waiver submitted by the PWSS Director(s);
- Information related to public notice of the waiver application, including a copy of the public notice, a record of any public comments received, and the responses to those comments; and
- Information related to documenting the EPA Regional Administrator's evaluation, including copies of all materials submitted to the EPA Regional Administrator and a copy of the EPA Regional Administrator's concurrence with issuance of the waiver.

Any supporting documents or materials related to the injection depth waiver review and any reports documenting the review should be uploaded to the project's permit package area in the GSDT.

#### ***4.1.12 Aquifer Exemption Expansions***

Class II well owners or operators injecting into an exempted aquifer who have made a decision to transition from Class II to Class VI and anticipate that the carbon dioxide plume and pressure front will expand beyond the area covered by an existing Class II aquifer exemption will need to apply to expand the areal extent of the aquifer exemption. The aquifer exemption requirements in the Class VI Rule afford Class VI permit applicants an opportunity to assess and select a suitable GS site in areas where oil and gas recovery has occurred while also protecting USDWs (i.e., formations/aquifers afforded SDWA protection). By regulation, expansions of the areal extent of

aquifer exemptions are only available and can only be granted to owners or operators of Class II wells with existing aquifer exemptions prior to re-permitting as Class VI.

An owner or operator seeking an aquifer exemption expansion must define the areal limits of the expanded aquifer exemption per 40 CFR 144.7(d)(1) and submit information to support a determination that the proposed Class VI aquifer exemption meets the criteria at 40 CFR 146.4(d).

The purpose of the UIC Program's evaluation of an aquifer exemption application is to ensure, based on site-specific information, that an appropriately sized area is exempted such that the carbon dioxide plume and pressure front remain within the exempted area. The review of the request to expand the areal extent of a Class II aquifer exemption could also take place concurrently with review of an injection depth waiver request (if applicable). This approach can help ensure that the aquifer exemption determination considers the most up-to-date information about the proposed project.

### ***Completeness Review***

Class II well owners or operators seeking to expand the areal extent of their approved aquifer exemption will apply for an aquifer exemption expansion; this application is a separate submittal from the Class VI permit application. It should be in the form of a narrative that describes the delineated area of the expansion, supported by geologic maps and model outputs and a description of how the aquifer exemption meets the criteria at 40 CFR 146.4.

The UIC Program should perform a preliminary review to confirm that the aquifer exemption application is based on the same or a similar delineation modeling, geologic, and operational data as those on which the Class VI permit application is based. Additionally, the UIC Program should verify that the demonstration that the aquifer exemption meets the criteria at 40 CFR 146.4 includes a description of the water quality analyses to determine the TDS of the aquifer to be exempted and that evaluations of current and future use of the aquifer are based on a thorough review of state and/or local water supply data or other appropriate sources.

### ***Evaluation***

The bolded and italicized text below outlines a suggested approach that a UIC Program might employ to evaluate information submitted to request an expansion of the areal extent of a Class II aquifer exemption, to confirm that an applicant's submittal meets the requirements of the Class VI Rule and that the expanded aquifer exemption is appropriate.

***Verify that the proposed expanded area of the aquifer exemption is complementary to and based on the same information used to delineate the Class VI AoR.*** It is likely that the applicant will use the AoR delineation modeling performed pursuant to 40 CFR 146.84 to delineate the aquifer exemption area. If this is the case, the modeling should account for all geologic data, operational conditions, and any other injection activities (i.e., related to Class II wells); see Section 4.1.2. If the aquifer exemption delineation is based on other modeling or analyses, compare the lateral and vertical extent of the delineated area of the aquifer exemption expansion to ensure that it encompasses, at a minimum, the entire geographic extent of the approved Class VI AoR.

**Confirm that the proposed aquifer exemption meets the criteria at 40 CFR 146.4(d).** An owner or operator seeking to expand the areal extent of an existing aquifer exemption should submit information to support a determination that the proposed area of the expanded aquifer exemption meets all of the following criteria: it does not currently serve as a source of drinking water; the TDS content of the groundwater is more than 3,000 mg/L and less than 10,000 mg/L; and it is not reasonably expected to supply a public water system.

**Verify that the aquifer is not currently a source of drinking water.** The EPA interprets water that currently serves as a source of drinking water to include water that is being withdrawn at the time of the aquifer exemption request and water that will be withdrawn in the future by wells that are in existence at the time of the request. Confirm that the applicant evaluated information on all public water suppliers and private wells across the entire AoR for the Class VI well and the area delineated per 40 CFR 144.7, accounting for any anticipated population or land use changes. Verify that the information reviewed is consistent with information from municipal water systems' websites, the Safe Drinking Water Information System (SDWIS), and county or state health department records of drinking water wells. If the applicant is also seeking an injection depth waiver, the information submitted for the aquifer exemption should match the information submitted per 40 CFR 146.95(a).

**Confirm that the TDS is more than 3,000 mg/L and less than 10,000 mg/L.** This should have been established for the previously exempted areas of the aquifer; TDS information for the expanded area should be consistent with information on formation fluids gathered as part of the Class VI permit application process or that will be collected under the pre-operational formation testing program. Verify that this information is available and that sampling and testing was (or will be) performed properly, i.e., tested in a certified laboratory or using proper QA protocols or pursuant to the Class VI QASP. Also confirm that any reported TDS levels are consistent with other information provided as part of the Class VI site characterization performed per 40 CFR 146.82(a)(6). If there is any uncertainty regarding whether the samples are representative of the entire expanded area (i.e., if there is variability), consider requesting that additional sampling be performed. If the TDS concentration in the proposed aquifer exemption expansion area is lower than 3,000 mg/L, an expansion of the areal extent of an aquifer exemption cannot be granted because it would not meet the requirement that the TDS content be greater than 3,000 mg/L.

**Review information to confirm that the aquifer is not reasonably expected to supply a public water system.** This determination will likely be related: to water use demands/plans and to the presence of economically valuable mineral, hydrocarbon, or geothermal energy resources (per 40 CFR 146.4(b)(1)). Verify that the applicant provided sufficient information about hydrocarbon recovery in the area of the expansion to support a determination that this criterion was met.

Verify that all three criteria at 40 CFR 146.4(d) are met; if one or more of the criteria is not met, an aquifer exemption expansion may not be granted. However, injection of carbon dioxide at a volume that remains within the previously exempted area may be acceptable, provided all other applicable Class VI requirements are met. Modified operations may be needed to ensure that the carbon dioxide remains within the originally exempted area, and appropriate limits should be specified in the Class VI permit.

### Review and Approval of Aquifer Exemptions

An expansion of the areal extent of an aquifer exemption for a Class VI project constitutes a substantial revision to a state's approved primacy program and requires an EPA rulemaking and revision of 40 CFR 147 [40 CFR 145.32]. All aquifer exemptions must be approved by EPA, even if the state has Class VI primacy.

Where the state has Class VI primacy, the state UIC Program Director must, following the review of information related to the aquifer exemption, submit a program revision to the EPA region. This review is separate from the review of the Class VI permit application. However, because the supporting information is related, EPA recommends that the UIC Program Director review the aquifer exemption and Class VI permit application at the same time. The state will perform the following activities:

- Review the information in the aquifer exemption application.
- Issue public notice of the proposed exemption. This is recommended, since an expansion to an aquifer exemption for the purposes of GS may be of interest to the public.
- Submit documentation of the review and any other documents required by EPA to the EPA Region.

Once the EPA Region has received information from the state, EPA will evaluate the state's revised program submission, issue a public notice that EPA has received an aquifer exemption, prepare the aquifer exemption rulemaking, and publish notice in the *Federal Register*.

EPA recommends that publication of the *Federal Register* notice about the aquifer exemption be timed to coincide with public notice of the draft Class VI permit (pursuant to requirements at 40 CFR 146.82(a) and 124.10). This would allow a single outreach process so that the public could review materials and submit comments on both actions at the same time.

See the *UIC Program Class VI Primacy Manual for State Directors* for additional information about revising state primacy programs.

### Outcomes

Most of the products of the aquifer exemption review at the pre-construction stage will likely be documentation associated with the primacy revision process required for aquifer exemption approvals. Information the state will produce will likely include:

- A report documenting the review of the aquifer exemption, including the evaluation that the expanded areal extent of the aquifer exemption is at least as large as the Class VI AoR and that the aquifer exemption meets the criteria at 40 CFR 146.4(d); and
- Documentation associated with the aquifer exemption review, including:
  - The completeness review;
  - Correspondence with the EPA Regional Administrator; and
  - Information related to public notice of the aquifer exemption and any public comments received.

## 4.2 Preparing the Permit

In addition to conducting a technical review of the permit application (as described in Section 4.1), a permit writer should perform the following steps in support of a permit decision. Some of these steps may be conducted concurrent with the technical evaluation while others will necessarily follow chronologically after the conclusion of the technical evaluation.

**Finalize the Environmental Justice (EJ) assessment.** If any portions of the AoR are in disadvantaged communities, compare maps of the AoR to maps of known disadvantaged communities and facilities that may adversely affect those communities. If the EJ analysis indicated that the proposed site may be near disadvantaged communities that are also exposed to environmental risks, confirm that any appropriate mitigation measures (e.g., additional monitoring) are included in the Class VI permit. See Section 3.3 for additional information on performing EJ analyses.

**Develop draft Class VI permit conditions** based on the preliminary site and project data submitted with the permit application. Include permit conditions to ensure that the owner or operator will meet all of the requirements of the Class VI Rule. As described earlier, the EPA developed a template for permit text that can be accompanied by a set of enforceable project-specific plans. Using the template will promote consistency among Class VI permits issued nationwide and facilitate the use of this Implementation Manual, which is organized in consideration of this approach. The templates of the Class VI permit (i.e., the main body and the associated enforceable plans) reflect the Class VI requirements and the recommendations in this Implementation Manual. These are available in the resource library of the GSDT. States may develop other template formats; however, the Class VI requirements and the recommendations about the content of the permit still apply.

The permit should also set conditions for reporting and recordkeeping required at 40 CFR 146.91. Identify what must be included in semi-annual reports. Require the owner or operator to report the results of MITs or workovers within 30 days. Identify situations that require “emergency” reporting and activities for which the owner or operator must provide advance notice. Require the owner or operator to submit all reports in an electronic format via the GSDT and identify recordkeeping requirements. See the *UIC Program Class VI Well Recordkeeping, Reporting, and Data Management Guidance for Owners and Operators* for additional information on electronic reporting.

Additionally, the permit should include general permit conditions that address modification, revocation, reissuance, termination, or transfer of permits; severability and confidentiality conditions; and duties and requirements of the permit, e.g., duty to comply, penalties for violations, duty to mitigate, operation and maintenance, duty to provide information, inspection and entry, and signatory requirements.

**Prepare a fact sheet and/or statement of basis** summarizing the project and the evaluation of the permit application. The EPA recommends that the permit writer develop both a fact sheet and a statement of basis about the permitting decision. The statement of basis [40 CFR 124.7] is a way to document the technical review, identify protective permit conditions, and explain the rationale for the regulatory agency’s decision-making.

The fact sheet is a public document that explains the permit in lay terms, per 40 CFR 124.8(b). Templates are available in the resource library of the GSDT. Include a brief description of the

facility, the injectate, the basis for the draft permit conditions, and how the permit writer determined the appropriate conditions. For example, describe the geology, the AoR, USDWs and the injection and confining zones, planned construction of the well, planned operating and monitoring requirements, and plans for plugging the well and performing post-injection monitoring. Explain that a draft permit has been issued, identify where people can obtain a copy of the draft permit, and provide a contact person in the permitting agency.

**Compile all information supporting the administrative record for the permitting decision.**

The administrative record should include the permit (incorporating all of the enforceable project plans), reports that document the review of the permit application (e.g., the AoR delineation modeling evaluation report, induced seismicity report, and financial responsibility report), references that the permit application review team consulted during the technical review, and documentation of all communications with the applicant (including email communications, call logs, and summaries of meetings).

The GSDT can facilitate this process because it is a repository of all the documents associated with the permit application. Identify the materials that are to be included in the administrative record and copy or move them into the permit package area for the project. Personal evaluation files, notes, drafts, etc., that are not part of the administrative record can be stored elsewhere in the GSDT for future reference.

**Finalize the draft permit for public notice and comment.** Publish a notice in a newspaper of general circulation near the project site that describes the project, explains the comment submission procedures and deadlines, provides information about planned public hearings, and provides information about where to receive additional information. If an injection depth waiver application and/or aquifer exemption expansion request has been submitted, the EPA recommends providing notice of this concurrently with notice of the permit application, if possible. A sample public notice of a Class VI permit application is available in the resource library of the GSDT. Hold one or more public hearings and document all input provided.

**Conduct outreach to stakeholders**, including any tribes, in or near the AoR. The unique nature of Class VI wells and GS highlights the importance of communicating with the public and among states, tribes, and territories about pending Class VI projects. See Section 2.3 above. Effective communication can ensure transparency in the permitting process, encourage coordination and information sharing, and promote safe, protective projects. In addition to providing a copy of the draft permit and a fact sheet and/or statement of basis, consider providing outreach or be prepared to answer questions from the public about the characteristics of the site, injection technology, the relationship of the well to all nearby public water systems and USDWs, and how public safety and potential contamination have been considered in the development of permit conditions. If any portions of the AoR are in disadvantaged communities, the EPA encourages conducting enhanced public outreach activities to these communities. If the AoR crosses (or comes close to) boundaries with other states, territories or tribes, notify appropriate officials in those jurisdictions (e.g., UIC program or environmental protection officials), per 40 CFR 146.82(b). A template of a letter that can accomplish this required notification is available in the resource library of the GSDT.

Consider posting materials relevant to the permit application online, if possible. For additional information on public outreach, see the UIC Quick Reference Guide *Additional Tools and*

*Considerations for UIC Directors on the Public Participation Requirements for Class VI Wells, and the Fact Sheet on Public Participation Requirements.*

**Review public comments**, including testimony at public hearings; prepare responses; and develop a responsiveness summary document.

**Finalize Class VI permit conditions**, if needed based on the public process, and issue a Class VI permit. Consistent with the regulations, the permit should specify that the applicant is authorized to construct or convert the injection well, but may not commence injection until authorized in writing to do so and that they must meet any new or revised conditions in the permit based on the final geologic data that are collected pursuant to 40 CFR 146.82(c). Identify the final geologic and well data that must be submitted and approved before injection will be authorized, e.g., as-built well schematics, pre-operational testing results, demonstration of mechanical integrity, completion of all required corrective action on wells in the AoR, updated financial responsibility information, submittal of final geologic data, AoR delineation modeling, and project plans. Templates with recommended language are available in the resource library of the GSDT. If the determination is positive, update the project status in the GSDT to show that the project is in the pre-operation phase.

### **4.3 Planning for the Pre-Operation Review**

As described above, the Class VI Rule is designed to address the fact that not all of the information needed to evaluate the suitability of a proposed GS site will be available at the time of a Class VI permit application. The information required at 40 CFR 146.82(a), and described in this section, will be collected and submitted before the well is constructed or converted and, accordingly, it will be based on preliminary information.

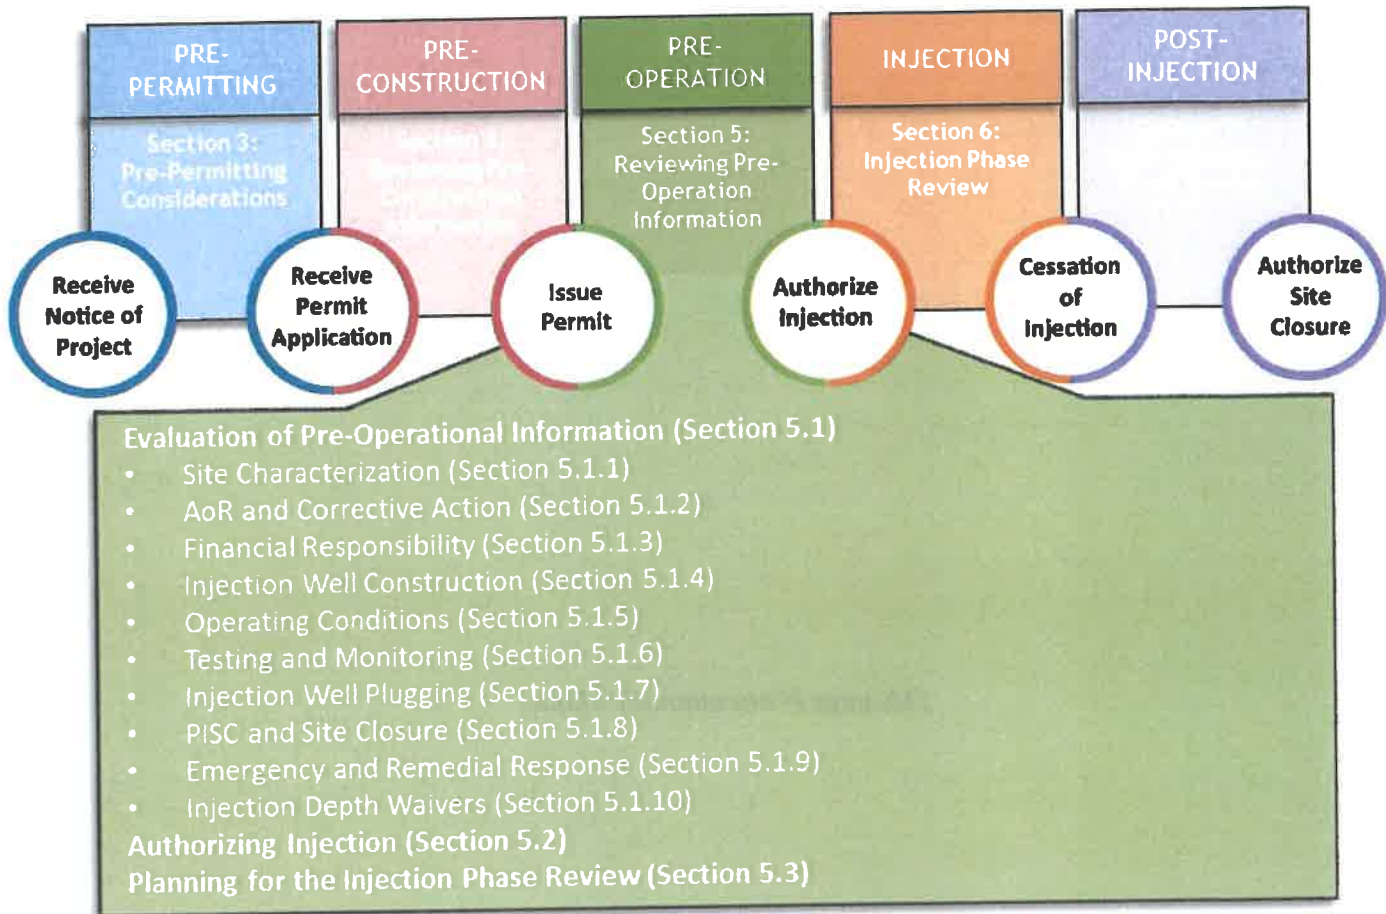

To address the uncertainties inherent in the pre-construction information (as described in Section 4.2), 40 CFR 146.82(c) requires the collection of information that confirms the assumptions on which the permit determination was based. After the permit is issued, the owner or operator will construct the well and perform the required pre-operational testing. The data collected will augment the regional geologic and hydrogeologic information with data specific to the direct vicinity of the well, e.g., based on cores and sampling during drilling.

The EPA recommends that the UIC Program communicate with the owner or operator while the well is constructed and formation testing is being performed. This can help ensure that all of the information that will be needed to address all uncertainties is collected. If witnessing of any tests (e.g., MITs, logging, sampling, or testing of automatic alarms and shut-off systems) is anticipated, make appropriate arrangements with the owner or operator.

As Section 5 describes, the UIC Program Director will receive additional information for review, generated by a Class VI permit applicant/owner or operator to confirm site-suitability, before the UIC Program Director can authorize injection. The EPA recommends that UIC Programs review Section 5 before the owner or operator submits information required at 40 CFR 146.83(c) to become familiar with, and plan for, the review.

***This page is intentionally blank.***

## Section 5: Reviewing Pre-Operation Information

***This page is intentionally blank.***

## 5 Reviewing Pre-Operation Information

Following receipt of the Class VI permit, the owner or operator will construct or convert their well and perform the pre-operational well and formation testing required at 40 CFR 146.87. Class VI well owners or operators must submit the results of all required pre-operational formation testing, updated information about site geology, the final AoR, any needed amendments to the project plans, and information about the construction and testing of the well [40 CFR 146.82(c)].

The primary goal of the pre-operation phase review is to ensure that any uncertainties identified during the course of the permit application review have been addressed. The newly acquired information should strengthen the basis on which the determination of site-suitability was made. Any remaining uncertainties should be addressed by appropriate risk mitigation methods, e.g., by planning targeted monitoring to detect carbon dioxide migration or setting operating limits to ensure confinement of the injected carbon dioxide.

The UIC Program should also confirm that the injection well was constructed to maintain mechanical integrity throughout the duration of the project (particularly in light of information about subsurface geochemistry) and is equipped to monitor injection operations and shut-in if needed.

### Pre-Operation Reviews for Converting Existing Wells

If the owner or operator converted an existing well (and has completed some or all of the formation testing required at 40 CFR 146.82(c) and 146.87), the permit application may include some of this information. The EPA encourages the UIC Program to consider the recommendations in this section during the permit application review. See Section 3.2 for additional information.

In general, the pre-operation phase review should parallel the initial permit application review. However, this review will likely be streamlined to focus on newly acquired information, particularly information that has changed based on the results of pre-operational testing or other pre-operational activities.

During the pre-operation phase, a UIC Program is likely to receive the following types of information submitted by the owner or operator (per 40 CFR 146.82(c)) for the UIC Program's evaluation:

- Updated geologic information based on the results of pre-operational formation testing (see Section 5.1.1);
- A final AoR delineation based on computational modeling and the status of corrective action on wells in the AoR (see Section 5.1.2);
- Updated financial responsibility information that reflects any changes to the Corrective Action, Injection Well Plugging, PISC and Site Closure, or Emergency and Remedial Response Plans (see Section 5.1.3);
- As-built well construction specifications and any revisions to the proposed operating data (see Sections 5.1.4 and 5.1.5);
- Updates to the Testing and Monitoring Plan, Injection Well Plugging Plan, PISC and Site Closure Plan, and Emergency and Remedial Response Plan (see Sections 5.1.6 through 5.1.9); and

- In addition, some owners or operators may need to submit updated information related to injection depth waivers [40 CFR 146.95]. See Section 5.1.10.

This section provides guidelines and recommendations for how the UIC Program should review the information submitted to confirm compliance with 40 CFR 146.82(c) and verify the suitability of the site. It describes the types of pre-operational information owners or operators will likely submit, how the UIC Program can evaluate the submitted information to ensure USDW protection, and the outcomes or products of the review.

Following the review of well construction information and the results of pre-operational formation and well testing that confirm site-suitability and proper well construction/conversion, the UIC Program Director can authorize injection. See Section 5.2.

### **5.1 Evaluation of Pre-Operation Information**

Following construction or conversion of their well and pre-operational testing, Class VI well owners or operators must submit the results of all required pre-operational well and formation testing, updated information about site geology, the final AoR, any needed amendments to the project plans, and information about the construction and testing of the well [40 CFR 146.82(c)].

The UIC Program should evaluate this information to confirm the assumptions on which the permit application, the AoR delineation modeling, or other information that supported the Class VI permit were based. The newly acquired information should strengthen the basis on which the determination of site-suitability was made. Any remaining uncertainties should be addressed by appropriate risk mitigation methods to form a robust, defensible permit record. Table 5-1 presents some examples of how the newly acquired information can inform various aspects of the pre-operation phase review.

The following sub-sections provide guidelines and recommendations for how the UIC Program should review, and where necessary, discuss the information with the owner or operator or request additional or clarifying information, to confirm compliance with 40 CFR 146.82(c) and verify the suitability of the site, focusing on how pre-operational formation testing program results can address uncertainties; make a risk-based determination and issue a modified permit if necessary to ensure protection of USDWs; and authorize injection operations. Each permit application is unique and the appropriate activities will be specific to the application being reviewed. Therefore, the activities described in the sections below outline a recommended course of action to accomplish the goal of evaluating pre-operational information to ensure that the final permit conditions are protective of USDWs.

**Table 5-1: Examples of how Pre-Operational Submittals can Inform Considerations for Issuing Authorization to Inject at a Class VI Well**

Required Submittals	Recommended Cross-Submittal Checks and Considerations
The final AoR and the status of corrective action on wells in the AoR [40 CFR 146.82(c)(1),(6)]	<ul style="list-style-type: none"> <li>• A larger AoR may affect: the need for additional corrective action, the areal scope of injection and post-injection phase testing and monitoring, resources to be addressed in the Emergency and Remedial Response Plan, and financial responsibility needs.</li> <li>• Revised estimates of the time for plume and pressure front movement to slow/cease may necessitate revisions to the alternative PISC timeframe and the PISC and Site Closure Plan; financial responsibility needs for PISC may also be affected.</li> <li>• Changes in the estimated speed or direction of plume and pressure front movement may affect the placement of monitoring wells and plume and pressure front tracking activities.</li> <li>• If any planned corrective action is not complete, financial responsibility cost estimates may need to be adjusted.</li> </ul>
Updated geologic information about the site [40 CFR 146.82(c)(2)]	<ul style="list-style-type: none"> <li>• The presence of additional fluid-containing or porous formations or geologic features that could allow fluid movement to USDWs should be addressed in injection and monitoring well construction and plugging.</li> <li>• Additional faults/fractures or other geologic features that could be pathways for fluid movement or carbon dioxide leakage should be addressed in the injection and post-injection testing and monitoring plans.</li> <li>• The presence of additional USDWs in the AoR should be addressed in the injection and post-injection phase testing and monitoring programs, the construction and plugging of injection and monitoring wells, and the Emergency and Remedial Response Plan; additional financial resources may be needed to cover associated activities.</li> <li>• New geologic information may affect AoR delineation modeling inputs and, therefore, the size/shape of the AoR.</li> <li>• Increased seismic activity should be addressed in the Testing and Monitoring Plan and Emergency and Remedial Response Plan.</li> </ul>
Carbon dioxide compatibility information [40 CFR 146.82(c)(3)]	<ul style="list-style-type: none"> <li>• Updated information about carbon dioxide-formation fluid compatibility may impact carbon dioxide trapping mechanisms, estimates of plume and pressure front behavior, or storage capacity estimates (and the injection volume limits).</li> <li>• Any anticipated geochemical changes that could affect the compatibility of the injectate with well materials should be addressed in the construction/conversion and plugging of injection and monitoring wells.</li> </ul>
Formation testing results [40 CFR 146.82(c)(4)]	<ul style="list-style-type: none"> <li>• Logging and testing data should confirm the assumptions on which AoR delineation modeling, site-suitability, and storage capacity estimates (and permitted injection volumes) are based.</li> <li>• Updated fracture pressure calculations based on formation testing results may necessitate modified injection pressure limits.</li> <li>• Updated information about formation fluid properties may affect storage capacity estimates (and volume limits), AoR delineation modeling inputs, and predictions of plume and pressure front migration.</li> <li>• New information about subsurface geochemical reactions may necessitate inclusion of additional geochemical parameters in the Testing and Monitoring and PISC and Site Closure plans.</li> </ul>

Required Submittals	Recommended Cross-Submittal Checks and Considerations
Final well construction procedures; logging and testing data and MIT results [40 CFR 146.82(c)(5),(7),(8)]	<ul style="list-style-type: none"> <li>The as-built well specifications should be reviewed before approving well construction/conversion; they may inform approval of monitoring well construction.</li> <li>Any divergences from the approved well construction procedures should be addressed in the Injection Well Plugging Plan; these may also affect financial responsibility needs.</li> <li>Logging and testing results and the results of MITs should be reviewed to confirm that the well was constructed or converted properly.</li> </ul>
Plan amendments or alternative PISC timeframe updates [40 CFR 146.82(c)(9)]	<ul style="list-style-type: none"> <li>Amendments to the AoR and Corrective Action, PISC and Site Closure, or Emergency and Remedial Response plans may affect financial responsibility needs.</li> <li>All amended plans should be checked for needed consistency changes in other plans.</li> <li>A change to the alternative PISC timeframe may affect financial responsibility needs for PISC and emergency and remedial response.</li> </ul>

### 5.1.1 Site Characterization

Following the required pre-operational testing, owners or operators must submit: the results of formation testing [40 CFR 146.82(c)(4); 146.87], updates to information on the geologic structure and hydrogeologic properties of the injection zone and overlying formations [40 CFR 146.82(c)(2)], and information on the compatibility of the carbon dioxide stream with fluids in the injection zone and minerals in the injection and confining zones [40 CFR 146.82(c)(3)]. This pre-operational data augments the regional geologic and hydrogeologic information on which the permit application was based to include data specific to the direct vicinity of the well, e.g., based on cores and water samples taken during drilling. This information should also address the key data gaps or uncertainties identified in the initial permit application review, as described in Section 5.1 above.

The purpose of the UIC Program's review of the geologic information collected during the pre-operation phase is to assess whether final geologic data are consistent with and confirm the data that were submitted with the permit application. The UIC Program should review this information to ensure that appropriate assumptions are made in the AoR delineation modeling and other analyses, particularly where supporting data were not available when the Class VI permit application was submitted.

#### **Completeness Review**

Following completion of formation testing, owners or operators will submit the testing results and any updated geologic information to the UIC Program.

The EPA anticipates that the pre-operational formation testing results will include a combination of graphs/figures, log results, tabular data, and third party materials such as log analyst reports. The UIC Program should:

- Verify that the owner or operator performed all testing required at 40 CFR 146.82(c) and 146.87, including any additional logging or testing that may have been identified as necessary during the initial permit application review;
- Verify that cores and samples were properly collected and that the submission includes the log analyst's report required at 40 CFR 146.87(b);
- Confirm that all parameters specified in the approved pre-operational formation testing program were analyzed and that all QA protocols were followed;

- Confirm that samples were taken at all locations and depths/formations specified in the approved pre-operational formation testing program (including any additional confining zones that may be needed to ensure confinement or containment of the carbon dioxide); and
- Verify that the specified analytical techniques were used and that all chemical analyses were performed at certified or accredited labs following the protocols in the approved QASP.

The EPA recommends that changes to the geologic information be submitted as a narrative document that meets the requirements at 40 CFR 146.82(c). The descriptive material should be a synthesis of the pre-operational formation testing results that highlights any changes to the understanding of the site since the initial permit application review. Ideally, it will address the uncertainties identified in the permit application and provide additional evidence to demonstrate that the site meets the suitability criteria at 40 CFR 146.83.

#### Identification of Additional USDWs

If pre-operational testing identifies the presence of additional USDWs above the injection zone (e.g., if water sampling in deep formations indicates that any formations below the previously identified lowermost USDW are less than 10,000 mg/L), groundwater sampling in the Testing and Monitoring and PISC and Site Closure plans should target all USDWs and the Emergency and Remedial Response Plan should identify appropriate responses to potential contamination of any USDW. Also, the AoR delineation modeling should address all USDWs and the well's construction should protect all USDWs. If any previously unidentified USDWs below the injection zone are detected, the owner or operator would need to obtain an injection depth waiver in order to inject carbon dioxide into the injection zone identified in the permit. See Section 4.1.11.

#### *Evaluation*

The bolded text below outlines a suggested approach that a UIC Program might employ to evaluate site characterization information, submitted by a Class VI well owner or operator, to confirm that information submitted meets the requirements of the Class VI Rule; confirm that the permit conditions are protective; and facilitate authorization to inject.

**Review the results of logs performed during drilling to evaluate formation properties** (e.g., resistivity, spontaneous potential, porosity, gamma ray, and fracture finder logs). Verify that logging results support consistent findings about subsurface stratigraphy and that they corroborate other geologic data provided in the original permit application or collected via pre-operational testing. Examine information on the depth, thickness, porosity, permeability, and lithology of the injection and confining zones to assess whether it is consistent with information in the initial permit application (including parameters used in AoR delineation modeling). Verify the locations of any USDWs and any hydrocarbon-containing zones. If there are any inconsistencies with information available at the time of the initial permit application, assess whether such differences affect site-suitability. For example, if the confining zone exhibits greater permeability than initially predicted, verify that it will still provide adequate containment. If the injection zone is less porous or permeable than indicated by initial data, assess whether storage capacity estimates might need to be revised and whether operating at the approved injection pressure can proceed without the potential for fracture. If multiple confining zones are needed to ensure confinement or containment of the carbon dioxide, verify that the intervening layers between the primary and additional confining zones will impede vertical fluid movement, are free of faults and fractures, and will allow pressure dissipation.

If additional logs in other wells were requested as part of the permit application review (e.g., to support facies analyses or evaluate the integrity of the confining zone), evaluate the results of these logs to determine whether they confirm assumptions about site-suitability. If well stimulation was performed, verify that the confining zone was not fractured as a result of stimulation.

**Review analyses of whole cores or sidewall cores of the injection and confining zones.**

Confirm that information about porosity, permeability, petrology, and mineralogy based on core analyses is consistent with other submitted information on the injection and confining zones. If any information based on this analysis conflicts with geologic data submitted prior to construction, evaluate its impact on site-suitability and operational parameters. For example, consider the effects of porosity and permeability on storage capacity and the permitted total volume of carbon dioxide to be injected or the effects of rock strength on injection pressure limits.

In any new information on the mineralogy, petrology, or lithology of the injection and confining zones affects the understanding of injectivity or containment, or if it suggests any potential for release of trace metals through mineral dissolution, confirm that these considerations are incorporated into the Testing and Monitoring Plan (e.g., via appropriate groundwater testing parameters) and as inputs to the AoR delineation model.

**Review information on formation fluids in the injection zone.** Examine the data provided (including temperature, pH, conductivity, reservoir pressure, and static fluid level or other physical and chemical characteristics of the formation fluids) to determine if they agree with information in the permit application, match AoR delineation modeling outputs, and address any uncertainties identified in the permit application review. If information about the physical and chemical characteristics of the formation fluids is not consistent with information used in the evaluation of compatibility with the carbon dioxide stream, assess whether revisions to the original compatibility assessment are warranted (or review any updates provided by the owner or operator). Verify that the physical and chemical characteristics of the formation fluid are consistent with the inputs of the AoR delineation modeling; confirm that the model reviewer is aware of any changes that may affect the modeling inputs. Assess whether new information about formation fluids indicates the need for any additional protective measures for USDWs (e.g., changes to operating limits or to monitoring parameters/frequencies in the Testing and Monitoring and PISC and Site Closure plans).

If, based on geochemical analysis of formation solids and/or fluids, there is a concern that trace metals may be liberated as a result of interactions with carbon dioxide and affect USDWs, coordinate with the reviewer(s) of the Testing and Monitoring and PISC and Site Closure plans to ensure that any contaminants that could be liberated/mobilized are addressed in the groundwater monitoring program.

**Review information about the fracture pressure of the injection and confining zones.**

Review the fracture pressure data (e.g., determined via a step rate test) to verify that the test was performed properly and the fracture pressure was calculated accurately. If the pressure gauges used for the test were not deployed at the bottom of the well, verify that proper correction factors were used.

**Review information on the hydrogeologic characteristics of the injection zone.** Verify that a pressure fall-off test and either a pump test or injectivity test were performed, that proper testing

and analytical procedures were followed (e.g., that surface gauges were properly corrected to obtain bottom-hole pressure), and that the testing parameters are based on the operating conditions in the permit (e.g., injection pressures). If pressure fall-off tests suggest the presence of faults or fractures near the well bore, determine whether these may be transmissive and could impact confinement. If the results of pressure fall-off tests indicate the presence of newly identified faults or fractures that were not considered in the permit application review, communicate this to the AoR delineation modeling team and to the staff reviewing the planned injection and post-injection phase testing and monitoring to ensure that monitoring will target areas where there is a potential for carbon dioxide migration.

Verify that the results of hydrogeologic testing are consistent with other geologic data. For example, compare transmissivity values calculated from the pressure fall-off test to injection zone permeability values determined from cores.

**Review the results of any additional testing** requested during the permit application review. In addition to the examples cited above, this may include additional or higher resolution geophysical surveys to evaluate the depth, areal extent, and thickness of the injection and confining zones or to explore alternate interpretations of the geologic site conceptual model. Review the results of any surface air and/or soil gas monitoring (if required) that may be appropriate to provide a longer-term baseline against which future results could be compared. If any of this information does not corroborate the initial geologic data or address uncertainties, consider revising the permit conditions.

**Review updates to the geologic site characterization** based on pre-operational formation testing results. The results of the formation testing will support the comprehensive evaluation as described in Section 4.1.1 and the *UIC Program Class VI Well Site Characterization Guidance*. Owners or operators must submit updates to the information on the geologic structure and hydrogeologic properties of the injection zone and overlying formations based on the results of pre-operational formation testing [40 CFR 146.82(c)(2)]. If an injection depth waiver was approved for the project, encourage the owner or operator to include any information relevant to the waiver, including the results of pre-operational formation testing below the lower confining zone, as part of these updates (see Sections 4.1.11 and 5.1.10 for additional information on waivers). Evaluate this information to confirm that the site is suitable for carbon dioxide injection, per 40 CFR 146.83 and in the context of the comprehensive evaluation of site-suitability (as described in Section 4.1.1).

- Assess whether newly acquired information confirms that *facies interpretations about the injection and confining zones* are consistent with the descriptions in the permit application. Verify that the confining zone(s) is sufficiently thick and continuous throughout the AoR to provide confinement. Confirm that the injection zone will provide adequate storage. If sampling and analyses of cores from locations in addition to the injection well were requested to evaluate facies in heterogeneous settings or structural features, evaluate the results of these analyses to determine whether they address uncertainties about the site and confirm assumptions about site-suitability.
- Review the results of any logging within wells other than the injection well and whether they confirm that *the structures of the injection and confining zones* are conducive to GS and form an adequate confining system. Also, consider whether additional monitoring

is needed in any areas to address uncertainty; if so, verify that such monitoring has been incorporated into the Testing and Monitoring and PISC and Site Closure plans.

- If any fluid sampling results vary from the assumptions used in geochemical or reactive transport modeling to demonstrate the *compatibility of the carbon dioxide stream with subsurface fluids and minerals*, verify that the owner or operator has updated the model(s) accordingly. Verify that the modeling results confirm assumptions about injectivity, appropriate operational parameters, etc. Identify whether the results of models or experiments indicate potential compatibility issues that could affect operational parameters, plume migration, carbon dioxide trapping mechanisms, or storage capacity. For information on considerations regarding evaluating the compatibility of the carbon dioxide stream with well materials, see Section 5.1.4.
- If *estimates of injection zone storage capacity* change based on pre-operational formation testing results, determine whether adjusting the injection rates and volume limits in the permit is necessary. If any revisions to the geochemical modeling or storage capacity estimation modeling were requested to address uncertainties identified during the permit application review, verify that the updated models incorporate all site-specific data collected during pre-operational testing.
- Compare the fracture pressure to assumptions on which the evaluation of *confining zone integrity* was based and to the distribution of pressures in the AoR as predicted by modeling. If information indicates that injection pressures will exceed the fracture pressure of the confining zone or 90 percent of the fracture pressure of the injection zone, consider adjusting operating limits in the permit or requesting information on additional confining zones. See Section 4.1.6 for additional information on using fracture pressure data to set operating limits.

#### Class VI Projects with Aquifer Exemptions

If an aquifer exemption expansion was approved for the project (see Section 4.1.12), newly acquired information should continue to support the basis for approving the aquifer exemption. Specific considerations include:

- The delineated lateral and vertical extent of the aquifer exemption expansion should encompass, at a minimum, the entire approved, final Class VI AoR (see Section 5.1.2).
- The results of geochemical sampling should confirm that the TDS content of the injection zone is between 3,000 and 10,000 mg/L (see Section 5.1.1).
- Any additional available information should support the determination that the aquifer does not currently serve as a source of drinking water.

If the EPA denied the aquifer exemption, the UIC Program should work with the owner or operator to ensure that the injected carbon dioxide will remain within the confines of the previously approved Class II exemption, e.g., by limiting injection rates or total allowable volumes of carbon dioxide in the Class VI permit.

**Review any updated information about seismic activity at the site.** If there has been recent natural or anthropogenic seismic activity at the site, review information collected since the permit was issued to determine whether the frequency or intensity of such events has increased. Also consider whether any newly acquired data indicate an increased risk that seismic activity may reactivate faults and compromise containment. Options to address seismic risk in the permit include: operational changes (e.g., reduced injection rates), incorporation of passive seismic

monitoring into the Testing and Monitoring Plan (if it is not already included), and addressing the potential for induced seismicity in the Emergency and Remedial Response Plan.

**Notify other members of the review team of any relevant changes to geologic information** that may affect other aspects of the review (such as evaluating the AoR delineation modeling) or necessitate revising permit conditions or the plans, as described above. See Section 4.1.1 for additional information on evaluating geologic information about the site.

### ***Outcomes***

Following the evaluation of final geologic information and pre-operational formation testing results, the UIC Program should consider documenting the review for inclusion in the permit file. This documentation could be informed by reports developed during the permit application review and may include:

- A description of how the results of pre-operational formation testing addressed deficiencies, uncertainties, or data limitations identified during the pre-construction review of geologic information or confirmed assumptions on which the permit decision was based; and
- Any updated information relevant to the evaluation of seismic risk, if necessary, to incorporate any newly acquired information about the potential for induced seismicity, recent seismic events, or revised permit conditions designed to minimize the risks associated with induced seismic events.

The revised reports and any supporting documentation should be uploaded to the project's permit package area in the GSDT.

### ***5.1.2 AoR and Corrective Action***

Following the required pre-operational testing, owners or operators must submit: the final AoR delineation [40 CFR 146.82(c)(1)], the status of corrective action on wells in the AoR [40 CFR 146.82(c)(6)], and any amendments to the approved AoR and Corrective Action Plan [40 CFR 146.82(c)(9)].

The purpose of the UIC Program's evaluation of the final AoR, any changes to the AoR and Corrective Plan, and the status of corrective action is to ensure that the AoR appropriately represents the area where USDWs may be endangered due to injection and that all potential conduits for fluid movement that could endanger USDWs in that area are identified and addressed. The primary focus of the UIC Program's evaluation should be to assess whether the data collected during pre-operational testing address the information gaps and/or uncertainties identified during permitting and support the assumptions used and the approach taken during computational modeling. Therefore, the UIC Program should review this information in close coordination with the review of the pre-operational testing results (see Section 5.1.1).

### ***Completeness Review***

Owners or operators will submit the final AoR delineation (including detailed modeling data to support the delineation), the amended AoR and Corrective Action Plan (if needed), and the status of corrective action. Similar to the proposed plan submitted during the pre-construction phase, the amended plan is expected to be a single narrative document, while the detailed modeling data will likely include a combination of modeling input and output data, short text descriptions, formulae, GIS data/maps, etc. The EPA anticipates that some of the data will be the same as

those used for the initial AoR delineation, while other components of the submission will reflect updated information or new data generated during the pre-operation phase.

The UIC Program should perform a preliminary assessment of the amended AoR and Corrective Action Plan and the final AoR, including the supporting modeling information. The following activities are recommended to ensure that the amended plan is complete:

- Identify the changes made to the AoR delineation, any key updates of the modeling data, and the revisions that have been made to the plan.
- Verify that all changes and amendments are documented comprehensively and consistently. For example, the final AoR delineation should be presented consistently throughout the AoR and Corrective Action Plan and other project submittals.
- Determine whether the submitted information is sufficient to evaluate compliance with the requirements for computational modeling and AoR delineation with an appropriate level of detail and clarity.

**Demonstration that no updates to the AoR and Corrective Action Plan are needed**

In some instances (e.g., for a well-characterized site with substantial data available in the pre-construction phase), the pre-operational testing data may fully support the existing, approved AoR delineation, and no amendments may be needed to the plan. In those cases, the owner or operator should submit a description of how the new data confirm and support the approved AoR delineation and the strategy used to determine this. The corrective action status and any relevant updates to the detailed modeling data supporting the final AoR delineation would still be required in those cases.

If any additional information or clarification is needed, consider sending one or more sets of questions/requests until a determination of completeness can be made.

***Evaluation***

The following recommendations apply to a generic new project and the evaluation process will need to be tailored to each project's specific conditions and each owner or operator's computational approach. For example, in most cases, it is anticipated that no operational testing and monitoring results will be available for model verification/calibration during the pre-operation phase, because injection has not yet begun. However, at some sites, there may be data from historical or nearby injection operations that could also be used to support the AoR delineation process.

Similar to the process used during the pre-construction phase, the evaluation of the final AoR delineation should involve a combination of qualitative and quantitative assessments. The goals of this evaluation include:

1. Verifying that all relevant new information has been appropriately considered in the delineation of the final AoR and identifying areas where new information supports the previous approaches/assumptions.
2. Ensuring that the updated conceptual/geologic model and model inputs are consistent with pre-operational testing results, and evaluating how the newly available information addresses the data gaps/uncertainties associated with the existing AoR delineation.

3. Assessing whether the updated computational/numerical model used to delineate the final AoR complies with 40 CFR 146.84, that it is constructed to reasonably and accurately represent the geologic and operational systems, and that it yields the information necessary to delineate the AoR.
4. Confirming that the methodology used to delineate the AoR (based on the modeling results) is a conservative and reasonable approach to ensure that the AoR accurately represents the area where USDWs may be endangered.
5. Ensuring that all simplifying assumptions are clearly stated, documented, and justified, as are the methods used for integrating new information into the modeling approach.

The bolded text below outlines a suggested approach that a UIC Program might employ to achieve these goals. This approach will help to: confirm that the final AoR delineation meets the requirements of the Class VI Rule; confirm that the permit conditions are protective in light of the pre-operational testing results; and facilitate authorization to inject.

**Assess the completeness of the pre-operational testing data incorporated into the AoR delineation** to ensure that all available relevant information collected pursuant to 40 CFR 146.87 and the permit has been used to support the process. The relevant data are expected to include, at a minimum: information on rock properties, such as porosity, permeability, and constitutive relationships (i.e., capillary pressure-saturation-relative permeability); injection and confining zone geochemistry; geomechanical characteristics of the injection and confining zones; and in situ fluid pressures and temperatures. See Section 5.1.1 for additional information on evaluating pre-operational formation testing data.

**Assess the conceptual/geologic model and model inputs** to evaluate the data/information used in the model. For example, qualitative methods and/or statistical evaluations (e.g., summary statistics, histograms, etc.) could be used to verify that the updates accurately represent the newly available data. Confirm that the updates are supported by all relevant new information. For a detailed description of the evaluation process for various model input categories, see Section 4.1.2.

**Review the owner or operator's computational/numerical modeling effort** to verify compliance with the rule requirements, assess consistency with the approach described in the approved AoR and Corrective Action Plan, and evaluate appropriateness for the project. This may involve both qualitative evaluation of certain modeling aspects and independent or semi-independent quantitative modeling. In addition to the recommendations provided in Section 4.1.2, determine whether any updates to the modeled subsurface processes, such as inclusion of any geochemical reactions, are necessary based on new information.

**Assess the owner or operator's methodology for delineating the AoR** to ensure that it represents the area where USDWs may be endangered. Confirm that an acceptable approach was used to determine the critical pressure (see the *UIC Program Class VI Well Area of Review Evaluation and Corrective Action Guidance*) and that the associated calculations are based on appropriate, site-specific values collected during pre-operational testing (e.g., pressure in various formations, salinity, etc.).

**Review the status of corrective action in the AoR.** Confirm that the owner or operator used appropriate methods to identify all artificial penetrations throughout the final AoR using database searches or other means, and that the list of artificial penetrations is complete. If the list

of artificial penetrations appears to be incomplete, ask the owner or operator to augment the list (e.g., by conducting more detailed surveys or additional well record searches).

Evaluate whether corrective action conducted on all previously determined and/or newly identified wells was completed in a suitable manner, e.g., using carbon dioxide-resistant materials. If phased corrective action was approved as part of the AoR and Corrective Action Plan, confirm that the owner or operator is conducting corrective action based on the pre-determined schedule. In particular, verify that any corrective action that the permit requires to be completed prior to commencement of injection has been performed using appropriate methods and materials.

**Verify that the amended AoR and Corrective Action Plan reflects the most up-to-date information on the AoR delineation and corrective action.** When evaluating the final AoR delineation and corrective action status, as described above, also review the changes made to the narrative plan to ensure that the plan accurately reflects all relevant information. The plan should present the final AoR delineation, describe how the delineation is supported by the newly collected data, and contain any necessary updates to the procedures for corrective action (including phased corrective action, if appropriate) and AoR reevaluation. It should provide an accurate and complete benchmark for future AoR reevaluations and corrective action, with a sufficient level of detail and clarity. See Section 4.1.2 for more information on evaluating the AoR and Corrective Action Plan.

**Periodically confer with other members of the review team** throughout the evaluation process, and before approving the final AoR and the amended AoR and Corrective Action Plan. Ensure that any issues identified during the review of the information submitted under 40 CFR 146.82(c) are considered by the team and that the final AoR is incorporated into any updates to other project plans or permit conditions.

### ***Outcomes***

Following the review of the final AoR delineation, the amended AoR and Corrective Action Plan, and the status of corrective action, the UIC Program should revise information in the permit file as needed. These materials may include the following:

- Revised permit conditions for AoR and corrective action, if needed;
- Documentation of any corrective action performed since the permit was issued and of any remaining corrective action activities that must be performed under a phased approach, if appropriate (and the schedule for those activities);
- The approved amended AoR and Corrective Action Plan, if needed, as an enforceable condition of the permit;
- An updated map of the approved AoR delineation, if needed; and
- A report documenting the evaluation of the AoR and corrective action submissions, highlighting newly incorporated information about the site and any updates to the independent modeling evaluation approach and results.

The AoR and Corrective Action Plan and any supporting documents should be uploaded to the project's permit package area in the GSĐT.

### 5.1.3 Financial Responsibility

Class VI well owners or operators must update their financial responsibility cost estimates annually or when any of the specified project plans have been updated [40 CFR 146.85(c)(2)]. Given the likelihood that one or more project plans will change during the pre-operation phase, it is possible that an updated cost estimate may be needed during this phase.

The purpose of the UIC Program's review of updated financial responsibility information is to confirm that the cost estimates for corrective action, injection well plugging, PISC, site closure, and emergency and remedial response are adjusted as needed to address any changes to the covered activities that were identified during the pre-operation review. For additional information, see the *UIC Program Class VI Financial Responsibility Guidance*.

#### **Completeness Review**

The owner or operator will submit updated cost estimates for corrective action, injection well plugging, PISC, site closure, and/or emergency and remedial response. These updates must reflect adjustments for inflation (if it has been at least one year since the instruments were approved), per 40 CFR 146.85(c)(2). Additionally, for any covered activities for which a change is necessary based on new information collected during the pre-operation phase, the owner or operator must submit revised cost estimates to ensure that the financial instruments will be adequately funded.

The UIC Program should verify that any changes to covered activities described in the Class VI project plans are addressed in the cost estimate updates. These may include: the number of wells that need corrective action as described in the AoR and Corrective Action Plan, the number of monitoring wells that need to be plugged following post-injection monitoring or site closure activities described in the PISC and Site Closure Plan, or potential response activities identified in the Emergency and Remedial Response Plan.

#### **Evaluation**

The bolded text below outlines a suggested approach that a UIC Program might employ to evaluate updated financial responsibility cost information and/or revisions to financial instruments submitted by a Class VI well owner or operator to: confirm that the submittal meets the requirements of the Class VI Rule; confirm that the permit conditions are protective; and facilitate authorization to inject.

**Review any revised cost estimates** in the context of amendments to the AoR and Corrective Action, Well Plugging, PISC and Site Closure, or Emergency and Remedial Response plans. If updated information impacts any of the activities for which financial responsibility is needed (which may result in increases or decreases to the cost estimates), verify that the cost estimates are appropriately updated and accurate. See Section 4.1.3 for additional information on the EPA's Cost Estimation Tool, which can facilitate this review. Below are examples of how updated information about the site may impact financial responsibility cost estimates:

- If the reevaluated AoR is larger than what was delineated in the initial permit application and encompasses additional wells that need corrective action, the cost estimate for corrective action will need to be adjusted. A larger AoR may encompass additional resources that were not identified and addressed in the Emergency and Remedial

Response Plan. It may also impact the number or depth of monitoring wells that would need to be constructed (and therefore plugged).

- If computational modeling results or other information indicate that a longer PISC timeframe may be necessary before an owner or operator could demonstrate non-endangerment, additional resources will need to be available to cover a longer post-injection testing and monitoring phase.
- If the injection well's construction differs from what was described in the original plan, this may affect the cost to plug the well.
- If pre-operational testing identifies the presence of additional USDWs in the AoR, the cost estimates for emergency and remedial response will need to be sufficient to address potential contamination of those USDWs. Also, if monitoring within these USDWs necessitates more or deeper monitoring wells, PISC and site closure costs may need to be adjusted to cover the increased monitoring well plugging costs.
- If any new information about subsurface formations impacts the well plugging methods or materials to be used, additional financial resources may be needed to plug the injection and/or monitoring wells.

**Review any adjustments to the cost estimates to account for inflation** if it has been at least a year since the financial instruments were established or last updated, as required at 40 CFR 146.85(c)(2). This may be needed, given the time needed to construct the well and perform all required pre-operational testing.

**Review any changes to the financial instruments.** If the owner or operator submits revised financial instruments, confirm that the instruments are suitable to the activities they cover, are adequately funded, and contain required language and conditions of coverage as described at 40 CFR 146.85(a). Verify that financial instruments for all activities are in force and fully funded prior to authorizing injection. If initiation of any instruments was to be deferred until injection commenced, verify that these are in place. Confirm that all applicable milestones in any pay-in schedules have been met. See Section 4.1.3 for additional information on evaluating financial instruments.

### ***Outcomes***

The UIC Program should revise the permit or other materials as needed following the review of updated financial responsibility information, including:

- Permit conditions for financial responsibility (if applicable);
- Final, fully-funded financial responsibility instruments with appropriate text/conditions to cover all required activities related to corrective action, well plugging, PISC, site closure, and emergency and remedial response;
- An updated description of the enforceable financial responsibility conditions of the permit (if applicable); and
- A report on the evaluation of the owner or operator's financial responsibility cost estimates.

The revised financial responsibility instruments and any supporting materials should be uploaded to the project's permit package area in the GSDT.

#### ***5.1.4 Injection Well Construction***

To demonstrate proper construction or conversion and testing of the well, the Class VI Rule requires owners or operators to submit information on final injection well construction procedures [40 CFR 146.82(c)(5)], all available logging and testing program data on the well [40 CFR 146.82(c)(7)], the results of MITs on the injection well [40 CFR 146.82(c)(8)], and information on the compatibility of the carbon dioxide stream with the materials used to construct the well [40 CFR 146.82(c)(3)].

The purpose of the UIC Program's evaluation of information on how the injection well was built and the results of well testing is to confirm that the well was engineered and constructed to meet the requirements at 40 CFR 146.86(a). The UIC Program's evaluation will ensure that the well's construction is appropriate for planned operations and conditions so that it will maintain integrity throughout its life and not become a conduit for fluid movement that could endanger a USDW.

#### ***Completeness Review***

Owners or operators will submit the final construction procedures to the UIC Program Director. The submittal will likely be in the form of a narrative document that describes how the injection well was constructed, accompanied by "as-built" schematics and specifications that show the final construction of the well along with cementing records. The specifications should indicate the location of all casing strings and cement, along with the location of the packer and perforated intervals. The schematics should illustrate the shut-off system and any continuous monitoring equipment installed to demonstrate internal mechanical integrity per 40 CFR 146.89 and 146.90.

The owner or operator will also submit the results of logging and testing program data on the well, internal and external MIT results, and information on the compatibility of the carbon dioxide stream with the well materials. The pre-operational testing results will likely include a combination of narrative information (such as log analyst reports), graphs/figures, tabular data, and log results in Log ASCII Standard (LAS) format. Confirm that all required tests were performed and that the results include appropriate analyses and discussions to support a determination that the well is of suitable construction, has mechanical integrity, and that corrosion will not impact well integrity.

Owners or operators who converted their wells should submit post-conversion schematics, the results of any additional tests that were requested in the course of the permit application review, and documentation that any needed repairs were performed.

## ***Evaluation***

The UIC Program should review information on the well to confirm that construction or conversion of the well took place as planned and that the construction is suitable based on updated geologic data and the results of pre-operational testing. Certain newly acquired information, e.g., about the compatibility of the carbon dioxide stream with the well materials or the location of fluid-containing/porous formations, may also impact proper monitoring well construction and should be considered in reviewing amendments to the Testing and Monitoring Plan (see Section 5.1.6).

The bolded text below outlines a suggested approach that a UIC Program might employ to evaluate as-built well construction information, to confirm that an owner or operator's submittal meets the requirements of the Class VI Rule; confirm that the well was constructed in a manner that is protective of USDWs, and that the permit conditions are appropriate to the well's construction; and facilitate authorization to inject.

**Compare the as-built schematics and construction procedures to those submitted with the permit application and the approved injection well construction plan.** Verify that the well was constructed as planned, including the use of proper lengths and diameters of casing and acceptable materials and cement (i.e., of sufficient strength and corrosion-resistance). Note and document any divergence from the approved construction plans, schematics, and procedures in the permit.

If there are changes from the approved construction plan, confirm that the well was constructed in a manner that will maintain mechanical integrity and prevent migration of fluids into unauthorized zones, as informed by the most up-to-date geologic information. If any of the changes might result in the inability of the well to prevent fluid migration or maintain mechanical integrity, verify that remedial actions were or will be performed (and identify the anticipated timing of such remediation). Confirm that continuous monitoring and recording devices to demonstrate internal mechanical integrity were installed, per 40 CFR 146.88(e) and that the well is equipped with shutoffs and safety devices that are linked to final operating limits (see Section 5.1.5).

If the well is deviated at all from vertical, compare the radius of curvature to the length of monitoring instruments described in the Testing and Monitoring Plan to ensure that the instruments will not become lodged in the bend of the well casing. Likewise, if the diameter of the well is different from what was planned, confirm that instruments required for testing, monitoring, and well workovers will fit in the well.

**Review the results of logs run during well drilling and construction** to evaluate whether the well was properly constructed. Verify that all well logs (e.g., caliper, cement evaluation, temperature, and cement bond) were conducted properly and as described in the permit. Review logs used to determine cement placement and verify that the emplaced cement is continuous and that no channels that would allow unacceptable fluid migration exist. Examine logging records to verify that the depths of well perforations are properly located within the injection zone. Examine cement bond logs to determine the quality of the cement. Independently evaluate the well properties if necessary to achieve a complete understanding of the suitability of the well.

Review cementing records to ensure that cement was circulated to the surface. If cement was not returned to the surface or logs indicate missing or thin cement in any areas, determine whether

the existing cement is adequate to ensure that there will be no fluid migration along the well bore for the duration of the Class VI project. If the cement is not adequate to prevent migration of fluids, determine if additional cement placement (e.g., through tremie pipes) could provide adequate cement to prevent fluid migration; if so, consider requesting that this be performed.

Review caliper logs and video inspections to evaluate the condition and placement of all well components. Verify that the packer is seated within the confining zone immediately above the injection zone. Ensure that the casing strings were installed as described in the construction plans, and that the casing size is sufficient to accommodate the necessary logging and workover equipment that will be needed to test the well during project operations. Evaluate the condition of the casing. If conditions are observed that indicate the casing cannot maintain its integrity for the duration of the project, require (or confirm) that appropriate repairs are made. Verify that the well was constructed using materials that are of sufficient strength to withstand anticipated stresses for the duration of the Class VI project. If well stimulation was performed, review post-stimulation documentation to verify that the well and cement were not impacted or compromised as a result of stimulation. If any well components were damaged, confirm that the necessary repairs were or will be made (and the anticipated timing of such repairs).

**Review the results of formation testing and analyses of geochemical samples taken** to verify that the assumptions on which well construction plans were based are accurate and that there are no concerns about the compatibility of the well construction materials with the carbon dioxide stream. If any variations have the potential to affect well integrity or cause premature corrosion of the well, discuss with the owner or operator whether any changes to the well materials or cement are needed. If geochemical analyses indicate that the subsurface geochemistry is significantly different than the assumptions on which the approved construction procedures were based, verify (or consider requesting a demonstration) that the well materials are compatible with formation conditions. Also, consider whether more frequent corrosion monitoring or MITs may be appropriate. (For information on the compatibility of carbon dioxide with formation fluids and minerals, see Section 5.1.1.)

**Verify that the well has mechanical integrity.** Examine the results of the pre-operational external MIT to ensure proper cementing. Review the results of the annular pressure test or other internal MIT to verify proper casing installation. If it appears that the well cannot maintain integrity for the duration of the project, require that appropriate repairs are made (or confirm that they have been successfully completed).

Additionally, if the permit included conditions to test deep monitoring wells (see Section 4.1.5), confirm that the tests were performed as required by the permit and verify that the wells were constructed as proposed and have mechanical integrity.

**Verify that any needed remedial actions for wells that were converted** pursuant to 40 CFR 146.81(c) were performed as planned and that all information necessary to demonstrate that the well was engineered and constructed to meet the requirements at 40 CFR 146.86(a) is present. Confirm that the owner or operator performed any needed replacement or remediation of any components or materials. Also, review information about any new materials that were installed to ensure compatibility with the injectate and formation fluids. Examine construction records to ensure proper procedures and adequate cement setting times. Review cement evaluation logs to verify proper cement placement. Evaluate post-remediation internal and external MITs to ensure

that the well has mechanical integrity. See Section 4.1.4 for additional information on evaluating the construction of converted wells.

**Consider whether any newly acquired information about the project impacts the appropriateness of the well's construction.** For example:

- If geologic testing revealed the presence of additional USDWs or porous formations, confirm that the well was cemented across these zones.
- Confirm that the well shut-in procedures are appropriate based on the most up-to-date information about the site or changes to planned operations.
- Verify that the approved well construction is suitable to the final operating conditions, e.g., related to the materials' strengths versus anticipated pressures.

Also, communicate any changes to the well's construction to reviewers of the Injection Well Plugging Plan and the well testing components of the Testing and Monitoring Plan and of financial responsibility information. For detailed information on the construction of Class VI wells, refer to the *UIC Program Class VI Well Construction Guidance*.

### ***Outcomes***

Following the review of as-built well construction specifications and pre-operational well testing results, the UIC Program should develop and upload the following to the project's permit package area in the GSDT:

- Final, as-built well construction specifications and schematics that describe all required casings, cement, safety and shutoff devices, and monitoring gauges;
- Revised permit conditions (if applicable);
- Documentation of the review of final schematics, including any divergence from the procedures that were approved with the initial permit, and an evaluation that the procedures and materials used ensure USDW protection;
- Documentation of the review of pre-operational well testing results; and
- An evaluation of the procedures employed to convert the well (if applicable), and documentation that the well was converted in compliance with 40 CFR 146.81(c).

### ***5.1.5 Operating Conditions***

Based on the outcomes of their pre-operational testing, owners or operators may submit updates to their planned operating conditions (e.g., injection pressure). It is anticipated that changes to the understanding of the site could impact appropriate operating limits and, if so, this should be addressed in the permit.

The purpose of the UIC Program's review of planned operations is to ensure that the injection rates and volumes in the permit are suitable to the site-specific geology and other project characteristics, particularly in light of pre-operational testing results, to ensure that injection operations will not endanger USDWs.

### ***Completeness Review***

Class VI well owners or operators may submit updated information about operating procedures, such as the proposed injection rates and pressures, annulus pressure, and the total volume of

carbon dioxide to be injected over the duration of the project. The updated information will likely be a narrative description supported by graphs or tables that highlight changes to the relevant operating parameters. The UIC Program should verify that any updated information is adequate to inform an evaluation, i.e., the information should be similar in content and level of detail to the operating information submitted with the initial permit application.

### ***Evaluation***

The bolded text below outlines a suggested approach that a UIC Program might employ to evaluate updated operating information, submitted by a Class VI well owner or operator, to confirm that the submittal meets the requirements of the Class VI Rule; confirm that the permit's operating conditions are appropriate to final geologic and well construction information; and facilitate authorization to inject.

**Confirm that the maximum allowable injection pressure in the permit is appropriate based on pre-operational formation testing results.** Review step rate tests performed after well construction and the results of other logs to verify that information provided in the permit application related to the fracture pressure of the injection and confining zones is correct. If the calculated fracture pressures of the injection and confining zones differ from the assumptions on which injection rates and pressures in the Class VI permit were based and, as a result, the injection pressure exceeds 90 percent of the fracture pressure of the injection zone, revise the permit conditions accordingly. If there is/are any uncertainty or inconsistencies in calculated fracture pressures within the injection or confining zones, consider whether the maximum injection pressure limit may need to be revised to less than 90 percent of the fracture pressure of the injection zone. Verify that any revised information about the site's geology (i.e., seismic history, potential interactions with subsurface fluids or well materials, or the presence of faults or fractures) does not affect the assumptions on which the injection pressure limits in the permit are based.

**Confirm that the total permitted volume of carbon dioxide to be injected is appropriate.** Consult with others on the permit application review team (including those reviewing site geology and the AoR delineation modeling) to confirm that there are no changes to the estimated storage capacity of the injection zone or the properties of the confining zone, and that the site can receive and contain the total volume of carbon dioxide to be injected.

**Confirm that the permitted annular pressure is acceptable in light of pre-operational testing results.** Consider whether any change to the annulus pressure is necessary in light of final well construction (e.g., the strength of the casing and tubing), formation fracture pressure, or injection pressure.

If the owner or operator revises any of the planned operating conditions (e.g., the total volume of carbon dioxide to be injected or the carbon dioxide source/composition), inform other members of the review team—including reviewers of the AoR delineation modeling and well construction—of the changes. Confirm that the well is equipped with shutoffs and safety devices that are tied to final operating limits. See Section 4 of the *UIC Program Class VI Well Construction Guidance* for additional information on Class VI well operating conditions.

### ***Outcomes***

Following the evaluation of operating requirements in the context of formation and well testing results and other information, develop or update the following:

- Final operating limits in the permit to reflect any needed changes to maximum injection pressure, volume, or annulus pressure limits;
- The summary of the enforceable operating conditions of the Class VI permit (if applicable); and
- Documentation of any reviews that resulted in changes to or confirmed the operating limits in the permit.

Any final materials should be uploaded to the project's permit package area in the GSDT.

#### ***5.1.6 Testing and Monitoring***

Owners or operators must submit an amendment to the Testing and Monitoring Plan if needed to address newly identified information gathered via pre-operational testing or other pre-operation phase activities [40 CFR 146.82(c)(9)].

The purpose of the UIC Program's review of any amendments to the Testing and Monitoring Plan is to ensure that the testing and monitoring procedures remain appropriate to planned operations, the well's construction, site-specific geologic and hydrologic conditions, and the predicted behavior of the carbon dioxide plume and pressure front based on final AoR delineation modeling. The UIC Program should also ensure that planned testing and monitoring will generate the data necessary to demonstrate that the project is not endangering USDWs, provide the necessary input data for AoR delineation modeling reevaluations, and provide data points on which the non-endangerment demonstration will be based.

Verifying that the strategy described in the amended Testing and Monitoring Plan is based on the most up-to-date understanding of the site is essential to ensuring that sufficient data will be generated to demonstrate compliance (with the permit conditions and the Class VI Rule) and to inform decision-making at project milestones.

#### ***Completeness Review***

An amendment to the Testing and Monitoring Plan will likely be in the same format as the approved Testing and Monitoring Plan, with changes made to address the results of pre-operational testing or any other new information about the site. Optimally, the owner or operator will highlight any changes to the testing and monitoring strategy, including explaining the purpose of any new monitoring methods and how the results will be used.

The UIC Program should perform a preliminary review of the amended Testing and Monitoring Plan to verify that it provides a sufficient level of detail to inform an evaluation. For example, it should describe any newly added testing and monitoring methods, including testing frequency, parameters, detection limits, and locations or depths. These should be representative of the most up-to-date AoR delineation and reflect the presence of any newly identified USDWs or other formations of interest identified through pre-operational testing. If any information is missing or is not presented in sufficient detail to inform an evaluation of the Testing and Monitoring Plan, the UIC Program should consider requesting the missing information or asking clarifying questions. See Section 4.1.7 for additional information on reviewing the completeness of the Testing and Monitoring Plan. Confirm that the owner or operator has updated the QASP if the amended Testing and Monitoring Plan includes any new testing or analytical methods.

## ***Evaluation***

The UIC Program should review the amended Testing and Monitoring Plan to confirm that it appropriately reflects all relevant new or updated information about the site. For example:

- Confirm that the plan includes changes to the planned carbon dioxide stream analyses (e.g., analytes or sampling frequency) that are needed to address updated information about the carbon dioxide composition or source.
- Confirm that planned well testing (e.g., corrosion testing, MITs, or continuous monitoring of operational parameters) reflects the most up-to-date information on project operations, well construction, carbon dioxide stream composition and source, and the compatibility of the carbon dioxide stream with well materials.
- Verify that planned groundwater sampling or other above-confining-zone monitoring reflects the most up-to-date information on site characteristics. For example, if formation testing data indicate that mobilization of additional constituents is possible, verify that the groundwater monitoring program includes monitoring for these constituents. If any new USDWs were identified during pre-operational testing, verify that the final plan includes monitoring to ensure that these USDWs are not endangered. Confirm that sampling locations, depths, and frequencies are appropriate based on the most up-to-date computational modeling results. For example, the monitoring strategy may need to be adjusted if the predicted direction of plume movement is substantially different compared to previous expectations or if any new pathways for potential carbon dioxide leakage have been identified.
- Verify that all monitoring wells that need to be installed prior to commencing injection are in place and properly constructed. Review as-built schematics in the context of any updated information about the compatibility of the carbon dioxide stream with well materials (see Section 5.1.4 for similar considerations regarding injection well construction).
- Confirm that plume and pressure front monitoring strategies are appropriate based on the most up-to-date geologic information, planned operational procedures, and computational modeling results. Monitoring locations/depths, spatial coverage, and frequencies should be appropriate to the most up-to-date AoR delineation, predictions of plume and pressure front behavior, and any new information about endangerment to USDWs within the AoR. For example, if predicted plume arrival times at certain monitoring locations have changed, the monitoring schedule may need to be adjusted to ensure that sufficient data are collected to compare with those predictions.
- Confirm that any surface air monitoring and/or soil gas monitoring (if required) remains appropriate based on the results of updated geologic information. The plan should incorporate any revisions to monitoring locations or frequencies that are needed based on the results of baseline testing or information on potential carbon dioxide leakage pathways.
- Review any additional testing and monitoring included in the plan.

- Request and review a revised QASP if any testing or monitoring activities (or the associated QA/QC needs) change. Verify that the QASP describes standard procedures and practices to ensure data quality for all testing and monitoring procedures.

The *UIC Program Class VI Well Project Plan Development Guidance* provides additional information on evaluating Testing and Monitoring Plan amendments. See the *UIC Program Class VI Well Testing and Monitoring Guidance* for additional information on testing and monitoring procedures for Class VI projects.

### ***Outcomes***

Following review and approval of the amended Testing and Monitoring Plan, the UIC Program should incorporate the following information into the permit file:

- Updated permit conditions for testing and monitoring and MITs, if modifications are needed based on the pre-operation phase review;
- The approved amended Testing and Monitoring Plan as an enforceable condition of the permit;
- A final, approved QASP that addresses all testing and monitoring activities in the amended Testing and Monitoring Plan;
- Approved construction schematics for all monitoring wells; and
- Follow-up reports or other materials documenting the evaluation, focusing on changes to the plan and highlighting how uncertainties or data limitations were addressed.

The Testing and Monitoring Plan, the QASP, and any associated materials should be uploaded to the project's permit package area in the GSDT.

### ***5.1.7 Injection Well Plugging***

Owners or operators must submit any amendments to the approved Injection Well Plugging Plan that are needed to address newly acquired information following pre-operational testing [40 CFR 146.82(c)(9)].

The purpose of the UIC Program's review of the amended Injection Well Plugging Plan is to confirm that the materials and procedures described in the plan are appropriate in light of the well's final construction and any new information about the site's geology and geochemistry, particularly regarding compatibility with the subsurface environment at the site. This review will ensure proper plugging of the injection well to prevent it from becoming a conduit for fluid movement that could endanger USDWs after well plugging.

### ***Completeness Review***

An amended Injection Well Plugging Plan should be similar to the approved plan. That is, it will likely be a narrative document that includes well schematics and describes how the owner or operator will plug the injection well in accordance with the requirements at 40 CFR 146.92. The plan should highlight and explain any changes that are needed to address modifications to the well's construction, as documented in the construction specifications (see Section 5.1.4), or new information about subsurface geochemistry based on the results of pre-operational formation testing and the compatibility of well materials with subsurface fluids and the injectate. See

Section 4.1.8 for additional information on reviewing the completeness of the Injection Well Plugging Plan.

### ***Evaluation***

The bolded text below outlines a suggested approach that a UIC Program might employ to evaluate an amended Injection Well Plugging Plan to: confirm that the owner or operator's submittal meets the requirements of the Class VI Rule; confirm that the permit conditions for well plugging remain appropriate in light of information on the well's final construction and other site information; and facilitate authorization to inject.

**Review the amended Injection Well Plugging Plan in the context of new information.** The review should be done in coordination with reviewing information on the final injection well construction (or conversion) and pre-operational testing results. For example:

- If any aspects of injection well construction varied from the approved procedures, verify that the types and amounts of cement and plugs in the final Injection Well Plugging Plan reflect these changes;
- If any new information is available about the injectate or formation fluid geochemistry (including any anticipated geochemical changes that could affect the compatibility of the injectate with well materials), confirm that the plugging materials and cement described in the Injection Well Plugging Plan are suitable to those conditions; or
- If pre-operational formation testing reveals the presence of any additional USDWs, other fluid-containing or porous formations, or other geologic features that could allow fluid movement that could endanger USDWs, confirm that the plan includes plugs and cement at appropriate depths and that the calculated quantity of cement is sufficient to cover all relevant formations.

If any aspects of the Injection Well Plugging Plan change based on the review, alert the staff reviewing the financial responsibility cost estimates that the estimates to plug the well may need to be revised. Note that changes to the procedures in the Injection Well Plugging Plan may also need to be reflected in the monitoring well plugging procedures; for this, coordinate with the reviewer of the PISC and Site Closure Plan as appropriate.

See Section 4.1.8 for additional information on addressing conversion of the injection well for another purpose following cessation of carbon dioxide injection for GS. This conversion should be addressed in the Injection Well Plugging Plan.

For additional information on evaluating amended Injection Well Plugging Plans, see the *UIC Program Class VI Well Project Plan Development Guidance*. See Section 2 of the *UIC Program Class VI Well Plugging, Post-Injection Site Care and Site Closure Guidance* for additional information on Class VI injection well plugging procedures.

### ***Outcomes***

Following the review of the amended Injection Well Plugging Plan, the UIC Program should develop and upload the following to the project's permit package area in the GSDT:

- Updated permit conditions for injection well plugging (e.g., procedures and materials) and associated notifications, if necessary;
- The approved amended Injection Well Plugging Plan as an enforceable condition of the permit; and
- Follow-up reports about any aspects of the review of the Injection Well Plugging Plan that have changed since the permit application review.

#### ***5.1.8 Post-Injection Site Care and Site Closure***

Owners or operators must submit any amendments to the PISC and Site Closure Plan or updates to the alternative PISC timeframe demonstration that are needed to address information gathered during pre-operational testing [40 CFR 146.82(c)(9)].

The purpose of the UIC Program's review of PISC and Site Closure Plan amendments is to ensure that any needed revisions are made to address information gathered during the pre-operation phase, so that protection of USDWs is ensured following injection operations. In particular, the UIC Program should ensure that the plan encompasses post-injection testing and monitoring throughout the entire AoR for a sufficient duration (as informed by the most up-to-date computational modeling results), reflects any changes in predicted behavior of the carbon dioxide plume and pressure front, and includes monitoring well plugging procedures that are appropriate based on the current understanding of the site. The review of the amended PISC and Site Closure Plan should be closely linked to reviews of the amended AoR and Corrective Action Plan, Testing and Monitoring Plan, and Injection Well Plugging Plan (as discussed in Sections 5.1.2, 5.1.6, and 5.1.7, respectively).

#### ***Completeness Review***

An amendment to the PISC and Site Closure Plan will likely be a narrative document (supported by maps, cross sections, and well schematics) that is similar in format and content to the approved plan in the Class VI permit. Any changes relative to the approved plan that address newly acquired information should be highlighted and explained, either in the plan or in supporting documentation.

The owner or operator should also submit an updated QASP to address any new testing and monitoring procedures or parameters. A single QASP that covers injection and post-injection phase testing and monitoring may be acceptable. The UIC Program should verify that the QASP addresses all post-injection testing and monitoring. Section 4.1.9 provides additional information on reviewing the completeness of the PISC and Site Closure Plan.

#### ***Evaluation***

The bolded text below outlines a suggested approach that a UIC Program might employ to evaluate the amended PISC and Site Closure Plan to: confirm that the owner or operator's submittal meets the requirements of the Class VI Rule; confirm that the permit conditions for post-injection site care are appropriate based on updated well and site-specific information; and facilitate authorization to inject.

**Verify that the predictions of post-injection phase plume and pressure front behavior are consistent with the most up-to-date computational modeling results.** If the results of pre-operational formation testing necessitate revisions to the AoR delineation modeling (see Section

5.1.2), any associated changes to the estimates of the pre- and post-injection pressure differential, the predicted position of the carbon dioxide plume and pressure front at site closure, or other relevant parameters should be reflected in the amended PISC and Site Closure Plan. Changes to operating procedures or updated geologic information may also affect predictions of plume and pressure front behavior.

**Review the proposed post-injection testing and monitoring program.** In general, the testing and monitoring methods used in the post-injection phase will likely be an extension of the injection phase testing and monitoring methods. Thus, any changes to the strategies in the Testing and Monitoring Plan may need to be reflected in this part of the PISC and Site Closure Plan. Verifying that the strategy described in the amended PISC and Site Closure Plan is based on the most up-to-date understanding of the site is essential to ensuring that sufficient data will be generated to demonstrate compliance with the permit conditions and the Class VI Rule and to inform decision-making at project milestones. For example, consider the following in reviewing the amended PISC and Site Closure Plan:

- If new pathways for potential carbon dioxide movement (e.g., additional faults, fractures, or other pathways) have been identified, verify that post-injection monitoring will target these areas;
- If any new USDWs are identified during pre-operational testing, verify that the final plan includes monitoring to ensure that these USDWs are not endangered;
- If formation testing data indicate that mobilization of additional constituents is possible, confirm that the groundwater monitoring program in the PISC and Site Closure Plan includes monitoring for these constituents;
- If the most up-to-date computational modeling results indicate that the predicted speed, direction, or extent of plume and pressure migration have changed, verify that the spatial and temporal coverage of plume and pressure front tracking methods are appropriate considering the new information; and
- Verify that the locations/depths, spatial coverage, and frequencies of post-injection phase testing and monitoring are appropriate to the most up-to-date AoR delineation, predictions of plume and pressure front behavior, and any new information about endangerment to USDWs within the AoR.

If the plan includes provisions to decrease monitoring parameters or frequencies during the post-injection phase, confirm that any quantitative triggers specified to reduce monitoring (or the baselines against which they would be compared) remain accurate based on the current understanding of the site and model predictions.

If any new monitoring activities are included in the amended plan, confirm that they are addressed in an updated QASP.

**Review the alternative PISC timeframe demonstration in the context of new information (if applicable).** If new information about the site is relevant to any of the criteria for an alternative PISC timeframe demonstration at 40 CFR 146.93(c), revisit the basis of the demonstration. In particular, any changes to the geologic understanding of the site based on formation testing, predicted interactions between carbon dioxide and formation fluids (based on geochemical analyses), or any changes to planned operating procedures (or the physical and chemical

characteristics of the carbon dioxide stream) may affect the trapping mechanisms and the overall behavior of the carbon dioxide plume and pressure front. When evaluating updates to the alternative PISC timeframe demonstration, also consider predictions about the rate or extent of carbon dioxide movement and/or the timeframe for pressure decline after injection ceases, changes to the understanding of the confining zone characteristics, the number/quality/location of conduits for fluid movement that could endanger a USDW in the final AoR, and the presence of any newly identified USDWs. Review this information and discuss it with the owner or operator as needed to confirm that the assumptions on which the predictions of the alternative timeframe are based remain accurate and the PISC timeframe is protective of USDWs. See Section 4.1.9 above for additional information.

**Review the non-endangerment demonstration criteria in light of newly available information.** If the PISC and Site Closure Plan included non-endangerment demonstration criteria, confirm that any changes to planned monitoring activities, computational modeling results, or information about potential conduits for fluid movement that could endanger USDWs are reflected in the non-endangerment demonstration criteria described in the amended plan. Also, confirm that a sufficient amount and types of baseline data to which future monitoring results will be compared were collected and documented during pre-operational testing. Coordinate with the reviewers of the Testing and Monitoring Plan and the AoR and Corrective Action Plan to ensure that sufficient information will be available at the end of the post-injection phase of the project to make a non-endangerment demonstration.

**Review plans for monitoring well plugging and site closure.** Any amendments made to the Injection Well Plugging Plan to address new information about the site (e.g., on subsurface geochemistry that could affect the compatibility of the injectate with well materials) should be considered for potential modifications to the monitoring well plugging procedures and materials. See Section 4.1.8. Verify that any other proposed site closure activities described in the plan are appropriate in light of newly collected information.

For additional information on evaluating amended PISC and Site Closure plans, see the *UIC Program Class VI Well Project Plan Development Guidance*. Section 3 of the *UIC Program Class VI Well Plugging, Post-Injection Site Care and Site Closure Guidance* provides additional information on PISC for Class VI projects.

### **Outcomes**

Following review of the amended PISC and Site Closure Plan and related information, the UIC Program should revise information in the permit file as needed, including the following:

- Permit conditions for PISC and site closure (if necessary);
- The approved amended PISC and Site Closure Plan as an enforceable condition of the permit;
- A final, approved QASP that addresses all testing and monitoring activities in the amended PISC and Site Closure Plan (if necessary, and if the owner or operator develops separate QASPs for injection and post-injection testing and monitoring);
- Any applicable updates to the conditions that must be met to demonstrate that the site does not pose an endangerment to USDWs; and

- Any revisions to the alternative PISC timeframe, including a report documenting the evaluation of the alternative PISC timeframe demonstration based on the results of newly available information.

The final PISC and Site Closure Plan and any associated supporting materials should be uploaded to the project's permit package area in the GSDT.

#### ***5.1.9 Emergency and Remedial Response***

Following pre-operational testing, owners or operators must amend the Emergency and Remedial Response Plan if necessary to address updated information [40 CFR 146.82(c)(9)].

The purpose of the UIC Program's review will be to ensure that the amended Emergency and Remedial Response Plan includes any revisions that are necessary to address newly available information, such as changes to site operations, additional resources in an expanded AoR, or the presence of previously unidentified USDWs.

#### ***Completeness Review***

The amended Emergency and Remedial Response Plan will likely be a narrative document that is similar in format and content to the approved plan in the permit. The amended plan should include any changes that are needed to address newly available or updated information about the site. This may include changes to the size of the AoR or the presence of additional resources or risks for which response procedures are needed. See Section 4.1.10 for additional information on reviewing the completeness of Emergency and Remedial Response Plans.

#### ***Evaluation***

The bolded text below outlines a suggested approach that a UIC Program might employ to evaluate an Emergency and Remedial Response Plan amendment to: confirm that the owner or operator's submittal meets the requirements of the Class VI Rule; verify that the permit conditions related to emergency response are protective; and facilitate authorization to inject.

**Review the amended Emergency and Remedial Response Plan to ensure that it addresses any newly identified risks or resources.** For example:

- If the size or shape of the delineated AoR changes based on newly acquired information, the Emergency and Remedial Response Plan should address risk to all resources and infrastructure throughout the final, approved AoR;
- If updated geologic information or modeling investigations suggest that there is a potential for induced seismicity, the Emergency and Remedial Response Plan should address induced seismicity;
- If pre-operational geochemical testing identifies additional USDWs within the AoR, the Emergency and Remedial Response Plan should address potential carbon dioxide or other fluid movement into these USDWs; and
- If updated information about the geologic characteristics of the site indicate the presence of additional pathways for fluid movement, the Emergency and Remedial Response Plan should describe any associated carbon dioxide leakage or groundwater contamination scenarios and identify responses.

Confirm that the amended Emergency and Remedial Response Plan meets the requirements at 40 CFR 146.94 and that planned responses will be adequate for mitigating any adverse events that could arise during injection and through the PISC phase. See the *UIC Program Class VI Well Project Plan Development Guidance* for additional information on evaluating amended Emergency and Remedial Response plans.

### ***Outcomes***

Following the review and approval of the amended Emergency and Remedial Response Plan, the UIC Program should develop the following information and upload it to the project's permit package area in the GSDT:

- Revised permit conditions for emergency and remedial response, if appropriate;
- The approved amended Emergency and Remedial Response Plan as an enforceable condition of the permit; and
- Follow-up reports about any aspects of the review that have changed since the permit application review, highlighting how any uncertainties or data limitations were addressed.

#### ***5.1.10 Injection Depth Waivers***

It is possible that additional geologic information collected during pre-operational testing may be relevant to the injection depth waiver determination or waiver-specific permit conditions. Additionally, such information could strengthen and support the demonstration of site-suitability and the appropriateness of an injection depth waiver. Thus, while there is no specific requirement to update the injection depth waiver application following construction of the well, it is anticipated that owners or operators may submit updated geologic information, required by 40 CFR 146.82(c)(2), that is relevant to the injection depth waiver, including the results of pre-operational formation testing below the injection zone.

Where an injection depth waiver is needed to allow injection into the identified injection zone, the UIC Program should review this in the context of newly acquired or updated geologic information collected during pre-operational testing, the reevaluated AoR, and the final construction of the well. The purpose of the UIC Program's evaluation is to confirm that all permit conditions are appropriate and that the Class VI project will be protective of USDWs. The EPA expects that this evaluation would be closely linked to the review of updated geologic information (see Section 5.1.1) and the AoR reevaluation (see Section 5.1.2).

### ***Completeness Review***

The EPA recommends encouraging the owner or operator to include in the updated geologic information any information relevant to the injection depth waiver—including information on the lower confining zone and USDWs below the injection zone—highlighting any newly acquired information. If necessary to ensure protection of USDWs above and below the injection zone, the UIC Program should consider requesting that the owner or operator submit this information, pursuant to 40 CFR 146.95(f)(5).

### ***Evaluation***

The bolded text below outlines a suggested approach that a UIC Program might employ to evaluate any updated information about the injection depth waiver to: confirm that the owner or operator's submittal meets the requirements of the Class VI Rule; confirm that the permit

conditions remain protective of USDWs above and below the injection zone; and facilitate authorization to inject.

**Verify that updated geologic data confirm the information on which the injection depth waiver application and its approval were based,** particularly regarding USDWs and other formations below the injection zone. Consider operations under an injection depth waiver in the context of the current understanding of the site (e.g., the results of formation testing or updated computational modeling). Modify the Class VI permit conditions or project plans if necessary to address any remaining uncertainties. For example:

- Review the results of fluid sampling and analysis on all formations, including USDWs, below the injection zone and in the context of potential adverse reactions between the carbon dioxide stream and formation fluids or the well. If there is potential for mineralization or liberation of trace metals that may endanger USDWs, consider whether additional groundwater monitoring parameters should be specified in the Testing and Monitoring Plan and PISC and Site Closure Plan. If fluid analysis indicates the potential for adverse reactions between the carbon dioxide stream and well materials in formations below the injection zone, modify the corrosion monitoring or MIT conditions in the permit, as appropriate.
- Verify that the injection and confining zones are still suitable for receiving and confining the total volume of carbon dioxide to be injected based on the current understanding of the site and any newly acquired geologic, geomechanical, geochemical, or lithologic data about the injection and confining zones. For example, if the estimated total storage capacity of the injection zone has changed, consider whether it is necessary to modify the total permitted volume of carbon dioxide. If there is any change in information about the injectivity of the injection zone or the integrity of the confining zone, consider modifying the injection rate or pressure limits in the permit.
- Verify that the AoR reevaluation incorporates all available data about the lower confining zone and USDWs below it, and that no movement of the carbon dioxide plume or pressure front into unacceptable zones is predicted to occur. If necessary, request and review updates to the computational model and/or an amended AoR and Corrective Action Plan that incorporates consideration of the lower confining zone based on newly acquired information.
- Verify that the amended Emergency and Remedial Response Plan and the most up-to-date demonstration of financial responsibility address any newly identified risks to USDWs below the injection zone.
- If, based on other aspects of the pre-operation phase review, revisions to the injection and/or post-injection phase testing and monitoring strategies are necessary, determine whether permit conditions for monitoring below the injection zone are also needed. If so, verify that these have been incorporated into the amended Testing and Monitoring Plan and PISC and Site Closure Plan, as appropriate.

**Verify that the well was constructed properly** and confirm that it will allow injection operations that are protective of USDWs above and below the injection zone. Confirm that the casings were constructed to prevent movement of fluid into all unauthorized zones, including USDWs, above and below the injection zone. Review cement logs and the results of other pre-

operational well tests to confirm the proper placement of cement. If the well was constructed differently than described in the original well construction plan, verify that the procedures and materials described in an amended Injection Well Plugging Plan are appropriate to protect USDWs below the lower confining zone. See Section 5.1.4 for additional information on evaluating the construction of the well.

If the owner or operator drilled test well bores to obtain logs and cores for geologic characterization below the injection zone, verify that they were plugged and sealed to prevent fluid movement.

**Coordinate with U.S. EPA Headquarters staff** as needed so that notice of the waiver can be posted on the EPA's Office of Water website, per 40 CFR 146.95(e). Provide information about the depth of the injection zone; the location of the well; the name and depth of all USDWs; a map of the AoR; the names of any public water supplies affected, reasonably likely to be affected, or served by USDWs in the AoR; and the date on which the waiver was issued.

### ***Outcomes***

Following the review of updated information related to the injection depth waiver, revise relevant information in the permit file as needed, including the following:

- Revised permit conditions to conduct direct and indirect testing and monitoring below the injection zone during the injection and post-injection phases or other accommodations to address operation under an injection depth waiver (e.g., related to injection pressure limits or well plugging conditions), if necessary;
- Follow-up to any reports that documented the initial evaluation of the injection depth waiver application, highlighting any changes or clarifications based on pre-operational formation testing results or updated geologic information;
- Documentation of any additional consultation with the applicable PWSS Director(s), e.g., in light of new information or to address questions or issues raised by the public;
- Copies of any public comments received on the waiver; and
- Information about the waiver that was posted on the EPA's website.

Any materials related to the injection depth waiver review should be uploaded to the project's permit package area in the GSDT.

## **5.2 Authorizing Injection**

Issuing authorization to inject will likely involve similar activities to those performed to prepare the initial Class VI permit that allowed construction or conversion of the well (see Section 4.2). UIC Programs should implement the following steps:

**Revise the Class VI permit conditions as needed to address any changes in the understanding of the site.** As described throughout this section, it is likely that any needed changes to permit conditions will result from: an evaluation of pre-operational testing results and revised geologic characterization data and/or any updates to previously submitted information to reflect information that was not available at the time the permit application was submitted. Incorporate any changes that are needed based on the reviews described in Section 5.1 into the Class VI permit language.

Modification of UIC permits is addressed at 40 CFR 144.39 and 144.41:

- 40 CFR 144.39 identifies the conditions under which permit modifications are needed. For Class VI permits, these include (but are not limited to): any permit changes that are necessary based on AoR reevaluations, amendments to any Class VI project plan, or any permit modification that is necessary based on a review of testing and/or monitoring results conducted in accordance with permit requirements. Permit modifications under 40 CFR 144.39 require additional public notification as described at 40 CFR 124. When a permit is modified, only the conditions subject to modification are reopened [40 CFR 144.39]. Note that, pursuant to 40 CFR 144.39, if the permit is revoked and reissued, the entire permit is reopened, subject to revision, and reissued for a new term.
- 40 CFR 144.41(h) presents examples of minor permit modifications for Class VI permits, which include revising any Class VI project plans where the modifications merely clarify or correct the plan. Minor permit modifications may be implemented without preparing a draft permit or soliciting public comment.

**Incorporate the amended project plans as enforceable conditions of the permit (if needed).** See Sections 5.1.6 through 5.1.9 for additional information on reviewing the amended project plans in the context of pre-operational testing results and other information the owner or operator submitted pursuant to 40 CFR 146.82(c).

**Conduct additional outreach per 40 CFR 124, if appropriate.** For example, if the AoR delineation changes and is determined to impact additional disadvantaged communities in areas that were not identified at the time of the initial permit development, communicate with representatives of these communities and provide outreach materials (see Section 3.3 for additional information on EJ considerations). If the final AoR delineation crosses boundaries with other states, territories, or tribes, notify appropriate officials (e.g., UIC Program or environmental protection officials). See 40 CFR 146.82(b) and the template of a letter that can help accomplish this notification, which is available in the resource library of the GSDT.

**Finalize the draft modified permit for notice and comment, if necessary.** Soliciting public comment is required if the updated information about the site necessitates more than minor modifications to the permit [40 CFR 144.39(a)]. For example, public notice and comment would be needed if the delineated AoR changes or calculations of fracture pressure necessitate a change in the approved injection pressure. See above for additional information on permit modifications. Develop a fact sheet and/or statement of basis and compile materials for the administrative record for the permitting decision (see Section 4.2 for additional information on using the GSDT to compile and organize permit files). Highlight how the permit has been modified, particularly how any changes address information acquired during pre-operational testing and updated geologic information. Publish a notice in a newspaper and post all relevant materials online, if possible [40 CFR 124.10(c)(2)(i)]. Provide an updated permit along with a summary of the revisions to the initial permit and why the permit conditions changed, i.e., based on site-specific data or the results of geologic testing. Hold a public hearing or hearings and document all input provided. Prepare responses to all public comments and develop a responsiveness summary document.

**Revise the Class VI permit conditions, if needed based on the public process, and issue authorization to inject for the Class VI well.** The permit should identify the date on which injection may commence. The authorization to inject may be a follow-up letter or other

communication to the permittee that the permit is effective on a specific date. Change the project status in the GSDT to show that the project is in the injection phase.

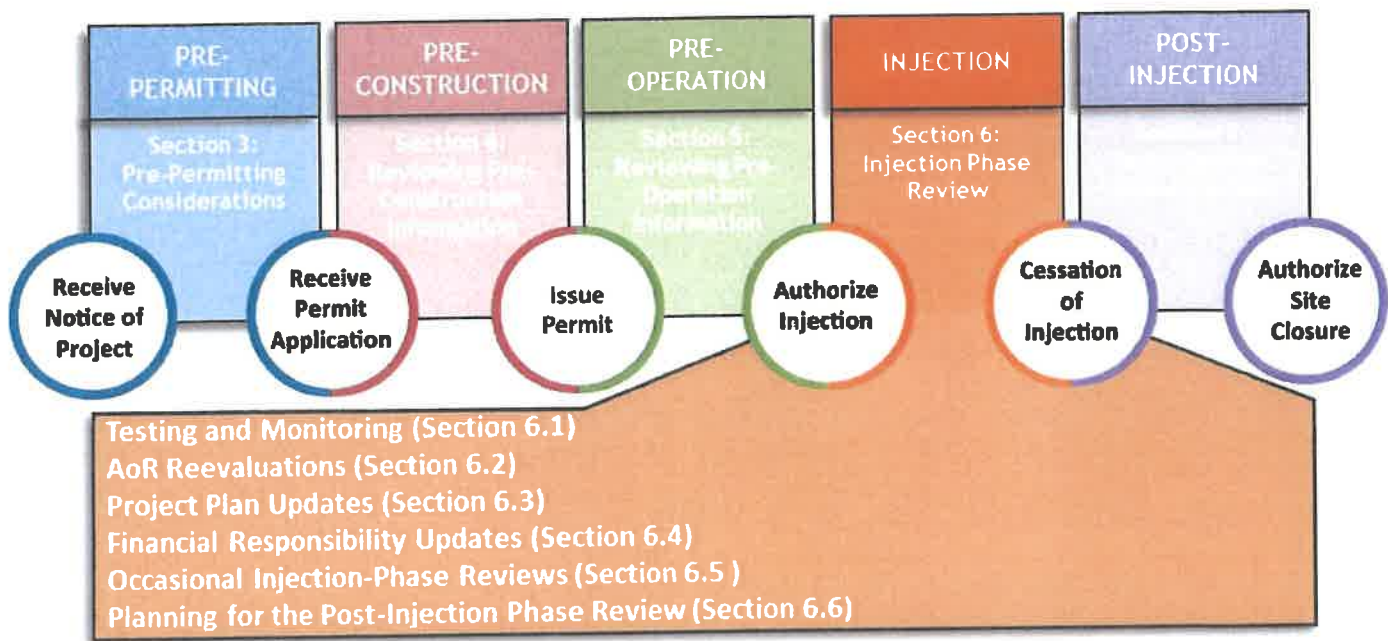

### **5.3 Planning for the Injection Phase Review**

After injection is authorized, the owner or operator will begin to inject carbon dioxide and perform required testing and monitoring. The information the owner or operator will generate and submit to the UIC Program should demonstrate that the project is operating within permitted limits and that the well maintains mechanical integrity. Monitoring data should: demonstrate that the plume and pressure front are behaving as predicted; confirm that USDWs are not endangered; and validate modeled predictions or identify the need for appropriate responses. Consistent with the regulations at 40 CFR 146.84, 146.90, 146.92, 146.93, and 146.94, the owner or operator will periodically reevaluate the AoR and update the project plans as needed to ensure that the permit and plans are tailored to site-specific conditions and the behavior of the project.

During the injection phase, the UIC Program should evaluate the testing and monitoring results, AoR reevaluations, and updated project plans submitted by the owner or operator to confirm that the project is performing as predicted or, if necessary, work with the owner or operator to implement appropriate actions to return the project to compliance and prevent or mitigate endangerment to USDWs.

Section 6 provides recommendations for how the UIC Program can evaluate the information submitted and coordinate with the owner or operator throughout the injection phase of a Class VI project. The EPA recommends that the UIC Program review Section 6 at the time injection is authorized and consult the section throughout injection operations.

# Section 6: Injection Phase Review

***This page is intentionally blank.***

## 6 Injection Phase Review

During the injection phase, Class VI well owners or operators will conduct injection activities and perform testing and monitoring as described in the permit and project plans. The information generated and submitted by the owner or operator should demonstrate that the well is maintaining integrity and the carbon dioxide plume and pressure front are behaving as predicted. Reviewing data on project performance or the position of the plume and pressure front can validate modeled predictions or identify the need for appropriate responses. Data generated during injection phase activities will inform the need for AoR reevaluation and the demonstration of non-endangerment.

The goal of the UIC Program's review of information during this phase should be to confirm that the Class VI well and the Class VI project are operating as planned and in compliance with the permit, and that USDWs are not endangered. This information should be evaluated in consideration of the findings of the site characterization and permit application review, particularly with respect to any identified uncertainties about the site.

The UIC Program will likely receive and evaluate the following types of information during the injection phase:

- The results of testing and monitoring required at 40 CFR 146.90 (see Section 6.1);
- Information associated with AoR reevaluations, including updates to the AoR and Corrective Action Plan (see Section 6.2);
- Updates to the other project plans including, at a minimum, the Testing and Monitoring Plan and the Emergency and Remedial Response Plan. The owner or operator may also submit an updated Injection Well Plugging Plan or PISC and Site Closure Plan during this phase (see Section 6.3);
- Updated financial responsibility information (see Section 6.4); and
- Occasional notifications associated with workovers, emergency events, or adverse financial conditions, if necessary (see Section 6.5).

This section presents recommendations for how the UIC Program can evaluate the submitted information. Each subsection below describes the types of information owners or operators will submit, followed by considerations for reviewing the information to verify compliance or identify appropriate follow-up actions (e.g., discussions with the owner or operator or requests for additional or clarifying information). Because each project is unique and the specific information submitted by the owner or operator will vary, the appropriate activities will be specific to the project; thus, the activities described below outline a recommended course of action to accomplish the goal of evaluating injection phase information to ensure that USDWs are protected.

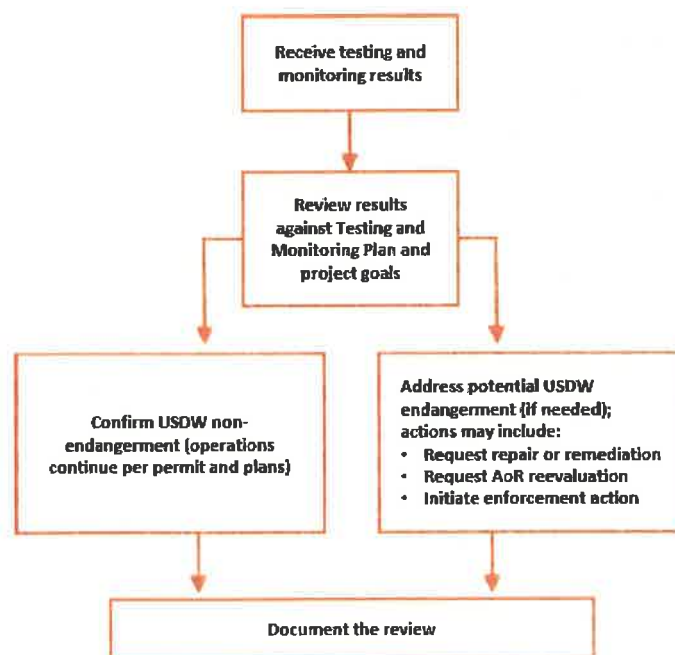

### 6.1 Testing and Monitoring

Throughout the injection phase, owners or operators must perform all testing and monitoring specified in the approved Testing and Monitoring Plan and submit the results to the EPA [40 CFR 146.90]. Owners or operators will also submit 30-day advance notifications of some testing and monitoring activities, as required by 40 CFR 146.91(d); see Section 6.5.1.

While the specific considerations for each type of required testing and monitoring will vary (as explained in the subsections below), the recommended approach to evaluating the submitted information is the same (see Figure 6-1). The UIC Program should:

- Confirm that the owner or operator has submitted all required information, i.e., as specified in the Testing and Monitoring Plan;
- Verify that the Class VI well is operating within the conditions of the permit and confirm that there is no evidence of USDW endangerment;
- Identify and discuss any exceedances or unexpected measurements that may provide evidence of endangerment or contamination and request appropriate responses, including well repairs or remediation, an AoR reevaluation, or additional monitoring;
- If there is any indication of noncompliance with the Class VI permit, determine whether a formal or informal enforcement action is appropriate (see Section 2.4); and
- Document the review.

**Figure 6-1: Reviewing Testing and Monitoring Results**

Each subsection below describes, for each type of required testing or monitoring, the types of information that Class VI well owners or operators may submit and suggestions for UIC Programs to consider when reviewing the information to verify permit compliance and identify, where appropriate, any follow-up actions.

### **6.1.1 Characteristics of the Carbon Dioxide Stream**

Class VI well owners or operators must analyze the physical and chemical characteristics of the carbon dioxide stream [40 CFR 146.90(a)]. The purpose of the UIC Program's review of information about the carbon dioxide stream is to confirm that its composition remains consistent with the permit and the information on which predictions of no adverse interaction between the injectate and well materials or formation fluids were based. Changes to the carbon dioxide stream could have implications for well integrity or subsurface geochemical reactions (e.g., reactions that could cause mineralization or alter the corrosivity of the injectate).

Owners or operators may submit the following information about the carbon dioxide stream as part of their semi-annual reports:

- Tabulations and/or plots of analytical results for each sampling event during the reporting period for the suite of parameters specified in the Testing and Monitoring Plan;

- Any changes to the physical, chemical, and other relevant characteristics of the carbon dioxide stream from the proposed operating data, per 40 CFR 146.91(c)(1);
- Compilations of previous results to facilitate evaluation of temporal trends; and
- Descriptions of the sampling methodology and copies of original laboratory reports.

### ***Evaluation***

In reviewing information about the physical and chemical characteristics of the carbon dioxide stream, the EPA recommends that the UIC Program implement the following activities:

- Review the information submitted to verify that it reflects the requirements of the Testing and Monitoring Plan. For example, verify that appropriate analytical parameters and methods were used, that the testing was performed on schedule and at the specified frequency, and that all QA protocols were followed.
- Evaluate the results of the analyses of the carbon dioxide stream (i.e., composition and the concentrations of any impurities or water content) and compare the results to permitted values.
- Compare the results against any previously reported results to identify any significant changes in the physical and chemical characteristics of the carbon dioxide stream composition over time.

During this review, the UIC Program should consider the following to ensure compliance with the permit:

- If any impurities in the injectate render it a hazardous waste, discuss the implications related to the RCRA conditional exclusion for carbon dioxide in GS activities and assist the owner or operator in coordinating with the RCRA Program regarding the conditional exclusion under 40 CFR 261.4(h), if one has not been certified within the last year (see Section 3.4);
- If any changes in the physical or chemical characteristics of the carbon dioxide stream could potentially lead to unwanted interactions with well components (particularly where exceedances or inconsistencies are ongoing), consider requiring the owner or operator to perform an internal MIT to confirm that there were no adverse impacts on the well;
- If any changes in the physical and chemical characteristics of the carbon dioxide stream could potentially lead to unwanted interactions with formation solids/fluids, consider requiring the owner or operator to modify the water quality monitoring parameters in the Testing and Monitoring Plan; and
- If trends in testing results indicate that the injectate regularly contains impurities that are not listed in the permit or are present in excess of permitted amounts, this may constitute a violation of the permit (see Section 2.4).

#### ***6.1.2 Continuous Monitoring Data***

Owners or operators must demonstrate internal mechanical integrity by continuously monitoring injection pressure, injection rate, injected volume, pressure on the annulus between the tubing and long-string casing, and annulus fluid volume [40 CFR 146.89(b); 146.90(b)].

The purpose of the UIC Program's review of operating data is to ensure that the Class VI project is operating as planned and within permitted limits and that the well is maintaining internal mechanical integrity.

The owner or operator may submit the following results of continuous monitoring in a tabular and/or graphical form in a PDF file, spreadsheet, or database file, as part of the semi-annual report:

- Injection rate, volume, and pressure measurements;
- Monthly maximum, minimum, and average values for injection rate, carbon dioxide volume (mass), injection pressure, and annular pressure;
- Monthly annulus fluid volume added; and
- Total volume (mass) injected each month and cumulative carbon dioxide volume (mass) injected for the project.

The owner or operator should also note and explain any divergences from the testing protocols described in the approved Testing and Monitoring Plan or any exceedances of a permit limit.

### ***Evaluation***

In reviewing continuous monitoring data submitted by the owner or operator, the EPA recommends that the UIC Program implement the following activities:

- Confirm that measurements were taken using approved equipment (i.e., as specified in the approved well schematics/the Testing and Monitoring Plan) and recorded at the frequencies specified in the permit. Also verify that measuring instruments have been regularly calibrated according to the QASP. Compare the reported operating data to the limits set forth in the permit and to expected values presented in the Testing and Monitoring Plan to ensure compliance with the Class VI permit.
- Confirm that injection pressures did not exceed 90 percent of the fracture pressure of the injection zone (or a lower injection pressure set as a permit condition) and that they are consistent with values used as inputs in computational modeling. If pressure gauges are not located downhole, verify that proper corrections were made to determine bottom-hole pressure.
- Compare the volume (mass) of carbon dioxide injected to the permitted values and to the overall project volume goals, including estimates of the storage capacity of the injection zone. Examine any calculations of carbon dioxide volume based on the injection rate and verify that proper corrections for bottom-hole temperature and pressure were applied. Sections 3.2 and 3.3 of the *UIC Program Class VI Well Testing and Monitoring Guidance* contain additional information on pressure and flow rate monitoring.
- Evaluate the amount of fluid added to the annulus. If the amount added is excessive (i.e., a greater volume than can be attributed to pressure and temperature changes), consider requiring an MIT to verify well integrity (i.e., to confirm that the annulus is not compromised or leaking fluid).

The UIC Program should consider the following to ensure that USDWs are protected from endangerment:

- Discuss potential reasons for the variances with the owner or operator. If necessary, require follow-up testing to determine the cause of any variances from predicted values or permit conditions;
- If there is a significant divergence over permitted injection pressures (or a pattern of exceedances), consider whether testing to ensure that the injection or confining zone were not fractured or adjustments to the AoR delineation modeling to predict the impacts of higher injection pressures is needed;
- If the injection rate or pressure exceeded permit limits during the reporting period, verify that the owner or operator provided a description of the event(s), including the cause of the exceedance, the duration of the exceedance, and the owner or operator's response;
- If any permit conditions were exceeded, issue a notice of violation and begin discussions with the owner or operator about how to prevent future occurrences. If operating conditions that meet permitted limits cannot be restored, issue a notice to cease injection until the situation can be remedied; and
- If operating data indicate that the project is proceeding differently than the inputs on which computational modeling for delineating the AoR were based (particularly if significantly higher volumes of carbon dioxide are injected), this should trigger an AoR reevaluation (see Section 6.2).

### **6.1.3 Corrosion Monitoring Results**

Owners or operators must perform quarterly corrosion monitoring [40 CFR 146.90(c)] and, if required by the UIC Program Director, perform casing inspection logs (CILs).

The purpose of the UIC Program's review of corrosion monitoring information is to confirm that there are no indications of well material corrosion that could compromise the well's integrity. This is important for Class VI projects, given the potential corrosivity of wet carbon dioxide injectate or of carbon dioxide-water mixtures where an injectate mixes with fluids in the subsurface.

The owner or operator may submit the following information in the semi-annual report:

- Measurements of mass and thickness loss in any corrosion coupons or loops and any assessment of additional corrosion, including pitting, in corrosion coupons or loops (as tabular data or a PDF file, spreadsheet, or database files); and
- The results of any CILs performed, including information about:
  - The measured CILs and comparison to previous logs;
  - The thickness of the casing (referencing the original casing thickness); and
  - The locations of any detected anomalies such as pits, scratches, and splits.

### **Evaluation**

In reviewing corrosion monitoring results, the EPA recommends that the UIC Program implement the following activities:

- Confirm that corrosion monitoring was performed at least quarterly and that any required CILs were performed on schedule. Verify that the corrosion monitoring parameters and techniques used are consistent with those required by the Class VI Rule and described in the approved Testing and Monitoring Plan.
- If the owner or operator used corrosion coupons, verify that the coupon composition is appropriate for the well component(s) being tested (e.g., consisting of the same material as the casing and tubing). Confirm that the coupons were subjected to conditions representative of downhole conditions (e.g., placed downhole or within the injection line) for a duration that will yield relevant results. If the owner or operator used corrosion loops, verify that the temperature of the corrosion loop was controlled to simulate well conditions (otherwise, because corrosion rate increases with temperature, the results may be artificially low). Review the reported measurements of mass and thickness loss in any corrosion coupons or loops used, as well as any information on the nature of the corrosion that is taking place (e.g., localized or general attack, presence of pitting or cracking).
- If the owner or operator performed a CIL, verify that the test was performed properly, using tools and procedures described in the Testing and Monitoring Plan. Review the results of the CIL, such as reported thickness of the casing and the locations of anomalies such as pits, scratches, or splits. If the owner or operator used an alternative method to monitor corrosion, verify that the procedures used were consistent with those described in the approved Testing and Monitoring Plan.
- For all methods of corrosion monitoring, compare the results to any previously reported results that are available to identify any changes in the rate and/or nature of corrosion over time. Based on this information, assess whether the results indicate that that corrosion rates are within acceptable ranges.

During a review of the corrosion monitoring results, the UIC Program should consider the following to ensure that the well is in compliance:

- While target corrosion rates of 1 mil per year or less (or approximately 25  $\mu\text{m}$  per year) are common in wells used in the oil industry, determining acceptable corrosion rates for wells at Class VI projects necessitate consideration of site-specific factors, such as subsurface conditions and well materials.
- The nature and location of corrosion is also important; a relatively higher rate of generalized metal loss may be less significant than a lower rate of localized corrosion, and certain well components may be more or less susceptible to different types of corrosion.
- If the information submitted suggests that unanticipated and/or unacceptable levels of corrosion may be occurring in any well components, initiate discussions with the owner or operator and request follow-up testing or repairs of the well, if necessary.

#### **6.1.4 Groundwater Quality Monitoring**

Periodic monitoring of groundwater quality above the confining zone(s) is required at 40 CFR 146.90(d). Owners or operators of projects that are operating under an injection depth waiver must also monitor in the first USDWs above and below the confining zones, per 146.95(f)(3)(i).

Reviewing the results of groundwater monitoring can reveal geochemical changes that result from leaching or mobilization of heavy metals and organic compounds, or from fluid displacement.

The purpose of the UIC Program's review of groundwater quality data is to identify whether there is evidence of the migration of carbon dioxide and/or other fluids out of the injection zone that may endanger USDWs and identify appropriate responses or mitigation activities.

Owners, or operators may submit the following types of information in the semi-annual reports:

- Tabulations of all analytical results for all chemical constituents analyzed, for each sampling event during the reporting period at each monitoring well;
- Previous results to facilitate evaluation of temporal trends;
- Maps and graphs in a geographic information system (GIS)-compatible format to support model validation; and
- Supporting information, including analytical data and interpretive analyses (e.g., using Piper or Stiff diagrams, time series graphs, or isopleth maps).

If the owner or operator supplemented their direct groundwater sampling with other above-confining-zone monitoring methods (such as well logging or geophysical techniques) they will also submit the results of these activities in their semi-annual reports.

### ***Evaluation***

In reviewing the results of groundwater quality monitoring, the EPA recommends that the UIC Program implement the following activities:

- Verify that samples were collected according to the schedule identified in the approved Testing and Monitoring Plan, taking into consideration any phased monitoring described in the plan (e.g., phased installation of monitoring wells), and that the parameters monitored are consistent with those identified in the plan.
- Verify that samples were collected and analyzed from all monitoring locations and intervals identified in the approved Testing and Monitoring Plan. Also verify that procedures such as well purging, instrument calibration, sample collection and handling, and quality assurance measures were carried out as described in the Testing and Monitoring Plan and the QASP. Confirm that samples were analyzed for all of the parameters specified in the Testing and Monitoring Plan using approved analytical methods. If applicable, verify that appropriate preservation of in situ conditions (e.g., pressure, temperature) was maintained to ensure that the results are representative of subsurface conditions. If additional above-confining-zone monitoring methods are used to supplement direct fluid sampling, review the results for consistency with the results of the groundwater analyses.
- Compare the analytical results with the baseline results collected during the site characterization process, as well as to any applicable predictions from the AoR delineation model or expectations stated in the Testing and Monitoring Plan. Also compare the results with previously reported data to identify trends that may indicate the movement of carbon dioxide and/or other fluids out of the injection zone. See the Interpretation subsection of Section 4.3 of the *UIC Program Class VI Well Testing and*

*Monitoring Guidance* for a description of trends that may indicate unintended fluid migration. However, keep in mind that these trends may have other causes and may not necessarily indicate leakage and/or migration.

During their review of the groundwater quality monitoring results, the UIC Program should consider the following to confirm non-endangerment of USDWs:

- If any excursions or trends indicate potential leakage or fluid migration out of the injection zone, initiate discussions with the owner or operator and request follow-up actions as needed. This may include additional testing or implementation of the Emergency and Remedial Response Plan.
- Review any analyses or documentation of trends provided by the owner or operator and, if necessary, discuss these or request that the owner or operator explain their cause.

#### **6.1.5 External MITs**

Owners or operators must perform annual external MITs, per 40 CFR 146.89 and 146.90(e). The purpose of the UIC Program's review of MIT results is to verify that the well is maintaining mechanical integrity and the injection system is operating as intended, or to identify integrity issues that may indicate a possible loss of containment that could endanger USDWs.

Owners or operators must submit the results of external MITs within 30 days of each test [40 CFR 146.91(b)]. Depending on the type of test(s) performed, submissions may include the following information:

- Graphs (e.g., temperature vs. depth from temperature logs);
- Supporting data in spreadsheets or databases; and/or
- Log results (e.g., in LAS format) accompanied by narrative interpretations of the logs.

#### **Evaluation**

In reviewing MIT data, the EPA recommends that the UIC Program implement the following activities:

- Confirm that the owner or operator performed the MITs using the methods and procedures specified in the approved Testing and Monitoring Plan.
- Verify that necessary test conditions were met for a particular MIT (e.g., a sufficient shut-in period for temperature logs). Also review reported instrument calibration and other quality assurance-related procedures for consistency with the QASP. If the MIT results (especially from temperature and noise logs) are ambiguous or there are unresolved anomalies, discuss the potential need for the owner or operator to re-test the well using another method.

The UIC Program should consider the following to ensure that the well will not become a conduit for fluid movement:

- If proper testing procedures were not followed, request that the owner or operator re-test the well.
- If it is confirmed that the well lacks external mechanical integrity or is otherwise out of compliance with the Class VI permit, pursuant to 40 CFR 146.88(f), require the owner or

operator to cease injection until the cause of the mechanical integrity loss has been determined and remedied. Ensure that the owner or operator completes follow-up activities (e.g., performing remedial action on the well) and, if necessary, implements procedures specified in the Emergency and Remedial Response Plan (see Section 6.3).

- If there is concern that carbon dioxide may have leaked from the well, discuss with the owner or operator whether additional above-confining-zone testing or monitoring may be appropriate.

#### **6.1.6 Pressure Fall-Off Test Results**

Class VI well owners or operators must perform a pressure fall-off test at least once every five years [40 CFR 146.90(f)] unless more frequent testing is specified in the Testing and Monitoring Plan.

The purpose of the UIC Program's review of pressure fall-off data is to confirm that reservoir pressures are consistent with predicted pressures and modeling inputs. The evaluation should also confirm the geologic information on which the site characterization is based and verify that projects are operating properly and that pressures within the injection zone are responding as predicted.

Owners or operators will submit the results of pressure fall-off testing within 30 days of the test if required by the UIC Program Director [40 CFR 146.91(b)(3)]. (Otherwise, the results may be provided as part of the semi-annual reports.) These submissions may include the following information:

- Narrative summaries that describe any changes to formation characteristics of the near-well bore environment and any indication of fluid leakage during the test;
- Supporting information, including tabular data and/or the outputs from commercial software used to analyze the data;
- Trend data comparing new test results with previous results; and/or
- Other supporting information, including: measured injection rates and pressures from the test well and any offset wells; plots of observed pressure, time, and change in pressure as a function of time; any temperature anomalies and whether they correspond to pressure anomalies; and calculated formation characteristics (i.e., transmissivity, well skin factor).

#### **Evaluation**

In reviewing pressure fall-off testing results, the EPA recommends that the UIC Program implement the following activities:

- Confirm that the pressure fall-off testing was performed using the procedures specified in the approved Testing and Monitoring Plan, that the testing was performed on schedule, and the results were reported as specified in the plan.
- Verify that, during the test, a sufficient shut-in period elapsed and pressure stabilization was achieved. Confirm that the owner or operator measured the pressure prior to beginning the test and verified that it was not changing and that the injection was shut off for the duration of the test. At sites where multiple wells are injecting into the same zone, review the procedures related to offset wells (e.g., whether injection was halted or held

constant at the offset wells). Also review reported gauge calibration records and other quality assurance-related items against the QASP, and verify that the quantitative methods used to analyze the results were consistent with the Testing and Monitoring Plan.

- Compare the resolution of the pressure fall-off test results to the sensitivity of the gauges used. Evaluate the methods used to account for multiphase effects and the assumptions made by the owner or operator when interpreting the results. To assess whether there have been any changes in the near-well bore environment, compare the test results to the results of any previous pressure fall-off tests and to the formation characteristics (e.g., permeability, transmissivity) reported with the geologic data used in the AoR delineation model.

During their review of pressure fall-off data, the UIC Program should consider the following to confirm compliance with the permit:

- If proper testing procedures were not followed, discuss with the owner or operator the potential need to re-test the well and submit the new results;
- If any aspect of the test results (e.g., anomalous pressure drops) suggest the possibility of fluid migration, initiate discussion with the owner or operator and request further testing, if appropriate; and
- If changes in formation characteristics have been identified, discuss the potential need to reevaluate the AoR to reflect the new values with the owner or operator.

#### **6.1.7 Plume and Pressure Front Tracking Information**

Owners or operators must track the carbon dioxide plume and pressure front using direct and indirect methods [40 CFR 146.90(g)]. The purpose of the UIC Program's review of plume and pressure front tracking information is to confirm that the carbon dioxide plume and pressure front are behaving as predicted (i.e., to validate the AoR delineation model) or identify any evidence of unintended carbon dioxide or formation fluid migration out of the injection zone and/or potential USDW endangerment.

Owners or operators will submit the results of both direct and indirect methods for tracking the pressure front within the injection zone and tracking the extent of the carbon dioxide plume unless indirect methods were not included in the Testing and Monitoring Plan based on a UIC Program Director decision pursuant to 40 CFR 146.90(g)(2). Owners or operators may submit the following types of information in the semi-annual report:

- A narrative summary that presents the results of all required tests/surveys, supported by maps, graphs, and monitoring data in tables;
- Monitoring data in a GIS-compatible format to allow data matching with the AoR delineation model;
- Comparisons of monitoring results to modeled predictions or to previous monitoring or survey results (to illustrate trends); and
- An assessment of whether any monitoring results indicate fluid movement into USDWs.

## ***Evaluation***

In reviewing the results of plume and pressure front tracking, the EPA recommends that the UIC Program implement the following activities:

- For each plume and pressure front monitoring activity, confirm that the measurement(s) or test(s) were conducted according to the schedule described in the approved Testing and Monitoring Plan. Also review the method(s) chosen (e.g., seismic, electrical, gravity) and specific procedures used for consistency with both the Testing and Monitoring Plan and the QASP. If the information submitted indicates that tests or measurements were not completed as described in the Testing and Monitoring Plan, initiate discussions with the owner or operator and, if necessary, request repeat or additional testing.
- For direct pressure monitoring, confirm that all pressure transducers have adequate sensitivity to measure the expected pressure increases caused by injection and that they were calibrated according to manufacturer's recommendations and/or industry standards. If pressure gauges are not placed downhole, review calculations to determine whether bottom-hole pressures have been properly calculated. Where fluid sampling from the injection zone is used to directly monitor the carbon dioxide plume, compare the results of this monitoring with baseline data, previously reported data, and predictions from the AoR delineation model to confirm that the plume and pressure front are behaving as predicted and/or identify any trends that may indicate that the rate and direction of plume movement are not as predicted.
- For indirect geophysical methods, verify that the instruments were properly placed and georeferenced. Verify that interpreted results are consistent with other monitoring data, such as directly measured data (e.g., pH, temperature, pressure, saturation).
- Compare the results of direct pressure front tracking against any threshold values for the pressure front established in the Testing and Monitoring Plan. Also compare the data to predictions of plume and pressure front locations based on AoR delineation modeling. If measurements have been collected from one or more zones above the confining zone, evaluate the results for possible indications of fluid migration (e.g., an increase in pressure above the confining zone).
- For indirect methods, compare the results against baseline surveys and other previous surveys, and any additional monitoring data that have been submitted since the last survey was conducted. In addition, review the assumptions made during data processing and other information used to constrain the interpretation of the results.

The UIC Program should consider the following about plume and pressure front behavior to ensure compliance with the permit:

- If the submitted information includes unexplained anomalies or ambiguous results, or indicates the possibility of fluid migration, initiate discussions with the owner or operator. As necessary, consider the need for follow-up testing or monitoring activities to ensure the protection of USDWs (pursuant to 40 CFR 146.90(i)).
- If the results suggest that the locations of the plume and/or pressure front do not agree with modeled predictions, this may trigger one of the criteria for an AoR reevaluation established in the AoR and Corrective Action Plan.

- If results indicate that fluid migration or pressure increases may be endangering USDWs, work with the owner or operator to initiate response procedures as described in the Emergency and Remedial Response Plan.

#### **6.1.8 Surface Air and/or Soil Gas Monitoring**

If surface air and/or soil gas monitoring is required as part of the Testing and Monitoring Plan, pursuant to 40 CFR 146.90(h), the owner or operator will submit the results along with other testing and monitoring results.

The purpose of the UIC Program's review of surface air and/or soil gas monitoring is to confirm that there were no results that might indicate fluid migration out of the injection zone and/or USDW endangerment.

The owner or operator will submit the results of any required surface air and/or soil gas monitoring in their semi-annual reports. The owner or operator may submit the following information:

- A narrative description of the monitoring results;
- Descriptions of any significant changes in carbon dioxide levels compared to background levels or any detection of carbon dioxide migration that may impact a USDW; and
- Supporting images, maps, or spreadsheets or databases of all available surface air and soil gas monitoring data from each sampling location and depth, including any background data and QA/QC samples.

#### **Evaluation**

In reviewing surface air and/or soil gas monitoring data, the EPA recommends that the UIC Program implement the following activities:

- Verify that any required surface air and/or soil gas monitoring was performed according to the schedule in the approved Testing and Monitoring Plan. Review measurement procedures (e.g., instrument calibration, vacuum-volume purge tests, sample probe purging, sampling rates) and analytical procedures for consistency with the Testing and Monitoring Plan and the QASP.
- Compare the surface air and/or soil gas monitoring results to background/baseline data and other expectations as described in the Testing and Monitoring Plan. Also consider previous monitoring results from the sampling site(s) to identify trends that may indicate carbon dioxide leakage to the surface. However, keep in mind that carbon dioxide detection above background levels in surface air and/or soil gas does not necessarily indicate USDW endangerment; for example, it may reflect changes in near-surface carbon dioxide levels that are unrelated to the Class VI project.

The UIC Program should consider the following when reviewing the monitoring results to ensure compliance and USDW protection:

- If specified procedures were not followed or there are unexplained data gaps, initiate discussions with the owner or operator and evaluate the need for re-sampling/re-analysis and re-submission of the results; and

- If the results indicate elevated surface air and/or soil gas carbon dioxide levels, initiate discussions with the owner or operator and request additional follow-up work or remedial actions as necessary to ensure the protection of USDWs.

#### **6.1.9 Other Required Monitoring**

A Class VI permit may include additional monitoring if, pursuant to 40 CFR 146.90(i), the UIC Program Director determined that such monitoring was necessary.

The purpose of the UIC Program's review of this monitoring data is to confirm that the results satisfy the intended purpose. For example, the UIC Program should evaluate the information submitted to determine compliance with the prohibition of fluid movement into USDWs per 40 CFR 144.12, and confirm that the monitoring/approach is appropriate to site-specific conditions. The UIC Program should also review the monitoring information to ensure that it confirms predictions of site behavior and/or supports updating or refinements to the AoR delineation modeling.

The specific information submitted and the timing of the submittal will depend on the testing and monitoring performed, but owners or operators may submit the following information:

- A narrative description of the monitoring results;
- A discussion of any changes or trends in the results;
- Maps, graphs, and monitoring data in tables (accompanied by historical data to illustrate trends) to support the monitoring data; and/or
- If passive seismic monitoring is required, information on the magnitude and location/depth of hypocenters of any microseismic activity or earthquakes, along with information about whether the event was felt (i.e., per USGS data).

#### **Evaluation**

While reviews of the results of additional testing and monitoring will be site-specific and depend on the nature of the activities performed, a general strategy may be followed. This section briefly explains several potential examples and activities that the EPA recommends that the UIC Program implement:

- Verify that the testing or monitoring was performed on the schedule set in the Testing and Monitoring Plan and that procedures (sampling, data collection, analytical methods, etc.) were consistent with the Testing and Monitoring Plan and the QASP. If specified testing/monitoring or quality assurance procedures were not followed, or if there are unexplained data gaps, initiate discussions with the owner or operator regarding re-sampling/testing, if necessary.
- Compare the results against any expected or threshold values included in the Testing and Monitoring Plan or predictions established by computational modeling, permit conditions, or other expectations.
- If the owner or operator performed passive seismic monitoring, review information about the magnitude and location/depth of seismic events, particularly any that were felt events, where applicable. Confirm that appropriate responses, e.g., applicable threshold-based

responses in the Emergency and Remedial Response Plan, were performed (see Section 4.1.10).

In evaluating the results of this monitoring, the UIC Program should consider the following, which may have implications for compliance:

- If any monitoring results indicate the possibility of a carbon dioxide leak or fluid migration out of the injection zone/through the confining zone, USDW endangerment, or any other unexplained anomalies, establish appropriate follow-up actions. These may include additional monitoring/testing (either with the same or a different method), revisions to the Testing and Monitoring Plan, an AoR reevaluation, or remedial action as described in the approved Emergency and Remedial Response Plan.
- If there is an indication that the frequency or intensity of seismic activity is increasing over time, consider modifying the operating parameters (e.g., injection rates or pressures) in the permit.

## 6.2 AoR Reevaluations

Class VI well owners or operators must reevaluate the AoR delineation throughout the duration of the project [40 CFR 146.84(e)] and, if necessary, update the AoR and Corrective Action Plan based on the results of the AoR reevaluation. Owners or operators must reevaluate the AoR at a frequency set in their approved AoR and Corrective Action Plan or when warranted based on certain conditions, such as following significant changes in site operations, monitoring results that deviate from computationally predicted behavior, or availability of new site-specific data that may impact modeling predictions. See Figure 6-2.

AoR reevaluations may result in two potential outcomes, with different submittals made by the owner or operator:

1. A technical demonstration that the existing AoR and Corrective Action Plan is adequate, supported by project monitoring data; or
2. An amended AoR and Corrective Action Plan with a modified AoR delineation and a revised corrective action strategy (or a demonstration that the existing corrective action strategy continues to ensure protection of USDWs).

The purpose of the UIC Program's review of information associated with AoR reevaluations is to ensure that all new and relevant observed/measured

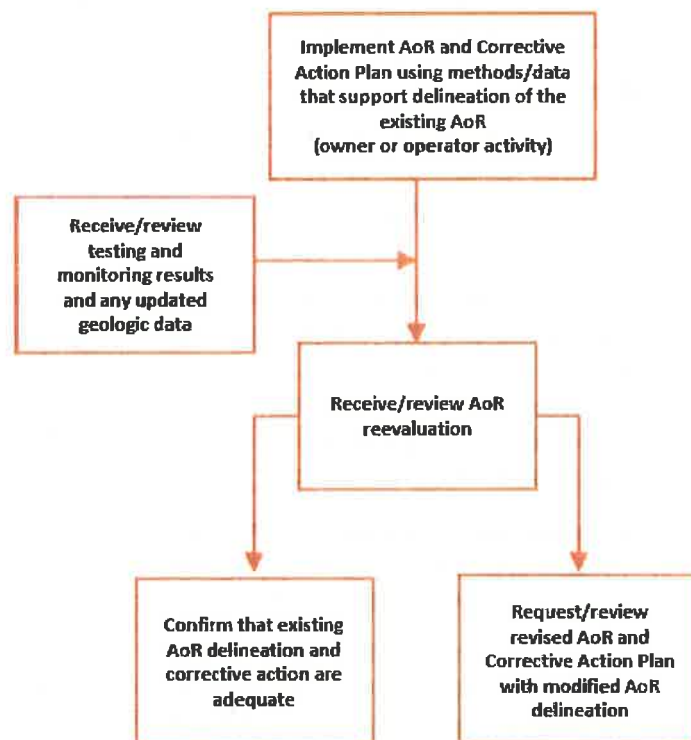

Figure 6-2: AoR Reevaluations

project data support the existing AoR or that, if necessary, a new AoR is delineated to more accurately represent the area where USDWs may be endangered. Reviewing this information is analogous to the pre-construction and pre-operation phase reviews of the AoR delineation, although it will focus on data collected during project operations.

The goal of evaluating these submittals is the same as that described in Section 4.1.2 for the initial AoR delineation: to assess (in light of any new data) whether the AoR appropriately represents the area in which USDWs may be endangered by the injection activity, and to ensure that all artificial penetrations that may allow fluid movement into USDWs in the AoR are identified and addressed by corrective action. For additional information on AoR reevaluations, see the *UIC Program Class VI Well Area of Review Evaluation and Corrective Action Guidance*.

### ***Completeness***

Depending on the progress of the project, owners or operators will either submit a demonstration that the existing AoR is adequate or a revised AoR and Corrective Action Plan.

Owners or operators may use a variety of approaches to demonstrate that the existing AoR is adequate. However, the EPA expects that such a demonstration will, at a minimum, involve comparison of the most up-to-date monitoring and operational data and other site-specific information to the computational predictions that supported the existing, approved AoR delineation. Owners or operators might also evaluate the agreement between the inputs used to delineate the existing AoR and the measured/observed project data or they might conduct additional computational modeling with updated, calibrated input parameters and show that this results in the same AoR.

The UIC Program should identify the approach taken by the owner or operator and examine the updated information to ensure that all necessary submissions/changes have been made to support the demonstration. The submission should account for all testing and monitoring, site characterization, and/or operational data used in the analysis and clearly reference the source of this information. If the owner or operator employed a new modeling approach and predictions used in the analysis have not been submitted previously, the permit writer should verify that the data associated with the predictions are also submitted to the GSDT along with a confirmation that they resulted from the same simulation (e.g., with the same initial conditions, simulation time, etc.) used for delineating the existing AoR.

If the owner or operator is submitting a revised AoR and Corrective Action Plan as a result of the reevaluation, the EPA expects that a detailed description of the reevaluation activities and the results that triggered a new delineation of the AoR will be submitted as part of this process. The UIC Program should confirm that:

- The submission sufficiently describes the inconsistencies found during the reevaluation;
- The necessary changes to the existing modeling data in the GSDT or the new data (e.g., associated with the calibration of the model) have been submitted and that they support the technical evaluation;
- An updated corrective action strategy has been provided, if needed; and
- A revised narrative plan, including all required components (as informed by 40 CFR 146.84), has been submitted.

## Evaluation

The specific aspects of the technical review of AoR reevaluations during the injection phase will depend on the types of information and materials submitted by the owner or operator. The bolded text below outlines a suggested approach for reviewing the injection phase AoR information.

This approach will help to confirm that the owner or operator's submittal meets the requirements of the Class VI Rule and the permit; confirm that the AoR is appropriately protective; and ensure that the submitted reevaluation sufficiently addresses identified uncertainties associated with the existing AoR delineation to confirm USDW non-endangerment.

**Review the demonstration that the existing AoR is adequate** (if the owner or operator submits one). Identify the parameters used in the owner or operator's analysis to demonstrate conformity between the predicted and observed data (e.g., between the computationally predicted plume and pressure behavior and the plume and pressure front tracking results). Ensure that the data used in the analysis incorporates all the relevant data that have become available since the existing AoR delineation was approved (including the results of monitoring collected throughout the AoR).

The demonstration should reflect the results from all relevant activities covered by the Testing and Monitoring Plan, as well as any newly available geologic data that the owner or operator may have collected (e.g., from new logs run at nearby wells). Pressure profiles at given locations (e.g., at injection or monitoring wells) over time are expected to be one of the key parameters of comparison between predicted and observed data. However, in addition to pressure data, it is important to ensure that the results of operational monitoring are also consistent with the operational input data used in the modeling effort, and to confirm that the observed plume migration agrees with predicted behavior. When conducting this evaluation, refer to the monitoring results submitted with the semi-annual reports (see Section 6.1) to ensure that the data used in the demonstration are accurate and complete.

### **If the AoR does not Change during the Reevaluation**

In some cases, the revised plan may only need to include a new corrective action strategy or related information, with no changes made to the existing AoR. For instance, the AoR reevaluation may have been triggered by testing and monitoring results that indicate fluid migration out of the injection zone/into a formation above the confining zone formation through a newly identified abandoned well. While the reevaluation in this case confirms that the existing AoR is adequately delineated, a revised corrective action strategy should be incorporated into the AoR and Corrective Action Plan and evaluated by the UIC Program.

This demonstration should also include assessments of compliance with regulatory requirements and validation of AoR delineation modeling predictions, and compliance with the permit (e.g., pressure limits to ensure that injection does not initiate or propagate fractures in the confining zone). Assessments of agreement between the predicted and observed trapping values for different mechanisms are also important, particularly to ensure that the alternative PISC timeframe, if one has been approved, remains adequate. Furthermore, the demonstration should include an assessment of the adequacy of the existing corrective action plan by confirming that the previously identified corrective action needs are still accurate and were addressed.

The EPA expects that the conformity between predicted and measured project behavior will, at a minimum, be based on graphical examination of the data for the chosen parameters. For example, these graphical evaluations may include plots comparing observed and predicted pressure values at a certain location, or a comparison of the predicted plume extent at certain times to corresponding 3D seismic survey results and/or plume arrival data at specific

monitoring locations. In addition to comparing data directly, evaluations may also include comparisons of ranges and medians of integrated parameter values, or comparison of cumulative distribution functions. Confirm that the data used in these graphical examinations are correct and complete. This may be best achieved by developing plots of reported monitoring data (see Section 6.1) over time and comparing them to plots provided in the detailed discussion of the monitoring results. If the conformity is supported by a statistical analysis, in addition to confirming the accuracy and completeness of the data used, also evaluate the statistical methods to ensure they are suitable and correctly implemented.

If new/updated geologic data is available, assess whether it affects the AoR delineation (e.g., if it is relevant to the porosity, permeability, or relative permeability of key formations, the depth or extent of the confining zone, the pressure at the bottom of the lowermost USDW, etc.). If it does, evaluate whether it is consistent with the inputs used in the existing AoR delineation model. For example, it might be appropriate to develop plots of the data used in the model (e.g., a layer-by-layer distribution of mean parameter values and standard deviations) and compare those to the new information.

If the owner or operator conducted any additional computational modeling to demonstrate that the new information does not affect the existing AoR, identify the method used (e.g., whether the owner or operator used the original model or a new approach) and evaluate its accuracy by, for example, using the independent model developed to evaluate the existing AoR delineation. Any relevant testing and monitoring results and other new information should be integrated into the independent model, and/or the model parameters should be calibrated using the new data to support simulations assessing the impact on the AoR.

**Review the revised AoR and Corrective Action Plan** (if one was submitted). Ensure that the approach used to delineate the new AoR complies with the requirements under 40 CFR 146.84 and that it accounts for all new site characterization, operational, and testing and monitoring information. The EPA expects that a detailed description of the AoR reevaluation and its results warranting a new delineation of the AoR will be submitted as part of the revised plan, to achieve consistency and continuity in documenting project decisions. Conduct an evaluation of this submission, similar to the evaluation of the demonstration that the existing AoR is adequate, to confirm the need for a revised plan and/or a new AoR delineation.

If the owner or operator submitted an updated AoR and Corrective Action Plan, review the following:

- The reevaluation approach and the identified inconsistencies that warranted the delineation of the new AoR;
- The delineation of the new AoR (including the computational modeling and delineation method); and
- Any corrective action status/updates, including any updates to the phased corrective action schedule (or the owner or operator's demonstration that no update is needed).

Review and confirm that all proposed or performed corrective action relies on methods that are consistent with the testing and monitoring results (e.g., geochemical data). If phased corrective action is being implemented, evaluate the schedule in light of the new AoR delineation and computational modeling results.

If any unexpected carbon dioxide movement, fluid migration out of the injection zone, or emergency events have occurred since the last AoR reevaluation, discuss with the owner or operator the possible need to revise the reevaluation schedule or triggers for reevaluations.

**Review a new AoR delineation** (if one was submitted). Evaluate all of the updates/changes made to the modeling data and confirm that:

- They represent parameters for which inconsistencies have been identified. For example, if the reevaluation identified an inconsistency between newly available data for relative permeability in the injection zone and the values used in the existing AoR delineation, confirm that the AoR delineation reflects the most up-to-date data.
- The updates/changes reflect the adjustments, within reasonable limits (depending on the parameter used), determined via model calibration procedures to achieve an acceptable agreement between model predictions and the collected testing and monitoring data. Such model calibration procedures should focus on the parameters that have been identified as the most sensitive parameters during sensitivity analyses. If the same numerical model that supported the existing AoR delineation is being updated, a sensitivity analysis should already have been conducted during the delineation process identifying these parameters. Model calibration procedures should also include the model outputs that are most affected by these key parameters. At a minimum, it is expected that model calibration would involve an iterative optimization process resulting in an updated conceptual model and input parameters (e.g., inverse modeling). Additional information on model calibration can be found in the *UIC Program Class VI Well Area of Review Evaluation and Corrective Action Guidance*.

For these assessments, the EPA recommends using a combination of qualitative and quantitative procedures similar to the procedures described in Section 4.1.2. As part of the quantitative approach, conduct independent or semi-independent computational modeling that also accounts for the calibration of model parameters. Follow these general steps:

- Assess the conceptual/geologic model and model parameters to verify that they are consistent with all available data (i.e., including any newly acquired geologic information, testing and monitoring, and operational information), and that they provide an accurate representation of the geologic and operational systems.
- Assess the computational/numerical model to verify that it accounts for all applicable chemical and physical characteristics of the injected carbon dioxide and displaced fluids; that it is constructed to accurately represent the geologic and operational systems based on the measured data; and that its outputs are consistent with the measured/observed monitoring results.
- Evaluate the methodology used to delineate the modified AoR, based on the new modeling results, to ensure that the AoR accurately represents the area where USDWs may be endangered and parameter values used in the delineation are consistent with the most up-to-date field measurements.
- Determine if any additional artificial penetrations are present in the new AoR and verify that the owner or operator has taken actions to evaluate the conditions of these new wells and perform any needed corrective action. If phased corrective action was approved,

verify that the phasing plan remains appropriate based on the most recent plume/pressure trajectory from the updated model or monitoring results.

- Confirm that the new AoR delineation process and the status of corrective action are documented in the narrative portion of the revised AoR and Corrective Action Plan. Determine if the frequency for future reevaluations included in the revised plan is sufficient, or whether more frequent reevaluations are necessary (e.g., due to some significant deviations identified during the current reevaluation process).
- Identify the other project plans that might need to be amended, such as the Testing and Monitoring Plan or PISC and Site Closure Plan (e.g., to include monitoring in new areas of the AoR or expanded geophysical monitoring that encompasses a wider area, or to identify more frequent monitoring) and the Emergency and Remedial Response Plan (e.g., to address additional resources in an expanded AoR). See Section 6.3 for more information on project plan updates and Section 5.2 for information on modifying the Class VI permit.

**Review information on any newly-performed corrective action** (i.e., under an approved phased corrective action schedule). Confirm that the owner or operator performed all phased corrective action on schedule and used appropriate/approved methods and carbon dioxide-resistant materials.

### ***Outcomes***

To ensure that the area where USDWs may be endangered due to the injection activity is accurately delineated and to support future site closure decisions, the UIC Program should develop the following:

- An updated AoR and Corrective Action Plan that is an enforceable condition of the Class VI permit;
- A modified permit that incorporates the amended plan; and
- A report documenting the technical evaluation process as described above to support a determination regarding whether revising the project plans (and potentially modifying the Class VI permit) are needed.

## **6.3 Project Plan Updates**

Class VI well owners or operators must submit amended Testing and Monitoring and Emergency and Remedial Response Plans within one year of an AoR reevaluation or submit information to demonstrate that no amendments to the project plans are needed [40 CFR 146.90(j)(1); 146.94(d)(1)]. Project plan revisions may also be triggered by significant changes to the facility (e.g., addition of new injection wells) or as required by the UIC Program Director.

The purpose of the UIC Program's evaluation of the updated plans is to confirm that they address the entire AoR delineated as part of the most recent reevaluation and address any relevant risks to the site. In particular, the UIC Program should ensure that the amended plans are appropriate to operations, the well's construction, and the most up-to-date understanding of the behavior of the site, as informed by the most recent testing and monitoring and AoR delineation modeling results.

As described in Section 6.2 above, AoR reevaluations may also trigger revisions to the AoR and Corrective Action Plan [40 CFR 146.84(e)(4)]. In addition, revisions to the project plans may necessitate an update to the financial responsibility cost estimates and financial instruments. See Section 6.4 for additional information about reviewing these updates.

### ***Completeness***

Project plan updates will likely be narrative documents that are similar to the approved project plans that are enforceable conditions of the Class VI permit; they may be supported by supplemental information (e.g., GIS files or other materials). Changes should reflect the monitoring, operating, or modeling activities that need to be revised based on the findings of the AoR reevaluation or other event that triggered the plan revision. If applicable, owners or operators should also submit an updated QASP for all testing and monitoring procedures (e.g., as part of a revised Testing and Monitoring Plan or PISC and Site Closure Plan). See Section 4.1 for additional information on evaluating the completeness of Class VI project plans.

If any changes are needed and either a revised plan was not submitted or the appropriate changes were not included in the revised plan, the UIC Program should consider requesting that the owner or operator update the plan and submit a revised version. Alternatively, in some cases, the owner or operator may make a justification that no plan updates are needed; this should be a technical demonstration based on site-specific data.

### ***Evaluation***

If the owner or operator submits one or more updated project plans, reviewing the updated plans will entail a process similar to the review of the initial plans submitted with the permit application (see Section 4.1 for specific considerations). However, reviews during this phase will focus on operating data and monitoring data generated since the last review/update of the plans, the most recent AoR reevaluation, and any aspects of the project that have changed since the plans were last approved.

If the owner or operator submits a demonstration that no updates to one or more project plans are needed, the UIC Program should review geologic data and the most recent AoR reevaluation to confirm that there have been no changes at the facility (or divergences from predicted values) that would warrant revision of any of the plans. The demonstration should show how operating data (e.g., injection pressures, volumes, rates) and monitoring data (e.g., position of the carbon dioxide plume and pressure front and groundwater quality data) confirm there have been no significant changes at the site.

The bolded text below outlines a suggested approach for reviewing updated project plans that a UIC Program might employ. This approach will help to confirm that the owner or operator's submittal meets the requirements of the Class VI Rule and the permit, and that the amended plans are protective in light of the most recent site data and the approved AoR.

**Review the updated Testing and Monitoring Plan** or the owner or operator's demonstration that no update to the plan is needed. If revised modeling delineates a larger or differently shaped AoR, or monitoring indicates that the carbon dioxide plume is moving at a rate or in a direction other than was predicted, verify that the amended Testing and Monitoring Plan includes an expanded groundwater monitoring well/pressure monitoring network, more frequent/extensive geophysical surveys, or other appropriate methods to track the plume/pressure front to ensure that USDWs are not being endangered.

If groundwater monitoring indicates leaching/mobilization of metals or organics, or impairment of a USDW has occurred, verify that the plan includes analysis of groundwater for additional parameters or analytes or more frequent analyses as needed to provide early indication of possible USDW endangerment. Likewise, if any of the physical or chemical characteristics of the carbon dioxide stream have changed, additional analytical parameters may be appropriate.

If MIT results or corrosion monitoring data identify changes to the injection well that could potentially endanger USDWs, confirm that any needed modifications to the well testing regime (e.g., to corrosion monitoring or MIT frequency or methods) are incorporated into the plan.

If new, more site-suitable testing and monitoring methods for use at the Class VI project become available, discuss with the owner or operator the merits of incorporating them into the Testing and Monitoring Plan.

**Review the updated Injection Well Plugging Plan** if any updates to the plan are submitted during the injection phase. Formal periodic reviews and amendments to the Injection Well Plugging Plan are not required during the injection phase. However, data on the chemistry of the carbon dioxide plume and formation fluids, well testing results, operational data, or significant changes to the facility may indicate that changes to the planned plugging techniques are necessary. If so, discuss with the owner or operator the need to eventually update the Injection Well Plugging Plan, including the merits of doing this during a current plan update cycle to ensure consistency across all the approved plans, or waiting until a future date. If a plan update is needed at a specific time, request an updated plan pursuant to 40 CFR 146.92(b).

If an updated Injection Well Plugging Plan is submitted during the injection phase, review the procedures and materials described in the plan to ensure that they are suitable to subsurface and carbon dioxide chemistry, operational data, and other aspects of the project based on recent testing and monitoring results. Cross-check the plan against information from monitoring and well logs, as appropriate. See Section 7.1 for additional information on reviewing the updated Injection Well Plugging Plan.

**Review the updated PISC and Site Closure Plan** if one is submitted. The Class VI Rule does not require formal periodic reviews and amendments to the PISC and Site Closure Plan during the injection phase; however, the owner or operator may choose to do so at any time [40 CFR 146.93(a)(4)]. If any changes in facility operations, monitoring results, or operational data warrant changes to other Class VI project plans, ask the owner or operator to consider updating the PISC and Site Closure Plan, particularly if the changes involve a permit modification.

Changes to the PISC and Site Closure Plan may be needed if monitoring indicates that the carbon dioxide plume is moving at a rate or in a direction other than was predicted, or pressures within the injection zone vary from modeled predictions. Additionally, changes may be appropriate if injection-phase AoR reevaluations indicate that predicted post-injection pressure differentials or the position of the carbon dioxide plume and pressure front will differ from those on which the plan was based. Additionally, if any changes to the injection-phase Testing and Monitoring Plan are needed (e.g., parameters or monitoring locations), the EPA recommends revising the post-injection monitoring strategy accordingly and concurrently with updates to the Testing and Monitoring Plan. If the owner or operator submits a revised plan that includes revisions to the PISC timeframe, evaluate the request in the context of available monitoring and operating data to determine whether a shorter (or longer) PISC timeframe is appropriate. Encourage the owner or operator to submit information that meets all of the criteria at 40 CFR 146.93(c) to demonstrate

that the alternative timeframe is protective of USDWs. See Section 7.2.1 for additional information on reviewing updated PISC and Site Closure plans and specific considerations for the review.

As part of the revisions to the PISC and Site Closure Plan, the owner or operator may submit changes to the non-endangerment demonstration criteria. The criteria should be based on monitoring and operational data that verify modeled predictions about the behavior of the carbon dioxide plume and pressure front and confirm USDW non-endangerment (see Section 4.1.9 for additional information on identifying criteria for non-endangerment demonstrations).

**Review the updated Emergency and Remedial Response Plan** or the owner or operator's demonstration that no update to the plan is needed. If revised modeling delineates a larger/differently shaped AoR that includes new resources/infrastructure or if recent (or planned) land use changes brought new resources or infrastructure near or into the AoR, consider requesting that the Emergency and Remedial Response Plan be revised to address such changes. If there has been a need to implement emergency procedures at the site, discuss the response with the owner or operator and consider asking them to incorporate any lessons learned into an amended Emergency and Remedial Response Plan.

Discuss with the owner or operator whether there have been any changes to available responding personnel (including updated contact information), training, or communications and notification procedures, or newly developed procedures that are not in the approved plan. If changes have occurred, verify that the Emergency and Remedial Response Plan includes this updated information.

### ***Outcomes***

Following review and approval of the amended plans, the UIC Program should develop the following information for inclusion in the permit file:

- Updated plans as enforceable conditions of the Class VI permit;
- A modified Class VI permit that incorporates the amended plans. See Section 5.2 for additional information on modifying Class VI permits;
- Documentation of the review to support the administrative record for a permit modification (if one is needed to incorporate the revised plans) or justify and explain to stakeholders and the public that testing and monitoring data and modeling indicate that the project is operating as planned and there is no evidence of endangerment to USDWs and, therefore, no changes to the plans are needed; and
- Periodic public updates on the status of the project. Consider providing status reports to reassure the public and stakeholders that the project is progressing as planned and that there is no endangerment to USDWs.

## **6.4 Financial Responsibility Updates**

Per 40 CFR 146.85(c)(2),(3), the owner or operator must update the cost estimates for covered activities annually or within 60 days of revising the AoR and Corrective Action Plan, the Injection Well Plugging Plan, the PISC and Site Closure Plan, or the Emergency and Remedial Response Plan. Cost estimate updates may also trigger revisions to third-party financial instruments, pursuant to 40 CFR 146.85(c)(4).

The purpose of the UIC Program's review of these updates is to confirm that sufficient resources remain available to ensure USDW protection without requiring the use of public funds to perform any of the covered activities.

### ***Completeness***

The owner or operator will submit cost estimates for any remaining corrective action and updates to the estimates for plugging the injection well, PISC and site closure, and emergency and remedial response. They may also need to submit updated financial instruments (e.g., renewed insurance policies or financial instruments with updated face values) or proposed language for any financial instrument(s) they plan to purchase.

Verify that the updated cost estimates reflect any changes to the covered activities and that the owner or operator plans to use one or more of the qualifying instruments at 40 CFR 146.85(a)(1) to cover the full amount of the cost estimates. Confirm that the updates were submitted on time; a delay in receiving updates to the financial instruments and cost estimates could serve as an indication that the owner or operator may no longer be able to meet the financial responsibility requirements.

#### **Reviewing Annual Submittals Associated with Self-Insurance**

Owners or operators who use self-insurance to demonstrate financial responsibility must submit a report of their bond rating and financial information annually [40 CFR 146.85(a)(6)(v)]. If the owner or operator fails to submit an updated report of their bond rating and financial information at the end of each fiscal year, then they may no longer qualify to use self-insurance as a financial instrument. The annual reports should be reviewed to confirm the owner or operator's continued eligibility for self-insurance. If self-insurance is no longer viable, the owner or operator will need to establish an alternative financial instrument within 60 days of the end of the fiscal year.

### ***Evaluation***

The text below outlines a suggested approach for reviewing updated financial responsibility information that a UIC Program might employ to confirm that the owner or operator's submittal meets the requirements of the Class VI Rule and the permit, and confirm that adequate financial resources are available to address the covered activities.

Verify that the cost estimates submitted by the owner or operator have been accurately adjusted for inflation relative to the prior year's cost estimates. If any changes to the Class VI project (e.g., related to changes to the size or shape of the AoR resulting from an AoR reevaluation) impact the covered activities, discuss with the owner or operator whether this may result in increases or decreases in the cost estimates and therefore necessitate changes to the value of the financial instrument(s). If so, request updated cost estimates and evaluate these. See Section 4.1.4 for additional information on the EPA's Financial Responsibility Cost Estimation Tool, which can support the evaluation of the cost estimates.

If the costs for any activity have increased, request that the owner or operator provide evidence that the value of the financial instrument has increased accordingly. If the cost estimate for any activity decreases, provide written approval to the owner or operator to reduce the face value of the financial instrument.

Release the owner or operator from financial instruments as activities are completed, e.g., as all corrective action is complete. Provide written authorization for the owner or operator to withdraw the financial instrument.

## ***Outcomes***

To ensure that adequate financial resources are in place to address all Class VI activities, develop or document the following:

- Permit conditions and/or a summary of the enforceable financial responsibility conditions that reflect any updates to the cost estimates or changes to the instruments;
- Copies of the financial instruments or documentation that any new or updated financial instruments are active or in force;
- Any documentation releasing the owner or operator from a financial instrument following completion of specific activities; and
- A report documenting the review, including the review of cost estimate updates and any adjustments for inflation; additional financial responsibility instruments obtained; or activities that have been completed.

### **6.5 Occasional Injection-Phase Reviews**

In addition to the information that must be submitted by all owners or operators at a schedule defined in the permit, owners or operators may also need to submit certain information to respond to occasional or unanticipated events. These events include additional testing (beyond that described in the Testing and Monitoring Plan) or workovers, emergency events, or adverse financial conditions experienced by the owner or operator or the issuer(s) of the financial instruments.

The purpose of the UIC Program's evaluation of this information is to ensure that USDWs are protected, or identify appropriate actions to address endangerment and the implications for project operations or updates to the permit (including the Class VI project plans). The UIC Program is encouraged to discuss the activity or event with the owner or operator.

#### ***6.5.1 Workovers, Stimulation, or Other Well Tests***

During the injection phase, an owner or operator may submit notices related to workovers, stimulation, or other well tests. The bolded text below describes activities that the UIC Program may need to take to review the information submitted to ensure that all work is planned and executed in a manner that protects both the integrity of the well and USDWs.

##### **Review advance notices of planned workovers, stimulation, MITs, or non-routine testing.**

Verify that proper procedures will be followed, including gradual well shutdown procedures according to the permit conditions (see Section 4.1.8).

- Review any descriptions of the work that the owner or operator submits with the notification to ensure that all work on the well will be performed such that fluids will be confined to the injection zone and that precautions are in place to avoid damage to the well or to mitigate the impacts of any damage.
- If the owner or operator provides notice of workovers or MITs less than 30 days in advance of the planned activity as required at 40 CFR 146.91(d), coordinate with the owner or operator to determine the feasibility of witnessing the tests. If witnessing is not feasible, confirm whether or not witnessing the test will impact the permitting authority's

ability to review the planned work. If witnessing the test is essential, work to identify dates that work for both parties.

**If appropriate or necessary, arrange to witness the work or activity.** Select the personnel who will witness the work and coordinate with the owner or operator for those personnel to be present.

**Review the post-workover or testing reports,** which must be submitted within 30 days of the activity [40 CFR 146.91(b)]. Verify that the work was performed as planned and consider the following:

- If there is evidence or an indication of well damage or integrity issues, discuss the situation with the owner or operator and identify needed responses, such as additional MITs.
- If there is evidence of unacceptable fluid movement, discuss the situation and appropriate responses with the owner or operator. These may include additional rounds of monitoring to detect excursions of carbon dioxide or formation fluids. Update the project plans if needed.
- If a violation has occurred, take appropriate informal or formal enforcement actions (see Section 2.4).

### **6.5.2 Emergency Response**

While the goals of proper siting, construction, and operation of a Class VI project are to prevent the occurrence of an emergency or adverse event, quick and effective response is vital for mitigating the effects of such an event, if one should occur.

The Class VI Rule requires owners or operators to report, within 24 hours, any evidence of endangerment to a USDW [40 CFR 146.88(f)(3); 146.91(c); 146.94(b)(3)], including:

- Any evidence that the carbon dioxide plume or pressure front may endanger a USDW;
- Any noncompliance with a permit condition;
- Any malfunction of the injection system;
- Any triggering of a shut-off system or a loss of mechanical integrity; or
- A release of carbon dioxide to the atmosphere or biosphere.

Initial information about these events or evidence of endangerment to a USDW, as required at 40 CFR 146.91(c), may be:

- Reported via emergency “24-hour notices” from the owner or operator about an accident or adverse event;
- The subject of public inquiries or comments about the facility; or
- Based on inspections or reviews of monitoring data (e.g., that increased levels of carbon dioxide or mobilized metals were detected outside the injection zone or in a USDW).

The EPA anticipates that emergency notifications (e.g., immediate/24-hour) will be initiated by phone or email and followed up by formal electronic submittals via the GSDT to comply with 40 CFR 146.91(e).

The Class VI Rule does not specify the content of the notifications; however, given the need for timely reporting, the EPA anticipates that they will take the form of a brief letter to the UIC Program Director describing: what happened, the time and date of the event, any immediate actions the owner or operator may have taken, and initial information on any impacts to the well or the environment. Depending on the nature of the emergency, it may also be appropriate to notify (or ask the owner or operator to notify) local water systems, government agencies, etc.

The UIC Program should communicate with the owner or operator during the event to ensure that responses are taken to expeditiously mitigate risk(s) and return the project to compliance. The bolded text below describes activities that the UIC Program may need to take, based on the specific nature of the event, to support the owner or operator in returning the project to compliance and ensuring that USDWs are protected.

**Work with the owner or operator to identify and implement an appropriate response.** The response will be site- and situation-specific and depend on a variety of factors. These may include: whether there was damage to the injection well or any monitoring wells; whether there was any unacceptable movement of carbon dioxide or other fluids (and, if so, the extent of movement); the presence of USDWs or water supplies within the AoR and their proximity to an event; and what, if any, impacts could (or did) result from the event.

Responding to emergency events should be guided by and follow established permit conditions or the procedures in the approved Emergency and Remedial Response Plan. Work with the owner or operator to verify that the appropriate immediate actions were taken and to develop solutions. For example:

- Verify that the owner or operator has shut down the well, if necessary. The shutdown should be conducted as described in the permit, including the implementation of gradual shutdown procedures, if appropriate.
- Begin discussions with the owner or operator to determine the cause of the event, identify remedies to be taken (as outlined in the Emergency and Remedial Response Plan), and set a timeline for resolving the problem and returning the well to service.
- Where the response will take months or years to implement (e.g., groundwater remediation), develop a compliance schedule that describes required activities and a timeline for their completion, and provide this to the owner or operator. Verify that the owner or operator meets the milestones in the compliance schedule as the response proceeds.

Maintain open communication with the owner or operator throughout the response to confirm that all necessary steps are being taken to prevent or mitigate contamination. This might include requesting updates on the status of the project, the remedial effort, and any testing or monitoring performed (and documentation of the results).

**Initiate an enforcement action, if necessary.** If the event caused or was a result of a violation (e.g., failure to maintain integrity of the well or an excursion of injectate or formation fluids into a USDW), determine what enforcement actions are appropriate. (Failure to implement the Emergency and Remedial Response Plan would also constitute a violation of the permit.) Note that some events described in an Emergency and Remedial Response Plan (e.g., the triggering of an automatic shutdown device where the integrity of the well was not compromised) may not

constitute a violation. See Section 2.4 for additional information on enforcement associated with Class VI permits.

**Require follow-up monitoring or testing** to confirm that remedial actions were successful and no USDWs were impacted. For example, if there was a loss of mechanical integrity, require internal and/or external MITs (i.e., pursuant to 40 CFR 146.88(f)(4)) or cement logs to verify that repairs to the well are complete. Arrange to witness MITs or other testing before the well is returned to service, if necessary. If there are indications that injectate or other fluids may have migrated out of the injection zone, consider the need for monitoring of USDWs or other formations. If a seismic event occurred, discuss the magnitude and location of the event with the owner or operator to determine whether additional monitoring stations may be needed. Check in with the owner or operator periodically to verify that milestones in a compliance schedule are being met.

**Authorize the owner or operator to resume injection.** After remediation is complete and the owner or operator demonstrates that the well has integrity and/or that USDWs are not endangered, inform the owner or operator that they may resume injection. UIC Program Directors also have discretion at 40 CFR 146.94(c) to allow injection to resume prior to remediation if the owner or operator demonstrates that the injection operation will not endanger USDWs. This determination will be site- and situation-specific, and should consider the extent of the contamination and proximity of USDWs or water supplies. For example, if movement of formation fluids or injectate was limited and no groundwater-based water systems or private water wells are near the migration pathway, it may be appropriate to allow injection to recommence, provided the owner or operator monitors water quality in the area.

**Request an AoR reevaluation, if appropriate.** If the event indicates that the carbon dioxide plume or pressure front are not moving as predicted, consider requesting an AoR reevaluation. Also request that the Class VI project plans be evaluated and updated, if needed (e.g., revising the Emergency and Remedial Response Plan to incorporate lessons learned during the event). See Section 6.3. The financial responsibility cost estimates may need to be updated accordingly.

**Consider communicating to stakeholders,** including customers of local water systems, nearby land owners, and the public about the event. If a water supply was endangered or contaminated as a result of the event, work with the water system operator or state drinking water authorities to ensure that appropriate actions are taken to protect public health. Alternatively, if the incident did not endanger USDWs or public health, communication is important to reassure stakeholders that UIC protective measures worked and that their water supply was protected. See Section 2.3 for additional information on communicating about Class VI projects.

**Document the event.** The EPA recommends documenting the event. This can provide a record that an appropriate response was taken or, if necessary, support the administrative record for future permitting actions (e.g., if any modifications to the permit or plans are needed based on the event or outcomes), or support an enforcement action (see Section 2.4). A summary report of the incident may address: what happened, including when it was discovered and the cause, if known; what responses or remedial action(s), including activities specified in the Emergency and Remedial Response Plan, were conducted; any impacts to USDWs; and the date that injection resumed.

### **6.5.3 Notification of Adverse Financial Conditions**

The owner or operator must notify the UIC Program Director of adverse financial conditions that may affect their ability to carry out injection well plugging and post-injection site care and site closure. [40 CFR 146.85(d)] These may include bankruptcy of the owner or operator or a third-party provider, suspension or revocation of a trustee, or failure of the issuing institution to renew a letter of credit. If the owner or operator provides notification of any adverse financial conditions, the UIC Program should perform the following activities to ensure that adequate financial resources are available:

- Initiate discussions with the owner or operator and/or the financial institution to address the issue;
- If a new financial instrument is proposed and determined to be sufficient, provide written approval of the new financial instrument and release the owner or operator from the previous financial instrument; and
- Verify that the owner or operator establishes other financial assurance within 60 days after such an event.

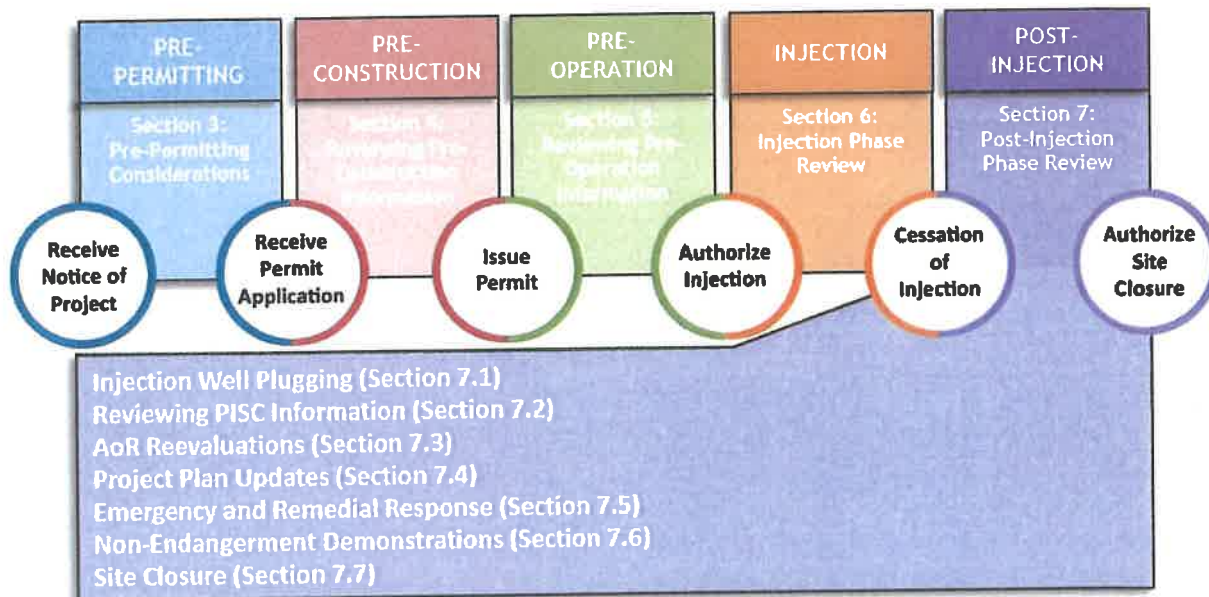

### **6.6 Planning for the Post-Injection Phase Review**

The activities and reviews described in this section will continue for as long as the owner or operator injects carbon dioxide for the purpose of GS. Following cessation of injection, the owner or operator will continue to monitor the site to ensure that the project complies with permit conditions or that any unforeseen USDW endangerment is identified and mitigated. Information about groundwater quality, the performance of the carbon dioxide plume and pressure front, and the results of any other required monitoring will also support the non-endangerment demonstration that must be made before the owner or operator may be authorized to perform site closure activities per 40 CFR 146.93(b).

During the post-injection phase, the UIC Program will receive information related to plugging the injection well, post-injection monitoring results, a non-endangerment demonstration, and site closure-related information to confirm that the project continues to be protective of USDWs and that, following site closure, the site will not endanger USDWs.

Section 7 presents recommendations for how the UIC Program can confirm that all required post-injection activities are performed and review the information that is submitted to ensure that the Class VI project remains in compliance until site closure is complete.

## Section 7: Post-Injection Phase Review

***This page is intentionally blank.***

## 7 Post-Injection Phase Review

During the post-injection phase, after injection has ceased, Class VI well owners or operators will conduct monitoring to confirm project behavior over time. While the potential for endangerment of USDWs will likely decrease during this phase (i.e., as trapping mechanisms continue to immobilize the carbon dioxide and subsurface pressures decline), continued monitoring of the site, per 40 CFR 146.93(a),(b), is necessary to ensure continued project compliance with the permit, confirm USDW protection, and address any identified USDW endangerment. Generating, evaluating, and discussing site data can also ensure collection of the amounts and types of information necessary for demonstration of non-endangerment and authorization of site closure. Also during this phase, the owner or operator must plug the injection and monitoring wells to ensure they will not become conduits for fluid movement that could endanger USDWs [40 CFR 146.92(b); 146.93(e)], and restore the site to pre-operation conditions [40 CFR 146.93(e)].

The goal of the UIC Program's review of the information submitted during the post-injection phase is to verify that the project continues to be protective of USDWs and that, following site closure, the site will not endanger USDWs. Specifically, the UIC Program should confirm that all post-injection phase milestones are met, including proper plugging of the injection and monitoring wells, a demonstration of non-endangerment to USDWs, and closure of the site.

During this phase, the UIC Program will likely receive and evaluate the following types of information:

- Information related to plugging the injection well (see Section 7.1);
- Post-injection site care information, including amendments to the PISC and Site Closure Plan and the results of post-injection testing and monitoring (see Section 7.2);
- AoR reevaluations (see Section 7.3);
- Emergency and Remedial Response Plan amendments or financial responsibility updates (see Section 7.4);
- Information associated with emergency events and associated responses (see Section 7.5);
- A non-endangerment demonstration (see Section 7.6); and
- Site closure notifications and documentation, including information on plugging of the monitoring wells (see Section 7.7).

This section presents recommendations for how the UIC Program can confirm that all required information is generated and submitted, and evaluate this information to ensure that the project continues to be protective of USDWs. Many of the evaluations during this phase are analogous to injection-phase activities (e.g., reviewing testing and monitoring data, AoR reevaluations, and project plan updates), and this section focuses on what is likely to be unique to the post-injection phase. The reader is encouraged to review Section 6 as needed.

Each subsection below describes the types of information owners or operators are anticipated to submit and considerations for reviewing the information (e.g., discussing the information with the owner or operator or requesting clarifying information, if necessary) to verify permit compliance as well as identifying appropriate follow-on actions to ensure USDW protection.

Because each project is unique and the specific information submitted by the owner or operator will vary, the appropriate activities will be specific to the project. Thus, the activities described below outline a recommended course of action to accomplish the goal of evaluating post-injection phase information to ensure that USDWs are protected.

## **7.1 Injection Well Plugging**

Class VI well owners or operators must implement the approved Injection Well Plugging Plan, pursuant to 40 CFR 146.92(b) during the post-injection phase. The timing of well plugging will be site- and project-specific; however, the activities to be performed to plug the well will be the same. Proper plugging of injection wells is necessary to ensure that the wells do not serve as conduits for fluid movement into USDWs following cessation of injection and site closure. See Section 2 of the *UIC Program Class VI Well Plugging, Post-Injection Site Care, and Site Closure Guidance* for additional information on plugging Class VI injection wells.

### ***Completeness***

UIC Program activities associated with injection well plugging should include reviewing the following information related to plugging the injection well:

- An amended Injection Well Plugging Plan if any changes have been made to the approved plan [40 CFR 146.92(b)]. The amended plan will likely be of a similar format to the approved plan that is included in the existing Class VI permit (see Section 4.1.8).
- A notice of intent to plug the well, which must be submitted at least 60 days prior to plugging unless a shorter timeframe is approved [40 CFR 146.92(c)].
- A well plugging report, which must be submitted within 60 days of plugging the well [40 CFR 146.92(d)] and that will likely consist of a narrative document, supported by schematics or other images.

### ***Evaluation***

The bolded text below outlines a suggested approach for reviewing injection well plugging information. This approach will help to confirm that the owner or operator's submittal meets the requirements of the Class VI Rule and the permit, and confirm that the well was plugged in a manner that will prevent USDW endangerment.

**Review any amendments to the Injection Well Plugging Plan** that the owner or operator submits in advance of plugging activities to ensure that it includes all the required elements at 40 CFR 146.92(b) and addresses the current conditions of the well. The review should focus on any changes to the well or other aspects of the project since the plan was approved. For example, if the owner or operator has become aware of any debris or lost tools that need to be removed, ensure that provisions are included for their removal. Review the calculation of fluid weight proposed for well flushing to ensure that it is based on the most recent downhole data. Review the proposed plugging materials and buffer fluids to be sure they are compatible with the most recent analyses of formation fluids (i.e., based on any chemical changes that may have resulted from interactions between formation fluids and the injectate). Modify the Class VI permit to incorporate the revised Injection Well Plugging Plan. See Section 5.2 for additional information on modifying Class VI permits.

**Review the notice of intent to plug the well.** Discuss the timing of well plugging with the owner or operator. If witnessing the plugging is necessary or appropriate, assign personnel to witness the plugging and schedule this with the owner or operator.

**Review the injection well plugging report,** which the owner or operator will submit following plugging activities, to confirm that all actions were completed as described in the approved Injection Well Plugging Plan and in a way that is compliant with the requirements at 40 CFR 146.92. Review records to confirm that tubing and all debris were removed from the well. Confirm that the fluid weight used for plugging operations was calculated using measured bottom-hole pressure. Verify that an MIT was performed and appropriate remedial action was taken to repair the well or cement across any zones where fluid movement did or could occur. Review information about the plugging materials that were used and confirm that they are compatible with downhole conditions and the location of plugs, and that they match the approved plan (or that any divergence from the plan is justified). Review cementing records and any tests performed to verify that appropriate cement strength was obtained.

Note any challenges the owner or operator encountered during plugging and confirm that adequate responses were taken. If it is not clear that the plugs were properly placed and are adequate to prevent fluid migration, additional information or testing may be needed. If testing indicates deficiencies in the plugs or the plugging procedures, confirm that the owner or operator performed remedial action to correct any deficiencies and retested the well.

## 7.2 Reviewing Post-Injection Site Care Information

The primary activities occurring during the post-injection phase will be associated with testing and monitoring to track the carbon dioxide plume and pressure front and demonstrate that the project is in compliance with the permit and the Class VI Rule. During this phase, the UIC Program will likely receive the following information:

- An amended PISC and Site Closure Plan or a demonstration that no amendment to the plan is needed, per 40 CFR 146.93(a)(3); and
- The results of testing and monitoring performed pursuant to the approved PISC and Site Closure Plan and 40 CFR 146.93(a),(b).

Section 3 of the *UIC Program Class VI Well Plugging, Post-Injection Site Care, and Site Closure Guidance* provides detailed information on post-injection site care.

### Converting Injection Wells to Post-Injection Monitoring Wells

The EPA acknowledges that injection wells may be converted to monitoring wells during the PISC phase. If an owner or operator plans to convert the injection well to a monitoring well, the EPA encourages the UIC Program to discuss the conversion process with the owner or operator and consider the following:

- Tubing and debris should be removed and the well should be flushed before monitoring equipment is installed.
- Any remedial actions that may be necessary prior to installation of monitoring equipment, i.e., to address zones of weakness in the cement.
- Whether any packers will need to be replaced or if additional packers will be needed to isolate the zones to be monitored.
- The monitoring equipment to be installed should be capable of providing accurate measurements and collecting the data that are needed throughout the post-injection monitoring period.
- Proper procedures should be in place to confine fluids to the injection zone during the conversion process.

### **7.2.1 PISC and Site Closure Plan Amendments**

Class VI well owners or operators must amend the PISC and Site Closure Plan at the end of the injection phase or demonstrate that no amendment to the plan is needed [40 CFR 146.93(a)(3)]. The owner or operator may also amend the plan at any time during the post-injection phase, pursuant to 40 CFR 146.93(a)(4).

The purpose of the UIC Program's review of the amended PISC and Site Closure Plan is to verify, before post-injection site care begins, that the activities in the plan reflect the most up-to-date understanding of the site. In particular, the review should focus on the most recent AoR delineation modeling, carbon dioxide plume and pressure front behavior, and any additional information needed to support the non-endangerment demonstration (e.g., information on plume trapping). The UIC Program should also work with the owner or operator throughout the review to ensure that the planned post-injection monitoring will generate the data needed to inform a non-endangerment demonstration. See Section 4.1.9 for additional information on evaluating PISC and Site Closure plans.

#### ***Completeness***

The amended PISC and Site Closure Plan will likely be a narrative document similar in format to the approved plan in the Class VI permit and must include all of the required elements described at 40 CFR 146.93(a). If any aspects of the testing and monitoring strategy have changed, the owner or operator may also submit an updated QASP.

If the owner or operator submits an alternative PISC timeframe demonstration as part of the plan amendment, the UIC Program should verify that the request includes sufficient information on which to base an evaluation, e.g., addressing all of the criteria at 40 CFR 146.93(c).

If any changes to the PISC and Site Closure Plan are needed and either an amended plan was not submitted or the changes were not adequately addressed in the amended plan, the UIC Program should consider requesting that the owner or operator update and resubmit the plan. A justification that no updates to the plan are needed should be a technical demonstration based on site-specific data.

#### ***Evaluation***

An amended PISC and Site Closure Plan will likely include the same activities that were described in previously approved versions of the plan. As such, the evaluation of any amendments submitted after cessation of injection should focus on any changes necessary to address new information that arose during site operations.

The bolded text below outlines a suggested approach for reviewing PISC and Site Closure Plan amendments. This approach will help to confirm that the owner or operator's submittal meets the requirements of the Class VI Rule and the permit, and confirm that PISC activities will ensure that USDWs are protected from endangerment.

**Review the predicted post-injection pressure differentials and the position of the carbon dioxide plume and pressure front.** Confirm that these predictions, as described in the amended PISC and Site Closure Plan, reflect the most recently modeled predictions of carbon dioxide plume and pressure front behavior (i.e., based on the findings of the most recent AoR reevaluation).

**Evaluate any changes to the post-injection monitoring strategy.** Verify that the proposed monitoring activities will allow for a comparison of results over time, ideally with monitoring continuing at the same locations/depths/extents and addressing the same analytes as during the injection phase. However, these monitoring activities should also be designed to capture the expected system behavior (as predicted by the AoR delineation modeling) and changes (e.g., monitoring of the carbon dioxide plume at points along its predicted trajectory or monitoring of trapping) during the post-injection phase. If groundwater monitoring during the injection phase identified leaching/mobilization of metals or organics, groundwater contamination, or plume excursions, determine whether analysis of groundwater for additional analytes is needed during post-injection monitoring. If new, more site-suitable testing and monitoring methods have become available, discuss with the owner or operator the merits of incorporating these into the PISC and Site Closure Plan. Any revisions to the fluid sampling/pressure monitoring network or the extent of geophysical surveys should encompass the entire extent of the current, approved AoR. Confirm that the owner or operator has updated the QASP, if necessary, to address new or additional testing and monitoring activities.

The owner or operator may propose reducing the scope or frequency of monitoring activities as the post-injection phase progresses. Any planned reductions should be informed by monitoring results, supported by AoR delineation modeling predictions, and linked to site-specific quantitative criteria. For example, the plan could include provisions for reducing the frequency of pressure monitoring at a location once pressures reach a specified level relative to baseline levels as demonstrated during pre-operational testing.

**Review plans to plug the monitoring well(s).** Confirm that the planned monitoring well plugging activities and materials remain appropriate based on any recent information about subsurface conditions, particularly the presence of potentially corrosive carbon dioxide-water mixtures.

**Evaluate an updated or new alternative PISC timeframe demonstration (if applicable).** If the owner or operator proposes an updated or new alternative PISC timeframe as part of the PISC and Site Closure Plan amendment, encourage them to submit information that meets all of the criteria at 40 CFR 146.93(c) to demonstrate that the alternative timeframe is appropriate and protective of USDWs. The evaluation of a proposed alternative PISC timeframe should focus on the results of the current AoR delineation modeling of pressure front and plume migration and immobilization of the plume due to site-specific trapping mechanisms and available monitoring data. Some specific considerations to support a decision that the project will no longer pose an endangerment to USDWs at the end of the post-injection phase include:

- The modeling results should demonstrate system-wide pressure levels and trends (e.g., decline) such that, at the end of the proposed alternative PISC timeframe, the project will no longer pose an endangerment to USDWs;
- The predicted results should demonstrate carbon dioxide plume immobilization by site-specific trapping mechanisms (e.g., structural trapping, capillary trapping, and mineralization) or a migration rate that is declining such that there is no potential for fluid movement into USDWs at the end of the proposed PISC timeframe; and
- All potential conduits within the AoR should be identified, characterized, and addressed and the proposal to revise the timeframe demonstrates that the conduits will not pose an endangerment to USDWs.

Consider meeting with the owner or operator to discuss the information that should be submitted and how best to conduct the analyses needed to demonstrate that an alternative PISC timeframe is appropriate. See Section 4.1.9 for additional information on evaluating proposed alternative PISC timeframes.

### ***Outcomes***

Following review and approval of the amended plan, the UIC Program should develop the following information for inclusion in the permit file:

- An updated PISC and Site Closure Plan as an enforceable part of the Class VI permit (if needed);
- A modified Class VI permit that incorporates the amended plan, if needed. See Section 5.2 for additional information on modifying Class VI permits; and
- Documentation of the review to support the permit's administrative record.

### ***7.2.2 Post-Injection Monitoring***

After injection has ceased, the owner or operator must implement the PISC and Site Closure Plan, which includes performing monitoring to track the position of the carbon dioxide plume and pressure front and ensure that USDWs are not endangered [40 CFR 146.93(a),(b)]. As noted earlier, post-injection testing and monitoring will likely be an extension of the injection phase testing and monitoring; see Section 6.1 for additional information on reviewing testing and monitoring results.

The purpose of the UIC Program's review of this information is to confirm that the owner or operator is in compliance with the PISC and Site Closure Plan and other permit conditions, or to identify the need for follow-up actions to address any endangerment to USDWs. The UIC Program is encouraged to discuss the results of post-injection testing and monitoring with the owner or operator in the context of an eventual non-endangerment demonstration to confirm that appropriate types and amounts of data are being collected throughout the post-injection phase to support this demonstration.

More information about PISC monitoring requirements and recommendations for meeting those requirements can be found in the *UIC Program Class VI Well Plugging, Post-Injection Site Care, and Site Closure Guidance*.

### ***Completeness***

The specific information the owner or operator submits and the timing of reporting will depend on the testing and monitoring provisions of the approved PISC and Site Closure Plan. However, the UIC Program will likely receive the following types of information:

- The results of groundwater quality monitoring (and potentially other above-confining-zone monitoring), including analytical results for each sampling event during the reporting period at each monitoring well;
- Plume and pressure front tracking information, including the results of all required tests/surveys;
- The results of any required MITs or corrosion testing of monitoring wells; and/or

- The results of any other required activities, e.g., surface air/soil gas monitoring and/or passive seismic monitoring.

The results should be accompanied by a synthesis that interprets the results. The report may describe any evidence of fluid migration out of the injection zone and/or into USDWs, compare results to modeled predictions, and identify trends in the context of previous results.

### ***Evaluation***

The bolded text below outlines a suggested approach for reviewing post-injection monitoring results. This approach will help to confirm that the owner or operator's submittals meet the requirements of the Class VI Rule and the permit, and confirm that USDWs are not endangered.

**Verify that all testing and monitoring was performed as planned, i.e., on schedule using approved methods, equipment, and procedures; that samples were taken at all required locations and depths; and that proper QA protocols were applied.** If the information submitted indicates that any tests or measurements were not completed as described in the approved PISC and Site Closure Plan and the QASP, a discussion with the owner or operator and/or a request for repeat or additional testing may be necessary.

**Review the testing and monitoring results, including any submitted interpretations of the data.** Confirm that:

- The plume and pressure front are tracked as permitted;
- Sufficient data are generated to inform future project decisions;
- The plume and pressure front location are consistent with the predicted behavior; and
- There have been no excursions of carbon dioxide or formation fluids out of the injection zone or any evidence of endangerment to USDWs.

Where applicable, this evaluation can be achieved by comparing the results to baseline data and/or to previous results from the injection and post-injection phases, along with the predictions of the system behavior.

Consider the overall trends in subsurface pressures. In most cases, sustained decreases in fluid pressures will be expected over time during the post-injection phase, unless there are other injection activities operating in the same formation. However, the rate of fluid pressure decline, which depends on the site-specific hydrogeologic properties of the injection zone and overlying formations, may not be steady within particular zones due to heterogeneity in the subsurface. Confirm that pressure measurements represent system-wide behavior and are consistent with the predicted pressure changes during this phase. Identify changes in any trends or deviations from predicted behavior and evaluate whether the results indicate the possibility of carbon dioxide or other fluid migration out of the injection zone, and whether reevaluation of the AoR is needed.

Also consider the trends in the behavior of both the separate-and dissolved-phase carbon dioxide plume. In general, most of the injected carbon dioxide is expected to remain as a separate-phase plume subject to both pressure- and/or buoyancy-driven migration. Confirm that plume monitoring results provide system-wide information (both spatially and temporally) that is consistent with, and complementary to, the AoR delineation modeling predictions. Review information on trapping mechanisms identified via monitoring data and their relevant/quantitative significance in the immobilization of the plume, and confirm that these

observations are consistent with the AoR delineation modeling predictions. Identify any deviations in the monitoring data from the predicted behavior and evaluate whether the results indicate the possibility of fluid migration out of the injection zone or USDW endangerment, and if a reevaluation of the AoR is necessary.

Review the results of other monitoring activities, such as monitoring above the confining zone, surface air/soil gas monitoring, and/or passive seismic monitoring, to confirm confinement of the injected carbon dioxide in the injection zone. Also review the results of periodic mechanical integrity and corrosion testing of the monitoring wells. For additional information on testing and monitoring for Class VI projects, see Section 6.1 and the *UIC Program Class VI Well Plugging, Post-Injection Site Care, and Site Closure Guidance*.

Note whether any anticipated milestones or benchmarks established in the PISC and Site Closure Plan have been reached, as these would support a demonstration of a decreased potential for endangerment to USDWs. Alternatively, if there is not a general trend of pressure decline or other results are not consistent with modeled predictions, discuss with the owner or operator whether additional monitoring or an amendment of the PISC timeframe may be needed. In addition, consider the testing and monitoring results in the context of the non-endangerment demonstration. For example, verify that data collection is tailored to meet any specific non-endangerment criteria established in the PISC and Site Closure Plan.

Based on the results of the review, consider whether the following activities may be appropriate to ensure compliance with the Class VI Rule and any related permit conditions:

- If warranted based on changes in site conditions, request that changes to monitoring frequency, methods, and/or locations or depths be incorporated into an amended PISC and Site Closure Plan.
- Request that the owner or operator reevaluate the AoR if any AoR reevaluation criteria were triggered or to incorporate new information to better predict the actual behavior of the carbon dioxide plume and pressure front.
- If monitoring results suggest the possibility of unintended movement of carbon dioxide or other fluids, or if there is concern that a monitoring well is experiencing degradation or a loss of mechanical integrity, initiate communication with the owner or operator and request additional testing to identify the source of the issue, followed by appropriate actions, such as remediation of monitoring wells or former injection wells.
- If the owner or operator is out of compliance with the Class VI permit, assess the situation, determine if a violation or USDW endangerment occurred, and if necessary, issue a violation (see Section 2.4). Work with the owner or operator to initiate response procedures as described in the Emergency and Remedial Response Plan if results indicate that fluid migration or pressure increases may be endangering USDWs (see Section 7.5).

### **Outcomes**

The EPA recommends that the UIC Program document the review of testing and monitoring results and any follow-up actions taken. Materials that can support a robust permit record and promote consistency and continuity in project-related decision-making include:

- A report that documents the review of all monitoring data, including whether the monitoring was performed in a manner consistent with the approved PISC and Site

Closure Plan, whether the results confirm predictions about the carbon dioxide plume and pressure front, or whether the results indicate any evidence of USDW endangerment; and

- Documentation of any identified deficiencies or concerns and how they were resolved, including whether a revision to the PISC and Site Closure Plan is needed, AoR reevaluation criteria were triggered, or any remedial responses were necessary (and how these were performed and the issue was resolved).

Note also that, following retention of PISC monitoring records (for 10 years following site closure, pursuant to 40 CFR 146.93(h)), the owner or operator must deliver these records to the UIC Program Director. The UIC Program Director must then designate a location for these records to be retained thereafter.

### 7.3 AoR Reevaluations

Reevaluations of the AoR and reviews of the AoR and Corrective Action Plan will continue throughout the post-injection phase. As in the injection phase, the purpose of the UIC Program's review of information associated with post-injection AoR reevaluations is to verify that predictions of plume and pressure front movement are accurate based on information collected via post-injection testing and monitoring. Reviewing this information is analogous to the injection phase review of AoR reevaluations, but focuses on post-injection phase monitoring results.

The bolded text below outlines a suggested approach for reviewing post-injection phase AoR reevaluations. This approach will help to confirm that the owner or operator's submittal meets the requirements of the Class VI Rule and the permit, and ensure that the AoR delineation is based on the most up-to-date information to prevent USDW endangerment.

**Review all new and relevant project data** generated from monitoring activities to ensure that the information is consistent with the modeling predictions and supports the existing AoR delineation. Reevaluations of the AoR must continue over the duration of the Class VI project, including the post-injection phase, to ensure that the area where USDWs may be endangered is delineated accurately [40 CFR 146.84(e)]. Post-injection phase AoR reevaluations will involve a comparison of newly collected data to the computational predictions that supported the existing, approved AoR delineation, similar to those conducted during the injection phase (as discussed in more detail in Section 6.2).

It is likely that, following cessation of injection, the area of increased pressure will reduce in size as pressures dissipate (unless there are other operations affecting the pressure in the formation); however, the separate-phase plume is expected to continue its migration until trapping mechanisms cause immobilization. The EPA anticipates that it is unlikely the area that may be endangered by the project will increase during the post-injection phase (if the existing AoR delineation was verified with monitoring data during the injection phase). However, in addition to plume movement and pressure changes, post-injection phase reviews of AoR reevaluations will also focus on verifying predicted trapping mechanisms (i.e., the type of trapping mechanism and their relative effects).

For projects where new information confirms and supports the existing AoR, the EPA expects that the owner or operator will submit a demonstration that the current AoR and predictions about plume/pressure front movement adequately represent the system behavior. If any monitoring data or other information about the project indicate a need to update the AoR

delineation and/or amend the AoR and Corrective Action Plan, consider discussing this with the owner or operator.

**Review an amended AoR and Corrective Action Plan (if one is submitted).** Similar to the corresponding injection phase activities, the focus of reviewing any amendments to the AoR and Corrective Action Plan will be to ensure that the new AoR delineation complies with 40 CFR 146.84 and accounts for all new, relevant project information. In addition to the amended plan, the EPA expects that the owner or operator will submit an analysis of the AoR reevaluation and whether its results warrant a new delineation and/or amendment of the plan. Review the amended plan to confirm that it accounts for the most recent testing and monitoring results or other site- or project-specific information. See Section 6.2 for additional information on AoR reevaluations and reviewing amendments to the AoR and Corrective Action Plan.

#### **7.4 Project Plan Updates**

In addition to the AoR and Corrective Action Plan, the owner or operator may update the Emergency and Remedial Response Plan and submit annual updates to the financial responsibility cost estimates and financial instruments in the post-injection phase. The owner or operator may also submit amendments to the Injection Well Plugging Plan or the PISC and Site Closure Plan during this phase; see Sections 7.1 and 7.2.1 for further information on evaluating amendments to these plans.

The UIC Program's evaluation of these amendments and updates should focus on information collected via post-injection testing and monitoring, with the goal of ensuring that USDWs are not endangered, that the project is in compliance with the permit, and that the project is progressing toward meeting the criteria for a non-endangerment demonstration.

The bolded text below outlines a suggested approach for reviewing post-injection phase plan updates. This approach will help to confirm that the owner or operator's submittals meet the requirements of the Class VI Rule and the permit, and confirm that planned activities will protect USDWs from endangerment.

**Review any proposed amendments to the Emergency and Remedial Response Plan** or the owner or operator's demonstration that no amendment to the plan is needed. This review should be similar in scope to reviews of injection-phase amendments to the plan (see Section 6.3), focusing on the presence of any new resources/infrastructure within the AoR or any updates to response personnel or procedures.

**Review any updates to the financial responsibility cost estimates and instruments** to ensure that they will cover all required activities, e.g., all remaining post-injection testing and monitoring (considering frequency, spatial coverage, etc.) and site closure. If the injection well has been plugged, release the owner or operator from financial responsibility for injection well plugging activities. Verify that the updated cost estimates reflect inflation or any changes to the project (e.g., related to changes to the size or shape of the AoR). Discuss with the owner or operator whether this may result in increases or decreases in the cost estimates and corresponding changes in the value of the financial responsibility instruments. Note that the requirements for updating or replacing financial responsibility instruments, as described in Section 6.4, continue to apply during this phase of the project.

Following review and approval of the amended plans, **incorporate the amended plans into the Class VI permit** and modify the permit. See Section 5.2 for information on modifying the Class VI permit.

## **7.5 Emergency and Remedial Response**

During the post-injection phase, events requiring an emergency or remedial response may involve excursions of the carbon dioxide plume and pressure front or other fluid movement. (Because the injection well will generally be plugged or converted for monitoring, mechanical integrity losses will be less likely.) The owner or operator must notify the UIC Program Director of any evidence of endangerment to a USDW within 24 hours [40 CFR 146.91(c), 146.94(b)(3)].

As with injection-phase events, the owner or operator's responses to emergency events should be guided by the approved Emergency and Remedial Response Plan and the permit. The UIC Program should discuss any events with the owner or operator to confirm that they have investigated the cause/impact of an event and initiated the appropriate response (if needed). On a project-specific basis, one of the following may be necessary: an AoR reevaluation and amendment to any of the Class VI project plans (see Sections 7.2.1 and 7.4); or an enforcement action if the event caused or was the result of a violation and impacted the integrity of the well and/or resulted in USDW endangerment (see Section 2.4).

The EPA encourages the UIC Program to communicate often with the owner or operator during these types of events to ensure that identified remedial actions are being taken and that they are successful in addressing the event. Additionally, communicating with/providing outreach to stakeholders and the public about the event and any impacts may be appropriate. For additional information, see Section 6.5.2.

## **7.6 Non-Endangerment Demonstrations**

Before the owner or operator can be authorized to perform site closure activities, they must submit a demonstration, based on monitoring and other site-specific data, that the Class VI project does not pose an endangerment to USDWs [40 CFR 146.93(b)(3)]. Pursuant to 40 CFR 146.93(b)(2), the owner or operator may submit this demonstration before the end of the 50-year PISC timeframe or the end of an approved alternative PISC timeframe. Owners or operators may do this regardless of whether an alternative PISC timeframe is in place. Additional information on non-endangerment demonstrations is available in Section 3.4 of the *UIC Program Class VI Well Plugging, Post-Injection Site Care and Site Closure Guidance*.

The purpose of the UIC Program's review of the non-endangerment demonstration is to confirm, based on all available monitoring and other site-specific data, that no additional monitoring is needed to ensure that the project does not pose an endangerment to USDWs.

### ***Completeness***

The non-endangerment demonstration should reference or summarize all relevant monitoring data—including trends and interpretations—on which the demonstration is based. It should also include a discussion of modeling results (e.g., following the last AoR reevaluation) and any other information necessary to assess, confirm, and validate the owner or operator's analysis. The demonstration should also present information to confirm that there are no conduits for fluid movement.

The UIC Program should verify that the data on which the non-endangerment demonstration was based reflect all relevant testing and monitoring results throughout the injection and post-injection phases to provide an accurate representation of current subsurface conditions and trends over time.

### ***Evaluation***

The bolded and italicized text below outlines a suggested approach for reviewing non-endangerment demonstrations. This approach will help to confirm that the owner or operator's submittal meets the requirements of the Class VI Rule and the permit, and confirm that there is no endangerment to USDWs from the carbon dioxide plume and pressure front.

**Review groundwater monitoring data** to verify that there is no USDW contamination that may be attributed to the Class VI project and that there is no evidence of fluid mobilization as a result of injection or interactions between the injectate and formation fluids. Verify that data from monitoring wells completed above the primary confining zone, within any USDWs that were monitored, or in the vicinity of any known leakage pathways demonstrate favorable trends in observed geochemical monitoring results. Compare recent data with baseline geochemical data and trends in monitoring data through the duration of the project, taking into account anything known about natural variability and surface influences.

**Verify that the carbon dioxide plume and pressure front are behaving as predicted** and that pressures within the subsurface are dissipating. Information about the movement of the carbon dioxide plume and dissipation of the pressure front should be based on a combination of in situ injection zone measurements, the results of geophysical surveys and/or other indirect monitoring techniques, and computational modeling results.

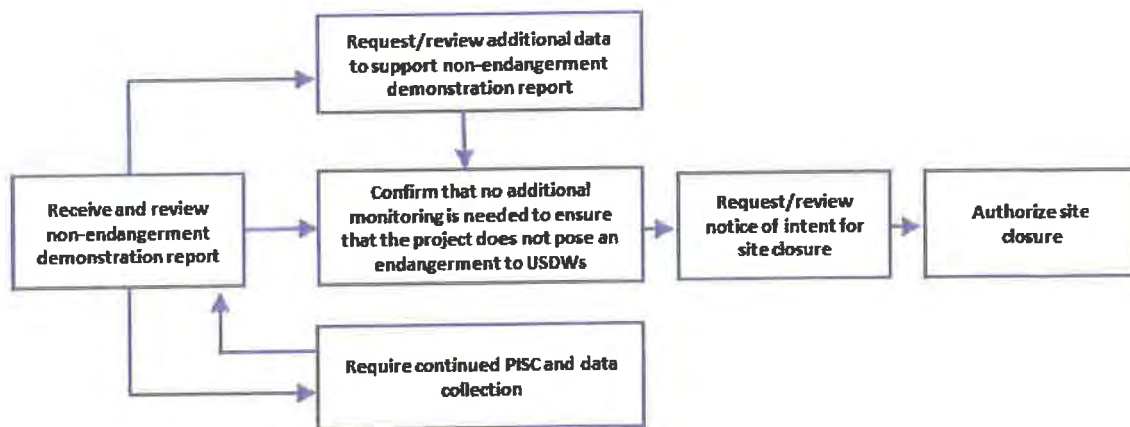

- Examine ***data from in situ pressure monitoring*** and/or any other indirect monitoring to determine whether pressures have declined to a level such that they no longer pose an endangerment to USDWs (e.g., to pre-operation conditions) and they are consistent (both spatially and temporally) with the approved AoR delineation modeling results. In cases where elevated pressures are sustained (e.g., if other operations are affecting pressures in the formation), review the pressure levels in light of their potential to drive fluids into unauthorized formations and the presence of potential conduits in the area affected by the injection (e.g., the AoR, if it is reevaluated and/or verified by the monitoring data).
- Evaluate ***plume monitoring results***, including direct measurements in the injection zone using monitoring wells combined with any geophysical survey results, to ensure that the separate-phase carbon dioxide is migrating as predicted (both laterally and vertically) and verify the trapping mechanisms (e.g., structural trapping, capillary trapping, and mineralization) and their effects (e.g., the estimated trapped fraction of the carbon dioxide). If the plume is predicted to continue migrating at a slow rate (i.e., it would take a significantly long period—on the order of thousands of years—for the plume to reach a potential receptor), confirm the predicted/estimated migration rate and verify that there are no other potential receptors along the plume trajectory.
- Review the results of the most recent ***AoR delineation modeling*** (e.g., AoR reevaluation). If any new computational modeling activities were conducted specifically for the non-endangerment demonstration, evaluate these efforts in a manner similar to that used to review AoR reevaluations during the injection phase (see Section 6.2).

While the owner or operator need not demonstrate that the plume has completely stopped moving, the non-endangerment demonstration should provide evidence, based on monitoring data, that the plume and pressure front are behaving as predicted and they will not pose any endangerment to USDWs and, therefore, no further monitoring is needed.

**Confirm that there are no potential conduits for fluid movement** in the vicinity of the project (e.g., active and abandoned wells, faults, or fractures). Verify that the analyses conducted to identify potential conduits (e.g., aeromagnetic surveys or records reviews) encompassed the maximum extent of the carbon dioxide plume and pressure front. Where conduits were identified, confirm that the owner or operator has demonstrated that none pose an endangerment to a USDW based on plugging records or MITs, assessments that faults or fractures are not transmissive to USDWs, or distance to USDWs.

**Discuss the results of the evaluation with the owner or operator.** Based on the review of the non-endangerment demonstration, three outcomes are possible (see Figure 7-1):

1. The non-endangerment demonstration supports a determination that the plume and pressure front no longer pose an endangerment to USDWs and additional monitoring is not needed. See Section 7.7 for more information on site closure.
2. Additional sampling data, more robust modeling, or additional analysis of results is needed to support a stronger demonstration of non-endangerment. If this outcome is indicated (and sufficient data exist at this point in the post-injection phase), work with the owner or operator to identify these needs and update the non-endangerment demonstration accordingly.

**Figure 7-1: Reviewing Non-Endangerment Demonstrations**

3. Monitoring or modeling data indicate that the carbon dioxide plume and pressure front continue to pose a potential endangerment to USDWs. If this outcome is indicated, request that the owner or operator continue to perform post-injection monitoring. If necessary to ensure protection, a UIC Program Director may require monitoring to continue beyond the previously established PISC timeframe [40 CFR 146.93(b)(4)]. If appropriate, consider asking the owner or operator to amend the PISC and Site Closure Plan, e.g., to modify the monitoring strategy, including increasing or decreasing the frequency at which monitoring is performed and results are submitted. Modify the Class VI permit if needed (see Section 5.2).

### ***Outcomes***

The EPA encourages the UIC Program to prepare the following materials to document the review of the non-endangerment demonstration and the outcome of the evaluation:

- A report that describes the information reviewed; and
- Documentation regarding whether:
  - The non-endangerment demonstration complies with the requirements under 40 CFR 146.93 and established permit conditions;
  - The UIC Program Director approves the non-endangerment demonstration;
  - Any additional actions, monitoring, or modeling are required of the owner or operator to protect USDWs from endangerment; and
  - The owner or operator may proceed to closing the site pursuant to 40 CFR 146.93(e).

### **7.7 Site Closure**

After non-endangerment has been demonstrated and approved by the UIC Program Director, a final site closure process is initiated pursuant to 40 CFR 146.93(d) and (e). During this process, the owner or operator submits a notice of intent to close the site for review and approval by the UIC Program Director. Following approval, the owner or operator closes the site as described in the approved PISC and Site Closure Plan and submits a site closure report to the UIC Program Director (see Figure 7-1).

Proper site closure is necessary to ensure that all monitoring wells are plugged appropriately to prevent them from serving as conduits for fluid migration and to restore the Class VI project site for other uses. The documentation associated with site closure is needed to ensure that future land owners and planners will be made aware that carbon dioxide is stored in the subsurface and help authorities impose appropriate conditions on subsequent drilling activities that may penetrate the injection or confining zone(s).

### ***Completeness***

During the post-injection phase, Class VI well owners or operators will submit a notice of intent for site closure and a site closure report to the UIC Program Director. Site closure notifications must be submitted at least 120 days prior to closure unless the UIC Program Director allows for a shorter notice period [40 CFR 146.93(d)]. The site closure notification will likely be a letter that includes information about the facility, contact information for site personnel, and the projected site closure date. At the time of the notification, the owner or operator must also provide an amended PISC and Site Closure Plan if any changes have been made to the approved plan [40 CFR 146.93(d)].

Owners or operators must submit a site closure report within 90 days of site closure [40 CFR 146.93(f)]. The report will describe the pre-plugging activities and the plugging procedures performed on all monitoring wells. It should also contain a copy of a survey plat that was submitted to the local zoning authority and document other required notifications to state, local, and tribal authorities.

### ***Evaluation***

The bolded text below outlines a suggested approach for reviewing information related to site closure. This approach will help to confirm that the owner or operator's submittals meet the requirements of the Class VI Rule and the permit, and confirm prevention of USDW endangerment.

**Review the notice of intent for site closure.** Consult with the owner or operator prior to the actual closure of the site so that a general understanding of the process is clear to everyone involved. Verify that all site closure activities will be completed by the closure date. If witnessing of monitoring well plugging or other closure activities is necessary, assign the appropriate personnel to witness the activities and schedule this with the owner or operator.

If the owner or operator submits amendments to the PISC and Site Closure Plan, review the information provided to ensure that the owner or operator plans to close the site in a manner that meets the requirements of 40 CFR 146.93. See Sections 4.1.9 and 7.2.1 for additional information on evaluating the PISC and Site Closure Plan.

If the injection well was converted to a monitoring well, ensure that the owner or operator will plug the well in the manner described in the approved Injection Well Plugging Plan [40 CFR 146.92].

**Authorize the owner or operator to proceed with site closure** after confirming that the notice of intent for site closure addresses any outstanding questions and that the owner or operator will proceed in a manner pursuant to 40 CFR 146.93(e) and the conditions of the Class VI permit.

**Review the site closure report** to verify that all activities were conducted according to the procedures described in the approved PISC and Site Closure Plan. Specifically:

- Verify that all monitoring wells were properly plugged as described in the approved plan.
- Review the results of any MITs performed on the monitoring wells prior to their plugging and confirm that appropriate remedial measures were taken to address any problems that were identified.

- Verify that tubing, other equipment, and debris were removed from the monitoring wells prior to plugging.
- Confirm that plugs are located as described in the PISC and Site Closure Plan and emplaced to prevent fluid migration between formations.
- Ensure that cement used for plugging is compatible with formation fluids and with carbon dioxide or carbon dioxide-water mixtures if the monitoring well penetrates the injection zone.
- Evaluate whether proper cement setting times were allowed and proper cement strength was obtained. If any monitoring wells were not properly plugged, request that the owner or operator perform remedial measures and/or retest the well.
- Confirm that the site was restored as described in the approved PISC and Site Closure Plan.
- Verify that all equipment slated for removal was removed and that any pits used for drilling have been properly filled.
- Confirm that vegetation has been replanted and any landscaping described in the plan has been accomplished.

**Verify that the owner or operator performed all site closure-related notifications required at 40 CFR 146.93(f) and (g).**

- Confirm that the required plat of the injection site was included in the site closure report and submitted to the appropriate land zoning authority.
- Verify that the location of the injection well is correctly indicated on the plat; the locations of the monitoring wells may also be helpful. Be sure that locations are documented with respect to permanently surveyed benchmarks.
- Verify that the owner or operator notified all appropriate state, local, tribal, and territorial agencies with authority over drilling activities, and that the notification included all of the information required at 40 CFR 146.93(f). This required information includes the location of the well, the nature of the injection activities, information about the carbon dioxide stream, and recent maps of the carbon dioxide plume position.
- Verify that the owner or operator recorded a notation on the deed to the facility property, and any other documents normally reviewed during a title search, that the site was used for injection of carbon dioxide. If any of the notifications required at 40 CFR 146.93(g) were not provided, request that the owner or operator complete and submit them to the appropriate parties and provide a copy to the Class VI permitting authority.

**Confirm that the owner or operator is aware of their recordkeeping responsibilities.** Many records must be retained for ten years following site closure [40 CFR 146.91(f)]. These include:

- Data collected to support the permit application;
- Data on the nature and composition of all injected fluids; and

- Well plugging reports, post-injection site care data (including, if appropriate, data and information used to develop the demonstration of the alternative PISC timeframe), and the site closure report.

If appropriate, require the owner or operator to deliver the records to the UIC Program Director at the conclusion of the retention period [40 CFR 146.91(f)(2)] or retain records for longer than 10 years after site closure [40 CFR 146.91(f)(5)].

**Release the owner or operator from remaining financial responsibility** after all site closure activities have been completed. Inform the owner or operator that, while they have been released from regulatory compliance and the Class VI permit, they are still responsible for any remedial actions necessary if USDWs should become endangered as a result of the injection activity. The owner or operator may also be liable to lawsuits and remedies under RCRA and the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). See Section 4 of the *UIC Program Class VI Well Plugging, Post-Injection Site Care, and Site Closure Guidance* for additional information.

## The Geologic Sequestration Data Tool

***This page is intentionally blank.***

## The GSDT

### **Storage and Access to Class VI Project Data**

The GSDT supports the collection, preservation, and evaluation of project-related information and the development of an administrative record for each Class VI permit. The flow and use of information in the GSDT is outlined below:

- Permit applicants/owners or operators use topic-specific **reporting modules** to upload and submit information (see “Permit Applicant/Owner or Operator Reporting Modules” below). Reporting modules are launched from a centralized **operator landing page**.
- Information submitted by the applicant/owner or operator is saved in read-only format in the **administrative record area** of the GSDT. In compliance with the EPA’s Cross-Media Electronic Reporting Regulation (CROMERR), users cannot modify these original, time-stamped files.
- Each time information related to a Class VI project is submitted, designated users receive an **automatic email alert**, which includes a PDF that summarizes the contents of the submittal and provides links to the location where the submitted information is stored. The PDF summary also highlights any information that has changed since the last submission.
- The permit writer and other members of the permitting authority team can access copies of the submitted files, save them to the **permit package area** of the GSDT, and collaboratively edit them as needed during the course of evaluating submittals (e.g., to annotate with questions, copy text to create reports, or add permit numbers to project plans). They can also launch the reporting modules directly to help them see the context of the original submittals.
- The permitting authority can request additional information, ask clarifying questions, or initiate other formal communications with the permittee via the **Information Request module**. The module facilitates the transmittal of information requests from the permitting authority to the permit applicant/owner or operator and the submission of responses. Because the communications take place within the GSDT, all requests and responses are automatically retained for inclusion in the permit’s administrative record.
- The permitting authority can use the GSDT to organize the **administrative record** for the permit by saving files in the designated area. Any file associated with a project can be included, including original submittals, correspondence with the applicant/owner or operator, UIC Program Director-generated reports, and elements of the permit package.
- When a project milestone is reached (e.g., issuance of a permit), the permit writer can **change the project phase** (e.g., from the pre-construction phase to the pre-operation phase). The GSDT then generates a new area within the project’s file structure to facilitate collection and review of information associated with the next project phase.
- The GSDT’s **resource library** contains various tools, templates, guidance documents, and other materials that can be used to support the permitting authority’s activities through the duration of a Class VI project.

The GSDT allows for project-specific access control to ensure the integrity of information in the GSDT while allowing for information sharing among permitting authorities. By default, registered permitting authority users will have read-only access to all materials (across all projects) to facilitate transparency and information sharing. Users can be granted higher levels of access on a project-by-project basis, if they need to create or edit materials for those projects. In contrast, permit applicant/owner or operator users can only access materials that they have submitted and information requests sent to them by their permitting authority.

### **GSDT Permitting Authority Capabilities**

Permitting authority users access the GSDT via a set of web-based dashboards, which provide users with flexibility to manage work on their assigned Class VI projects. These include user dashboards (which allow individual users to manage work and navigate the site) and project dashboards (to manage information related to each Class VI project).

Permitting authority users seeking access to the GSDT should send an email to [GSDDataTool@epa.gov](mailto:GSDDataTool@epa.gov) or request an account at <https://epa.velo.pnnl.gov/gs3/> to begin the registration process. Figure A-1 illustrates the GSDT capabilities and resources available to permitting authorities relative to those available to permit applicants/owners and operators.

#### ***Permitting Authority Dashboards***

Upon logging onto the GSDT, permitting authority users arrive at their user dashboard, which serves as a personalized landing page. The dashboard helps users navigate throughout the GSDT and keep track of relevant information. It provides links to useful information and pages, including:

- The Class VI projects (and associated files) to which the user has been invited (e.g., as a permit writer/project manager or team member) and pending invitations to additional projects.
- Recently edited documents or other materials chosen as “favorites,” for easy access to frequently viewed items.
- The overall file structure for the GSDT, with read-only access to all projects.
- User account settings (for changing a password, etc.).
- A resource library (for user documentation, templates, etc.).
- The owner or operator landing page, so that permitting authority users can launch the reporting modules.

Additional capabilities available to permitting authority users include task assignment/management and support for computational evaluation tools.

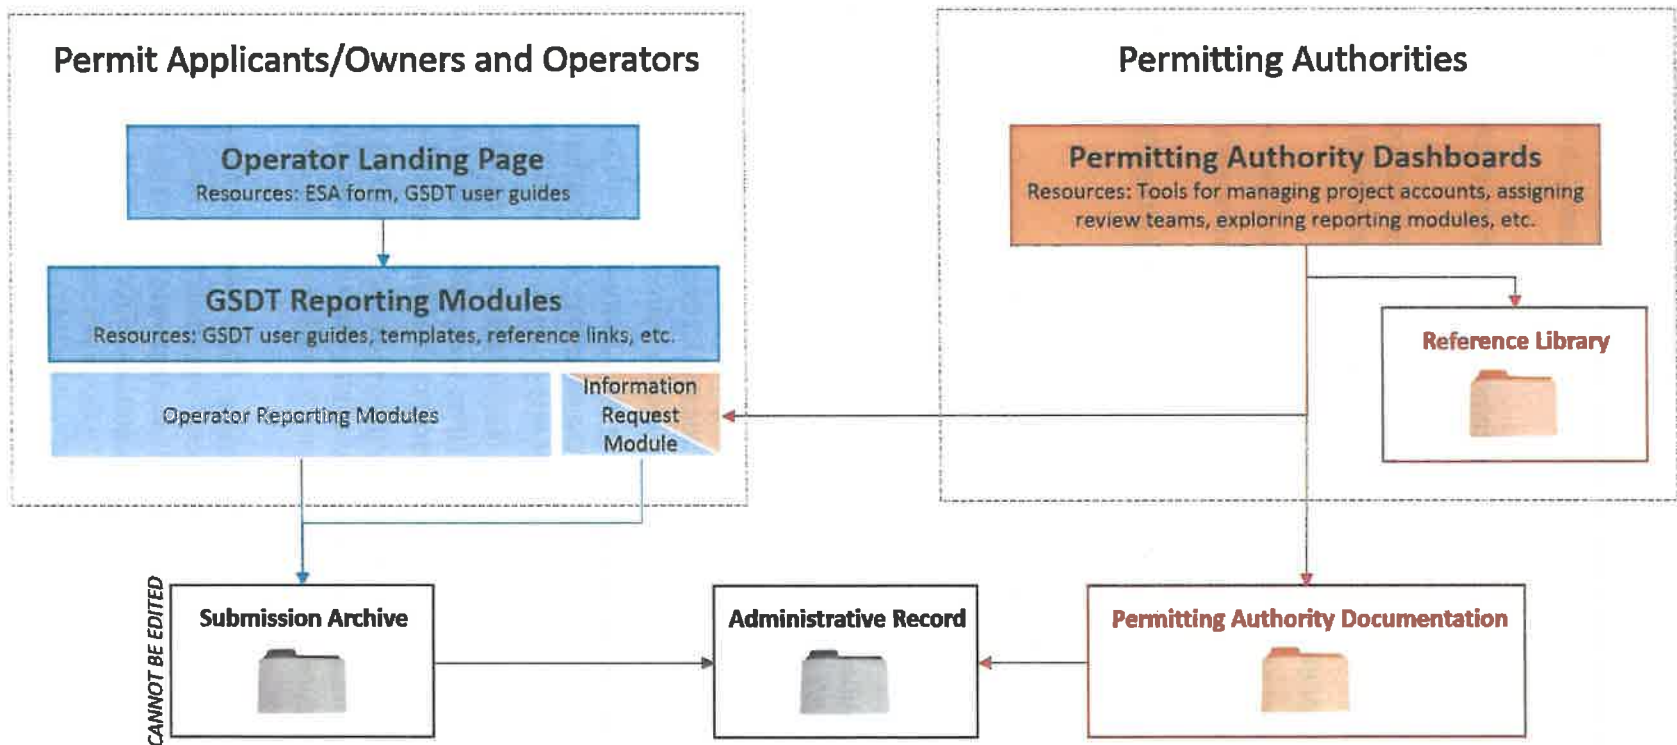

Figure A-1: Schematic of GSDT Capabilities and Resources for Permit Applicants/Owners or Operators and Permitting Authorities

## ***Project Dashboards***

The GSDT is designed so that each Class VI project has its own dashboard. Project dashboards are created automatically in the GSDT when a new project is created. These dashboards serve as centralized landing pages for each project.

Project dashboards allow easy access to all information and activities related to the project, including:

- The project file structure, which includes both permit applicant/owner or operator submissions and files created or added by the permitting authority team.
- A list of project team members and their roles.
- A summary of recent project updates, such as new content, new users, etc.
- Special capabilities for project manager (permit writer) users, such as project milestone tracking.

For additional information on navigating the dashboards and using the GSDT, see the GSDT user guides for permitting authorities.

## **Permit Applicant/Owner or Operator Reporting Modules**

To facilitate the efficient submittal of required information, permit applicants/owners or operators interact with the GSDT via a set of reporting modules that reflect the Class VI Rule requirements. Permit applicants/owners or operators access the modules through a centralized operator landing page.

The GSDT provides the following capabilities to facilitate use of the modules and support compliance with the Class VI Rule:

- The reporting modules consist of structured electronic forms that reflect the Class VI Rule requirements. Within the modules, applicants/owners or operators provide information via a combination of selections (with check boxes, radio buttons, drop-down menus, etc.), direct entry into text fields, and file uploads.
- Some modules contain templates (e.g., for the various Class VI project plans) to help users ensure that they have included all the necessary information to fulfill the Class VI Rule requirements while providing flexibility to tailor submissions to their project.
- Each reporting module has a user guide that describes the specific technical procedures necessary to populate and submit data. These user guides can be downloaded from within the modules and be accessed from the operator landing page of the GSDT.
- Most modules are designed to be used during multiple Class VI project phases. This allows owners or operators to return to modules that they have already populated and provide updated information when necessary, while avoiding the need for duplicative submissions.

See the *UIC Program Class VI Well Recordkeeping, Reporting, and Data Management Guidance for Owners and Operators* for additional information on use of the GSDT by permit applicants and permittees. That guidance describes electronic reporting in the context of the Class VI Program, the key components and capabilities of the owner or operator modules of the GSDT, and how permit applicants can register to use and access the GSDT. Step-by-step instructions for using each module can be found in the GSDT user guides.

### Useful Websites

The websites below provide tools and information that can support the UIC Program Director in reviewing permit applicant/owner or operator submittals or performing activities associated with developing a Class VI permit or supporting documents as part of a Class VI permit record. Some of the sites below are also referenced in the UIC Program guidance documents for owners or operators.

#### ***EPA UIC Program Websites***

The EPA's GS Guidance page includes all of the draft and final technical guidance documents for implementing the Class VI Rule. See <https://www.epa.gov/uic/class-vi-guidance-documents>.

The GSDT can be accessed at <https://epa.velo.pnnl.gov/>.

A list of Regional UIC contacts and links to state UIC contacts is available on the EPA's UIC page at <https://www.epa.gov/uic>.

Information on plugging monitoring wells is provided in the *UIC Program Class VI Well Plugging, Post-Injection Site Care, and Site Closure Guidance* and the EPA Region V's "Guidance on Plugging and Abandoning Injection Wells," which is available at <https://www.epa.gov/sites/production/files/2015-09/documents/r5-deepwell-guidance4-plugging-abandoning-injection-wells-19941222.pdf>.

The EPA's financial responsibility resources are available at <http://www.epa.gov/uic/financial-responsibilities-underground-injection-well-owners-or-operators>.

#### ***Other EPA Websites***

Information about water systems is available on the EPA's Safe Drinking Water Information System (SDWIS) at <http://www.epa.gov/enviro/facts/sdwis/search.html>.

Information on reporting under subpart RR of the Greenhouse Gas Reporting Program is available at <https://www.epa.gov/ghgreporting>.

Information and guidance related to EJ, including the EPA's environmental justice screening and mapping tool are available at <https://www.epa.gov/environmentaljustice>.

The EPA's Drinking Water Mapping Application to Protect Source Waters (DWMAPS), an online mapping tool to support updating of state source water assessments and protection plans, is available at <https://www.epa.gov/sourcewaterprotection/dwmaps>.

The EPA public involvement policy and public involvement web pages provide resources designed to assist in addressing community issues. See <https://www.epa.gov/international-cooperation/public-participation-guide>.

An index of EPA-approved laboratory methods can be found at <https://www.epa.gov/dwanalyticalmethods>.

A listing of state laboratory certification programs is available on the EPA's website at <http://water.epa.gov/scitech/drinkingwater/labcert/statecertification.cfm>.

### ***U.S. Department of Energy Websites***

DOE's Office of Fossil Energy provides news and information about research related to Carbon Capture and Storage (CCS) and best practices documents. Information is available at <http://energy.gov/fe/science-innovation/carbon-capture-and-storage-research>.

Information on the TOUGHREACT reactive transport model is available from the Lawrence Berkeley National Laboratory at <http://esd.lbl.gov/TOUGHREACT/>.

Information on STOMP is available from the Pacific Northwest National Laboratory at <http://stomp.pnnl.gov/>.

The National Risk Assessment Partnership (NRAP) develops risk assessment tools for geologic sequestration. Information about NRAP and its resources is available at <https://www.netl.doe.gov/research/coal/crosscutting/national-risk-assessment-partnership>.

### ***U.S. Geological Survey Websites***

USGS maintains a variety of tools that can support reviews of geologic information in Class VI permit applications and injection depth waiver applications. Some examples include:

- The USGS Earthquake Hazards Program database, available at <http://earthquake.usgs.gov/hazards/qfaults/>.
- Groundwater information including groundwater use, aquifers, and water quality data, available at <http://water.usgs.gov/ogw/data.html>.
- USGS's Hydrologic Investigations Atlas Series, available at <http://pubs.usgs.gov/ha/ha730>.
- Data on water use by county is available at <http://water.usgs.gov/watuse/>.
- The Land Cover Institute databases of land use are available at <http://landcover.usgs.gov/urban/intro.php>.

# Geologic Sequestration of Carbon Dioxide

## Underground Injection Control (UIC) Program Class VI Well Site Characterization Guidance

INDUSTRIAL COMMISSION  
STATE OF NORTH DAKOTA  
DATE 6/12/24 CASE NO. 30869-880  
Introduced By Bofto (Hydro Solutions)  
Exhibit LO-20  
Identified By Bofto.

## Disclaimer

*The Federal Requirements under the Underground Injection Control Program for Carbon Dioxide Geologic Sequestration Wells* (75 FR 77230, December 10, 2010), known as the Class VI Rule, establishes a new class of injection well (Class VI).

The Safe Drinking Water Act (SDWA) provisions and U.S. Environmental Protection Agency (EPA) regulations cited in this document contain legally-binding requirements. In several chapters this guidance document makes suggestions and offers alternatives that go beyond the minimum requirements indicated by the Class VI Rule. This is intended to provide information and suggestions that may be helpful for implementation efforts. Such suggestions are prefaced by “may” or “should” and are to be considered advisory. They are not required elements of the rule. Therefore, this document does not substitute for those provisions or regulations, nor is it a regulation itself, so it does not impose legally-binding requirements on EPA, states, or the regulated community. The recommendations herein may not be applicable to each and every situation.

EPA and state decision makers retain the discretion to adopt approaches on a case-by-case basis that differ from this guidance where appropriate. Any decisions regarding a particular facility will be made based on the applicable statutes and regulations. Mention of trade names or commercial products does not constitute endorsement or recommendation for use. EPA is taking an adaptive rulemaking approach to regulating Class VI injection wells, and the agency will continue to evaluate ongoing research and demonstration projects and gather other relevant information as needed to refine the rule. Consequently, this guidance may change in the future without a formal notice and comment period.

While EPA has made every effort to ensure the accuracy of the discussion in this document, the obligations of the regulated community are determined by statutes, regulations or other legally binding requirements. In the event of a conflict between the discussion in this document and any statute or regulation, this document would not be controlling.

Note that this document only addresses issues covered by EPA’s authorities under the SDWA. Other EPA authorities, such as Clean Air Act requirements to report carbon dioxide injection activities under the Greenhouse Gas Mandatory Reporting Rule (GHG MRR), are not within the scope of this document.

## Executive Summary

EPA's *Federal Requirements Under the Underground Injection Control Program for Carbon Dioxide Geologic Sequestration Wells* are codified in the U.S. Code of Federal Regulations [40 CFR 146.81 *et seq.*] and are referred to as the Class VI Rule. The Class VI Rule establishes a new class of injection well (Class VI) and sets minimum federal technical criteria for Class VI injection wells for the purpose of protecting underground sources of drinking water (USDWs). This document is part of a series of technical guidance documents designed to support owners or operators of Class VI wells and the UIC Program permitting authorities.

Site characterization is critical to operating safe and effective geologic sequestration (GS) projects. The proper siting of a Class VI injection well is the foundation for successful GS operations. Site characterization identifies potential risks and eliminates unacceptable sites (e.g., sites with transmissive faults or fractures that would impair containment). Key aspects of an appropriate GS site, per 40 CFR 146.83, include geologic formations that provide adequate storage capacity to store the injected carbon dioxide and a competent confining zone that will contain the injected carbon dioxide. Class VI well owners or operators also must identify additional confining zones, if required by the UIC Program Director.

The Class VI Rule also requires owners or operators of Class VI wells to perform, among other activities, a detailed assessment of the geologic, hydrogeologic, geochemical, and geomechanical properties of the proposed GS site to ensure that wells are sited in suitable locations [40 CFR 146.82(a) and (c)]. As part of the site characterization required to be documented in a Class VI permit application, owners or operators of Class VI wells must submit maps and geologic cross sections describing subsurface geologic formations as well as the general vertical and lateral limits of all USDWs at the proposed GS site [40 CFR 146.82(a)]. Data and information collected during site characterization are used in the development of injection well construction and operating plans; provide inputs for the computational model that estimates the extent of the injected carbon dioxide plume and related pressure front; and establish baseline information to which geochemical, geophysical, and hydrogeologic site monitoring data collected over the life of the injection project can be compared.

This *UIC Program Class VI Well Site Characterization Guidance* describes those data and information that are typically used to characterize the geology of a site, including methods for measuring or estimating important geologic parameters. The introductory section of this guidance provides an overview of the Class VI Rule, specifically with regard to geologic siting requirements. The second section describes the site characterization data needed to obtain a permit for the construction of a Class VI well. The third section addresses certain aspects of site characterization activities that involve the synthesis of geologic, hydrogeologic, geochemical, and geomechanical data in order to demonstrate that the project site is suitable for injection (i.e., has an injection zone capable of receiving the anticipated volume of carbon dioxide and a confining zone(s) capable of containing the plume and pressure front). The fourth section addresses requirements applicable to drilling and completion of the injection well that must be met before operation may be authorized, pursuant to 40 CFR 146.82(c) and 146.87. In each section, the guidance describes options for meeting the Class VI Rule requirements and the types of information recommended to be submitted.

OOIP	Original oil in place
pAVAZ	P-wave amplitude variation with offset and azimuth, also referred to as pAVOA
Pe	Capillary entry pressure
PGIP	Producible gas in place
PIA	Petrographic image analysis
PISC	Post-injection site care
SC	Specific conductivity
SCAL	Special core analysis
SDWA	Safe Drinking Water Act
SEI	Secondary electron imaging
SEM	Scanning electron microscope (or microscopy)
SGR	Shale gouge ratio
SP	Self potential (when referring to geophysical techniques)
SP	Spontaneous potential (when referring to logging)
TDS	Total dissolved solids
TOC	Total organic carbon
UIC	Underground Injection Control
USBM	United States Bureau of Mines
USDW	Underground source of drinking water
USGS	United States Department of the Interior, United States Geological Survey

VSP	Vertical seismic profile
XLOT	Extended leak-off test
XRD	X-ray diffraction
XRF	X-ray fluorescence

## Definitions

Key to definition sources:

- 1: 40 CFR 146.81(d).
- 2: EPA's UIC website (<http://water.epa.gov/type/groundwater/uic/glossary.cfm>).
- 3: Class VI Rule Preamble.
- 4: 40 CFR 144.6(f) and 144.80(f).
- 5: This definition was drafted for the purposes of this document.
- 6: 40 CFR 144.3.

**Area of Review (AoR)** means the region surrounding the geologic sequestration project where USDWs may be endangered by the injection activity. The AoR is delineated using computational modeling that accounts for the physical and chemical properties of all phases of the injected carbon dioxide stream and displaced fluids, and is based on available site characterization, monitoring, and operational data as set forth in 40 CFR 146.84.<sup>1</sup>

**Brine** means water that has a large quantity of salt, especially sodium chloride, dissolved in it. Large quantities of brine are often produced along with oil and gas. Water having high total dissolved solids (TDS) content.<sup>2</sup>

**Buoyancy** refers to the upward force on one phase (e.g., a fluid) produced by the surrounding fluid (e.g., a liquid or a gas) in which it is fully or partially immersed, caused by differences in pressure or density.<sup>3</sup>

**Capillary pressure** refers to the difference of pressures between two phases existing in a system of interconnecting pores or capillaries. The difference in pressure is due to the combination of surface tension and curvature in the capillaries.<sup>5</sup>

**Carbon dioxide plume** means the extent underground, in three dimensions, of an injected carbon dioxide stream.<sup>1</sup>

**Carbon dioxide stream** means carbon dioxide that has been captured from an emission source (e.g., a power plant), plus incidental associated substances derived from the source materials and the capture process, and any substances added to the stream to enable or improve the injection process. This subpart [Subpart H of 40 CFR part 146] does not apply to any carbon dioxide stream that meets the definition of a hazardous waste under 40 CFR part 261.<sup>1</sup>

**Class VI wells** means wells that are not experimental in nature that are used for GS of carbon dioxide beneath the lowermost formation containing a USDW; or, wells used for GS of carbon dioxide that have been granted a waiver of the injection depth requirements pursuant to requirements at 40 CFR 146.95; or, wells used for GS of carbon dioxide that have received an expansion to the areal extent of an existing Class II EOR/EGR aquifer exemption pursuant to 40 CFR 146.4 and 144.7(d).<sup>4</sup>

**Computational model** means a mathematical representation of the injection project and relevant features, including injection wells, site geology, and fluids present. For a GS project, site-specific geologic information is used as input to a computational code, creating a computational model that provides predictions of subsurface conditions, fluid flow, and carbon dioxide plume and pressure front movement at that site. The computational model comprises all model input and predictions (i.e., output).<sup>5</sup>

**Confining zone** means a geologic formation, group of formations, or part of a formation stratigraphically overlying the injection zone(s) that acts as barrier to fluid movement. For Class VI wells operating under an injection depth waiver, confining zone means a geologic formation, group of formations, or part of a formation stratigraphically overlying and underlying the injection zone(s).<sup>1</sup>

**Corrective action** means the use of Director-approved methods to ensure that wells within the AoR do not serve as conduits for the movement of fluids into USDWs.<sup>1</sup>

**Cratonic** means pertaining to the old, stable lithosphere in the interiors of continents.<sup>5</sup>

**Drilling mud** means a heavy suspension used in drilling an “injection well,” introduced down the drill pipe and through the drill bit.<sup>6</sup>

**Dynamic models** refers to a method or methods for estimating carbon dioxide storage capacity after initiation of carbon dioxide injection, including decline curve analysis, material balance, and reservoir simulation.<sup>5</sup>

**Effective permeability** means the permeability of one fluid when more than one fluid phase is present.<sup>5</sup>

**Enhanced Oil or Gas Recovery (EOR/EGR)** typically means, the process of injecting a fluid (e.g., water, brine, or carbon dioxide) into an oil or gas bearing formation to recover residual oil or natural gas. The injected fluid thins (decreases the viscosity) and/or displaces extractable oil and gas, which is then available for recovery. This is also used for secondary or tertiary recovery.<sup>3</sup>

**Equation of state** refers to an equation that expresses the equilibrium phase relationship between pressure, volume and temperature for a particular chemical species.<sup>5</sup>

**Fluid** means any material or substance which flows or moves whether in a semisolid, liquid, sludge, gas or other form or state.<sup>6</sup>

**Formation or geological formation** means a layer of rock that is made up of a certain type of rock or a combination of types.<sup>3</sup>

**Geochemical characterization** means to study the chemistry of the formation fluids and solids (rock) and to identify potential chemical interactions among the injectate (carbon dioxide), formation fluids, and solids.<sup>5</sup>

**Geologic sequestration (GS)** means the long-term containment of a gaseous, liquid or supercritical carbon dioxide stream in subsurface geologic formations. This term does not apply to carbon dioxide capture or transport.<sup>1</sup>

**Geologic sequestration project** means an injection well or wells used to emplace a carbon dioxide stream beneath the lowermost formation containing a USDW; or, wells used for GS of carbon dioxide that have been granted a waiver of the injection depth requirements pursuant to requirements at 40 CFR 146.95; or, wells used for GS of carbon dioxide that have received an expansion to the areal extent of an existing Class II EOR/EGR aquifer exemption pursuant to 40 CFR 146.4 and 144.7(d). It includes the subsurface three-dimensional extent of the carbon dioxide plume, associated area of elevated pressure, and displaced fluids, as well as the surface area above that delineated region.<sup>1</sup>

**Geomechanical characterization** means to study the rock mechanical characteristics associated with carbon dioxide containment such as fault and reservoir rock stability and confining zone integrity.<sup>5</sup>

**Geophysical surveys** refers to the use of geophysical techniques (e.g., seismic, electrical, gravity, or electromagnetic (EM) surveys or well logging methods such as gamma ray and spontaneous potential) to characterize subsurface rock formations.<sup>3</sup>

**Heterogeneity** refers to the spatial variability in the geologic structure and/or physical properties of the site.<sup>5</sup>

**Hysteresis** means the phenomenon where the response of a system depends not only on the present stimulus, but also on the previous history of the medium. For example, in a GS project, relative permeability, capillary pressure, and residual trapping will depend upon the saturation history of the formation (i.e., injection vs. post-injection phase).<sup>5</sup>

**Injection zone** means a geologic formation, group of formations, or part of a formation that is of sufficient areal extent, thickness, porosity, and permeability to receive carbon dioxide through a well or wells associated with a GS project.<sup>1</sup>

**Injectivity** is the pressure differential over existing reservoir pressure required to inject a unit volume of fluid in a given unit of time. It is typically expressed as psi/bbl/day (psi per barrel per day) but can be expressed in any combination of pressure, volume, and time units.<sup>5</sup>

**In situ stresses** refers to the three principal stresses (vertical stress, maximum horizontal stress, and minimum horizontal stress) commonly used to characterize the geomechanical model.<sup>5</sup>

**Intracratonic** means located in an area above old, stable lithosphere, usually in the interiors of continents far away from plate boundaries.<sup>5</sup>

**Intrinsic permeability** refers to a parameter that describes properties of the subsurface that impact the rate of fluid flow. Larger intrinsic permeability values correspond to greater fluid flow rates. Intrinsic permeability has units of area (distance squared).<sup>5</sup>

**Irreducible water saturation** refers to the smallest amount of remaining water in a core sample after forced displacement by another fluid.<sup>5</sup>

**Lithology** means the description of rocks, based on color, mineral composition, and grain size.<sup>3</sup>

**Mineralogy, petrology, and solid-phase chemistry** refers to the composition of the solids in an aquifer, including the minerals, rock types and their origins, and bulk chemical composition.<sup>5</sup>

**Mud log** means data collected from drilling mud as it circulates. It produces a record of the different types of data collected when drilling a well, such as the rate of drilling, the rock types in the cuttings, and the presence of hydrocarbons.<sup>5</sup>

**Parameter** means a mathematical variable used in governing equations, equations of state, and constitutive relationships. Parameters describe properties of the fluids present, porous media, and fluid sources and sinks (e.g., injection well). Examples of model parameters include intrinsic permeability, fluid viscosity, and fluid injection rate.<sup>5</sup>

**Pore throat radius** means the radius of the opening to a pore in a rock.<sup>5</sup>

**Porosity** means the percentage of rock consisting of void space.<sup>5</sup>

**Post-injection site care** means appropriate monitoring and other actions (including corrective action) needed following cessation of injection to ensure that USDWs are not endangered, as required under 40 CFR 146.93.<sup>1</sup>

**Pressure front** means the zone of elevated pressure that is created by the injection of carbon dioxide into the subsurface. For [GS projects], the pressure front of a carbon dioxide plume refers to the zone where there is a pressure differential sufficient to cause the movement of injected fluids or formation fluids into a USDW.<sup>1</sup>

**Relative permeability** refers to a factor, between 0 and 1, that is multiplied by the intrinsic permeability of a formation to compute the effective permeability for a fluid in a particular pore space. When immiscible fluids (e.g., carbon dioxide, water) are present within the pore space of a formation, the ability for flow of those fluids is reduced, due to the blocking effect of the presence of the other fluid. This reduction is represented by relative permeability.<sup>5</sup>

**Reserve** means the estimated volume available for carbon dioxide storage in the injection zone, considering technological, economic, and regulatory constraints and limitations. Reserve estimates can be considered a subset of resource estimates.<sup>5</sup>

**Resource** means the estimated volume available for carbon dioxide storage in the injection zone.<sup>5</sup>

**Site closure** means the point/time, as determined by the UIC Program Director following the requirements under 40 CFR 146.93, at which the owner or operator of a GS site is released from post-injection site care responsibilities.<sup>1</sup>

**Skin factor or skin effect** refers to the restrictions to flow in the near-well bore region, typically associated with damage during drilling and well operations.<sup>5</sup>

**Static models** refers to the methods for estimating carbon dioxide storage capacity prior to startup of injection and includes volumetric and compressibility methods.<sup>5</sup>

**Storage capacity** means the pore volume within the injection zone available for carbon dioxide storage.<sup>5</sup>

**Stratigraphy** means the sequence of rock strata, or layers. This generally refers to layers of sedimentary or igneous rocks.<sup>5</sup>

**Supercritical fluid** means a fluid above its critical temperature (31.1°C for carbon dioxide) and critical pressure (73.8 bar for carbon dioxide).<sup>5</sup>

**Tensile strength** refers to the maximum force an element can take in tension before it breaks.<sup>5</sup>

**Total dissolved solids (TDS)** means the total dissolved (filterable) solids as determined by use of the method specified in 40 CFR part 136.<sup>6</sup>

**Transmissibility** means a coefficient associated with Darcy's law that characterizes flow through porous media. It is equal to the coefficient of permeability (hydraulic conductivity) multiplied by the thickness of the formation.<sup>5</sup>

**Transmissive fault or fracture** means a fault or fracture that has sufficient permeability and vertical extent to allow fluids to move between formations.<sup>1</sup>

**Underground Injection Control Program** refers to the program EPA, or an approved state, is authorized to implement under the Safe Drinking Water Act (SDWA) that is responsible for regulating the underground injection of fluids by injection wells. This includes setting the federal minimum requirements for construction, operation, permitting, and closure of underground injection wells.<sup>5</sup>

**Underground Injection Control Program (UIC Program) Director** refers to the chief administrative officer of any state or tribal agency or EPA Region that has been delegated to operate an approved UIC program.<sup>2</sup>

**Underground Source of Drinking Water (USDW)** means an aquifer or its portion which supplies any public water system; or which contains a sufficient quantity of ground water to supply a public water system; and currently supplies drinking water for human consumption; or contains fewer than 10,000 mg/l total dissolved solids; and which is not an exempted aquifer.<sup>6</sup>

**Well bore** refers to the hole that remains throughout a geologic (rock) formation after a well is drilled.<sup>5</sup>

**Wireline** refers to a wire or cable that is used to deploy tools and instruments downhole and that transmits data to the surface.<sup>5</sup>

**Workover** refers to any maintenance activity performed on a well that involves ceasing injection and removing the wellhead.<sup>5</sup>

# 1. Introduction

Site characterization is a long-standing requirement of the Underground Injection Control (UIC) Program to ensure safe deployment of injection operations and the protection of underground sources of drinking water (USDWs). The U.S. Environmental Protection Agency's (EPA's) *Federal Requirements Under the Underground Injection Control (UIC) Program for Carbon Dioxide Geologic Sequestration (GS) Wells*, found at 75 FR 77230, December 10, 2010, and codified in the U.S. Code of Federal Regulations [40 CFR 146.81 *et seq.*], are referred to as the Class VI Rule. The Class VI Rule requires owners or operators of wells used to inject carbon dioxide for GS to identify the presence of suitable geologic characteristics at a proposed site to ensure the protection of USDWs during and following injection activities.

Site characterization for Class VI permitting focuses on demonstrating that a proposed project site has a suitable injection zone to receive the carbon dioxide and a confining zone that will prevent fluid movement out of the injection zone as described under 40 CFR 146.83. Owners or operators must gather the data necessary to demonstrate site suitability and submit this with a Class VI permit application to be evaluated by the UIC Program Director prior to receiving authorization to construct the well [40 CFR 146.82(a)], and must update and gather more detailed site-specific information and submit this prior to receiving authorization for injection [40 CFR 146.82(c)].

The site characterization process typically includes a general characterization of regional and site geology, followed by detailed characterization of the injection zone and confining zones. The more general characterization includes data on the regional geology and hydrogeology, supported by maps, cross sections, and other available data. The more detailed information focuses on the proposed project site and involves submission of data on stratigraphy, structural geology, hydrogeology, geomechanical properties, and geochemistry. The initial stage includes compiling pre-existing and/or new information, maps, cross sections, geochemical and petrophysical data, and geophysical or remote sensing information as described under 40 CFR 146.82(a). Final site characterization data will be collected as the injection well is drilled, core samples are taken and analyzed, and logs and tests are performed, as described under 40 CFR 146.82(c).

In addition to being essential to USDW protection, thorough site characterization is a necessary element of selecting viable GS sites. EPA expects that selecting GS sites will be analogous to the process by which oil and gas recovery projects are sited—from a “big picture” regional evaluation of prospective resources that relies primarily on existing data, to more detailed evaluations of prospects that appear, based on preliminary data, to be promising sites. These detailed evaluations involve the use of the same logging, testing, and modeling techniques needed to perform site characterizations that can meet the requirements of the Class VI Rule (NETL, 2010).

## 1.1. Overview of Class VI Rule Requirements

The Class VI Rule, at 40 CFR 146.83, establishes minimum criteria for the siting of Class VI wells. Specifically, Class VI wells must be located in areas with a suitable geologic system, including: (1) the presence of an injection zone of sufficient areal extent, thickness, porosity, and permeability to receive the total anticipated volume of the carbon dioxide stream; and (2) the presence of confining zones that are free of transmissive faults or fractures and of sufficient areal extent and integrity to contain the carbon dioxide stream and displaced formation fluids and allow injection without initiating or propagating fractures [40 CFR 146.83(a)]. Additionally, at the UIC Program Director's discretion, owners or operators may be required to identify and characterize additional confining zones to ensure USDW protection, impede vertical fluid movement, allow for pressure dissipation, and provide additional opportunities for monitoring, mitigation, and remediation [40 CFR 146.83(b)].

Owners or operators must demonstrate that a proposed site is suitable for GS by performing detailed site characterization and submitting extensive geologic data to the UIC Program Director. These data, described at 40 CFR 146.82(a), are necessary to demonstrate that the well will be sited in an area with a suitable geologic system that will ensure USDW protection and meet the requirements of 40 CFR 146.83. The Class VI Rule specifies distinct requirements for information to be submitted with the permit application and before well construction is approved at 40 CFR 146.82(a), and information to be submitted before operation of the well is authorized at 40 CFR 146.82(c).

Site characterization is an iterative process. Site characterization data are submitted to the UIC Program Director to fulfill the requirements for a Class VI permit application [40 CFR 146.82(a)] before well construction is approved. Pursuant to the requirements at 40 CFR 146.82(c), the data must be updated and refined before operation of the well is authorized based on the results of the formation testing program required at 40 CFR 146.82(a)(8) and 146.87 that is executed during injection well drilling and completion.

The types of site characterization information specified by the Class VI Rule that must be provided with a Class VI well permit application include:

- Maps and cross sections of the area of review (AoR) [40 CFR 146.82(a)(3)(i) and 146.82(a)(2)];
- The location, orientation, and properties of known or suspected faults and fractures that may transect the confining zone(s) in the AoR, along with a determination that they will not interfere with containment [40 CFR 146.82(a)(3)(ii)];
- Data on the depth, areal extent, thickness, mineralogy, porosity, permeability, and capillary pressure of the injection and confining zone(s) and on lithology and facies changes [40 CFR 146.82(a)(3)(iii)];
- Geomechanical information on fractures, stress, ductility, rock strength, and in situ fluid pressures within the confining zone(s) [40 CFR 146.82(a)(3)(iv)];

- Information on the seismic history of the area, including the presence and depths of seismic sources, and a determination that the seismicity will not interfere with containment [40 CFR 146.82(a)(3)(v)];
- Geologic and topographic maps and cross sections illustrating regional geology, hydrogeology, and the geologic structure of the local area [40 CFR 146.82(a)(3)(vi)];
- Maps and stratigraphic cross sections indicating the general vertical and lateral limits of all USDWs, water wells, and springs within the AoR, their positions relative to the injection zone(s), and the direction of water movement (where known) [40 CFR 146.82(a)(5)]; and
- Baseline geochemical data on subsurface formations, including all USDWs in the AoR [40 CFR 146.82(a)(6)].

The types of site characterization information specified by the Class VI Rule that must be provided for the UIC Program Director to review and approve the operation of a Class VI well include:

- Any relevant updates to the information on the geologic structure and hydrogeologic properties of the proposed storage site and overlying formations, based on data obtained during logging and testing of the well [40 CFR 146.82(c)(2)];
- Information on the compatibility of the carbon dioxide stream with fluids in the injection zone(s) and minerals in both the injection and the confining zone(s) [40 CFR 146.82(c)(3)];
- The results of formation testing [40 CFR 146.82(c)(4)]; and
- All available logging and testing program data on the well required by 40 CFR 146.87 [40 CFR 146.82(c)(7)].

Owners or operators are expected to take full advantage of existing site characterization data to fulfill the requirements at 40 CFR 146.82. However, a stratigraphic well may need to be drilled in some cases (e.g., if adequate data are not already available). If owners or operators need to drill a stratigraphic well, they may consider ultimately using it for injection or monitoring.

Owners or operators should keep in mind that if the AoR delineation or any of the project plans require significant changes based on the final site characterization data, the Class VI permit would have to be modified to incorporate these changes before injection can be authorized [40 CFR 144.39]. Depending on the extent of the modifications, the UIC Program Director may need to re-initiate the public notice process. To avoid any potential delays associated with the permit modification process, EPA encourages owners or operators to collect as much site-specific data as possible before submitting the initial Class VI permit application. Additional information on the Class VI permitting process and how UIC Program Directors may evaluate the site characterization submittals is presented in the *UIC Program Class VI Implementation Manual for State Directors*.

## 1.2. Overview and Purpose of this Guidance

The purpose of this guidance is to describe the data needs, process, and procedures for conducting a geologic assessment that meets the requirements of the Class VI Rule at 40 CFR 146.82 and 146.83. This document provides guidance on the types of information to collect and submit with a Class VI injection well permit application as well as where and how such information might be obtained. Illustrative examples of some of the required information are in the Appendix to this document.

This guidance document is written to assist Class VI injection well owners or operators, parties that may conduct the geologic siting activities on behalf of owners or operators, and the UIC Program permitting authorities who will evaluate Class VI permit applications. This guidance can also help owners or operators who hire contractors to perform some or all of the required site characterization activities understand, as signers of the permit application, all of the information that is submitted. Likewise, owners or operators are encouraged to share this guidance document with contractors so that they understand the permitting authority's expectations for the data submitted.

It is important to note that not all sites will be suitable for GS. This guidance provides considerations for determining when issuing a Class VI permit is or might not be appropriate, or when more data may be needed to make a determination regarding the suitability of a site. EPA encourages owners or operators to review the considerations in this guidance and discuss the data being collected with the UIC Program Director throughout the site characterization process. Table 1-1 presents the activities owners or operators undertake as part of the site evaluation/characterization process (based on the requirements of 40 CFR 146.82), the corresponding Class VI Rule requirement, and the section of this guidance that describes how owners or operators can collect this information and submit it to demonstrate to the UIC Program Director that the site is appropriate for GS.

**Table 1-1: Site Characterization Activities in the Class VI Rule**

Activity	Class VI Rule Requirement	Guidance Section
<b>Regional evaluation</b>		
Characterize regional geology and hydrogeology and local structural geology	Maps and cross sections of the AoR [40 CFR 146.82(a)(3)(i)].	2.3.1
	Geologic and topographic maps and cross sections illustrating regional geology, hydrogeology, and the geologic structure of the local area [40 CFR 146.82(a)(3)(vi)].	2.1
Gather information on all wells, etc.	Map showing the injection well, the applicable AoR, and faults, if known or suspected [40 CFR 146.82(a)(2)].	2.2
Study seismic history	Information on the seismic history of the area, including the presence and depths of seismic sources [40 CFR 146.82(a)(3)(v)].	2.3.7

Activity	Class VI Rule Requirement	Guidance Section
<b>Detailed analysis</b>		
Study faults and fractures in the AoR	The location, orientation, and properties of known or suspected faults and fractures that may transect the confining zone(s) in the AoR and a determination that they would not interfere with containment [40 CFR 146.82(a)(3)(ii)].	2.3.2
Collect data on the depth, areal extent, and thickness of the injection and confining zones, and facies changes	Data on the depth, areal extent, thickness, mineralogy, porosity, permeability, and capillary pressure of the injection and confining zone(s); including geology/facies changes based on field data which may include geologic cores, outcrop data, seismic surveys, well logs, and names and lithologic descriptions [40 CFR 146.82(a)(3)(iii)].	2.3.3, 3.1
Characterize mineralogy of the injection and confining zones	Data on the depth, areal extent, thickness, mineralogy, porosity, permeability, and capillary pressure of the injection and confining zone(s); including geology/facies changes based on field data which may include geologic cores, outcrop data, seismic surveys, well logs, and names and lithologic descriptions [40 CFR 146.82(a)(3)(iii)].	2.3.4
Characterize porosity, permeability, and capillary pressure of the injection and confining zones	Data on the depth, areal extent, thickness, mineralogy, porosity, permeability, and capillary pressure of the injection and confining zone(s); including geology/facies changes based on field data which may include geologic cores, outcrop data, seismic surveys, well logs, and names and lithologic descriptions [40 CFR 146.82(a)(3)(iii)].	2.3.5
Perform geomechanical characterization	Geomechanical information on fractures, stress, ductility, rock strength, and in situ fluid pressures within the confining zone(s) [40 CFR 146.82(a)(3)(iv)].	2.3.6
Characterize hydrology and hydrogeology of the AoR	Maps and stratigraphic cross sections indicating all USDWs, water wells and springs within the AoR, their positions relative to the injection zone(s), and the direction of water movement, where known [40 CFR 146.82(a)(5)].	2.3.8
Characterize geochemistry	Baseline geochemical data on subsurface formations [146.82(a)(6)].	2.3.9
Perform geophysical characterization	Data on the depth, areal extent, thickness, mineralogy, porosity, permeability, and capillary pressure of the injection and confining zone(s); including geology/facies changes based on field data which may include geologic cores, outcrop data, seismic surveys, well logs, and names and lithologic descriptions [40 CFR 146.82(a)(3)(iii)].	2.3.10
<b>During/after well drilling</b>		
Update site characterization data based on pre-injection logs and tests	Any relevant updates, based on data obtained during logging and testing of the well and the formation, to the information on the geologic structure and hydrogeologic properties of the proposed storage site and overlying formations [40 CFR 146.82(c)(2)].	4
Perform formation testing	The results of the formation testing program [40 CFR 146.82(c)(4)].	4.1

Activity	Class VI Rule Requirement	Guidance Section
Analyze cores	Take whole cores or sidewall cores of the injection zone and confining system and formation fluid samples from the injection zone(s), and submit a detailed report prepared by a log analyst that includes: well log analyses (including well logs), core analyses, and formation fluid sample information [per 40 CFR 146.87(b), required at 146.82(c)(7)].	4.2
Characterize injection zone fluids	Record the fluid temperature, pH, specific conductivity, reservoir pressure, and static fluid level of the injection zone(s) [per 40 CFR 146.87(c), required at 146.82(c)(7)].	4.3
Calculate fracture pressures	Determine or calculate fracture pressure and other physical and chemical characteristics of the injection and confining zone(s) and physical and chemical characteristics of the formation fluids in the injection zone(s) [per 40 CFR 146.87(d), required at 146.82(c)(7)].	4.4
Characterize injection zone hydrogeologic properties	Prior to operation, conduct a pressure fall-off test and a pump test or injectivity tests to verify hydrogeologic characteristics of the injection zone(s) [per 40 CFR 146.87(e), required at 146.82(c)(7)].	4.5
Analyze carbon dioxide stream compatibility	Information on the compatibility of the carbon dioxide stream with fluids in the injection zone(s) and minerals in both the injection and the confining zone(s), based on the results of the formation testing program, and with the materials used to construct the well [40 CFR 146.82(c)(3)].	3.3

This guidance assumes that readers are familiar with many of the available techniques used in geologic site characterizations and their use. Thus, descriptions of these techniques in this document are minimal. The Appendix provides background information on a number of these technical topics, along with an extensive list of references.

### 1.3. Relationship to Other Class VI Activities

This guidance document focuses on collecting the geological, physical, and chemical data necessary to support Class VI permit determinations during the pre-injection phase of a GS project. Data obtained during the site characterization process will also support other permit application and site operation activities. For example:

- Data on rock and fluid properties can inform the design and calibration of AoR delineation models;
- Information on injection zone and/or confining zone mineralogy, fluids, and properties can inform proper well construction and pre-injection testing;
- Data on the confining zone fracture pressure and storage capacity can inform setting protective operating limits; and
- Water quality and geophysical profiling data can serve as a baseline for the testing and monitoring that will take place during the operational phase of the project.

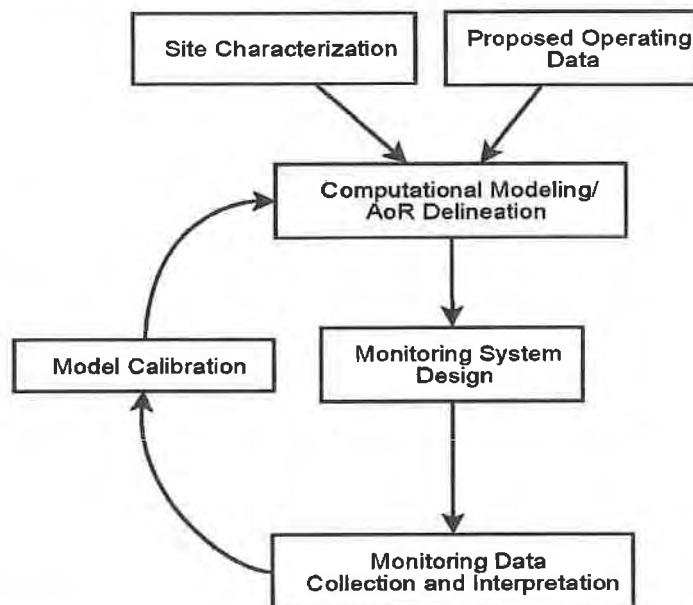

These cross-linkages between guidance documents are noted in the text where appropriate.

This guidance document is part of a series of technical guidance documents developed to provide information and possible approaches for addressing various aspects of permitting and operating a Class VI injection well. A number of UIC Class VI Program companion guidance documents focus on other steps in the process. These documents include:

- The *UIC Program Class VI Well Area of Review Evaluation and Corrective Action Guidance* explains how site data will inform computational modeling of the AoR;
- The *UIC Program Class VI Well Construction Guidance* describes how to construct injection wells using materials that are compatible with the carbon dioxide and subsurface conditions;
- The *UIC Program Class VI Well Testing and Monitoring Guidance* describes how baseline geochemical and other site data will inform appropriate site monitoring;
- The *UIC Program Class VI Well Project Plan Development Guidance* explains how site data can inform development of the required project plans; and
- The *UIC Program Class VI Well Injection Depth Waivers Guidance* provides special considerations and additional requirements for evaluating sites where injection into non-USDWs above or between USDWs is planned.

These guidance documents are intended to complement each other and to assist owners or operators in preparing permit applications that satisfy the requirements of the Class VI Rule and are tailored to the characteristics of individual sites. The material that these guidance documents encompass reflects the linkages among the different steps and stages of a GS operation as shown in Figure 1-1.

**Figure 1-1: Flow Chart Showing Relationships among Site Characterization, Modeling, and Monitoring for a GS Project**

## 1.4. Organization of this Guidance

Following the introduction (Section 1), this guidance document is organized as follows:

- Section 2, Activities Performed Prior to the Construction of a Class VI Well, presents the activities that owners or operators will perform before an injection well may be drilled (i.e., to apply for a Class VI permit). Information generated from these activities will meet the requirements of 40 CFR 146.82(a)(2), (3), (5), and (6).
- Section 3, Data Synthesis for Demonstration of Site Suitability, provides considerations and recommendations for how owners or operators can synthesize the information collected to demonstrate that the site meets the requirements of 40 CFR 146.83, is acceptable to the UIC Program Director, and is suitable for a Class VI permit. This section describes some of the “big picture” questions about a proposed site that will need to be answered through the site characterization process. Owners or operators should consider these as they plan to collect the site data that will inform their permit application.
- Section 4, Activities Performed Prior to the Operation of a Class VI Well, presents activities that owners or operators will perform before injection may be authorized. The information obtained from these activities will meet the site characterization-related requirements of 40 CFR 146.82(c)(2)–(4) and (7), and 146.87(b)–(e).

## **2. Activities Performed Prior to Construction of a Class VI Well**

The Class VI Rule, at 40 CFR 146.82(a), requires Class VI permit applicants to submit to the UIC Program Director extensive information on the characterization of surface and subsurface features of the proposed storage site, in particular on the injection zone(s), confining zone(s), and USDWs. Applicants will submit geologic and hydrogeologic data on the injection and confining zones, including their lithologic properties; the seismic history of the site; the structural geology of the site, including the presence of faults and fractures; and other information. Required submissions also include geochemical data on subsurface formations, including USDWs, and geomechanical data on the confining zone(s).

This section provides information to assist owners or operators in conducting the site characterization activities necessary to gather information, prepare, and submit a Class VI permit application. Each subsection below describes the activities owners or operators will need to perform to submit the elements of a Class VI permit application required at 40 CFR 146.82(a). For each required piece of information, this guidance describes potential sources of information and provides recommendations for how this information can be submitted to the UIC Program Director to support a determination that the site is suitable for GS. Note that, for completeness in describing a thorough geologic characterization, some of the information described in this section may only be available before construction if the site has been previously characterized for another purpose, e.g., for hydrocarbon exploration. Where this is not the case, such information will need to be finalized after the well is constructed or based on information gathered via a stratigraphic test well.

Where appropriate, the subsections below also provide recommendations and special considerations for obtaining and interpreting data and note particular aspects of the site characterization process that might warrant discussions with the UIC Program Director.

### **2.1. Regional Geology, Hydrogeology, and Local Structural Geology**

Owners or operators must submit geologic and topographic maps and cross sections illustrating the regional geology and hydrogeology and the geologic structure of the local area [40 CFR 146.82(a)(3)(vi)]. This characterization will describe the area surrounding the proposed project including the subsurface formations that are targeted for injection and identified as the confining unit(s). This information may help in eliminating unsuitable project sites or identify the need to characterize additional confining zone(s). If data obtained during site characterization suggest that a secondary confining zone is needed to protect USDWs, the owner or operator is encouraged to communicate with the UIC Program Director about the need to characterize additional zones [40 CFR 146.83(b)]. See Section 3.6 for considerations related to secondary confinement.

Providing maps and cross sections of the region and local area will enable the UIC Program Director to place the project site in a regional geologic context, including the types of large-scale structural features that may act to confine a carbon dioxide plume. This information will also illustrate the relationship between the injection formation and regional and local USDWs. When

considered along with detailed site-specific geologic information (see Section 2.3), this information will help in formulating the geologic conceptual model needed for modeling of the AoR.

### **Data Collection and Analysis**

The geologic and topographic maps and cross sections to be submitted can be obtained through a number of sources such as the U.S. Geological Survey (USGS), state geological surveys, and other state and published literature and reports on general geology and water, mineral, and/or energy resources. For projects proposed in reservoirs undergoing enhanced oil recovery (EOR) or where significant exploration has taken place, owners or operators may have access to regional background information previously compiled.

### **Information to Submit**

Owners or operators should demonstrate that an adequate screening-level analysis has taken place to determine if the project site is suitable. Maps, cross sections, and stratigraphic columns of the region and an accompanying narrative will constitute a key part of that demonstration. This information can provide the context for some of the specific information submitted to fulfill other requirements, e.g., descriptions of faults or geologic structure. It will also help in identifying the preliminary boundaries of the computational model used for delineating the AoR.

Features to describe in the narrative and in geologic and topographic maps and cross sections include:

- The names, lithologies, and depths of the injection formation(s) and confining zone(s);
- Depths, extent, and ground water flow patterns of regional USDWs;
- A brief synopsis of the geologic history of the project site;
- Regional faults, fault types, trends, and whether they transect the injection formation(s) and/or confining zone(s); and
- Structural geology of the local area:
  - Presence and trends of folds, and
  - Whether the proposed storage site will be bounded by faults or other structural features.

To support the UIC Program Director's evaluation of the submitted information, EPA recommends that, with the accompanying narrative, the owner or operator describe the regional setting and how the proposed project site fits into this regional setting. The owner or operator should ensure that the information submitted is complete, adequately describes the proposed project site and surrounding region, and is consistent with other available information about the region.

## 2.2. Map of Injection Well, Area of Review, Surface Water Bodies, Artificial Penetrations, and Faults

The Class VI Rule, at 40 CFR 146.82(a)(2), requires applicants for a Class VI permit to create a map to report the number or name and location of all wells in addition to a number of other surface features, water bodies, faults, and infrastructure. At 40 CFR 146.82(a)(4), the Class VI Rule also requires the tabulation of additional descriptive information regarding wells within the AoR that penetrate the injection or confining zone(s). Data compiled on wells within the AoR will help identify the need for corrective action. Furthermore, these data will help identify other activities (e.g., injection or production operations) that should be accounted for during AoR delineation and when developing the Testing and Monitoring Plan [40 CFR 146.90] and the Emergency and Remedial Response Plan [40 CFR 146.94].

At this stage of the site characterization process (particularly if the AoR delineation model has not been developed), estimates of the AoR may be preliminary, depending on the amount of pre-existing quality data, and refinements to the estimated AoR will be performed prior to operation once the formation testing program has been executed. Maps submitted at this initial stage should show at least the approximate AoR and the general direction of plume and pressure front migration. A detailed discussion of AoR delineation is provided in the *UIC Program Class VI Well Area of Review Evaluation and Corrective Action Guidance*.

The Class VI Rule, at 40 CFR 146.82(a)(2), requires the map to show:

- **Surface bodies of water and springs.** This includes seasonal bodies of water such as vernal pools, fens, carrs, and playas;
- **Mines (both surface and subsurface) and quarries.** For subsurface mines, the UIC Program Director may request additional information such as the extent of subsurface mining and the maximum depth at which mining has occurred or, in the case of an active mine, is predicted to occur;
- **Surface features, including structures intended for human occupancy.** These include, but are not limited to homes, schools, hospitals, prisons, and other buildings. Other pertinent surface features include transportation infrastructure such as roads, highways, airports, and railways;
- **Political boundaries such as state, tribal, and territorial boundaries.** This information is needed to ensure that permitting follows all applicable laws and regulations within these jurisdictions and will inform notification of other UIC Program Directors, per 40 CFR 146.82(b);
- **The surface trace of all known and suspected faults.** The faults can be presented using standard geologic symbols indicating the relative motion of the fault blocks. Suspected faults must also be presented (suspected faults should be differentiated from known faults on the map). At the direction of the UIC Program Director or at their own discretion, the owner or operator may indicate the extent of complex fault zones through shading or some other means;
- **The number or name, and location of all injection wells, producing wells, abandoned wells, plugged wells, dry holes, or deep stratigraphic holes.** This

information will help the UIC Program Director evaluate potential risks from artificial penetrations, especially any that penetrate the confining zone, to determine if risk is sufficient to render a site unsuitable, or to identify wells that are currently in use but might need to be plugged later; and

- **State- or EPA-approved subsurface cleanup sites.** Information should include any sites with the potential to impact USDWs.

The Class VI Rule, at 40 CFR 146.82(a)(4), requires tabulation of all wells within the AoR that penetrate the injection or confining zone(s). Such information must include:

- A description of each well's type, construction, date drilled, location, and depth;
- A record of plugging and/or completion; and
- Any additional information the UIC Program Director may require.

### **Data Collection and Analysis**

Cartographic information for map features is available from a variety of sources:

- State geographic information system (GIS) clearinghouses. Most states offer online clearinghouses for state GIS data. This may include layers for boundaries, roads, buildings, and other information;
- National agencies such as the USGS, or local cartographic or planning offices. The USGS can also provide geologic maps containing the surface traces of faults; and
- Tax assessors, who may be able to provide boundary, building, and other map data.

For state- or EPA-approved subsurface cleanup sites, owners or operators may indicate the nature of the contamination at the site and the nature and progress of remediation activities at the site. In addition to the sources listed above, information on cleanup sites can be obtained from:

- National databases compiled by the EPA such as the Comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS) as part of the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (Superfund) program;
- Various state departments (health, environment, natural resources, etc.) may also maintain their own databases of subsurface cleanup sites;
- Local universities and academic institutions; and
- Citizen watchdog groups.

The locations of wells in the proposed AoR and descriptive information on wells that intersect the injection or confining zone(s) can be obtained from:

- Federal agencies, such as EPA. The National UIC Data System and the Integrated Compliance Information System (ICIS) database may both provide well information;
- State agencies, such as state oil and gas commissions. These entities often maintain records of the location and construction parameters for all wells within the state;

- Geological surveys (both state and national). Maps may be available for either wells or magnetic anomalies, which may be used to infer the locations of wells;
- State GIS clearinghouses or city planning offices. These agencies may also provide layers or tables with well data;
- Water and other utilities. The UIC Program Director may request, and/or the owner or operator may provide, the yield of the water wells, the number of people supplied by the water wells, and the ownership status (public or private) of water wells; and
- Academic literature. This is especially applicable for stratigraphic boreholes.

Only existing information in the public record is required to be used when populating the map required at 40 CFR 146.82(a)(2). However, additional data requested at 40 CFR 146.82(a)(4) on well parameters for wells within the AoR may need to be generated by the owner or operator if it is not available or reliable. In cases where available records do not provide the necessary information required at 40 CFR 146.82(a)(4), or indicate that a well was plugged improperly or with materials inappropriate for contact with carbon dioxide, then site investigations are required to be performed to establish the condition of the well, as discussed at 40 CFR 146.84(c)(3).

### **Information to Submit**

The owner or operator must submit a map that identifies all of the required information described above [40 CFR 146.82(a)(2)]. When data are not sufficiently complete to locate wells with certainty, and if appropriate or requested by the UIC Program Director, the owner or operator may mark regions of the map that are known or suspected of being well fields. For these areas, a description of typical well construction and operation (e.g., injection, production) may be included with the description of known wells within the AoR. This approach may be needed in areas with an extensive history of hydrocarbon production or areas suspected to have a number of private water wells.

Additional information that may be included or requested by the UIC Program Director includes gas storage fields, other injection operations, local, state, and national park or monument boundaries, locations of archeological or cultural heritage sites, military installations, habitat for threatened or endangered species, surface water impoundments, and floodplain or spillway boundaries. The applicant is encouraged to include on the map any additional information they deem appropriate.

The UIC Program Director may request additional information if full coverage of the AoR is not provided. The owner or operator should also provide sufficient information to support the UIC Program Director's review of existing features that may affect water quality in USDWs and that may affect baseline environmental conditions in the AoR.

## **2.3. Detailed Geology and Hydrogeologic Site Characterization**

This section provides guidance on characterizing the specific geologic, hydrogeologic, geochemical, geophysical, and geomechanical properties of the proposed site. The site characterization activities described in the subsections below outline the information and data

that must be considered by the UIC Program Director in authorizing a Class VI well permit as identified in 40 CFR 146.82(a)(3)–(6).

### **2.3.1. Maps and Cross Sections of the Area of Review**

Maps and cross sections of the AoR are required by the Class VI Rule at 40 CFR 146.82(a)(3)(i). The maps will likely include both topographic and geologic maps. Geologic maps in particular, and accompanying cross sections and stratigraphic columns, summarize key information on lithology, sequence of geologic units (including the proposed injection formations, confining units, and USDWs), approximate formation thicknesses, lateral extent of units, and correlation of units in the vicinity of the proposed project site and across the region. This information will help the UIC Program Director understand the spatial relationship between the proposed injection formation and other aspects of the site geology, including USDWs. The information will also help inform the geologic conceptual model on which the modeling for the AoR delineation is built. This information can also help identify zones for geochemical monitoring.

The narrative accompanying the maps and cross sections of the AoR should be similar in scope to the evaluation of regional geology, but provide more detail on the AoR. Among other features, the owner or operator should highlight the lateral extent of the proposed injection formation and show that it is continuous throughout the proposed site [40 CFR 146.82(a)(3)(iii) and 146.83(a)(1)]. The required evaluation of the areal extent of the confining zones is equally critical [40 CFR 146.82(a)(3)(iii) and 146.83(a)(2)]. If there are additional confining units farther up in the stratigraphic column, this strengthens the case for suitability of a proposed site. Areas where formations pinch out should be identified. An estimate of the approximate dimensions of the injection formation in the AoR also allows the owner or operator to estimate storage capacity.

### **Data Collection and Analysis**

If a project site has been well characterized for hydrocarbon exploration and/or production, geologic maps and cross sections and topographic maps of the area may be available. Topographic and geologic maps may be obtained from the USGS, state geologic surveys, or through a commercial provider. Geologic maps and cross sections may also be produced by the owner or operator based on information from cores, well logs, field mapping, or seismic surveys. Maps and cross sections should be of an appropriate scale to illustrate features at the project site that would affect the suitability of the site for GS.

Geologic maps, cross sections, and stratigraphic columns may be improved with additional data. As site characterization progresses, it is recommended that the owner or operator be alert to potential alternative interpretations of the cross sections and other similar map information. Owners or operators should discuss any assumptions or uncertainties in the features illustrated in maps and cross sections. If an injection depth waiver is sought, the owner or operator should make sure that the cross sections include all relevant layers down to at least the first USDW below the lower confining zone.

## **Information to Submit**

EPA recommends that owners or operators include a narrative with the maps and cross sections that describes, at a minimum:

- The formation names, lithologies, and depths of the injection formation(s), confining zone(s), and USDWs within the proposed AoR;
- A general description of stratigraphy, including the vertical distance and formations separating the injection formation from USDWs; and
- Structural geology of the project site, including whether the proposed storage site will be bounded or influenced by a structural trap (e.g., faults or a dome).

Identification and analysis of faults and their potential to affect containment is required at 40 CFR 146.82(a)(3)(ii) and is discussed in Section 2.3.2. Information on facies changes is required at 40 CFR 146.82(a)(3)(iii) and is discussed in Section 3.1.

### **2.3.2. Faults and Fractures in the Area of Review**

The Class VI Rule, at 40 CFR 146.82(a)(3)(ii), requires owners or operators to submit information on the location, orientation, and properties of known or suspected faults and fractures that may transect the confining zone(s) in the AoR and a determination that they would not interfere with containment. This information is needed to demonstrate to the UIC Program Director that the site has a confining zone(s) free of transmissive faults or fractures and that will allow injection at proposed maximum pressures and volumes without initiating or propagating fractures in the confining zone(s), as required at 40 CFR 146.83(a)(2). Evaluation of fault stability and fault or fracture sealing capacity is needed to demonstrate that faults will not interfere with containment of the carbon dioxide. If an injection depth waiver is sought, the owner or operator must also demonstrate that the lower confining unit(s) is/are free of transmissive faults and fractures [40 CFR 146.95(a)(2)].

EPA recommends that owners or operators obtain information on faults in the injection formation as well. This information should also include whether a fault zone consists of one major plane or a series of faults that may collectively provide a conduit for fluid movement through the confining zone, especially if the faults intersect lenses of high permeability material. Faults crossing the confining zone will need to be evaluated for their stability (see below) and sealing capacity (see Section 3.5 and the Appendix).

## **Data Collection and Analysis**

Materials available from the USGS include geologic and topographic maps (e.g., the National Geologic Map Database), aerial photographs, and reports. The USGS's Earthquake Hazards Program provides maps of faults for many regions in the United States. The Earthquake Hazards Program database (available at <http://geohazards.cr.usgs.gov/cfusion/qfault/index.cfm>) provides detailed information on faults. Maps and other data may also be available from state geologic surveys. Such maps (i.e., from the USGS and state geological surveys) are generally at the quadrangle scale, but maps can also be found at the county and state scale.

Geophysical survey data, including seismic, electrical, magnetic, and gravity surveys, can complement information from maps and other sources and can be used to delineate faults and fractures and to characterize their geometry. The project area and the size and location of the fault will determine whether two dimensional (2D) data will provide sufficient information or whether the higher resolution of three dimensional (3D) data is needed. See Section 2.3.10 and the Appendix for additional information on geophysical surveys.

### ***Fault Stability and Fault or Fracture Sealing Properties***

Assessment of fault stability requires knowledge of fault geometry, which can be obtained from the structural interpretation of seismic data, as well as in situ stresses (see Section 2.3.6). Several options are available to support a determination that faults will not interfere with containment through reactivation, including assessments of failure plots, 3D fault slip tendency, and critical pore fluid pressure increase (see the Appendix for additional details). EPA recommends that owners or operators use one of the above methods, based on information on downhole stresses and fault geometry, to determine fault stability and the maximum sustainable pressure that could be associated with injection. This information can be used to set safe injection pressure limits.

Faults and fractures can be assessed for the likelihood that they are sealing using one of several approaches described in Section 3.5.2. Faults may be assessed for the units they juxtapose, the presence of catalysis, the shale gouge ratio, or pressure compartmentalization. Both faults and fractures may be assessed for whether mineralization has rendered them non-transmissive. The choice of method will depend upon the availability of data and samples.

### **Information to Submit**

In describing faults and fractures, EPA recommends that owners or operators submit the following information:

- Location and characteristics of the fault or fracture (e.g., geometry, depth, fault displacement, units juxtaposed by fault);
- Formations intersected or transected by the fault or fracture;
- Methods and results of fault stability analyses and comparison to preliminary anticipated (modeled) pressures during the injection phase of the project; and
- Information on faults and fractures in the lower confining zone (in cases where an injection depth waiver is sought).

To demonstrate that a fault is not transmissive, the owner or operator may submit:

- A description of the approach used to infer whether a fault or fracture is transmissive;
- A summary table of data used to formulate the estimate;
- Supporting data and information (e.g., analyses of core samples, results of geophysical surveys, pore pressure data, maps, and cross sections) and any relevant calculations (e.g., calculation of shale gouge ratio);

- A narrative that describes and integrates the relevant information, including a discussion of any spatial heterogeneity in sealing properties and whether a fault or fracture is likely to be transmissive in the project area; and
- A discussion of uncertainties in the data.

See Section 3.5.2 and the Appendix for examples of approaches that may be employed for this demonstration.

To support the UIC Program Director's evaluation of the data, the owner or operator should make sure that the data are complete and adequate for understanding the geometry of any major faults and the pressures that could lead to activation. All supporting data should be provided and/or referenced in the appropriate section of the permit application.

### **2.3.3. Depth, Areal Extent, and Thickness of the Injection and Confining Zones**

The Class VI Rule requires the owner or operator to provide information to the UIC Program Director on the depth, areal extent, and thickness of the injection formation and confining zone(s) [40 CFR 146.82(a)(3)(iii)]. These features affect the ability of the injection formation to receive and store the injectate, as well as the ability of the confining zone(s) to contain the carbon dioxide and pressure front. In addition, the depth of the injection zone will govern the state (e.g., supercritical) of the injected carbon dioxide.

Information on the lithologies and thicknesses of both the injection and confining zones will support the estimation of storage capacity and development of a site-specific geologic conceptual model and the computational modeling required for AoR determinations at 40 CFR 146.84. (See the *UIC Program Class VI Well Area of Review Evaluation and Corrective Action Guidance* for more information on multiphase fluid modeling for AoR determinations). It will also support an analysis of facies changes, as required at 40 CFR 146.82(a)(3); see Section 3.1 for information on conducting facies analyses.

### **Data Collection and Analysis**

Seismic techniques and other geophysical methods can provide valuable stratigraphic information on the injection and confining zones. Ideally, demonstration of the extent of these formations will be documented by adequate boreholes and grids of 2D or 3D seismic images in addition to maps and cross sections (Chadwick et al., 2008). More information on the details of geophysical techniques and a brief description of seismic stratigraphy can be found in Section 2.3.10 and in the Appendix. Seismic techniques are also discussed in the *UIC Program Class VI Well Testing and Monitoring Guidance*. If the owner or operator is applying for an injection depth waiver, information on depth, extent, and thickness of the lower confining zone(s) must be supplied as well, as required at 40 CFR 146.95 (see the *UIC Program Class VI Well Injection Depth Waivers Guidance* for further discussion).

### **Information to Submit**

EPA recommends that owners or operators discuss the depth, areal extent, and thickness of the injection formation and confining zone(s) in a narrative discussion that accompanies the geologic maps and cross sections required at 40 CFR 146.82(a)(3)(i); see Section 2.3.1. The narrative should include a discussion of data quality and uncertainties in the information. If an injection depth waiver is sought, the owner or operator should provide similar types of information on the lower confining zone(s) as well.

Formation thickness may also be illustrated using:

- Isopach maps (contour maps showing equal values of true stratigraphic thickness); and
- Isochore maps (contour maps showing equal values of true vertical thickness) and supported by available well logs and cores (also see Sections 4.1 and 4.2).

Other supporting information may include:

- Seismic or other geophysical survey results, with relevant information highlighted (if geophysical data are used for this demonstration); and
- Well log data (when it is available), with injection and confining zones highlighted (if well logs are used for this demonstration).

Any variability in the thickness of the injection formation and confining zone(s) that could affect storage of the carbon dioxide should be discussed in the narrative report, and the owner or operator should demonstrate that this would not adversely affect confinement. The owner or operator should bear in mind that if the areal coverage of the confining zone does not cover the full extent of the AoR or appears to be discontinuous, the UIC Program Director may request information on a secondary confining zone.

#### **2.3.4. Petrology and Mineralogy of the Injection and Confining Zones**

The Class VI Rule requires the owner or operator of a proposed Class VI injection well to submit data on the mineralogy of the injection and confining zone(s) [40 CFR 146.82(a)(3)(iii)]. This information will support the identification of any geochemical reactions that may affect the storage and containment of injected carbon dioxide which could result from potential changes in the properties of the injection or confining zones (e.g., porosity, permeability, injectivity). It will also provide information on mobilization of trace elements from the formation matrix if minerals known to contain trace elements are identified, which informs decisions regarding parameters to analyze as part of a testing and monitoring program. Evaluation of the minerals and potential geochemical reactions is the basis of the required demonstration of compatibility of the carbon dioxide stream with fluids in the injection zone and minerals in the injection and confining zones required prior to commencement of injection at 40 CFR 146.82(c)(3); see Section 3.3. This information may also support the facies analysis required at 40 CFR 146.82(a)(3)(iii) (see Section 3.1).

If an evaluation of potential geochemical processes suggests that long-term storage and confinement of carbon dioxide may be affected by changes in the injection formation and confining zone(s), the AoR delineation may need to account for geochemical reactions through the use of reactive transport models. Any potential effects on storage and confinement due to mechanisms such as precipitation and dissolution may also affect the post-injection site care (PISC) time frame. [40 CFR 146.93(c)(1)(v)].

### **Data Collection and Analysis**

If the proposed site has undergone previous characterization (e.g., for oil and gas development), data on the mineralogy of the injection and confining zones may be available. Owners or operators should consult with the UIC Program Director regarding whether available data are of sufficient quality and completeness and whether they adequately represent the injection formation and confining zones in the AoR, or if additional information is needed. If the UIC Program Director determines that additional data are needed to satisfy the requirements at 40 CFR 146.82(a)(3)(iii), this may entail analysis of existing cores or, if needed, the collection of new cores.

Collection of new data will most likely be necessary in pristine saline formations under consideration for GS project sites; however, such new information may also be needed for depleted oil and gas reservoirs if the previous characterization was not sufficient to demonstrate that the site meets the requirements of the Class VI Rule. If the owner or operator is requesting an injection depth waiver, the lower confining zone must be represented in this analysis [40 CFR 146.95(a)(2)]; see the *UIC Program Class VI Well Injection Depth Waivers Guidance* for further discussion of injection depth waivers. EPA recommends that owners or operators discuss with the UIC Program Director any potential needs for stratigraphic/test wells to collect the necessary data and samples.

Basic lithologic information can be obtained from inspection of cuttings and cores retrieved during drilling of a stratigraphic well (or from existing samples from previous work at the project site). Such information may be reported as part of routine mud logging. Polarized light microscopy and scanning electron microscopy may be used on thin sections, and powdered samples may be subject to X-ray diffraction (XRD). Background information on these methods is provided in the Appendix.

### **Information to Submit**

EPA recommends that owners or operators submit a narrative report that includes, at a minimum, the following information:

- Methods used in examining samples;
- Locations (on maps) and depths of samples and the names of the formations sampled;
- Lithologies and descriptions (e.g., color, texture) from cores or hand samples;
- Mineralogic and petrologic descriptions obtained via microscopy (with approximate percentages of minerals);
- Cementation minerals and dissolution features; and

- A preliminary discussion of geochemical reactions that may affect the storage, confinement, and/or overall performance of the project (see Section 2.3.9 for additional information on baseline geochemistry).

Although the identification of mineralogy is required at 40 CFR 146.82(a)(3)(iii), and must be submitted before a permit is obtained to construct the injection well, additional data will also be obtained during the core analyses performed pursuant to 40 CFR 146.87(b), and the owner or operator must provide any updates to the UIC Program Director before injection is authorized, per 40 CFR 146.82(c)(2).

To support the UIC Program Director's evaluation of the application, the owner or operator should demonstrate that a sufficient number of samples have been analyzed to provide an indication of variability in mineralogy. The owner or operator should also highlight any information on the mineralogy and petrology of the injection and confining zones that is relevant to the required analysis of compatibility of the carbon dioxide to subsurface formations (see Section 3.3).

Lithologic and mineralogic information should be complete and consistent with other information sources such as maps and well logs. The UIC Program Director may ask for additional information if descriptions and analyses are incomplete.

### **2.3.5. Porosity, Permeability, and Capillary Pressure of the Injection and Confining Zones**

Data on porosity, permeability, and capillary pressure of the injection and confining zones, required at 40 CFR 146.82(a)(3)(iii), are crucial for a number of aspects of site characterization including determination of storage capacity, injectivity, and integrity of the confining zone. They are also needed for the multiphase modeling to predict plume and pressure front behavior and delineate the AoR. Data may be obtained from well logs and laboratory analyses of core samples. If the owner or operator is seeking an injection depth waiver, information on the lower injection and confining zones is needed to evaluate their suitability.

Section 2.3.5.1 describes information sources and analyses and information to submit to the UIC Program Director related to porosity; Section 2.3.5.2 addresses permeability data; and Section 2.3.5.3 discusses data on capillary pressure.

#### **2.3.5.1. Porosity**

Evaluation of porosity may entail collection and review of existing data, use of field methods, and use of laboratory methods, as described below.

## **Data Collection and Analysis**

### ***Existing Data***

In evaluating existing data from prior activities in the project area, owners or operators should note the methods used, the locations where samples were taken, and the overall quality of the data. Sufficient representative data will be needed from within the AoR. If available data are inadequate to establish the suitability of the site, the owner or operator will need to collect new data or perform new analyses. Any questions about the suitability and representativeness of samples should be discussed with the UIC Program Director.

### ***Field and Laboratory Methods***

If existing data are not available, are inadequate, or are of insufficient quality, new data will be needed. To satisfy the requirement under 40 CFR 146.82(a)(3)(iii), the owner or operator may use laboratory or field methods (e.g., well logging, seismic) to measure and/or estimate the porosity of the injection and confining formations. See Section 2.3.10 for additional information on seismic surveys. See the Appendix for additional information on the principles of well logging for porosity and brief descriptions of laboratory methods. When considering field data, owners or operators should be aware of the limitations and appropriate applications of different methods. Supporting data on lithology, corrections and/or interpretations applied to well logs or geophysical methods, and any statistical computations performed should be described and referenced.

In selecting samples for laboratory analysis, EPA recommends that owners or operators be aware of the quality of the sample because the method of sample collection can influence the measured porosity. Owners or operators should also note any possible issues with sample quality when reporting results.

### ***Comparing Laboratory and Field Data***

Laboratory and field methods may or may not agree because laboratory methods provide point measurements, while field methods sample a volume of the subsurface. As a result, field-based data can incorporate small-scale heterogeneities that result from variability in lithologic characteristics and larger-scale fluid migration pathways such as vugs, fractures, and dissolution features (Cone and Kersey, 1992). Therefore, field measurements may yield higher or lower values for a particular formation than measurements collected in the laboratory. EPA suggests that owners or operators address any discrepancies between field and laboratory data if both types of data are submitted.

### **Information to Submit**

EPA recommends that owners or operators submit, at a minimum, the following information on porosity:

For laboratory-based data:

- Locations (on maps) and depths of cores and the formations from which those cores were taken;
- Coring method used and notes on the condition of the cores;
- Laboratory analysis method(s) used, justification for selection of method(s), associated assumptions, and a description of experimental conditions;
- Approximate grain sizes and shapes;
- Approximate pore sizes and shapes;
- Results in tabular and graphical form shown as laboratory results and porosity distributions within the injection and confining formations; and
- Photomicrographs if porosity was determined using thin sections.

For field-based data:

- Results of field measurements and estimations shown as porosity distributions within the injection and confining formations (also see Section 4.1), including:
  - Date and time of sampling/surveying,
  - Method used (e.g., logging, seismic),
  - Information on the location/area and intervals tested, and
- Calculations, corrections, or other steps in processing of field data.

For both field- and laboratory-based data:

- Summary statistics on data and any statistical representations (e.g., variograms); and
- A discussion of the results, including data quality and sources of uncertainty.

Because core samples represent point measurements, for reliable results, measurements are best made on a number of cores. The applicant should consider submitting a statistical representation of measurements such as a variogram (see the Appendix for additional information).

EPA recommends that the owner or operator demonstrate that the data are of sufficient quality. The owner or operator should ensure that a sufficient number of samples were analyzed and that they represent likely heterogeneities in the injection and confining zones. The owner or operator should demonstrate to the UIC Program Director that appropriate methods were used and that downhole conditions were simulated (or explain why they were not and whether this is expected to affect the usability of the measurements). Finally, EPA recommends that owners or operators provide a discussion comparing field and laboratory-based data, giving careful consideration to the reliability of the measurements and contributions to any discrepancies.

#### **2.3.5.2. Permeability**

The permeability of the injection zone is one of the factors governing the rate at which carbon dioxide can be injected and is one of the parameters needed for the computational modeling involved in AoR determination. Permeability of the confining zone is one of the factors

considered in assessing the suitability of the confining zone. The subsections below provide considerations for the procurement and submission of permeability data. Because a GS project is a multiphase fluid system, effective and relative permeability data are also needed for AoR determination.

### **Data Collection and Analysis**

EPA encourages owners or operators to use data from field testing, well logging, and laboratory analyses of cores to estimate intrinsic (absolute) permeability. Laboratory analyses should also be performed to obtain a relative permeability-saturation function. When comparing field and laboratory measurements for intrinsic permeability, owners or operators should bear in mind that permeability measurements can differ by scale. Well tests measure a much greater area than core samples. As such, well testing tends to provide composite representations of localized variability. Permeability derived from well logs represents an intermediate scale between core logs and well tests.

#### ***Existing Data***

Where data are available from prior activities in the project area, owners or operators should take note of methods used, locations from where samples were taken, and overall quality of the data. These are described below, along with a discussion of spatial variability in permeability data.

#### ***Field Methods for Absolute Permeability***

Permeability can be estimated in situ using a variety of methods. Pressure changes during fall-off tests can be analyzed quantitatively. If multiple wells are available, variable flow test analysis can be used to determine permeability provided that the reservoir pressure, flowing bottomhole pressure, flow rates, and the total time of the test are known (Smolen, 1992; Matthews and Russell, 1967). Permeability can also be determined from well log data using an estimator of porosity such as a density log. A summary and comparison of the various empirical methods available to relate porosity, resistivity, and other parameters to permeability is given by Balan et al. (1995). Nelson and Batzle (2006) also provide a description of methods for permeability estimation from well logs. Owners or operators should be aware of the limitations associated with any method they select and be alert for uncertainties in the data and how these uncertainties might affect modeling efforts.

#### ***Laboratory Methods***

As with porosity measurements, owners or operators should be aware of any damage to cores that may have occurred during drilling and that might reduce permeability. Plug samples taken from the center of the core may be the best way to avoid such damage or infiltration of mud or other particles into the pore spaces. See the Appendix for additional discussion regarding coring and sample selection for permeability measurements.

EPA recommends that owners or operators consider conducting laboratory measurements of absolute permeability in an environment that simulates reservoir conditions or discuss

anticipated effects that pressure and temperature might have on results. When permeability is measured from a whole core, measurements should be reported in two directions: one parallel to the major fracture plane and the other at 90 degrees perpendicular to this direction (Almon, 1992).

A relative permeability-saturation function is needed for incorporation into the computational modeling for the AoR delineation. For GS projects, changes in relative permeability may result in improved or reduced injectivity into reservoir rocks and/or improved or reduced sealing capacity for confining formations. In measuring and reporting data on relative permeability, owners or operators should be aware of hysteresis effects and should consider the need for separate curves for drainage and imbibition. Additional discussion of permeability-saturation functions is provided in the *UIC Program Class VI Well Area of Review Evaluation and Corrective Action Guidance*.

EPA recommends that data be obtained from analysis of samples collected from as many cores, boreholes, or wells as practical and available to provide an understanding of spatial variability in permeability. Along each borehole, a number of core samples should be analyzed to capture heterogeneity. Owners or operators should be alert to variations that might indicate lenses of lower or higher permeability material that may affect storage capacity or carbon dioxide migration. Furthermore, permeability may be an anisotropic property that varies in the x, y, and z directions and typically shows the greatest variation in the direction perpendicular to layering. For the computational modeling performed for AoR determination, a realistic representation of the permeability distribution is needed, and EPA suggests that owners or operators consider a geostatistical approach. Further discussion regarding geostatistical approaches is provided in the Appendix and also discussed in the *UIC Program Class VI Well Area of Review Evaluation and Corrective Action Guidance*.

### **Information to Submit**

EPA recommends that owners or operators submit the following data related to permeability of the injection and confining zones:

For laboratory-based data:

- Locations (on maps) and depths of cores and the formations from which cores were taken;
- Coring method used, and notes on the condition of the cores;
- Approximate grain sizes and shapes;
- Approximate pore sizes and shapes;
- Laboratory analysis method(s) used, justification for selection of method(s), associated assumptions, and a description of experimental conditions; and
- Results in tabular and graphical form shown as laboratory results and permeability distributions in the injection and confining formations.

For field-based data:

- Date, time, and method of logging/surveying;
- Information on the locations (on maps)/areas and intervals tested;
- Calculations, corrections, or other steps used in processing of field data;
- Methods used for permeability estimation (e.g., specific well logs, seismic) or whether new interpretations are being made using archived data; and
- Results of field measurements and estimations shown as permeability distributions within the injection and confining formations.

For both field- and laboratory-based data:

- Summary statistics on data and any statistical representations (e.g., variograms); and
- A discussion of the results, including data quality and sources of uncertainty.

To support the UIC Program Director's evaluation, the owner or operator should demonstrate that the data are complete and representative of the actual site. The discussion of permeability should also address variability in permeability and implications for the operational parameters for the project or for the storage capacity of the injection formation. See the Appendix regarding geostatistical methods.

### **2.3.5.3. Capillary Pressure**

Capillary pressure is one of the factors affecting the integrity of the confining zone and how readily carbon dioxide will penetrate into the confining zone.

#### **Data Collection and Analysis**

Several established methods are available for measurement of capillary pressure: mercury injection, centrifuge, porous plate, and restored state cell. See the Appendix for brief descriptions of these methods. In selecting a suitable method, owners or operators should consider methods that allow measurement at pressures and temperatures representative of the injection zone. Particular attention should be paid to the capillary pressure of the confining zone because a sufficiently high capillary pressure is one of the mechanisms by which the confining zone acts to inhibit migration of carbon dioxide. Owners or operators may compare their estimated capillary entry pressure ( $P_e$ ) to the anticipated surface tension of the supercritical carbon dioxide (Chadwick et al., 2008), taking into account the anticipated buoyant pressure and potential height of the carbon dioxide column (Lindeberg, 1997).

#### **Information to Submit**

EPA recommends that owners or operators submit the following information on capillary pressures of the injection and confining zones:

- Locations (on maps), formations, and depths of samples used for analysis;

- Method used for analysis, fluid used, and laboratory conditions;
- Results in functional forms for the saturation-capillary pressure functions and/or tabular and graphical form;
- Summary statistics on data;
- A discussion of any limitations of the data or methods; and
- Any issues associated with extrapolation of results to a setting in which supercritical carbon dioxide is the non-wetting fluid.

To support the UIC Program Director's evaluation of the data, EPA recommends that the owner or operator demonstrate that the data are of sufficient quality and that the number and locations of samples are adequate to provide good characterization of the injection and confining zones.

### 2.3.6. Geomechanical Characterization

The Class VI Rule requires that geomechanical information be submitted on fractures, stress, ductility, rock strength, and in situ fluid pressures within the confining zone [40 CFR 146.82(a)(3)(iv)]. Geomechanical characterization is important for evaluating confining zone integrity as well as setting safe operational parameters. If an injection depth waiver is sought, the owner or operator must also characterize and provide information on the lower confining zone(s) as required at 40 CFR 146.95(a)(2); this would include geomechanical information to support a complete analysis.

#### Data Collection and Analysis

This section outlines options for performing and submitting the results of geomechanical studies of fractures, ductility, rock strength and stresses, and pore pressure measurement.

**Fractures** may be detected in boreholes by several methods, including fracture finder (microseismogram) logs, caliper logs, or acoustic logs. Also, resistivity, gamma, and neutron logs can detect clay or fluids contained in fractures. Video logs can also show fractures. Fractures may be seen in cores, although unless the core was oriented, it will not be possible to determine the orientation of the fractures.

**Ductility** is most commonly measured by performing a triaxial load test on a core sample. EPA recommends that such measurements be conducted in conjunction with other tests of core samples, such as strength, porosity, permeability, and capillary pressure.

**Rock strength** can be measured in the laboratory using a triaxial compression test. ASTM International (ASTM) D7012-10, *Standard Test Method for Compressive Strength and Elastic Moduli of Intact Rock Core Specimens under Varying States of Stress and Temperatures* (ASTM, 2010), is suitable for simulating downhole stress conditions. Owners or operators should bear in mind that these measurements will not account for larger scale features that affect overall strength in situ, such as faults or joints; results should be interpreted accordingly.

**The in situ stress field** is important in determining the natural stresses in the formation and, therefore, the reaction of the various geologic units to injection, including the potential for fault

reactivation (as discussed in Section 2.3.2). The in situ stress field consists of three components: vertical stress, maximum horizontal stress, and minimum horizontal stress:

- **Vertical stress** can be determined by integrating the density of the rock above the point of stress measurement (Chiaramonte et al., 2008; Herring, 1992; Streit et al., 2005). The density is determined using density logs (see the Appendix); and
- The magnitudes of the **minimum horizontal stress** ( $S_{hmin}$ ) and **maximum horizontal stress** ( $S_{hmax}$ ) can be determined with considerable accuracy through direct in situ formation stress tests (See Zoback et al., 2003). ASTM Method D 4645-08, *Standard Test Method for Determination of In-Situ Stress in Rock Using Hydraulic Fracturing Method* (ASTM, 2008) may be used. Additional descriptions of the determination of in situ stresses at a GS site are given by Chiaramonte et al. (2008), Streit et al. (2005), and Streit and Hillis (2004).

**Pore pressure** can be measured in an open borehole by formation testers, either on wireline (Smolen, 1992) or during logging while drilling (LWD). If existing data are not available, this information will likely be acquired as part of logging and testing procedures after the well is constructed or by drilling a stratigraphic test well to obtain the necessary data to meet the requirements at 40 CFR 146.82(a).

### **Information to Submit**

In submitting field- or laboratory-based information on geomechanical properties, the owner or operator should provide:

- The test(s) performed, dates, and locations (on maps);
- Sample collection procedures for cores;
- Test conditions (as appropriate);
- Results in tabular and/or graphical form;
- A narrative of results, including any anomalies or uncertainties in the data;
- Comparison of data from different tests if more than one type of test is used for a particular parameter; and
- Any issues with sample procurement, e.g., disintegration of poor quality rocks during transport or sample retrieval, the existence of discontinuities (fractures, fossils, etc.) in tested samples.

To support the UIC Program Director's evaluation of the geomechanical data submitted, EPA recommends that the owner or operator demonstrate that the data are complete, and that all data (e.g., from different surveys and logs) support consistent conclusions. The owner or operator should also demonstrate that in situ stress fields are consistent with and support the appropriateness of the proposed injection pressures and that fault stability analyses are consistent with in situ stress data (see Section 2.3.2 for additional information on fault stability analyses).

### 2.3.7. Seismic History

The Class VI Rule, at 40 CFR 146.82(a)(3)(v), requires Class VI permit applicants to report on the seismic history of the project site, including the presence and depth of all seismic sources. Additionally, the Rule requires a determination that seismic activity will not compromise subsurface containment of injected carbon dioxide. Records of prior seismic activity (both historical and geologic) should be used to make a determination of seismic risk. Information submitted for this requirement will also help to establish a site-specific monitoring program and inform the Emergency and Remedial Response Plan required at 40 CFR 146.94.

EPA anticipates that existing data will be sufficient for determining the presence and depths of all seismic sources. However, owners or operators may need to model or otherwise determine, using documented methods, that seismic activity from identified sources will not endanger USDWs.

#### Data Collection and Analysis

Seismic records and confirmed or inferred seismic sources are available from a variety of national and state sources, many of which are free and publicly available. State databases are generally more detailed, but sometimes contain partial or incomplete records. Nationally, the USGS Earthquake database provides source, date, time, latitude, longitude, magnitude, intensity, and seismic-related information for earthquakes greater than magnitude (M) 2.5. For earthquakes greater than M 0, the Advanced National Seismic System catalog, hosted by the Northern California Earthquake Data Center, is available. Other national databases include the Center for Earthquake Research and Information (CERI) and the National Oceanic and Atmospheric Administration (NOAA)'s National Geophysical Data Center. The USGS's Earthquake Hazards Program database (available at <http://geohazards.cr.usgs.gov/cfusion/qfault/index.cfm>) also provides information on recorded earthquakes.

Databases cataloging active faults are also available. These databases provide information on the hypocenters of seismic events, which can be mapped to provide a record of seismic sources for an area. Other databases of seismic sources include the USGS's Quaternary Fault and Fold Database of the United States, which tracks faults associated with seismic events greater than M6. Property insurers may also be able to provide seismic data for the region surrounding the proposed site.

Information on earthquake risk is available, most notably from the USGS's National Seismic Hazards Maps, which are available at numerous scales and for numerous risk thresholds. The data and software used to create the maps are also freely available, enabling the customization of maps and introduction of new data or modeling parameters. International and national humanitarian organizations, engineering organizations, and disaster preparedness agencies have also developed manuals, plans, and models of earthquake risk and, in addition, have attempted to quantify the potential impact of seismic events on infrastructure. For example, the Federal Emergency Management Agency (FEMA) has several manuals on seismic risk throughout the United States. The internationally-developed Global Earthquake Model (GEM) may also provide useful information for determining the seismic risk to infrastructure at various scales.

Although a seismic event would not necessarily lead to loss of containment, using seismic hazard maps to demonstrate the reasonable expectation that no seismic events would occur during the course of a GS project may fulfill the requirements at 40 CFR 146.82(a)(3)(v). However, if such maps indicate a substantial likelihood of seismic activity, other required geologic information, such as geomechanical data, depth to confining zones, and fault stability analysis may be needed to demonstrate that seismic activity will not compromise subsurface containment. Any demonstration that seismic activity will not interfere with containment should support a demonstration that the confining zone(s) will not be compromised by generation of new faults or reactivation of existing faults and that well bores will not be damaged in order for the site to meet the requirements at 40 CFR 146.83. The owner or operator should also consider the effect that seismic activity would have on site access and the ability of the owner or operator to verify containment under those circumstances as discussed in the Emergency and Remedial Response Plan.

### **Information to Submit**

In reporting information on seismic risk, owners or operators should submit the following:

- A tabulation and/or map of seismic sources and their depths;
- A tabulation of seismic events, their hypocenters, and magnitudes for as far back as data are available;
- The sources of all seismic history data;
- Information on any seismic risk models used and the results; and
- A discussion of the degree of seismic risk in the region and information to support a determination that the confining system and wells at the project site are not vulnerable to damage from seismic activity.

The owner or operator should demonstrate to the UIC Program Director that the data provided to support an evaluation of seismic risk cover an appropriate time period and include sufficient information on the magnitudes and locations of the hypocenters of previous seismic events. If seismic risk models are used, the owner or operator should describe any limitations of those models.

### **2.3.8. Hydrology and Hydrogeology of the Area of Review**

The owner or operator of a proposed Class VI injection well must submit maps and stratigraphic cross sections indicating the general vertical and lateral limits of all USDWs, water wells, and springs within the AoR, their positions relative to the injection zone(s) and confining zone(s), and the direction of water movement, where known [40 CFR 146.82(a)(5)]. This information can demonstrate the relationship between the proposed injection formation and any USDWs, and it will support an understanding of the water resources near the proposed well. The maps and cross sections developed to meet this requirement may be related to or overlain on the maps and cross sections illustrating regional geology and hydrogeology required at 40 CFR 146.82(a)(3)(vi); see Section 2.1. Potentiometric maps and isopach maps may also be submitted; additionally, the

cross sections submitted to satisfy the requirements at 40 CFR 146.82(a)(3)(i) should include information on the vertical limits of USDWs in the AoR.

This information can support development of the water quality monitoring procedures in the Testing and Monitoring Plan required at 40 CFR 146.90.

### **Data Collection and Analysis**

In most cases, the information needed to satisfy this requirement will be available from existing data sources, as described below. However, the owner or operator should discuss the available information with the UIC Program Director to ensure that the level of detail and the areal scope over which the information is available will be adequate to demonstrate that all USDWs have been identified, accounted for, and characterized.

Information on **USDWs and springs in the AoR** can be obtained from the USGS as well as from state and local agencies (e.g., departments of environmental protection or municipalities). Published academic literature and reports from existing exploration or injection projects may also be used. In particular, the USGS maintains a website for ground water information that includes ground water use, aquifers, and water quality data (<http://water.usgs.gov/ogw/data.html>). Additionally, the USGS's Hydrologic Investigations Atlas Series contains maps with a large amount of water resources information including water availability, producing aquifers, depth to ground water, and other data. More than 700 of these atlases have been published and are available at <http://pubs.usgs.gov/ha/ha730>.

If the project involves an injection depth waiver, the owner or operator will need to provide information on USDWs *above and below* the injection zone. Information on all USDWs—above and below the injection zone—should be provided in the Class VI permit application *and* the injection depth waiver application required at 40 CFR 146.95(a) to support a review of all USDWs in the context of each evaluation. See the *UIC Program Class VI Well Injection Depth Waivers Guidance* for additional information on the injection depth waiver application.

Information on **water wells in the AoR** is available from the following sources:

- State water centers or water surveys, state departments of water resources, or state Water Resources Research Institutes;
- State health departments, which may have information on local and regional water supplies and private wells and state engineer's offices may have databases of well permits; and
- State well permitting records, which may provide locations of public and private supply wells. States that issue well permits typically keep permit information in a searchable database either online (e.g., on environmental protection websites), or in hardcopy at an office or agency library.

This information will complement the information submitted to satisfy the requirement for a tabulation of all wells within the AoR that penetrate the injection or confining zone(s) at 40 CFR 146.82(a)(4). Note that the requirement discussed in this section, at 40 CFR 146.82(a)(5), is to

show the location of all water wells, whereas 40 CFR 146.82(a)(4) is specific to wells that penetrate the injection and confining zones and must include additional information about the wells' construction, including the well type, date drilled, information on plugging, etc. See the *UIC Program Class VI Well Area of Review Evaluation and Corrective Action Guidance* for additional information on that requirement.

### **Information to Submit**

EPA recommends that, to satisfy this requirement, Class VI injection well permit applicants provide the following information to the UIC Program Director:

- The numbers, thicknesses, and lithologies of USDWs (including interbedded low permeability zones);
- Information on all USDWs in the AoR and the region, and whether they are currently being used for drinking water; and
- The location of water wells and springs within the AoR.

In addition to tables and other files, the owner or operator may submit maps (e.g., showing the location of water wells on the maps of USDWs described above) and cross sections. If any water quality data or data on hydraulic conductivity, hydraulic gradient, or porosity are available from the sources examined, the owner or operator should reference this information or discuss it in the required analysis of baseline water quality, required at 40 CFR 146.82(a)(c) and described in Section 2.3.9. The owner or operator should ensure that the information submitted is complete and accurate; otherwise, the UIC Program Director may need to request additional information to thoroughly evaluate site hydrogeology and hydrology. For example, if state well databases have incomplete coverage of the area of the proposed well, owners or operators may need to fill in information gaps using on-the-ground surveys or hand searches of health or environmental department records. As noted above, most of the information needed to satisfy this requirement will likely come from existing data. If the data come from USGS or state data sources, it is likely that the UIC Program Director will be satisfied with the quality and accuracy of the data.

### **2.3.9. Baseline Geochemical Characterization**

The Class VI Rule requires baseline geochemical information on subsurface formations including all USDWs in the AoR [40 CFR 146.82(a)(6)]. This encompasses both fluid and solid phase chemical analysis. Information on water chemistry indicates which formations in the stratigraphic column qualify as USDWs and confirms that the proposed injection formation is not a USDW. Geochemical information on both solids and fluids is also needed, in combination with the mineralogic data required at 40 CFR 146.82(a)(3)(iii), to determine whether the interaction of the formation fluids with the injectate and solids will cause changes in injectivity, changes in the properties of the confining zone, or the release of trace elements. This will inform an assessment of the compatibility of the carbon dioxide stream with injection zone fluids and minerals in the injection zone and confining zones, required at 40 CFR 146.82(c)(3) (see Section 3.3). Fluid chemistry also controls the amount of carbon dioxide that can dissolve in the fluid, affecting estimates of carbon dioxide trapping mechanisms and storage capacity. Furthermore, a baseline geochemical analysis will be important for comparison with future data collected via

required water quality monitoring above the confining zone [40 CFR 146.90(d)]. If an injection depth waiver is sought, the owner or operator should also provide data on or perform analyses of the geochemistry of USDWs that lie below the injection zone.

Owners or operators will need to review existing data and may need to collect samples and perform analyses for fluid characterization and bulk solid phase chemistry. Guidance for providing information about fluid chemistry and bulk chemical analysis is presented below.

### **2.3.9.1. Fluid Chemistry**

#### **Data Collection and Analysis**

##### ***Pre-Existing Data***

Geochemical data for the site may be available if previous exploration and hydrocarbon production have taken place at the project site, or data may be obtained from other sources such as the USGS's National Water Information System (NWIS; <http://waterdata.usgs.gov/nwis/qw>) or Produced Waters Database (<http://energy.cr.usgs.gov/prov/prodwat/>). State geological surveys, water surveys, or water resources research institutes may also have information available.

Owners or operators should submit any available analyses of water or brine from all USDWs and other relevant formations within the AoR. If the owner or operator is requesting an injection depth waiver, data will be needed for the lower confining zone to serve as a baseline for geochemical monitoring. Where pre-existing geochemical data are available, owners or operators should be aware that data quality may vary among sources. Limitations or uncertainties regarding data quality should be noted, including the presence or absence of analyses of duplicate and quality assurance (QA) samples. In relatively homogeneous geological settings and in formations with slow flow rates, analyses taken from areas outside of the AoR may be generally representative of water quality within the AoR and may be used to help understand the geochemistry of the area. However, data will be needed from within the AoR as well. Owners or operators should also consider whether the existing analyses are complete and include a full suite of parameters (see below). Owners or operators may discuss the applicability of pre-existing water quality data sets with the UIC Program Director. Data with limited analyses may still be useful for providing some general characterization, but newer data may also be needed to provide full characterization of water quality within the AoR.

Owners or operators should note the time period over which the samples were taken and whether this information may be sufficient to capture any naturally occurring trends in water chemistry, especially in formations affected by recharge or surface activities. Having sufficient background information will allow owners or operators to distinguish possible effects of injection from naturally occurring variations over the life of the project.

### ***Parameters to Analyze***

The specific parameters to be analyzed will depend on the characteristics of the site, each formation being analyzed, and the composition of the planned carbon dioxide stream. Parameters tested should help inform and be consistent with the testing and monitoring planned during the GS project operation and PISC period. Analyses should include basic parameters, such as pH; total dissolved solids (TDS); alkalinity; specific conductivity (SC); and major anions and cations (e.g.,  $\text{Ca}^{2+}$ ,  $\text{Mg}^{2+}$ ,  $\text{K}^+$ ,  $\text{Na}^+$ ,  $\text{Cl}^-$ ,  $\text{Br}^-$ ,  $\text{SO}_4^{2-}$ , and  $\text{NO}_3^-$ ). Other constituents may differ by formation and be determined based on the mineralogy of the injection and confining formations (as evaluated under 40 CFR 146.82(a)(3)(iii) and discussed in Section 2.3.4). These may include:  $\text{Sr}^{2+}$ ,  $\text{Fe}^{2+}$ ,  $\text{Fe}^{3+}$ , Al,  $\text{SiO}_2$ , total organic carbon (TOC), carbon dioxide (aq), and hydrogen sulfide (aq) (if the site is an oilfield) and trace metals (e.g., As, Hg, Cu, Zn, etc.). Additionally, baseline gaseous carbon dioxide should be measured in subsurface formations including all USDWs within the AoR. Samples from proposed injection zones that are depleted hydrocarbon reservoirs may need to be analyzed for hydrocarbons.

Constituents quantified by laboratory methods (e.g., major ions, trace elements, hydrocarbons, and TDS) should be analyzed using approved methods, including ASTM methods, Standard Methods (Greenberg et al., 2005), and EPA-approved methods. The *UIC Program Class VI Well Testing and Monitoring Guidance* can be consulted for more details, including a listing of specific methods that are generally used. An index of EPA methods can be found at <http://www.epa.gov/region1/info/testmethods/pdfs/testmeth.pdf>.

### ***Sample Collection from Existing Monitoring Wells***

If there are monitoring wells in the AoR and they have not been recently sampled, owners or operators should consider taking fresh samples for water quality analysis. For wells in deep formations, including the injection formation, owners or operators may use a sampling apparatus that maintains downhole conditions if such a device is compatible with the construction of the well. If samples are retrieved at the surface, it is crucial that downhole estimates of pressure and temperature be obtained to support modeling of water chemistry speciation under conditions in the injection formation. For shallow wells, EPA guidelines are provided in USEPA (1991) and USEPA (1992). Additional information on sample retrieval and handling is provided in the *UIC Program Class VI Well Testing and Monitoring Guidance*. Following careful sampling procedures during site characterization will provide a reliable baseline for any future monitoring using the same monitoring wells. Owners or operators should also consider obtaining baseline samples over an adequate period of time to capture any natural temporal trends in water chemistry.

### ***Sampling Fluids while Drilling a Stratigraphic Well***

If owners or operators drill a stratigraphic well to obtain information to fulfill the requirements at 40 CFR 146.82(a), EPA recommends that samples of formation fluids be taken at that time. Sampling can be conducted using wireline sampling devices. Commercial systems are available that can take fluid samples in addition to obtaining downhole measurements of parameters such as density, pH, and mud contamination. Such equipment has been developed for characterization

of hydrocarbon reservoirs and would be applicable to deep formations under consideration for GS. Additional discussion of fluid sampling is provided in Section 4.3. If the owner or operator obtains analyses of pore water in the confining zone(s), owners or operators should note if special methods were used (e.g., squeezing of shale core samples) and whether low volumes precluded analyses of any parameters.

#### **2.3.9.2. Bulk Solid Phase Chemical Analysis**

In addition to mineral identification, an elemental analysis of the formation solids in the injection and confining zones and other relevant formations (e.g., the first permeable formation overlying the confining zone) may be needed to evaluate the potential for liberation of trace metals due to lowered pH from injection. Options include X-ray fluorescence (XRF) of whole rock samples, or sample digestion followed by analysis by inductively coupled plasma/mass spectrometry (ICP/MS).

#### **2.3.9.3. Geochemical Calculations and Modeling**

With a complete chemical analysis of formation fluids and measurements of pH and temperature, equilibrium geochemical speciation of the constituents in the fluids and saturation indices for relevant mineral phases can be calculated to help identify the major reactions that may affect injection and containment. EPA recommends that this baseline information be compared against results from any future sampling. Two examples of suitable programs are PHREEQC, the current version of the USGS's PHREEQ program (Parkhurst et al., 1980) and the Geochemist's Workbench® (from Rockware, Inc.). Owners or operators should verify that the program selected for this purpose has the capability to perform calculations for waters with the ionic strength of the formation fluids (i.e., brines).

If the owner or operator plans to perform additional analyses beyond basic equilibrium calculations, both of the above-mentioned programs are examples of software that can model reactions of fluids with minerals (identified as required by 40 CFR 146.82(a)(3)(iii)) and gases and can incorporate reaction kinetics (rates) and transport of fluids. The advantage of such modeling is that it allows consideration, prior to injection, of the types of reactions (e.g., loss of carbonates, precipitation of carbonates, long-term dissolution of silicates) that can change permeability, release undesirable elements, alter injectivity, and affect ultimate storage capacity. The owner or operator may choose to conduct reactive transport modeling to account for any significant effects of geochemistry while delineating the AoR. Additionally, see Section 3.3 for discussion of geochemical modeling as part of a demonstration of compatibility between the injectate and formation fluids and formation solids.

#### **Data Collection and Analysis**

If pre-existing data on the geochemistry of solids or core samples from previous characterization work are available, the owner or operator should discuss their availability and quality with the UIC Program Director, along with whether new core samples are needed for the baseline characterization and if so, which formations should be tested.

Bulk chemical analysis of a powdered, solid sample may be obtained by XRF. Alternatively, samples may be digested and the extracts analyzed by inductively coupled plasma/atomic emission spectrometry (ICP/AES) or ICP/MS. Sample digestion can be done with EPA Method 3052 (Microwave Assisted Acid Digestion of Siliceous and Organically Based Materials). For the analysis stage, EPA Method 6020A (ICP/MS) or EPA Method 6010-C (ICP/AES) can be used.

### **Information to Submit**

Owners or operators should submit the following information related to the baseline geochemistry of the site:

- The source of the data (if using existing analyses);
- Dates, locations (on maps), formations, and depths from which samples were taken;
- Sampling methods and sample preservation methods used;
- Analytical methods;
- QA data or QA samples (duplicates, blanks, matrix spikes); and
- A discussion of the results, including any anomalous data, and a discussion of the spatial representativeness of the data for a given formation.

Results should be presented in tabular and graphic form and plotted on a map of the AoR, if possible. The report on fluid chemistry should also include, temperature, SC, and pressure values taken at the time of sampling. In addition to submission of baseline fluid chemistry in tabular form, owners or operators may present their data in graphical form (e.g., using a Piper diagram (Piper, 1944) or a Stiff diagram (Stiff, 1951)).

To support the UIC Program Director's evaluation of the data, the owner or operator should demonstrate that the data are representative of the injection and confining zones, appropriate formation(s) above the confining zone, including USDWs, and, if needed, potential secondary confining zones, consistent with 40 CFR 146.82(a)(6) and 146.83(b). If geochemical data (e.g., analysis of the bulk chemistry of the solids) indicate high concentrations of trace elements, the owner or operator should evaluate injection and confining zone mineralogy and whether any trace elements are associated with minerals that are anticipated to be dissolved under the low pH conditions that may occur due to injection of carbon dioxide. In some circumstances, the owner or operator may also choose to analyze the presence of trace elements in the first permeable formation overlying the confining zone.

If vintage data are used, the owner or operator should demonstrate to the UIC Program Director that they are adequate to establish a reasonable baseline prior to injection. The owner or operator should also identify and discuss any spatial variability in water quality data.

### **2.3.10. Geophysical Characterization**

To support the requirement at 40 CFR 146.82(a)(3)(iii) to submit data on the injection and confining zone(s), owners or operators can use a variety of field data, which may include seismic surveys or other geophysical methods. Although they are an indirect means of measurement and

subject to uncertainty and interpretation, geophysical methods provide a means of generating information about the subsurface in lieu of physically sampling the layers of interest. They can also provide information over a larger area than cores alone can reasonably provide. Depending upon the scale and resolution of the investigation, geophysical methods (e.g., seismic and other surface and cross-well geophysical techniques) can be used to estimate the stratigraphy, structure, extent, and thickness of subsurface units. Data collected for a baseline geophysical survey will also serve as the reference point for future monitoring as required at 40 CFR 146.90(g)(2) and as described in the *UIC Program Class VI Well Testing and Monitoring Guidance*.

There are four main types of geophysical methods: seismic, gravity, magnetic, and electrical/electromagnetic (EM). These methods can image a large area of the subsurface without penetrations (i.e., wells or boreholes). EPA recommends that owners or operators deploy at least one of these methods during site characterization as they can provide good spatial coverage of a project area and may be especially useful in regions where subsurface geology is heterogeneous and/or wells are sparse. Owners or operators should demonstrate that their selected method will achieve adequate resolution at the depths needed.

In selecting the specific geophysical method(s) to use, owners or operators should consider the following:

- The goals of the survey and types of information desired;
- The desired resolution;
- Subsurface lithologies;
- Subsurface heterogeneity;
- Known or suspected faults and whether their geometries are likely to be imaged by the type of survey considered;
- Locations of existing wells to use for downhole methods;
- Whether an injection depth waiver is sought; and
- The availability of other information from cores, well logging, and other sources to aid in interpretation of the data.

Table 2-1 summarizes the status and utility of the various geophysical methods, and Table 2-2 outlines the phases of a GS project to which various geophysical techniques may be suited. The types of geophysical methods are described in Sections 2.3.10.1 through 2.3.10.4, followed by a discussion of what information should be submitted to the UIC Program Director. Additional detail on all four types of methods is provided in the Appendix.

**Table 2-1: Applicability of Geophysical Techniques to Geological Features of Interest**

<i>Investigation of</i>	SEISMIC						GRAVITY		ELECTROMAGNETIC/ ELECTRICAL			MAGNETIC
	2D	3D	VSP*	3D-VSP	Cross- well	Borehole Microseismic	Aerial & Surface Gravity	Borehole Gravity	Natural Source	Controlled Source	ERT*	Aerial & Surface Magnetic
<i>Near Borehole and Shallow Subsurface</i>			W	W	W	W		W		W		
<i>Field-Wide Subsurface Studies</i>	W	W		W		P	W		W	W		W
<i>Stratigraphy</i>	W	W	W	W	W		W <sup>1</sup>	W	P	P	W	P <sup>2</sup>
<i>Thickness</i>	W	W	W	W	W			W			W	
<i>Structure 0-100 m</i>				P		P	P		P	P	P	P
<i>Structure 100 m – 1 km</i>	W	W		W	W	W	P	P	P	P	W	P
<i>Structure &gt;1 km</i>	W	W		W	P	W	W <sup>3</sup>	P	W	W	P	W <sup>3</sup>
<i>Fault/Fracture</i>	W	W		W	W	W <sup>4</sup>	P		P <sup>5</sup>	W <sup>5</sup>	P <sup>5</sup>	W
<i>Porosity</i>							P	W	W <sup>6</sup>	W <sup>6</sup>	W <sup>6</sup>	
<i>Pore Pressure</i>	P	W	P	?	P							
<i>Abandoned Wells<sup>7</sup></i>											W	W <sup>8</sup>

W = Well Suited (e.g., already in use for site characterization with good results);

P = Potential (e.g., could be used, but often not used because better alternatives are available or in use but results are not as resolved as desired).

<sup>1</sup> Valid for flows, sills, channel fills, or other discontinuous units with high density contrast

<sup>2</sup> Chiefly for iron-mineral bearing units (e.g., mafic intrusions, red-beds, etc.)

<sup>3</sup> Characterizes depth to basement

<sup>4</sup> Valid only if faults/fractures are actively undergoing deformation

<sup>5</sup> Valid only in non-porous formations

<sup>6</sup> Qualitative estimates compared to nearby formations

<sup>7</sup> For additional geophysical techniques on finding abandoned wells see the *UIC Program Class VI Well Area of Review Evaluation and Corrective Action Guidance*

<sup>8</sup> Valid only if wells are cased in the near surface with metal

\*VSP = Vertical Seismic Profile; ERT = Electrical Resistance Tomography

**Table 2-2: Stages in a Geologic Sequestration Project where Geophysical Techniques May Be Applicable**

### 2.3.10.1. Seismic Methods

For site characterization, seismic methods are well suited for determining formation thickness, stratigraphy, structures, and the location and/or attributes of faults (Table 2-2). These methods work best for characterizing simple, homogenous geologic settings where supplementary sources of data such as well logs, outcrop data, and other geophysical surveys are available. More detailed information on seismic methods and processing is available from numerous sources, including introductory guides such as: *A Handbook for Seismic Data Acquisition* (Evans, 1997), *Environmental Geology – A Handbook* (Knödel et al., 2007), and *An Introduction to Geophysical Education* (Kearey et al., 2002). For additional discussion on the principles and deployment of seismic methods, see the Appendix.

## Data Collection and Analysis

### Pre-Existing Data

Because seismic methods are used by a variety of industries, pre-existing seismic surveys may be available for the area of interest, especially if the region has been the subject of hydrocarbon or other mineral exploration. Existing seismic data will most likely be 2D. Some seismic data may also be available for free from government agencies; for example, the USGS maintains the Seismic Data Processing and Interpretation Group, which houses the National Energy Research Seismic Library (NERSL) and has been acquiring seismic reflection data since the mid-1970s. Processing methods for seismic data have improved greatly in recent years, and reprocessing vintage raw data can lead to improved resolution or identification of features not identified in the original survey (Hyne, 2001). Owners or operators should recognize that the quality or resolution of publically available or free data may not be suitable for GS project site characterization.

## ***Seismic Deployments***

Seismic deployment can be done on the surface (2D or 3D), in boreholes, or a combination of both. If owners or operators are conducting a new seismic survey for purposes of site characterization, EPA recommends that the decision regarding the type of deployment be based upon what is known about site geology and features that may need imaging. Furthermore, it should be kept in mind that seismic data acquired during site characterization will serve as the baseline for any geophysical monitoring activities conducted during the injection phase of the project. Because 2D surveys produce “slices” of the subsurface, they are not optimal in settings where significant lateral heterogeneity is expected or faults are known to be present. 3D surveys may be preferable to 2D surveys when characterizing sites with complex or variable subsurface geology, where subsurface geology is not well constrained, where improved resolution is necessary, or where high well costs require greater certainty in subsurface characterization. A vertical seismic profile (VSP) can help increase the resolution and accuracy of other seismic surveys, can help with pore pressure estimation, and can help to link geology derived from other borehole logs to seismic attributes (Kearey et al., 2002). When imaging thin beds, cross-well seismic methods may be useful; they offer good resolution and can fill the resolution gap between high-resolution well cores and 3D surface data or to help correlate structure between well bores. Cross-well imaging may be considered in areas with abundant subsurface penetrations in locations that will allow imaging of features of interest.

## ***Additional Seismic Data Analysis***

### ***Pore Pressure Interpretation***

If seismic data are of adequate quality, owners or operators may consider using the data to remotely estimate subsurface pore pressure. Any seismic data that yield an accurate seismic velocity can be used to approximate effective stress and estimate pore pressure. However, not all seismic data meet this criterion because accurate velocity values are not needed to image the subsurface. Ensuring that seismic data can also be used for pore pressure prediction requires planning. Once accurate velocity data have been obtained, there are numerous methods available to convert velocity to pore pressure. These methods tend to work best in developed basins filled with shales and sands. The main disadvantage of this technique is that it requires extensive data processing and interpretation, which may introduce large errors and necessitate basin-specific correction factors during velocity processing.

### ***Seismic Stratigraphy***

Because seismic reflections follow large-scale bedding, the geometry of the reflections allows the delineation of features such as unconformities, depositional sequences, and unit thicknesses (e.g., Vail et al., 1977). EPA recommends the integration of seismic data with lithologic data from cores, well logs, and other data to assist in interpretation of depositional features and environments. If the owner or operator undertakes a detailed analysis, lithologies and other characteristics identified at wells and boreholes can be correlated to seismic attributes, which can then be used to predict subsurface properties at other locations through various methods, including regression or neural networks. Stratigraphic features identified in this manner may help

in identifying features (e.g., barriers, channels, fans) that might affect storage capacity and migration of carbon dioxide.

#### **2.3.10.2. Gravity Methods**

Gravity methods are well established for determining stratigraphy and formation thickness and have possible usefulness for identifying structure, faults, and porosity (Table 2-2). Because detection of faults and structural features using gravity data depends upon contrasts in density, EPA recommends that owners or operators reserve the use of gravity methods for basins with varied lithologies. Salt domes and igneous intrusions are the easiest types of lithologic features to image because they generally have a high density contrast with surrounding formations. Faults may be detected with gravity data if units with contrasting density or regions with different sedimentary thicknesses are juxtaposed. EPA also recommends that owners or operators consider the types of faults that are likely to occur in the project area; small faults or faults with large displacement occurring in discrete steps are more difficult to detect with gravity data than large planar faults. Vertical faults are especially difficult to detect using surface gravity methods (Barbosa et al., 2007).

#### **Data Collection and Analysis**

Aerial and land-based gravity surveys are commonly performed by government agencies. They are widely available and are often free. However, data available from such sources may be undersampled for many site characterization purposes or may not have been targeted at shallow to moderate-depth sedimentary sequences. Gravity data may be more likely to exist than other types of geophysical data if investigations into deep saline formations have previously occurred at the site.

Where the owner or operator deploys a gravity survey for the purpose of site characterization, the choice of deployment (land-based, aerial, or subsurface (boreholes)) is usually based on factors such as desired resolution and site-specific geology. Broad land-based or aerial gravity surveys may suffice for detecting large-scale changes in the thickness of basin fill and other basin-wide features, while more detailed surveys will be needed to detect finer features such as the distribution and thickness of specific formations. Borehole surveys can be used to determine layer thickness and aid in determination of lithologic composition. In regions that are laterally variable, borehole gravity data may indicate features such as salt domes and reefs even if they do not intersect the borehole (LaFehr, 1992).

#### **2.3.10.3. Electrical/Electromagnetic Geophysical Methods**

Electrical and EM methods have potential application in certain formation types for delineating structure, stratigraphy, faults, and porosity (see Table 2-2 for additional details). Resolution is low for most electrical/EM methods compared to seismic methods. However, the depth and breadth of electrical/EM surveys can provide valuable information on the regional geologic framework at low cost (Orange, 1992). Additional information on EM methods for GS' site characterization is presented in the Appendix.

## **Data Collection and Analysis**

Electrical survey data are not likely to be available for a proposed Class VI injection well site unless the region has previously been characterized for hydrocarbon or ground water resources.

Data can be collected aerially, from the surface, or from the subsurface. For a detailed site characterization, EPA recommends the use of subsurface deployments when possible; this is because subsurface techniques are generally of superior quality compared to most surface methods, and heterogeneous surface conditions tend to attenuate the signal (Wilt et al., 1995). See the Appendix for additional details on the various types of electrical and EM methods.

### **2.3.10.4. Magnetic Geophysical Methods**

Magnetic methods are suited for imaging faults and large-scale structures and may also be useful for smaller structures and stratigraphy (Table 2-2). Faults and other structural features in both basement rocks and overlying sedimentary formations can be imaged, but formation characteristics are difficult to determine using magnetic data (Ugalde, undated). Because magnetic data are non-unique and do not represent specific lithologies, additional data from other types of geophysical surveys or other sources (boreholes, outcrops, etc.) are needed to improve magnetic data interpretation (Jordan and Hare, 2002). The Appendix provides additional detail on magnetic geophysical methods.

Magnetic methods are sensitive to human infrastructure. As a result, they are not useful in populated or developed areas because buildings, pipes, and wires obscure the geologic signal. They are, however, well suited for locating abandoned, cased wells that may need corrective action. See the *UIC Program Class VI Well Area of Review Evaluation and Corrective Action Guidance* for additional information.

## **Data Collection and Analysis**

Magnetic surveys have already been conducted over the majority of North America. However, the resolution of these surveys may not be high enough for site characterization purposes. High-resolution data are more likely to have been collected for hydrocarbon-producing basins and areas targeted for mineral exploration.

## **Information to Submit**

In reporting the results of geophysical surveys, EPA recommends that owners or operators submit to the UIC Program Director the following information:

- The source of the data and whether they are vintage or newly collected;
- The type of survey and other details of the deployment (e.g., date, location/areal extent of the survey, vendor who performed the survey);
- If boreholes were used, the locations of the boreholes;
- Type of data processing, including any reprocessing of vintage data;

- Images, with locations of profiles indicated on a map and salient geologic features identified (including formations below the injection zone where an injection depth waiver is sought);
- Assumptions and limitations associated with the method, data, and their interpretation;
- A narrative discussing the results in the context of the site geologic conceptual model; and
- If the data suggest non-unique interpretations, the owner or operator should address alternative interpretations.

To support the UIC Program Director's evaluation of the data, the owner or operator should demonstrate that the geophysical survey results provide an image of the subsurface at a suitable resolution for evaluation of the injection and confining zones. The owner or operator should also demonstrate that the results of the survey are consistent with other data such as geologic maps and lithologic information from cores. If the owner or operator submits a new survey to serve as a baseline for future monitoring, EPA recommends that the survey be georeferenced for comparison against future surveys. If vintage data are submitted, the owner or operator should demonstrate to the UIC Program Director that the data provide adequate coverage of the AoR and are of sufficient quality.

### **2.3.11. Surface Air and Soil Gas Monitoring**

At the discretion of the UIC Program Director, the owner or operator may be required to monitor surface air and/or soil gas for carbon dioxide leakage that may endanger a USDW [40 CFR 146.90(h)]. Carbon dioxide detection above background levels in soil gas or at the surface does not necessarily indicate USDWs have been endangered, but that a leakage pathway or conduit exists at some point in the operation.

Baseline surface air and soil gas data should be collected if the UIC Program Director requires surface air and soil gas monitoring as part of the Testing and Monitoring Plan. Baseline data on carbon dioxide concentrations and fluxes collected prior to operation will provide data for comparison to levels during and after the operational phase of the project in order to detect any potential leakage. The owner or operator or the UIC Program Director may opt to perform surface air and soil gas monitoring during the site characterization phase to provide a baseline if they plan to incorporate surface air and soil gas monitoring technologies at a later date.

The AoR should be characterized with respect to properties that may affect the baseline data, such as soil type, soil organic carbon content, vegetation type and density, topography, and surface water hydrology. Different approaches can be used to conceptualize the system, such as ecological modeling to identify the sources and sinks and/or flow and transport modeling to understand the flow paths and dispersion processes.

### **Data Collection and Analysis**

Overall, the spatial distribution of soil carbon dioxide fluxes and concentrations should be determined on a site-specific basis. A more precise determination of baseline would require repeated measurements at several fixed sites to capture any seasonal or diurnal variations. In

particular, EPA recommends that the location of soil gas and/or surface air sampling points be based on the following considerations:

- Avoiding areas with highly fluctuating background concentrations, based on previously recorded data;
- Selecting potential point-sources, including wellheads, artificial penetrations, and fault or fracture zones. A transect-profiling approach may be used for linear features, such as faults (see ASTM, 2006); and
- If intended to monitor for non-point source leakage, monitoring throughout the AoR, using a grid methodology in areas of potential leakage. Grid cell spacing may range over several orders of magnitude, depending on site-specific factors. See ASTM (2006) for discussion of establishing a soil sampling grid.

During measurement of concentration and fluxes, EPA also recommends monitoring soil temperature and moisture. Some other important data, such as atmospheric temperature, pressure, and wind speed and direction can be obtained from a nearby weather station. The data collected should be analyzed using regression analysis to develop empirical relationships between correlated parameters for the entire area or the chosen sub-areas, which can then be used to predict background carbon dioxide fluxes expected under a given set of environmental conditions (Oldenburg et al., 2003).

EPA recommends that when surface air and/or soil gas monitoring is conducted in compliance with multiple regulatory programs, the owner or operator design a baseline determination and monitoring strategy that efficiently meets all objectives (e.g., to meet the requirements of the Class VI Rule and Subpart RR of the GHG MRR, promulgated under the authority of the Clean Air Act). In some cases, separate technologies (e.g., eddy covariance towers versus soil gas probes) may be used to meet specific objectives. However, it is likely that data collected from multiple techniques will be complementary and useful in data analysis and interpretation for all regulatory programs. Further information on technologies that can be used for soil gas and surface air monitoring can be found in the *UIC Program Class VI Well Testing and Monitoring Guidance* and the Subpart RR General Technical Support Document (USEPA, 2010).

### **Information to Submit**

If baseline surface air or soil gas analyses are needed, EPA suggests that owners or operators submit the following:

- Site characteristics: soil type, soil organic carbon content, vegetation type and density, topography, surface water hydrology;
- Sampling locations (in map form) and dates;
- Soil temperature and moisture data and atmospheric conditions;
- Sampling and analytical methods, including detection limits;
- Results presented as concentrations and fluxes in tabular and graphic form, including QA samples and analyses;
- Methods and results of regression analyses; and

- Methods and results of any ecological modeling performed, including input data, outputs, and sensitivity analyses.

To support the UIC Program Director's evaluation of surface air and soil gas data, the owner or operator should demonstrate that the locations sampled represent a reasonable grid size and that potential point sources are represented and will serve as a good baseline to which future monitoring data can be compared. The owner or operator should also demonstrate that seasonal and diurnal variations in carbon dioxide levels have been captured and describe the variability in the data for future reference. If an inadequate time series of analyses was performed or if there are concerns regarding the quality of analytical data, the owner or operator may be asked to submit additional data.

### 3. Data Synthesis for Demonstration of Site Suitability

The information required at 40 CFR 146.82 and described in this guidance provide comprehensive data and descriptions for many properties of the proposed project site (e.g., porosity, geochemistry). These data do not individually provide a complete picture of the site to demonstrate that it can safely receive and confine the carbon dioxide. Together, however, this information can form a comprehensive picture of the site and demonstrate whether it is a good candidate for GS and meets the requirements at 40 CFR 146.83. This section describes how the owner or operator can synthesize the information collected during site characterization to demonstrate site suitability.

- Information on **facies changes**, required at 40 CFR 146.82(a)(3)(iii) supports the development of the site conceptual model and an understanding of how the carbon dioxide plume will move in the subsurface; it can also inform the AoR modeling. Section 3.1 briefly discusses how owners or operators may present geologic information (e.g., cores, outcrop data, seismic surveys, and well logs) to provide an illustration of facies changes within the subsurface;
- **Structural information on the injection and confining zones** is necessary to demonstrate how the carbon dioxide will be confined in the injection zone and that there are no potential leakage pathways. Section 3.2 describes how information collected, including maps, cross sections, and seismic data, support a description of the site structural geology;
- **Carbon dioxide stream compatibility** with the well and subsurface formations and fluids is important to the long-term viability of the injection operation. The owner or operator must provide information on the compatibility of the carbon dioxide stream with fluids in the injection zone(s) and minerals in both the injection and the confining zone(s) [40 CFR 146.82(c)(3)]. This information will show that the well will not be damaged by the injectate and that no geochemical reactions within the injection and/or confining formations will affect the storage and/or containment in a manner that is not accounted for in planning or reduce the storage capacity of the site. Section 3.3 describes how information on the injectate, fluids in the injection zone(s), minerals in the injection and confining zones, and well materials can be combined and evaluated together to demonstrate compatibility of the carbon dioxide stream;
- Information on the **storage capacity of the injection zone** is important to demonstrate that the site, based on site-specific information such as thickness, porosity, geochemistry, etc., has sufficient capacity to receive the amount of carbon dioxide anticipated to be injected as required at 40 CFR 146.83(a)(1). Section 3.4 briefly discusses approaches that may be considered to evaluate storage capacity;
- Information on **confining zone integrity** supports a demonstration that the confining zone will not allow migration of carbon dioxide outside the intended injection zone(s) and that the site meets the requirements at 40 CFR 146.83(a)(2). Section 3.5 describes how information collected, including lithologic and stratigraphic data, structural data, core analyses, and formation testing data can support a demonstration of confining zone integrity; and

- A demonstration of **secondary confinement** may be appropriate to ensure USDW protection, impede vertical fluid movement, allow for pressure dissipation, and provide additional opportunities for monitoring, mitigation and remediation. Section 3.6 describes the information that is needed to make this demonstration and how the owner or operator would present it to the UIC Program Director if it is required per 40 CFR 146.83(b).

Some aspects of this data synthesis involve combining geologic, geochemical, and geomechanical information and explaining how they demonstrate that the site meets the Class VI Rule requirements. Other aspects may require additional analysis, such as modeling. The sections below present recommended approaches for compiling, synthesizing, and presenting the necessary information.

Thinking of the proposed site in the context of this larger analysis can help guide the site characterization process by identifying the big questions about the site that need to be answered and tailoring the information collection to ensure that the data support a determination that the site is appropriate for GS. This synthesis also supports the AoR modeling, project plan development, and effective management of injection operations. It can also facilitate the UIC Program Director's review of the application and may improve public acceptance of the project by demonstrating to the public how the geologic data support a determination of site suitability.

### 3.1. Facies Analysis for the Project Site

The Class VI Rule, at 40 CFR 146.82(a)(3)(iii), requires owners or operators to provide information on facies changes in the injection and confining zones. Understanding facies changes at the injection site will help the owner or operator develop a geologic conceptual model that describes the depositional environments and the resulting distribution of lithologies. Because lithofacies exert control on porosity, permeability, and mineralogy, a good facies analysis will help in anticipating heterogeneity in these properties and the associated effects on the injection and storage capabilities of the site. Understanding of subsurface heterogeneity can also be used to select the placement and design of injection and monitoring wells as well as refine the parameterization of multiphase flow modeling for the site (see the *UIC Program Class VI Well Area of Review Evaluation and Corrective Action Guidance*). This section briefly discusses considerations and data needed for assessing facies changes.

#### Data Collection and Analysis

An analysis of facies changes and identification of the spatial distribution of lithofacies within different layers/formations may require integration of several types of information gathered during site characterization. Lithofacies distribution for computational modeling can be estimated using geostatistical approaches (e.g., geometric object-based methods or cell-based methods).

The data needed for facies analysis can include geologic maps, isopach maps, stratigraphic columns, wireline logging data, descriptions and analyses of core samples, and seismic data. For example:

- Descriptions and analyses of core samples will provide information on a number of relevant characteristics including mineralogy, cross-bedding, grain sizes, sorting, fine-grained interbeds, and cementation;
- Seismic stratigraphic features can be used to identify stratigraphic sequences; and
- Wireline logging data can provide information on properties such as lithology and porosity and can be used to confirm the depths of formations.

Correlation of these various data sources can provide a three-dimensional representation of the subsurface stratigraphy. Owners or operators should bear in mind that there may be considerable uncertainty in facies models given the need to interpolate between what may be sparse data points and logistical challenges to obtaining representative data. A brief discussion of facies considerations for GS and some useful references are provided in the Appendix.

### **Information to Submit**

Owners or operators should prepare a discussion of the inferred depositional environment(s) at the project site in the context of the site geologic conceptual model. The discussion should address, at a minimum:

- The implications for connectivity within the injection formation and the suitability of the confining zone;
- Lithofacies distributions mapped in the injection and confining formations, including the distributions of properties such as porosity and permeability for each lithofacies;
- The potential for preferential flow paths;
- Diagenetic processes that may affect present-day hydrogeologic properties; and
- Uncertainties associated with the data and with the resulting facies model.

The narrative should reference appropriate data, maps, geophysical images, cross sections, and stratigraphic columns.

To support the UIC Program Director's evaluation of the data, EPA recommends that the owner or operator demonstrate that correlation among data types is reasonable and that the available data support facies interpretations. The owner or operator should also assess possible preferential flowpaths or barriers and their implications for movement of carbon dioxide and for the quality of the confining zone. The report should also demonstrate how the facies interpretation informed the development of the site geologic conceptual model for the AoR delineation modeling.

## **3.2. Structure of the Injection and Confining Zones**

The Class VI Rule, at 40 CFR 146.82(a)(3)(vi), requires that geologic and topographic maps and cross sections illustrate the geologic structure of the local area. An assessment of the structural geology of the project area is a crucial part of a demonstration that the well will be sited in an area that meets the requirements of 40 CFR 146.83(a), and owners or operators should provide a thorough discussion that integrates all relevant information compiled during site characterization. This may include use of:

- Geologic and structural maps and cross sections (see Section 2.3.1);
- Isopach maps (see Section 2.3.3);
- Results of geophysical surveys (see Section 2.3.10); and
- Data from well logs and core analyses (see Sections 4.1 and 4.2).

### **Data Collection and Analysis**

EPA encourages the use of all available data in the AoR and the surrounding region in this analysis. However, owners or operators should be alert to the quality of vintage data, especially if samples or raw data are not available.

EPA strongly encourages the use of seismic data when evaluating structures at a GS site and emphasizes the usefulness of 3D seismic data or a grid of 2D seismic profiles. Lower or fair quality 2D data can be extremely useful for identifying larger faults, reservoir limits, and for general regional mapping. If geology is complex, especially around the point of injection, and greater detail is needed, 3D data are superior. If seismic profiling is not feasible at the project site, owners or operators should consider whether other geophysical methods will provide useful data.

In the evaluation of regional and local structural geology, EPA recommends that the owner or operator illustrate and discuss major structural features that will affect the migration of carbon dioxide in the subsurface, such as:

- Folds and their trend and plunge;
- The presence of domes;
- The strike and dip of unfolded beds;
- The locations, orientations, types of faulting (normal, reverse, strike-slip, thrust), and depths of faults; and
- Units juxtaposed by faults.

Owners or operators should discuss the role of structural traps in providing for secure storage (in a manner similar to the role of these structures in forming oil and gas traps). Such structures should limit the migration of carbon dioxide. The disadvantage of a closed structure, however, is that a confined column of carbon dioxide may form, putting stress on the confining zone from buoyant forces. In such settings, extra care may be needed in constraining the capillary pressure and geomechanical stability of the confining zone (Chadwick et al., 2008).

In unfolded, gently-dipping sequences, carbon dioxide may potentially migrate long distances and the AoR may be larger. In such settings, careful attention should be paid to the presence of higher-permeability preferred flowpaths. Also, more data may be needed to accurately constrain structural surfaces that have minimal topography because uncertainties in the data will have a greater impact on predictions of carbon dioxide movement.

Owners or operators should clearly indicate whether faulting is likely to enhance the project site by providing a trap, or potentially compromise the confining zone. Fault-bounded trapping through juxtaposition of the injection zone with a low-permeability layer may provide a favorable storage formation. Non-transmissive faults that transect the confining zone, however, may pose a leakage risk, and should be carefully evaluated for their stability and sealing capacity (see Section 2.3.2 for additional information on fault analyses and Section 3.5 for information on confining zone integrity).

### **Information to Submit**

The owner or operator should prepare a narrative for the UIC Program Director that clearly describes how the local and regional geologic structure are conducive to GS and that an adequate confining system is present. This discussion should describe how the structure of the injection and confining zones fit into and support the development of the site conceptual model developed for delineation of the AoR. Owners or operators should identify which features support the capacity of the site to contain carbon dioxide, including the role of structural traps. Potential weaknesses should also be addressed (e.g., if faults are present, whether data indicate that they are sealing). The owner or operator should also discuss whether there are alternative interpretations to the data.

Because this evaluation is based on data collected to meet other requirements, the owner or operator should reference the relevant data and associated uncertainties and describe how the data were used to support the structural analysis. Owners or operators should address the representativeness of these data and their consistency with other site data as well as with region-wide data (e.g., maps and geophysical images) and explain limitations when using these data to develop a conceptual model of the subsurface in the entire project area. The owner or operator should demonstrate that sufficient data were used to evaluate the structural geology, keeping in mind that the amount of data needed will be site-specific to some degree. For example, fewer data may be needed in areas with simple structures than in complex areas.

### **3.3. Compatibility of the Carbon Dioxide Stream with Subsurface and Well Materials**

The Class VI Rule requires owners or operators to report on the compatibility of the carbon dioxide stream with fluids in the injection zone(s) and minerals in both the injection and the confining zone(s), based on the results of the formation testing program, and with the materials used to construct the well [40 CFR 146.82(c)(3)]. This demonstration is needed to support an understanding of (1) whether subsurface interactions among the injectate, fluids, and solids will lead to precipitation or dissolution of minerals such that permeability, porosity, and injectivity may change; (2) if geochemical changes due to the introduction of large amounts of carbon dioxide into the subsurface might cause trace elements such as lead or arsenic to be liberated from subsurface solids; and (3) if interactions among the fluid, carbon dioxide, and cement might cause deterioration of the cement such that the cement sheath would become a conduit for fluid migration.

### 3.3.1. Compatibility of the Carbon Dioxide Stream with Fluids and Minerals

The compatibility demonstration will use information gathered during site characterization and during execution of the formation testing program, including:

- Chemical analyses of fluids in the injection zone and, if available, the confining zone (see Section 2.3.9);
- Mineralogy of the injection and confining zones (see Section 2.3.4);
- Bulk chemical analyses of solids in the injection and confining zones (see Section 2.3.9);
- Pressure, temperature, and pH in the injection zone and, if available, the confining zone (see Section 2.3.9); and
- The chemical characteristics of the injectate (see the *UIC Program Class VI Well Testing and Monitoring Guidance* for information on this analysis).

#### Data Collection and Analysis

To make a demonstration of compatibility, the owner or operator may take one or more of a few approaches, synthesizing information as appropriate: perform geochemical modeling, conduct bench-top laboratory experiments, and/or (in limited circumstances) provide an in-depth but qualitative discussion of potential geochemical reactions based on site data and GS literature. Guidance and recommendations for these approaches are presented below.

Owners or operators are strongly encouraged to perform **geochemical modeling** to assess potential impacts of injection on the subsurface. Equilibrium speciation modeling with programs such as PHREEQC or the Geochemist's Workbench® can be used to obtain saturation indices to predict the potential for mineral precipitation or dissolution, as described in Section 2.3.9. Such programs can also be used to model the reactions of fluids with minerals and gases and can incorporate reaction rates (kinetics). These geochemical models have also incorporated some capacity for 1D (PHREEQC) or 2D (Geochemists' Workbench®) reactive transport simulations. Other geochemical models that may be used in GS applications include SOLMINEQ.88 (Kharaka et al., 1989) and EQ3/EQ6 (Wolery, 1992). STOMP and TOUGHREACT are reactive transport models developed by Pacific Northwest National Laboratory and Lawrence Berkeley National Laboratory (<http://esd.lbl.gov/TOUGHREACT/>), respectively. They incorporate multiphase fluid and heat flow with geochemical reactions. TOUGHREACT has been used to model GS scenarios and anticipated mineral trapping (e.g., Xu et al., 2007; Xu et al., 2005). See the *UIC Program Class VI Well Area of Review Evaluation and Corrective Action Guidance* for additional information on multiphase reactive transport modeling.

In performing geochemical modeling, the owner or operator should be aware of and discuss limitations in modeling capabilities and resulting uncertainties. In particular, this includes limitations in available thermodynamic and kinetic data. Gaus (2010) presents a more in-depth discussion of geochemical interactions in a GS context. Owners or operators are encouraged to take advantage of literature and research on suitable models and available thermodynamic and kinetic data. For example, Krupka et al. (2010) published a literature review on thermodynamic data for modeling of carbonate reactions associated with GS. A 2007 book by Marini covers thermodynamics, kinetics, and reaction path modeling as applied to GS. Gaus et al. (2008) have

published a review article on geochemical and solute transport modeling for GS. Palandri and Kharaka (2004) have published a compilation of kinetic data.

Owners or operators may consider **bench-top laboratory experiments** to simulate reactions among subsurface solids, fluids, and the injectate. If an owner or operator plans to use an experimental approach, EPA recommends using core samples of the injection and confining zones (see Section 4.2). If a sufficient sample is not available, rock and mineral samples representative of the subsurface at the project site may be used with documentation that they are very similar to the mineralogy of the injection and confining zones. The fluid phase should be formulated to mimic the formation fluids in the injection zone, and the carbon dioxide phase should include anticipated impurities. Pressure and temperature conditions should be representative of conditions at depth during operation at the project site.

The duration of the experiment should allow for establishment of steady state conditions prior to introduction of carbon dioxide. After introduction of carbon dioxide, the experiment should be conducted for a sufficient time frame to result in measurable changes to the rock sample and for the fluid composition (pH, major ions) to achieve steady state; this may entail a run time of several weeks or a few months, depending upon the mineralogy of the sample and anticipated reaction rates among the fluid, minerals, and carbon dioxide. Fluid chemistry should be tracked during the experiment, and the solid materials should be analyzed after completion of the run. Rock/mineral samples should be evaluated for changes in porosity, permeability, and mineralogy by any of the methods described in Sections 2.3.4 and 2.3.5.

Alternatively (and with the UIC Program Director's agreement), the owner or operator may provide a detailed **discussion of the geochemical characteristics** of the injection and confining zone(s) and the injectate composition in the context of what is known in the literature about the reactivity of the minerals and anticipated reactions with the carbon dioxide and carbon dioxide-rich brine.

To make a convincing demonstration, this discussion should draw extensively on the geologic, mineralogic, geochemical, and GS literature and should tie this information closely to the known properties of the subsurface geochemistry and mineralogy at the project site, based on data collected during site characterization. Information from the literature such as mineral dissolution and precipitation rates should be considered in this evaluation, and the owner or operator should take note of limitations in available data (e.g., variations among studies, differences between field- and laboratory- derived data). Geochemical studies from GS pilot projects may be referenced if they have properties similar to the project site. Such a discussion will be qualitative in nature and is likely to be appropriate only in limited situations, such as where the geology is uncomplicated and homogeneous, the mineralogy is simple and relatively unreactive, and the injectate is known to be relatively free of impurities such as sulfur dioxide, which may give rise to very low pH values in the injection formation (Xu et al., 2007). If an owner or operator plans to use this approach, he or she should consult with the UIC Program Director. If this approach is supported by the UIC Program Director, the owner or operator should submit a thorough discussion that cites relevant literature and references mineralogic and geochemical data collected during site characterization.

### **Information to Submit**

If geochemical modeling is performed, owners or operators should submit:

- The model used;
- Input data in tabular form;
- Modeling parameters and data used (e.g., activity coefficient model, identification of thermodynamic database, solid phases selected, reactions modeled, kinetic data, etc.);
- Results in tabular and graphical form;
- A thorough narrative interpreting the results and their applicability to the project; and
- A discussion of limitations and uncertainties associated with the modeling.

To support the UIC Program Director's evaluation of the data, EPA recommends that the owner or operator demonstrate that the information on which the model is based is complete and that the model is appropriate for the GS scenario. If significant mineral precipitation or dissolution is predicted, the owner or operator should discuss its impact on injectivity and whether precipitation or dissolution of minerals at the interface with the confining zone might either diminish or improve the sealing capabilities of the confining zone.

In reporting the results of experimental work, owners or operators should submit:

- A thorough description of the experimental method;
- A description of the composition and origin of solids used;
- The chemistry of the input solution and the carbon dioxide phase (i.e., impurities);
- Porosity and permeability of the rock sample prior to experimentation;
- Plots of solution chemistry with time during the experiment;
- Geochemical reactions (e.g., dissolution and precipitation of minerals) that have taken place;
- Methods of evaluating permeability and porosity at the end of the experiment and the resulting values; and
- A narrative discussing the results and their implication for long-term behavior of the site, including changes in injectivity, the degree of mineral trapping, and how this information relates to the AoR delineation.

To support the UIC Program Director's evaluation of the data, EPA recommends that the owner or operator demonstrate that the test conditions and input materials are representative of the injection formation and the downhole conditions, that the test was run for an adequate period of time, and that the fluid chemistry achieved steady state.

If data are available from more than one location within the AoR, the owner or operator should provide an analysis that encompasses any variability in fluid chemistry and discuss any impacts on the resultant modeling or experiments. Similarly, if core analyses indicate lithologic and mineralogic heterogeneity, this too should be discussed.

### 3.3.2. Compatibility with Well Materials

Owners or operators must provide information on the compatibility of the carbon dioxide stream with fluids in the injection zone(s) and minerals in both the injection and the confining zone(s) [40 CFR 146.82(c)(3)]. This will support a demonstration that reactions between the cement, formation fluids, and carbon dioxide will not lead to deterioration in the strength of the cement sheath or increases in the porosity and permeability that could result in the cement sheath becoming a conduit for carbon dioxide or carbon dioxide-rich fluids.

The chemical and mechanical properties of hydrated cement in contact with a carbon dioxide-rich environment should be considered. This is particularly relevant for Portland based cements. Owners or operators should demonstrate that the proposed cement sheath for their injection well will maintain integrity during the course of the project, including after injection ceases. This demonstration should take into account the following information gathered during site characterization and during well construction:

- Chemical analyses of fluids in the injection zone and, if available, the confining zone;
- Cement type and additives;
- Pressure, temperature, and pH in the injection zone and, if available, the confining zone;
- Chemical characteristics of the injectate, including impurities that may result in an especially low pH (e.g., sulfur dioxide); and
- Mineralogy of the injection and confining zones.

### Data Collection and Analysis

To make a demonstration of compatibility, the owner or operator may conduct bench-top laboratory experiments and/or perform modeling or provide a detailed discussion of geochemistry based on available literature. Guidance and recommendations for these approaches are presented below.

**Modeling** may be performed to support the compatibility demonstration. Owners or operators should state assumptions used in modeling such as governing mechanisms (diffusion of carbon dioxide into cement, transport through microannuli), and assumption of local equilibrium vs. modeling of kinetics. Owners or operators should identify the aqueous and mineral components (e.g., carbonate minerals, jennite or tobermorite for calcium silicate hydrate) included in the modeling and identify the thermodynamic data set used. Modeling should also account for changing subsurface conditions as a result of injection over time. If the owner or operator chooses to pursue modeling as part of the demonstration, he or she may consider the approaches used in recent studies (e.g., Wigand et al., 2009; Huet et al., 2010).

Owners or operators may use **benchtop laboratory experiments** in a hydrothermal or flow-through apparatus to support their compatibility demonstration. Any such experiments should be conducted at downhole pressure and temperature conditions. Samples of cement used in experiments should be cured under conditions representative of downhole pressure and temperature conditions in order to replicate the mechanical properties of the cement sheath in the injection zone. Experimental fluids should be formulated to mimic formation fluid composition.

Experiments should be conducted over a sufficient time frame to permit measurement of the resulting mineralogical and mechanical properties. At the end of the experimental run, cement samples should be analyzed for mineralogy, texture, porosity, permeability, and strength; results should be compared with initial values. Examples of laboratory experiments performed for research purposes include Wigand et al. (2009) and Carroll et al. (2011).

Owners or operators may discuss with the UIC Program Director the acceptability of using a **literature-based discussion** for their demonstration. This approach may be viable for settings where the injectate will be free of impurities, such as sulfur dioxide that might cause extremely low pH, and if the proposed cement has additives known to reduce susceptibility to carbonic acid attack. Such a discussion should take into account both field and laboratory-based information and should also explain how the proposed cementing procedures will result in a high-quality sheath that will resist incursion of carbon dioxide-rich fluid along the well bore (i.e., no microannuli or channels in the cement).

### **Information to Submit**

In submitting the cement compatibility demonstration, the owner or operator should describe the method selected for the demonstration and why it was chosen. For a literature-based discussion, all relevant literature and relevant data from site characterization (e.g., formation fluid chemistry) should be referenced.

If owners or operators use an experimental approach, EPA recommends that they provide:

- A thorough description of the experimental methods;
- Why the particular experimental technique was chosen;
- Conditions under which the cement sample was cured;
- The chemistry of the input solution and the carbon dioxide phase (i.e., impurities);
- Porosity, permeability, and density of the cement sample prior to experimentation;
- Plots of solution chemistry with time during the experiment;
- Properties of the cement sample at the end of the experiment and at any intermediate stages at which samples are taken; and
- A discussion of the results and implications for the long-term integrity of the cement.

If owners or operators select a modeling approach, they should provide the following:

- The model used;
- Input data in tabular form;
- Modeling parameters and data used (activity coefficient model, thermodynamic database, solid phases selected, reactions modeled, kinetics data, etc.);
- Results in tabular and graphical form;
- A thorough narrative interpreting the results and their applicability to the project; and
- A discussion of limitations and uncertainties associated with the modeling.

To support the UIC Program Director's evaluation of the data, EPA recommends that the owner or operator demonstrate that the experimental conditions or modeling parameters are representative of the project, and that any reactions between the carbon dioxide and the cement or other well materials would not compromise the integrity of the well. See the *UIC Program Class VI Well Construction Guidance* for additional information on the compatibility of well materials and cements with carbon dioxide.

### **3.4. Demonstration of Storage Capacity**

A demonstration of storage capacity can support predictions of the ability of the injection zone to receive and contain the anticipated total volume of carbon dioxide to be injected throughout the life of the GS project without endangering USDWs. It will support a demonstration that the site meets the requirements of 40 CFR 146.83(a)(1) that the injection zone or zones be of sufficient areal extent, thickness, porosity, and permeability to receive the total anticipated volume of the carbon dioxide stream. This information should be consistent with the proposed operating parameters, site-specific information, and AoR delineation under 40 CFR 146.84.

#### **3.4.1. Methods for Estimating Carbon Dioxide Storage Capacity**

Carbon dioxide storage capacity depends on a combination of factors including multiphase flow processes, formation geometry and types of boundaries (e.g., open or closed boundaries, fault sealing), geologic parameters (e.g., porosity, permeability, compressibility) and their heterogeneity, and subsurface geochemistry (Doughty et al., 2001). Therefore, each type of geologic system chosen for storage (e.g., oil and gas reservoirs, saline formations, unmineable coal seams, and shale and basalt formations) may have different characteristics to consider while estimating storage capacity. In addition, project-specific factors also affect the storage capacity estimations, such as total volume, and chemical and physical characteristics of carbon dioxide to be injected; injection well configuration (e.g., number of wells and locations) and well bore integrity; operational parameters (e.g., pressure, injection rate); and other injection and production activities. EPA recommends that estimates of storage capacity, therefore, be accompanied by a clear statement regarding factors considered and the limitations of the assessment method used.

Methods for estimating carbon dioxide storage capacity can be divided into static and dynamic models (USDOE, 2008; NETL, 2010). The application of static and dynamic models for estimating carbon dioxide storage capacity is based on methods routinely used in the UIC Program and by industry and others for estimating petroleum reserves, ground water resources, and underground natural gas storage. The selection of suitable methods for estimating storage capacity needs to consider various combinations of physical and chemical trapping mechanisms and their effectiveness over geological time frames and scales (Bachu et al., 2007; IPCC, 2005). Brief discussions regarding static and dynamic modeling methods for estimating carbon dioxide storage are provided in Sections 3.4.2 and 3.4.3, respectively. Section 3.4.4 describes considerations for the application of storage capacity estimation methods.

### 3.4.2. Static Models

Static models are simplified mathematical expressions that can be used to estimate the quantity of carbon dioxide stored in a reservoir and are typically used prior to injection, although they can also be used for estimating storage capacity after injection commences. Static models include volumetric and compressibility models (USDOE, 2008). Volumetric models are applied to open reservoirs when it is assumed that formation fluids are freely displaced from the reservoir. These models use porosity, area, and thickness in a Monte Carlo simulation approach with various efficiency terms included to account for the fraction of accessible pore volume that will be occupied by the injected fluid (USDOE, 2008). Compressibility-based models are used to estimate carbon dioxide storage in closed reservoirs, which are separated laterally by low-permeability zones where the injected carbon dioxide is constrained by the compressibility of the formation's native fluid and rock matrix. The compressibility approach is generally used for fluids with nearly constant total compressibility and assumes a single-phase system; typical applications include single-phase oil reservoirs and confined saline formations.

Static models, typically applied to basin- or regional-scale assessments, can be used to quantify carbon dioxide storage estimates for oil and gas reservoirs, saline formations, and unmineable coal seams (Bachu et al., 2007; NETL, 2010). Standardized methodologies for estimating carbon dioxide storage capacity using static models have been adopted by the Carbon Sequestration Leadership Forum, and use of static methods has been proposed by DOE's Regional Carbon Sequestration Partnership Program. A comparison of methods proposed by the two groups can be found in Bachu (2008). Owners or operators should be aware of the limitations of any static model selected, including the model's limited ability to address factors that affect carbon dioxide storage capacity such as geologic heterogeneity, fault-sealing, well bore integrity, injectivity, formation geochemistry, the various trapping mechanisms, and the injection well configuration. While these models are employed more generally for basin- or regional-scale assessments, they also do not address issues related to far-field pressure buildup or native formation fluid (e.g., brine) displacement (Birkholzer and Zhou, 2009). Additional information on storage capacity estimation using static models is available in the Appendix.

### 3.4.3. Dynamic Models

Dynamic methods include decline curve analysis, material balance, and reservoir simulation (USDOE, 2008). Of these, reservoir simulation is the most advanced and the most resource-intensive option and may not be easily applicable to basin- or regional-scale assessments where the necessary data are limited. However, this approach is suitable for local- or site-scale assessments, such as a Class VI project, where site characterization data are available and numerical modeling is already employed for AoR delineation. Using this approach will allow the development of more realistic, site-specific storage estimates that account for site-specific factors (e.g., boundaries, formation heterogeneity, near- and far-field pressure buildup, formation fluid displacement, etc.) as well as project-specific factors (e.g., operational parameters, injection well configurations, well bore integrity, etc.). This approach can also be used to reduce uncertainty and refine estimates of storage capacity by integrating new field data and well testing information during operation.

Decline curve analysis, for which a specific injection rate-time relationship (e.g., exponential function) is assumed, can be used for estimating storage capacity; however, it can only be used for active injection operations (USDOE, 2008). This method is generally applicable to individual wells or entire fields as long as the injection rate and time data exhibit a trend that fits the assumed function. Similarly, the material balance approach is also more suitable for injection operations already taking place since it includes the cumulative carbon dioxide injection and the corresponding pore pressure at various times.

#### **3.4.4. Application of Methods for Estimating Carbon Dioxide Storage Capacity**

Storage capacity estimates needed to support a demonstration that the site meets the requirements of 40 CFR 146.83(a)(1) will initially be submitted along with the permit application, which also includes the required AoR delineation information under 40 CFR 146.84. The numerical modeling employed for delineating the AoR must be based on site characterization data and account for chemical and physical properties of all phases of the carbon dioxide injected [40 CFR 146.84(a)]. Therefore, EPA recommends performing dynamic storage capacity estimates, complemented by static methods as described below, in concert with development of the numerical modeling used for the AoR delineation. If another method is chosen by the owner or operator, the application used should account for the planned and proposed operational parameters and the site characterization data collected, and be consistent with the AoR delineation process.

In formulating an initial storage capacity estimate for site selection or screening activities, owners or operators may use static models in conjunction with available data on the project site. Additionally, static models can provide alternative assessments of storage capacity to confirm numerical modeling results if a reservoir simulation is chosen to determine and/or demonstrate the suitability of a site for a proposed project.

In depleted reservoirs that have been used for EOR, reservoir simulations may have been previously performed to predict reservoir behavior based on the amounts of carbon dioxide injected. In these cases, estimating storage capacity can be facilitated by continued use of reservoir modeling. In coalbed methane settings, the storage mechanism is relatively straightforward and may be done in a manner similar to reserves estimation (Bachu et al., 2007). A static model may be suitable for such settings, keeping in mind limitations in calculation of the storage efficiency factor; owners or operators are encouraged to discuss the suitability of such estimates with the UIC Program Director.

Estimation of storage capacity in deep saline formations will be more challenging than for depleted reservoirs or coalbed methane enhanced recovery settings because saline formations will involve several trapping mechanisms; in addition, fewer data may be available and existing data may be at a lower spatial resolution. Bachu et al. (2007) note that the storage capacity estimate needs to include the contributions from the various trapping mechanisms (structural/stratigraphic, solubility, residual, and mineral), and provide examples of using static model calculations for different trapping mechanisms. Numerical simulations can be used to explore this level of complexity at the site scale and are the most rigorous approach. However, the usefulness of reservoir simulation will be limited by the amount and quality of data available

at the time the estimate is made. In some cases, static models may provide an adequate initial estimate; however, EPA recommends that they be refined using dynamic modeling when adequate data become available. Any uncertainties about which approach is suitable should be discussed with the UIC Program Director.

See the Appendix for additional discussion of data needs for storage capacity estimates. EPA also strongly encourages owners or operators to perform sensitivity analyses to estimate the effects of uncertainty in the input data for all storage capacity estimates.

After injection commences, the owner or operator should periodically update and refine the estimate of carbon dioxide storage capacity based on new field data and well testing information. EPA recommends the use of dynamic modeling for updating carbon dioxide storage capacity estimates. Periodic reevaluations of the storage capacity should be done in conjunction with reevaluations of the AoR. For example, estimates of carbon dioxide trapping mechanisms from reactive transport modeling will affect storage capacity estimates. Likewise, alterations in storage capacity estimates may lead to changes in operational parameters. Evaluations of storage capacity and operational parameters may especially need to be revisited in case of unexpectedly high pressure buildup within the injection formation or evidence of fluid displacement that may cause significant risk of endangerment to USDWs.

### **Information to Submit**

In reporting storage capacity estimates, the owner or operator should submit:

- A description of the selected estimation method, including a discussion of its suitability for the type of formation;
- Tabulation of any input data used, along with estimates of uncertainty in those data;
- Results in tabular or graphic format;
- A discussion of the results, relating them to proposed operational parameters and the anticipated total volume of carbon dioxide to be injected and the duration of the project and any identified site-specific vulnerabilities (e.g., faults, fractures, etc.);
- A discussion of assumptions and limitations of the method used;
- A discussion of uncertainty based on the results of a sensitivity analysis; and
- A discussion of how the results are consistent with and/or supported by the AoR delineation modeling.

To support the UIC Program Director's evaluation of the data, EPA recommends that the owner or operator demonstrate that the storage capacity estimates support the anticipated injection rate and operational period, and that the anticipated total amount of injected carbon dioxide will not exceed storage capacity. The owner or operator should also demonstrate through sensitivity analyses that conservative estimates have been used for setting the proposed injection rate and volumes. An example evaluation of carbon dioxide storage capacity has been described by Asghari et al. (2006).

### 3.5. Demonstration of Confining Zone Integrity

The owner or operator must demonstrate the ability of the confining zone to contain the carbon dioxide [40 CFR 146.83(a)(2)] and not allow migration of carbon dioxide, either through interconnected pore spaces across the thickness of the seal or through the confining zone along faults or fractures. In particular, analyses may be needed to ensure that existing non-transmissive faults will not become transmissive under anticipated injection and storage pressures.

A number of approaches may be used to demonstrate competence of the confining zone. The Class VI Rule does not specify which methods should be used; rather, the choices of analyses and the data needed will depend on site geology. The methods described here are applicable to sites with single confining zones or multiple confining zones, if characterization of such additional zones is required by the UIC Program Director, per 40 CFR 146.83(b).

#### Data Collection and Analysis

An assessment of confining zone integrity will involve a synthesis of several types of information gathered through the site characterization process. In general, the following types of data may be used when demonstrating confining zone integrity:

- **Lithologic and stratigraphic data**, e.g., on the depth, thickness, and mineralogy of the confining zone (see Sections 2.3.3 and 2.3.4);
- **Structural data**, e.g., on faults and fractures, including fault geometry, depth of origin and termination, and the amount of displacement along the fault, including determinations of whether slip is consistent or variable along the fault and where such variations occur (see Sections 2.3.2 and 4.2);
- **Data from core analysis**, e.g., the capillary pressure, rock strength, permeability, and porosity (see Section 4.2);
- **Field formation testing data**, e.g., in situ fluid pressures, the magnitudes of principal stresses, and temperature (see Section 4); and
- **Geophysical survey data**, e.g., seismic, gravity, magnetic, or other geophysical methods (see Section 2.3.10).

Furthermore, while not a direct measure of integrity, the ability of the confining zone to contain natural oil and gas accumulations may serve as an additional line of evidence. Considerations for demonstration of confining zone integrity are presented in Section 3.5. Section 3.5.3 provides additional considerations for projects that will operate under injection depth waivers.

#### 3.5.1. Movement through the Confining Zone

Continuous confining zones lacking faults or fractures may still allow the transmission of carbon dioxide through interconnected pore spaces throughout the thickness of the seal. Movement across intact seals in a GS setting will likely be controlled primarily by capillary pressure and permeability:

- **Capillary pressure.** As a general rule, good seals will have capillary entry pressures between approximately 6 and 40 MPa (Duncan, 2009). EPA recommends that owners or operators verify that the capillary entry pressure is in excess of pressure increases expected from the buoyancy-driven accumulation of carbon dioxide. Computational modeling developed for AoR delineation can assist in evaluating whether predicted pressures will remain below the capillary entry pressure, but owners or operators should bear in mind that such a demonstration is constrained by the fact that capillary pressure measurements will only be available from limited point locations. Capillary pressure and related measurement techniques are discussed in Section 2.3.5.3; and
- **Permeability.** Once the fluid pressure exceeds the capillary pressure, fluid may flow through the layer at a rate controlled by the permeability and the fluid pressure (Duncan, 2009). A layer can make an effective seal even if the capillary entry pressure is low or if capillary entry pressure is exceeded, as long as the permeability is also low. Owners or operators should provide relative permeability-saturation-capillary pressure relationships derived from core analyses. They should discuss permeability of the confining zone in the context of other characteristics such as capillary pressure and thickness, and they may consider the performance of similar lithologies in other GS projects. Owners or operators may also consider numerical modeling to assess the potential effectiveness of the seal in inhibiting migration of carbon dioxide. See the Appendix for additional information on measurement of intrinsic permeability and relative permeability.

### 3.5.2. Transmission of Carbon Dioxide through Faults

A confining zone may be compromised if faults or fractures allow carbon dioxide movement across it. Faults can provide leakage pathways and fractures can be generated when capillary entry pressure and pore pressure exceed the rock strength. At that point, the layer will fracture before carbon dioxide enters into the pore spaces.

#### *Characterizing the Sealing Potential of Existing Faults or Fractures*

Faulted or fractured formations may seal carbon dioxide (Meckel, 2007), but EPA recommends that applicants verify confining zone integrity by characterizing the sealing potential of the formation. Any faults or fractures that intersect, originate, or terminate in the confining zone should be thoroughly characterized (i.e., dimensions, geometry, sealing properties) regardless of their size (Knipe et al., 2001; Meckel, 2007). Thorough characterization of these features is important because properties can be heterogeneous across the fault or fracture plane, complicating interpretation (Freeman et al., 1998). A fault or fracture may be sealing (non-transmissive) in some regions while remaining transmissive in others.

Owners or operators should also keep in mind that leakage can occur in complex seals composed of numerous variably permeable layers. For example, small faults and fractures that do not extend completely through the unit can connect permeable regions of the unit to form pathways for carbon dioxide migration (Ingram et al., 1997). These types of leakage pathways are likely to be more difficult to characterize because of their smaller scale.

EPA suggests several possible approaches to evaluate the likelihood of leakage occurring across existing faults or fractures, as follows:

- **Juxtaposition of units.** Faults are likely to be sealed against lateral movement of carbon dioxide across the fault if the fault juxtaposes conductive and non-conductive units on either side. An Allan chart can be used to determine which units contact each other along a fault surface (Knipe et al., 1998);
- **Leakage along faults.** The risk of leakage along a fault will be lower if sediments with a high capillary pressure and low permeability are found along or incorporated into the fault zone. These sediments will prevent migration of carbon dioxide along the fault for the same reasons they can prevent migration upward when present as a seal. Such materials can occur along the faults as a result of catalysis, diagenetic sealing, or by entrainment during fault movement. Owners or operators may use information from outcrops or cores that intersect the fault to evaluate whether such sediments occur in the fault zone;
- **Catalysis.** Breakdown of materials along the fault due to physical abrasion during fault slip can produce fine material that tends to have smaller pore throats and, correspondingly, high capillary pressure. Catalysis can reduce the permeability of high-porosity sandstones up to four orders of magnitude with only a few centimeters of slip and lead to sealing behavior along the fault (Yielding et al., 1997). Owners or operators may evaluate the degree of catalysis by examining hand samples, cores, or thin sections of samples taken from the fault zone. After evaluation, hand samples may be subjected to capillary pressure tests or other laboratory tests to quantify the effect of catalysis on pore size;
- **Diagenetic sealing.** Determining the amount of diagenetic sealing of a fault or fracture due to authigenic calcite or silicates requires the direct examination of core samples from the fault or fracture zone in the laboratory. In some cases, samples taken from nearby faults or outcrops may be used to infer the amount of diagenetic sealing on buried faults or fractures, provided that the faults or fractures examined originated in the same time period and that evidence at various scales (e.g., thin section, hand sample, outcrop) indicate that diagenetic behavior is similar throughout the unit;
- **Calculation of shale gouge ratio (SGR).** Materials from hanging- and footwalls in shale and other clay-rich formations can be incorporated along a fault, producing shale gouge. This fine-grained material helps to retard the flow of fluids along the fault. The amount of shale entrained by the fault from the shale/siltstone units the fault intersects can be estimated using the SGR (Freeman et al., 1998). This method works best for shale/sandstone/siltstone sequences. See the Appendix for additional information on calculation and interpretation of the SGR. Calculation of the SGR and other shale-entrainment methods requires accurate knowledge of lithology (specifically clay/phylosilicate content) and thickness in the area of the fault. This level of information may require new boreholes, seismic surveys, other geophysical surveys, and/or a refined analysis of fault geometry and extent. EPA encourages owners or operators to determine the SGR where it is feasible and appropriate; and
- **Pressure compartmentalization.** If a fault compartmentalizes regions of different subsurface pressure, it may be sealing (Huffman, 2002). This method requires both subsurface mapping of all faults within the area of interest and pore pressure

measurements. Pressure measurements can be taken directly from wells on both sides of the fault (Doughty and Karasaki, 2004), or indirect pore pressure data may be generated by transforming seismic velocity data into pore pressure (see Section 2.3.10 and the Appendix). An example figure is provided in the Appendix.

The owner or operator should be aware that use of seismic pore pressure estimates is still under development and can introduce errors, especially in subsurface environments that have not undergone significant subsurface exploration. Gathering sufficient subsurface pressure data by wells to use the pressure compartmentalization method may be labor intensive, and, although a pressure difference across a fault indicates sealing behavior, the lack of a pressure difference does not definitively indicate a transmissive fault.

### **3.5.3. Special Considerations for Characterizing Lower Confining Zones**

An owner or operator applying for an injection depth waiver must demonstrate the integrity of both the upper and the lower confining zones [40 CFR 146.95(a)(2)]. The basic methods for evaluating seal integrity remain the same whether the confining zone is above or below the injection zone. Estimates of thickness, permeability, fracture pressure, capillary pressure, and other parameters are recommended, as well as an understanding of whether the zone contains interbedded units of higher permeability. The owner or operator will also need to demonstrate that the confining zones are free of transmissive faults and fractures [40 CFR 146.95(a)(2)].

One important difference to consider between confining zones above and below the injection zone is that the upper confining zone will likely contact free-phase carbon dioxide prior to its dissolution while the lower confining zone may or may not contact free-phase carbon dioxide. However, both the upper and lower confining zones will be in contact with brine and may eventually be in contact with carbon dioxide-saturated brine. While capillary entry pressure is not relevant in the case of brine contacting a confining zone already saturated with brine, the capillary entry pressure of free-phase carbon dioxide in the lower confining zone should be determined and considered. See the *UIC Program Class VI Well Injection Depth Waivers Guidance* for additional information on applying for injection depth waivers.

#### **Information to Submit**

EPA encourages owners or operators to submit a discussion of confining zone integrity. The owner or operator should reference all relevant information from the site characterization and should provide a narrative discussing all lines of evidence used to support the demonstration. Details should be shown for any calculations performed (e.g., SGR), and images that support the demonstration should be annotated to illustrate relevant features. Not all types of analyses presented above may be needed, but the information presented should collectively indicate that the confining unit meets the requirements at 40 CFR 146.83. Any limitations in the data or analysis should be noted.

Because the parameters used to assess confining zone integrity are calculated from existing data, the reliability of the final measurement depends upon the quality of the input data, and errors will be propagated through any calculations done in support of this analysis. The owner or operator

should discuss any potential errors and how they may affect the evaluation of confining zone integrity.

Because fault properties may vary spatially along the fault, resulting in variability of sealing capacity, the owner or operator should communicate any uncertainties in the data and be cognizant of the need for additional analyses to represent any spatial heterogeneity.

### **3.6. Considerations for Secondary Confinement**

The Class VI Rule, at 40 CFR 146.83(b), provides the UIC Program Director with discretion to require the owner or operator to identify and characterize additional zones that will impede vertical fluid movement, are free of faults and fractures that may interfere with containment, allow for pressure dissipation, and provide additional opportunities for monitoring, mitigation, and remediation. This demonstration is needed to facilitate consideration of GS sites where the owner or operator or the UIC Program Director determines that an additional barrier to fluid movement is appropriate based on site-specific data.

These additional confining zones will not be needed in all circumstances, and the UIC Program Director would exercise their discretion to require characterization of secondary confinement if, for example, the first impermeable zone immediately above the injection zone can provide some confinement but may not demonstrate all of the properties needed to ensure that the carbon dioxide will not migrate. Characterization of a secondary confining zone may be needed if:

- The primary confining zone does not exhibit sufficient strength to allow injection at the proposed pressures;
- Known or suspected faults or fractures transect the primary confining zone and would interfere with containment of carbon dioxide;
- The primary confining zone is not sufficiently extensive to cover the entire maximum extent of the carbon dioxide plume and pressure front or it is not sufficiently thick and homogeneous over the entire area; or
- There is insufficient information or conflicting data about the primary confining zone.

#### **Data Collection and Analysis**

If the UIC Program Director requires information about a secondary confining zone, the owner or operator will need to demonstrate how the two layers would contain and prevent upward movement of the carbon dioxide. This demonstration should address how the two confining zones together meet all the requirements for confinement at 40 CFR 146.83(a)(2). Specifically, they should be free of faults that are transmissive throughout both confining zones, be of sufficient areal extent and integrity to contain the injected carbon dioxide stream and displaced formation fluids, and allow injection at proposed maximum pressures and volumes without initiating or propagating fractures. The owner or operator may also need to characterize the intervening zones between the primary and secondary confining zones to demonstrate that they allow for pressure dissipation and provide additional opportunities for monitoring or remediation.

Characterizing the secondary confining zone and any intermediate zones will involve the same methods that are used to characterize the primary confining zone. Some types of data, such as well logs or cross sections, will probably contain information about all subsurface formations, and the owner or operator would need to highlight information relevant to the additional confining zone and intervening layers.

If existing data or cores are used, the owner or operator should verify that they include coverage of the secondary confining layer and, ideally, any intervening units. If adequate data and/or samples are not available, additional sampling or analysis may be needed. If core samples are taken during drilling of a stratigraphic well, the owner or operator should ensure that the cores include representative samples from the primary and secondary confining zone, as well as any intervening layers. Owners or operators may need to obtain core analyses for samples from the secondary confining unit (e.g., porosity, permeability, capillary pressure, mineralogy, strength). Any relevant features on seismic or other geophysical images that help define the thickness and areal extent of the confining zone and characterize faults should be highlighted. In some cases, the owner or operator may need to establish the fracture pressure or fault sealing capabilities in the secondary confining unit.

Information on the potential for pressure dissipation within the intervening layers may come from AoR modeling that includes information about both confining zones and the intervening formations. If additional ground water quality monitoring or direct monitoring for carbon dioxide or pressure measurements in these zones is warranted, the owner or operator should demonstrate how such monitoring enhances the Testing and Monitoring Plan.

### **Information to Submit**

The owner or operator is encouraged to discuss with the UIC Program Director specific needs related to characterizing additional confining zones, including how the primary confining zone is deficient. This will establish the level of data collection and analysis that may be needed to demonstrate that the system of subsurface formations is sufficient to confine the carbon dioxide and protect USDWs from endangerment.

Based on the discussions, additional data collected, and additional analysis of the secondary confining zone, the owner or operator should submit to the UIC Program Director a description of the primary and secondary confining zones and the intervening layers, and how they will impede vertical fluid movement, allow for pressure dissipation, and provide additional sites for monitoring, mitigation, and remediation.

### **3.7. Reporting Process**

The Class VI Rule requires owners or operators to submit site characterization data collected pursuant to 40 CFR 146.82(a) and (c) with the permit application or prior to receiving authorization to begin injection, respectively (see the preceding sections of this document for specific recommendations on the types of information to submit). These data must be retained throughout the life of the GS project and for 10 years following site closure [40 CFR 146.91(f)(1)].

Under the Class VI Rule, regardless of whether a state has primary enforcement responsibility, owners or operators are required to submit site characterization data to EPA in an electronic format approved by EPA [40 CFR 146.91(e)]. The data and supporting documents may be submitted as PDF files, including charts, graphs, and tabular data. EPA also recommends that raw data be submitted, in separate files (e.g., LAS, Excel). Additionally, EPA recommends that maps be submitted in a GIS-compatible format, to further assist a more detailed and flexible review process by the UIC Program Director. For additional information on complying with the reporting requirements related to submitting site characterization data, please see the *UIC Program Class VI Well Recordkeeping, Reporting, and Data Management Guidance for Owners and Operators*.

## 4. Activities Performed Prior to Operation of a Class VI Well

Prior to commencing injection, owners or operators must provide extensive geologic and hydrogeologic data collected during the construction of a Class VI well to demonstrate to the UIC Program Director that the injection and confining zones are suitable for receiving and containing injected fluids [40 CFR 146.82(c)]. This section provides guidance on the formation and well testing and logging activities that the owner or operator must conduct to generate the information and data required to receive authorization to inject at a Class VI well.

The testing and logging activities described here provide the information and data that will be considered by the UIC Program Director in authorizing Class VI operation as identified in 40 CFR 146.82(c) and the formation testing requirements at 40 CFR 146.87. (The *UIC Program Class VI Well Construction Guidance* provides information on how owners or operators can meet the injection well testing requirements of 40 CFR 146.87.)

For new Class VI wells, these testing and logging activities are undertaken during and after drilling and construction of the new injection well. For Class VI wells to be transitioned from other classes of injection wells (or pre-existing monitoring, stratigraphic test, or production wells), the testing and logging information can be provided from previous and ongoing testing and monitoring of the formation and from well tests and logs conducted during the previous use of the well.

The activities described in this section include formation testing/logging, core sampling and analysis, and hydrogeologic testing to determine the physical and chemical characteristics of the injection and confining zones. Importantly, these post-well construction/pre-operational testing and logging data will provide updates to and can be synthesized with related injection and confining formation data obtained during the GS site characterization and submitted earlier as part of the Class VI permit application. Where appropriate, this section references related topics in Section 2 of this guidance.

Each section below describes the Class VI Rule requirements that relate to specific testing/logging activities and identifies the use or relevance of the information to be provided. Brief technical descriptions are provided in the Appendix for testing and logging methods and how required information and data can be generated or obtained. Where appropriate, subsections below also provide recommendations and special considerations for obtaining and interpreting data and note particular aspects of the formation and well characterization process that might warrant discussions with the UIC Program Director.

### 4.1. Well Logging

During the drilling and construction of a Class VI injection well, the owner or operator must run logs, conduct surveys, and perform tests when appropriate to determine or verify the depth, thickness, porosity, permeability, lithology, and salinity of any formation fluids in all relevant geologic formations [40 CFR 146.87].

These well logging activities supplement data on geologic and hydrogeologic properties of relevant subsurface formations collected during initial site characterization and are used to support building a conceptual understanding of the site, conducting the AoR determination, and designing the GS project. Performing a variety of logs provides complementary information on subsurface properties as well as taking advantage of the different levels of vertical resolution of the log types.

### **Data Collection and Analysis**

At a minimum, well logs must include resistivity, spontaneous potential, gamma ray, porosity, fracture finder logs, and any other logs the UIC Program Director requires based on the geology of the site [40 CFR 146.87(a)(2) and (3)]. These logs must be conducted before installation of the surface casing [40 CFR 146.87(a)(2)(i)] *and* before installation of the long-string casing [40 CFR 146.87(a)(3)(i)]. Any alternative methods that provide equivalent or better information must be approved by the UIC Program Director prior to implementation [40 CFR 146.87(a)(5)]. These types of logs are described in the Appendix; for further information on geophysical logging and analysis, see Asquith and Krygowski (2004), Telford et al. (1990), and NETL (2009).

### **Information to Submit**

The owner or operator must submit to the UIC Program Director a descriptive report prepared by a knowledgeable log analyst that includes an interpretation of the results of these logs [40 CFR 146.87(a)]. This report must be provided in an electronic format and should include:

- The date and time of each test, the date of well bore completion, and the date of installation of all casings and cements;
- Chart results of each log and any supplemental data;
- The name of the logging company and log analyst and information on their qualifications;
- Interpretation of the well logs by the log analyst, including any assumptions, determination of porosity, permeability, lithology, thickness, depth, and formation fluid salinity of relevant geologic formations; and
- Any changes in interpretation of site stratigraphy based on formation testing logs.

To support the UIC Program Director's evaluation of the logging results, EPA recommends that the owner or operator demonstrate that the collected information is consistent with other available site characterization data in the permit application and that the data support other assessments of stratigraphy and formation properties. The owner or operator should demonstrate that the logs were adequately performed and properly characterize all formations, and that logging tests were conducted by a knowledgeable log analyst. The UIC Program Director may compare the results of formation testing logs from different wells in the vicinity to interpret local stratigraphy and verify the depths and properties of the proposed injection and confining zones.

Where information gathered via the logs diverges from other data or supports different conclusions about the subsurface, the owner or operator should discuss in the report, and with the

UIC Program Director, the implications for any of the planned operational procedures, the AoR determination, or the GS project plans.

## **4.2. Core Analyses**

The Class VI Rule [40 CFR 146.87(b)] requires the owner or operator to take whole cores or sidewall cores of the injection and confining zones and formation fluid samples from the injection zone(s) and to submit to the UIC Program Director a detailed report prepared by a log analyst.

Core samples provide information to support stratigraphic correlation, interpretation of depositional environments, and wireline log calibration. Information from cores will be used to refine site characterization data submitted pursuant to 40 CFR 146.82(a). Core samples may also have been taken prior to well construction if a stratigraphic well was drilled during initial site characterization.

### **Data Collection and Analysis**

#### ***Core Sampling***

Decisions about the type of coring to perform will ultimately depend upon logistics and the type of lithology to be cored. Detailed information on the various coring methods is available in Whitebay (1992). Proper drilling methods should be practiced to maintain zonal isolation when penetrating the confining zone or any over- or under-pressured zones.

Core samples must be taken from the injection and confining zones [40 CFR 146.87(b)]. Owners or operators may also consider analyzing samples from the first permeable formation overlying the confining zone or from other permeable formations and confining zones farther up in the stratigraphic column. The lower confining zone should be included if the owner or operator has been granted an injection depth waiver (see the *UIC Program Class VI Well Injection Depth Waivers Guidance* for additional information on the injection depth waiver application process).

The optimal number of samples to analyze will vary by site, but representative samples should be chosen from cores and core sections with different lithologies and characteristics (e.g., texture, grain size). Heterogeneous formations would warrant more closely spaced core samples than uniform formations. For heterogeneous formations with many fractures or solution features, it may be preferable to examine the complete length of full-diameter core in the interval being tested. Owners or operators may have also used a geostatistical approach to model the distribution of permeability and porosity in the injection and confining zone(s); selection of core samples during drilling and construction of the Class VI well should be planned to further refine such estimates.

#### ***Core Logging and Analysis***

Core logs should include descriptions or indications of: lithology, thickness, grain size, sedimentary structures, diagenetic features, contacts, textural maturity, oil staining, fracturing,

and porosity. Laboratory analysis of cores should include petrology and mineralogy; petrophysical properties; and geomechanical properties (see Sections 2.3.4 through 2.3.6). Owners or operators may consider special core analysis (SCAL) to obtain an in-depth suite of tests for parameters relevant to GS, such as relative permeability, capillary pressure, fluid compatibility, wettability, and pore volume compressibility.

### **Information to Submit**

Owners or operators must submit to the UIC Program Director a report prepared by a log analyst [40 CFR 146.87(b)]. Owners or operators should review the report prior to submission to ensure that it is complete and includes information on methods, notes on QA samples and calibration of instrumentation as appropriate, results in tabular and/or graphic form, and photographs as appropriate. Where information from the core analysis diverges from other data or supports different conclusions about the subsurface, the owner or operator should discuss in the report, and with the UIC Program Director, the implications for any of the planned operational procedures, the AoR determination, or the GS project plans.

### **4.3. Characterization of Injection Formation Fluid Chemical and Physical Properties and Downhole Conditions**

The Class VI Rule requires the sampling and characterization of the chemical and physical properties of the formation fluids in the injection zone [40 CFR 146.82(a)(8) and 146.87(b)] as well as recording of the fluid temperature, pH, SC, reservoir pressure, and static fluid level [40 CFR 146.87(c)]. Fluid sampling and recording of downhole pressure, temperature, SC, and pH provides information to support a determination of the compatibility of the injectate with the formation fluids [40 CFR 146.82(c)(3)].

### **Data Collection and Analysis**

Information on downhole pressure, temperature, pH, and SC can be obtained before completion using formation testing tools. Such tools may also record other parameters such as fluid density and fluid carbon dioxide. Alternatively, downhole conditions may be recorded after completion using wireline tools.

Fluid sampling can be done before well completion using wireline sampling devices, or after well completion. If sampling is performed before completion, the well bore should be cleaned of drilling mud as much as possible before the sample is taken (Nagarajan et al., 2007). After well completion, samples can be collected downhole using devices such as a flow-through device (see the *UIC Program Class VI Well Testing and Monitoring Guidance*), or at the surface by pumping the fluids for collection. Analyses generally include major anions and cations, pH, temperature, pressure, alkalinity, TOC, and total inorganic carbon (see Section 2.3.9).

### **Information to Submit**

To meet the requirements of 40 CFR 146.82(a)(8) and 146.87(b), the owner or operator should submit the following information to the UIC Program Director:

- Type of sampling equipment used and field procedures (e.g., sample preservation);
- If the sample was pumped, flow rate, type of pump, and location of the pump, and geochemical modeling results indicating the likely geochemical makeup of the fluids at downhole conditions;
- Data for field measurements (pH, SC, temperature, pressure);
- Laboratory results, including QA samples (e.g., blanks, duplicates, matrix spikes); and
- Notes on any anomalous data.

To support the UIC Program Director's evaluation of the data, EPA recommends that the owner or operator demonstrate that they used proper field techniques to obtain samples. Where information gathered via formation testing diverges from other data or supports different conclusions about the injection and confining zones, the owner or operator should discuss with the UIC Program Director, and in the report, the implications for any of the planned operational procedures, the AoR determination, or the GS project plans.

#### **4.4. Fracture Pressure of the Injection and Confining Zones**

Owners or operators must determine or calculate the fracture pressure of the injection and confining zones [40 CFR 146.87(d)(1)]. This information, in conjunction with predictions of pore pressures within the injection zone, is used to support the determination of an appropriate injection pressure to ensure that injection will not initiate or propagate fractures in the confining zone [40 CFR 146.83(a)(2)]. In addition, this information can be used to confirm or refine the preliminary site characterization information described in Section 2. Where the owner or operator has received an injection depth waiver, they should provide information on the fracture pressure of the lower confining zone(s) to support the determination of injection pressures that do not compromise confinement below the injection zone.

In addition, owners or operators may be asked by the UIC Program Director to determine or calculate other physical and chemical characteristics of the injection and confining zone(s) [40 CFR 146.87(d)(2)]. Any such request will be site-specific and would likely involve gathering data to augment other information gathered during the site characterization process, address any data anomalies or inconsistencies, support the development of the AoR delineation model, or support setting of permit conditions (e.g., operational limits).

### **Data Collection and Analysis**

The step rate test is a common method for determining the fracture pressure of a formation (see the Appendix and USEPA, 1999 for additional detail). EPA recommends the use of downhole pressure gauges during the test. If a surface gauge is used, the reading needs to be corrected to obtain the downhole pressure and the correction factor will need to account for friction. For wells with depths greater than 3,000 feet, the uncertainty in the friction correction may introduce too

much error to allow for an accurate reading (McAleese, 2000). EPA recommends using two pressure gauges to ensure that there is a backup if one gauge fails. Additionally, the flow meter should be calibrated prior to the test (USEPA, 1999).

### **Information to Submit**

For the UIC Program Director to appropriately evaluate the fracture pressure calculation, as required at 40 CFR 146.87(d)(1), EPA recommends that the owner or operator submit the following information:

- Type and location of the pressure gauge;
- Type of flow meter and calibration records;
- Raw pressure and flow data;
- Plot of flow rate versus pressure data; and
- Discussion of any anomalous data.

To support the UIC Program Director's evaluation of the data, EPA recommends that the owner or operator demonstrate that proper test conditions were obtained and that the proposed operating pressure is appropriate based on the information gathered and the predicted (modeled) pore pressures throughout the injection zone. The owner or operator should also demonstrate that proper correction factors were used if the gauges were not deployed at the bottom of the well bore and that a constant injection rate was used at each step period.

The owner or operator should also discuss how the calculated fracture pressure compares with data from core tests or other wells in the area. Where this information is not consistent with existing data or supports different conclusions about the subsurface formations, the owner or operator should discuss in the report, and with the UIC Program Director, the implications for any of the planned operational procedures (e.g., injection pressure).

Data from the step rate test may also be helpful in designing well stimulation programs. Step rate tests can be carried out in conjunction with hydrogeologic testing described in Section 4.5 in order to determine other reservoir properties such as transmissibility.

## **4.5. Hydrogeologic Testing**

The Class VI Rule requires hydrogeologic testing of the injection well before injection operations begin. A pressure fall-off test and either a pump test or injectivity test [40 CFR 146.87(e)(1)–(3)] must be performed. These tests are designed to verify information on the injectivity of the injection zone to support the setting of permit limits for carbon dioxide injection rates and volumes. Injectivity depends on parameters such as porosity, permeability, and connectivity. Many of these parameters will have been measured during the initial site characterization. Hydrogeologic testing can verify these parameters and can also help determine any local reduction in permeability near the well bore caused by the well construction process, often referred to as the skin factor. Hydrogeologic testing can also be used to determine if a stimulation program is necessary and aid in the design of such a program. Data from

hydrogeologic testing may also be useful in verifying the computational model for AoR determination.

#### **4.5.1. Pressure Fall-Off Tests**

Pressure fall-off tests are conducted on a well to verify several hydrogeologic parameters: the transmissibility of the injection zone, the static injection zone pressure, and the skin factor. Pressure fall-off tests can also indicate if there are faults and fractures near the well bore.

#### **Data Collection and Analysis**

EPA recommends the use of downhole gauges with surface displays for fall-off tests. The surface readout allows real time reading of the pressure and allows any anomalies to be noted and potentially corrected while the test is being conducted rather than during data analysis. Using two pressure gauges will provide a backup in case one fails and will provide two data sets which can be used to verify the accuracy of the test.

The appropriate injection and shut-in periods are determined based on site-specific parameters and the desired area for which data will be gathered. It is important that the flow rate during injection is constant and that the test is conducted over a sufficient period of time so that the pressure effects seen are not caused by the well bore but reflect the reservoir conditions. If the pressure fall-off test is to be used to examine reservoir features such as faults, non-homogenous areas, or other wells, the time should be long enough to allow the pressure effects from those areas to be seen. EPA Region 6 has published a guidance entitled “The Nuts and Bolts of Falloff Testing” (USEPA, 2003) that provides guidance on determining the appropriate injection and fall-off times, along with many other technical details.

#### **Information to Submit**

For the UIC Program Director to appropriately evaluate the fall-off test, EPA recommends that the owner or operator submit the following information:

- Raw pressure data;
- Flow data from the injection portion of the test;
- Test parameters (injection time, shut-in time, fluid viscosity, temperature, well bore diameter, pressure gauge type and location);
- Semi-log plots used for data analysis;
- Parameters calculated from the analysis; and
- Discussion of the results, including data quality and any anomalous values.

If the fall-off test data were used to verify computational model results, the owner or operator may also want to reference those results.

To support the UIC Program Director's evaluation of the data, EPA recommends that the owner or operator provide sufficient information to demonstrate the validity and results of the test. For

example, the owner or operator should demonstrate that pressure gauge data accurately capture the full range of test data and that the gauge was either properly placed to measure downhole pressure or appropriate corrections were made to calculate downhole pressure. The owner or operator should also demonstrate that a steady rate was held before the shut-in portion of the test was begun and that the time frame of the test was sufficiently long. The owner or operator should demonstrate that the semi-log plots were linear and explain any non-linearities against other data submitted for the site characterization.

EPA recommends that any interpretation of anomalies be corroborated with other data. For example, if an anomaly is proposed to have been caused by a fault, then the owner or operator should review and provide information from geologic maps and seismic data to determine if faults are documented in the area indicated by the pressure transient analysis.

Finally, the owner or operator should demonstrate that the results of the analysis are consistent with other site data. For example, transmissivity values calculated from the fall-off test may be compared to permeability values determined from cores. Where the information diverges from other data or supports different conclusions about the subsurface, the owner or operator should discuss the implications for any of the planned operational procedures, the AoR determination, or the GS project plans.

#### **4.5.2. Injectivity and Pump Tests**

Injectivity and pump tests are used in a manner similar to pressure fall-off tests to determine the transmissibility of the reservoir, the skin factor, and to identify nearby faults or fractures. The tests are subject to less interference from the well bore than pressure fall-off tests, but they are subject to more noise in the pressure data from the flowing fluid. Obtaining data from both a fall-off test and an injectivity or pump test allows verification of data, because, in some cases, more than one factor can yield similar pressure response curves.

#### **Data Collection and Analysis**

Injectivity testing involves pumping carbon dioxide into the well at a constant rate and recording the pressure response in the well. A pump test is similar to an injectivity test, but fluid is pumped from the well instead of injected. Either test can be used to fulfill the requirement at 40 CFR 146.87(e), and they should yield the same results. Injectivity tests are more commonly used in injection well applications. As with fall-off tests, placing the pressure gauge downhole reduces inaccuracies that are caused by friction loss in the well bore. Generally, with wells over 3,000 feet deep, downhole pressure gauges should be used (McAleese, 2000). Dual pressure gauges are also recommended to ensure that a backup gauge is available.

The rate of injection on an injectivity test should be low enough that the fracture pressure of the formation is not exceeded. The injection rate should be held constant long enough that radial flow is established and there are no near-well bore pressure effects. Variable flow rates or too short of an injection period may lead to poor test results.

Several variations on injectivity testing may be performed. A multi-rate injection test uses two or more injection rates to produce more data for a more complete analysis. Each injection rate is held long enough to obtain radial flow. In interference tests, fluid is injected into one well and the pressure is measured at another well. The interference test can yield information on the porosity and compressibility of the formation between the two wells. If planned properly, a pressure fall-off test can also be conducted following an injectivity test.

Pressure data from each of these tests are analyzed in the same way, using the same types of plots as those used for pressure fall-off tests. If the semi-log plots are not linear, this is likely due to errors in the assumptions underlying plot construction. Such errors could include non-constant injection rates, non-homogenous reservoir properties, interfering wells, or faults.

### **Information to Submit**

Data submitted for injectivity or pump tests would be similar to data for a pressure fall-off test and should include:

- Raw pressure data;
- Flow data including rates and times;
- Test parameters (injection time, fluid viscosity, temperature, well bore diameter, pressure gauge type and location);
- Semi-log plots used for data analysis;
- Parameters calculated from the analysis; and
- A discussion of the results, including data quality and any anomalous values.

To support the UIC Program Director's evaluation of the data, EPA recommends that the owner or operator demonstrate that the test results are valid and verified, and that the data are consistent with other collected data. For example, the owner or operator should demonstrate that pressure gauge data accurately capture the entire range of injection pressures used. The owner or operator should also demonstrate that gauges were properly located to provide accurate bottomhole readings and/or that surface pressure readings were properly corrected to obtain bottomhole pressure.

The owner or operator should demonstrate that flow data and flow meters were calibrated and that a constant flow rate was maintained. The owner or operator should show that semi-log plots are linear and explain any anomalies, comparing data as necessary to other information collected during site characterization to aid in interpretation. Any deviations from linear behavior should be analyzed and a cause determined and documented. Because an anomaly may be caused by more than one type of phenomenon, any interpretations of anomalies should be verified using independent data. Where information from injectivity or pump tests diverges from other data or supports different conclusions about the subsurface, the owner or operator should discuss the implications for any of the planned operational procedures, the AoR determination, or the GS project plans. If the injectivity or pump test data were used to verify computational model results, the owner or operator may also want to reference those results.

## Introduction

This Appendix provides background information on some of the activities that will be performed as part of site characterization for a GS project that meets the requirements of 40 CFR 146.82 and 40 CFR 146.87. The *UIC Program Class VI Well Site Characterization Guidance* assumes that owners or operators are familiar with many of the available techniques used in assessing proposed GS sites, and it focuses on how these techniques should be applied to meeting the Class VI Rule requirements. This Appendix presents additional information, including examples of the application of various techniques in GS or other scenarios, on certain activities that reviewers of the draft guidance suggested was too detailed for the guidance document. It also refers the reader to additional sources of published information that are publically available.

This Appendix includes the following sections:

- A1, Information to Support Development of Maps and Cross Sections of the Area of Review, Determination of Formation Thickness, Illustration of Structural Geology, and Facies Analysis, which augments Sections 2.3.1 and 2.3.3 of the guidance;
- A2, Information to Support Petrologic and Mineralogic Analysis, which supports Section 2.3.4 of the guidance;
- A3, Information to Support Submittal of Data on Porosity, Permeability, and Capillary Pressure of the Injection and Confining Zones, which supplements the information in Section 2.3.5 of the guidance;
- A4, Information to Support Geomechanical Characterization of the Confining Zone, which supports Section 2.3.6 of the guidance;
- A5, Information to Support Fault Stability Analysis and Analysis of Confining Zone Integrity, which provides additional information related to Sections 2.3.2 and 3.5 of the guidance;
- A6, Information to Support Geophysical Characterization, which provides additional information related to Section 2.3.10 of the guidance;
- A7, Information to Support Demonstration of Storage Capacity, which supplements Section 3.4 of the guidance; and
- A8, Information to Support Pre-Injection Logging and Testing, which relates to the information in Section 4.1 of the guidance.

## **A1. Information to Support Development of Maps and Cross Sections of the Area of Review, Determination of Formation Thickness, Illustration of Structural Geology, and Facies Analysis**

To support owners or operators as they compile and/or prepare maps and cross sections of the AoR, as required by the Class VI Rule at 40 CFR 146.82(a)(3)(i), the sections below provide background information on stratigraphic cross sections, structural cross sections, and dipmeter logs. This information also supports determination of formation thickness [40 CFR 146.82(a)(3)(iii)] and local structural geology [40 CFR 146.82(a)(3)(vi)]. Information is also provided on facies analysis; a description of facies changes is required at 40 CFR 146.82(a)(3)(iii), and owners or operators may elect to do a more thorough facies analysis to help in developing the site conceptual model. For additional information and recommendations regarding this information, please see Sections 2.3.1 and 3.1 of the guidance.

### **Stratigraphic Cross Sections**

Stratigraphic cross sections show characteristics of correlatable stratigraphic units relative to a chosen geologic layer, or datum. Cross sections can rely on and incorporate data from a variety of sources, including logs, seismic data, cores, and cuttings. Figure A-1 shows an example of a schematic stratigraphic cross section that also displays log data.

The choice of a datum (the level or reference horizon) is a key part of developing a stratigraphic cross section. By displaying geologic units relative to the datum, the stratigraphic cross section may illustrate geologic relationships as they existed at a previous time (i.e., prior to deformation). In many cases, an unconformity (such as a buried erosion surface) is used as a datum because unconformities often represent relatively uniform time horizons (Boak, 1992).

Stratigraphic cross sections may be produced with various orientations relative to structural features. Sections oriented perpendicular to the depositional strike show facies changes toward or away from the basin margin, while sections oriented parallel to the depositional strike show lateral variations of particular units or sequences (Boak, 1992; Evenick, 2008). Another common orientation is perpendicular to a fold axis or major fault (Groshong, 2006). Furthermore, while cross sections are normally presented perpendicular to the ground surface, only cross sections oriented perpendicular to the dip of the units will show the true bedding thickness (Groshong, 2006).

Cross sections can be checked for accuracy by restoring deformed strata to an original, undeformed state, where there are no gaps or overlaps between sedimentary layers. This technique may not be possible for complexly deformed areas and requires simplifying assumptions (such as consistent thickness) about the original depositional characteristics of the layers. In addition, this technique is not applicable to non-homogenous strata such as salt domes and reefs (Evenick, 2008).

Cross sections can be anchored or projected (Evenick, 2008). Anchored cross sections have direct well control; they are either pinned (have at least one well directly on the surface trace of

the cross section) or tied (the trace follows a line from well to well). While tied cross sections have the advantage of direct data, they often enhance out-of-plane features and distort the thickness and other properties of subsurface layers (Evenick, 2008).

Projected cross sections have no direct well control. Projected cross sections may be bounded or synthetic. Bounded cross sections have data projected from nearby wells, and synthetic sections are not based on direct data. Projection of data onto the trace should be done carefully to avoid introducing error. Common methods include along dip, with structural contours, and within dip domains (groups of dips). See Groshong (2006) for more information on projected cross sections.

**Figure A-1: Interpreted Cross Section.**

Constructed from well log data. Distance scale is irregular to make the cross section more compact. Gamma ray logs are displayed to the left of the well, and conductivity is displayed to the right. From: Kirschbaum and Hettinger (2004).

## Structural Cross Sections

Structural cross sections illustrate the subsurface relationships and structural features of rock units. Cross sections are generally most useful when oriented perpendicular to major structural trends, although bends in the section can be used to show variable structural trends or other features (Boak, 1992). Additional smaller cross sections can be included to illustrate specific features such as faults. Structural cross sections may reference attached stratigraphic cross sections if correlations are difficult. Figure A-2 shows an example of a structural cross section.

Stratigraphic and structural cross sections are developed using similar methods. For a structural cross section, the datum is generally sea level, and units are drawn above or below that elevation according to their present positions (Boak, 1992). Unlike stratigraphic cross sections, structural cross sections are generally drawn with little or no vertical exaggeration; this allows the cross section to accurately represent the relative positions of the layers.

**Figure A-2: Structural Cross Section of the Soan Syncline, Kohat-Potwar Geologic Province, Upper Indus Basin, Pakistan.**

From: Wandrey et al. (2004).

## Dipmeter Logs

Dipmeters are designed to measure the dip of the stratum and the dip direction of layered rock surfaces that intersect the well. To generate a dipmeter reading, microresistivity sensors are mounted on a caliper logging tool. A minimum of three calipers is needed, but most modern dipmeters have six or more sensors to provide redundancy in case of failure, as well as to improve results (Johnson and Pile, 2006). The dip is calculated based on depth, the positions of the sensors, and the diameter of the well. If two or more sensors are present on the same caliper, small-scale features such as cross-bedding and directional sand transport can sometimes be identified (Johnson and Pile, 2006). Dipmeter logs can also be used to identify structural features such as faults and folds when compared to standard dip models such as the one shown in Figure A-3.

## TILTED ANTICLINE

Plunging 10° N

## Facies Analysis

Facies analysis can inform conclusions about whether to expect good lateral connectivity within the formation and whether there are barriers to vertical connectivity. Ambrose et al. (2008) have discussed the importance of facies changes to GS projects. Beach and barrier island deposits, for example, tend to be homogeneous and continuous. Fluvial facies produce heterogeneity in the reservoir because the fluvial channels are associated with fine-grained floodplain deposits; this heterogeneity may produce more limited, poorly connected areas for carbon dioxide storage. In some settings (e.g., the GS project at Sleipner), mudstone layers serve as permeability barriers, forming baffles that limit the buildup of buoyant pressure in the injection formation (Chadwick et al., 2008).

Variable porosity/permeability distributions are related to grain sizes, facies changes, and variability in cementation (Norden et al., 2010), and a good facies model will be valuable for understanding these variations. However, some fine-grained deposits may also have high porosity and permeability. These grain size and facies variations cannot be used exclusively as an indicator of permeability. Furthermore, diagenetic (post-deposition) processes also govern the characteristics of formations, especially carbonates. Like descriptions of clastic systems, descriptions of carbonate facies are based on observations of rock fabrics and pore spaces from core and cutting samples. These descriptions are correlated with wireline log responses and other information to map porosity, saturation, and permeability (Lucia, 1992). Because the

characteristics of carbonates are often strongly (and sometimes completely) determined by the sediments' interactions with formation fluids, understanding current and past hydrogeology is also important in the analysis of carbonate facies.

A sequence stratigraphic approach focuses on surfaces (unconformities) that divide the sediments into chronostratigraphic units and allows strata to be correlated and then extrapolated to areas where data are lacking. Sequence stratigraphy is well established and is widely used in the oil and gas industry to characterize reservoirs and may be a useful approach for a GS project; it has already been used in the characterization of facies in some GS projects (e.g., Gibson-Poole et al., 2005). Additional information is available in the following sources: Lang et al. (2001); Van Wagoner et al. (1990); Posamentier and Allen (1999).

## **A2. Information to Support Petrologic and Mineralogic Analyses**

The Class VI Rule requires the owner or operator of a proposed Class VI injection well to submit data on the mineralogy of the injection and confining zone(s) [40 CFR 146.82(a)(3)(iii)]. This section provides background information on conducting petrologic and mineralogic analyses to support meeting this requirement, including analysis by polarized light microscopy, scanning electron microscopy, and XRD. For additional information and recommendations, see Section 2.3.4 of the guidance (Petrology and Mineralogy of the Injection and Confining Zones).

### **Examples of Mineralogic and Petrologic Features Relevant to GS**

The most common lithologic types in oil and gas reservoirs and deep saline formations are sandstone, limestone, and dolomite. The major minerals in sandstones include quartz and feldspar, with calcite (often as cement) and clay fines common as lesser components. Limestones and dolomites consist primarily of carbonate minerals (calcite, aragonite, dolomite). “Impure” limestones may have minor quartz grains, pyritic limestone contains pyrite, and argillaceous limestones contain clay components (Williams et al., 1982). Figures A-4 and A-5 show examples of thin sections of a sandstone and a fossiliferous limestone.

Shales and mudstones (clay-silt mixtures) will be common in the confining zones of GS projects. These lithologies consist of clay minerals and small particles of quartz, feldspar, and mica. Individual particles may be difficult to see by optical microscopy (Figure A-6), and, aside from general confirmation of the lithology and texture, limited information can be gained. If detailed information is desired, a scanning electron microscope (SEM) may be considered.

Some of the textural features that might be observed in thin sections and under SEM include cementation (secondary minerals providing cohesion to the rock), dissolution features (indicative of removal of minerals), pore size and shape, and the presence of fine clay minerals. For example, in Figure A-5, the carbonate cement can be seen infilling voids within the fossils and in between the fossil fragments. The extent of these features is integral to understanding porosity and permeability and for anticipating changes that may take place as a result of interactions between the injectate, native fluids, and formation solids.

The composition, grain size, grain shape, and sorting seen under a microscope can all be used to infer the depositional environment. This facies analysis can help in locating changes in physical parameters. For example, if grain size is seen to decrease upwards, a corresponding decrease in permeability may be seen. Such observations are considered a routine part of the determination of reservoir quality in the oil and gas field (e.g., Grier and Marschall, 1992) and would be valuable as part of storage formation characterization. A detailed discussion of the genesis, composition, and textures of rocks is also provided in Williams et al. (1982).

## Analysis by Polarized Light Microscopy

The petrographic microscope is a fundamental tool for identifying and characterizing rock and mineral samples. Samples are prepared by mounting chips of the rock onto glass slides, cutting and grinding down to a thickness of 30 microns, and polishing. Poorly consolidated samples are often impregnated with epoxy prior to cutting them into chips.

A petrographic microscope is a transmitted light microscope designed for the examination of rock thin sections. It includes a rotating stage and polarizers both above and below the stage; the specimen is examined both with the upper polarizer in place (“crossed polarizers” or “crossed nicols”) and with it removed (“plane polarized light”). When the upper polarizer is inserted, the vibration directions of the two polarizers are perpendicular. This arrangement takes advantage of the optical properties of minerals; those that are not isotropic have more than one index of refraction, and light passing through is split into separate rays with different velocities. Under crossed polarizers, the difference in the velocities produces interference colors, which helps with mineral identification when taken together with cleavage, shape, and other characteristics.

Petrographic microscopes have remained relatively unchanged in principle since their development in the late 1800s. Edwards (1916) and Kerr (1959) are examples of classic texts that are still available on the optical properties of minerals, descriptions of the petrographic microscope, and mineral identification using the microscope. Basic descriptions of petrographic microscopes are commonly available on the Internet.

Careful petrographic analysis can provide information about the minerals present, the relationships among them (e.g., overgrowths), textures, grain size, and weathering (e.g., rounded grains in a clastic sediment). Williams et al. (1982) provide details on the mineralogy and textures to be expected in different rock types and how they relate to rock formation.

## Scanning Electron Microscopy

SEM uses a beam of electrons instead of visible light, permitting much higher resolution and magnification than a petrographic microscope. The term “scanning” refers to the raster pattern used in moving the electron beam over the sample surface (similar to a television). The same thin sections prepared for light microscopy can be used in a scanning electron microscope. Also, unconsolidated samples can be prepared for analysis by mounting them onto a glass slide using adhesive.

The most common use of an SEM is for secondary electron imaging (SEI). In this mode, it produces a high resolution image of the sample surface with good depth of field. This function can image grain morphology and other features in loose samples affixed to a slide, but it is not appropriate for thin sections because they are polished flat. The oil and gas industry uses SEM in this capacity for assessment of reservoir quality (Grier and Marschall, 1992).

With thin sections, an SEM can be used in backscattered electron (BSE) mode. The signal from backscattered electrons depends on the atomic weight of the material being examined. Minerals are seen with different levels of brightness, with higher density minerals appearing brighter. This

can be helpful for distinguishing minerals that appear similar under light microscopy. The same types of textural relationships would be seen as with a petrographic microscope, but very fine grains such as clay minerals and other clay-sized particles can be identified, as can mineral coatings and cements. Also, an elemental analysis of the minerals can be obtained if the SEM is equipped for energy-dispersive X-ray spectroscopy or wavelength-dispersive X-ray spectroscopy. Such analyses are point measurements, allowing analysis of specific sections of a mineral grain or of cements and grain coatings. Energy-dispersive spectra can be quickly viewed during examination as a qualitative aid in mineral identification in addition to being used for quantitative analysis.

Images taken in BSE mode can be used in petrographic image analysis to calculate estimates of porosity, permeability, and capillary pressure based on 2D measurements (Welton, 2004).

### **X-ray Diffraction**

XRD may be useful for verification of mineralogy or identification of clay minerals. XRD helps to identify minerals based on structure rather than chemistry. The most common method for geologic samples is powder XRD, in which a slurry of the ground specimen is allowed to dry on a glass slide, which is then placed in the diffractometer. The sample is exposed to a beam of X-rays, which are diffracted by the various planes within the structure of the mineral. The angle of refraction for each plane is determined by Bragg's Law. During the analysis, a detector is moved through a range of angles relative to the sample and registers the angles at which X-rays are detected. The resulting pattern of X-ray peaks is used to identify the mineral. If multiple minerals are present, the patterns will be superimposed upon each other, and a qualitative estimate of the relative quantities of the minerals may be possible. XRD may be especially useful for identifying clay minerals, which are too fine to fully characterize by polarized light microscopy. Moore and Reynolds (1989) provide a thorough coverage of the theory and practice of XRD, with a focus on its application to clay minerals.

### **Use of Mineralogic and Petrologic Information**

Data on the characteristics of the solids in the injection and confining zone(s) can also support an evaluation of the potential for geochemical reactions between the carbon dioxide, brine, and minerals that may cause changes in geomechanical and operational parameters or result in mobilization of contaminants. Lowered pH in the near-well bore region would promote dissolution of any carbonate minerals and cements in the injection formation, and precipitation of carbonates may occur in the more distal regions where pH is higher. Such reactions may affect porosity, permeability, and injectivity (Cailly et al., 2005). The kinetics of the dissolution and precipitation of silicates in clastics are slower (Palandri and Kharaka, 2004); certain lithologies such as clean sandstones will be less reactive in a carbon dioxide-rich system. Certain reactive clays and mafic silicates, however, may provide cations for precipitation of authigenic carbonates. Relatively rapid formation of carbonates would be expected in basalts (McGrail et al., 2006). Sulfide minerals and iron oxides may be dissolved and can liberate metals. Thus, an accurate assessment of mineralogy is important for predictions of long-term effects of injection on the properties of the injection formation.

### **A3. Information to Support Submittal of Data on Porosity, Permeability, and Capillary Pressure of the Injection and Confining Zones**

Owners or operators must submit data on porosity, permeability, and capillary pressure of the injection and confining zones, per 40 CFR 146.82(a)(3)(iii). This section provides background information to support meeting this requirement. For recommendations on meeting this requirement, see Section 2.3.5 of the guidance on Porosity, Permeability, and Capillary Pressure of the Injection and Confining Zones. Additional information on capillary pressure is also provided in Section A8 of this Appendix.

#### **Porosity**

##### **Factors Affecting Measured Porosity**

Porosity is controlled by many variables. In sedimentary rocks, porosity is a function of the packing, sorting, grain size, and grain shape of the individual particles as well as in situ stress (Cone and Kersey, 1992). Pore space can occur as space between grains, as micro-scale pores along grain surfaces or other boundaries (when spaces are less than 2  $\mu\text{m}$ ), or along fractures. It can also be controlled by dissolution features (typically in carbonates). In clastic rocks, intergranular pore space is generally the most significant, especially in loosely packed, medium to large grain well-sorted lithologies such as clean sandstones. Fractures are usually the most important contributors to porosity in non-sedimentary rocks although there are exceptions, e.g., vuggy basalts can have porosities up to 12% (Fetter, 1988). Clastic rocks on average have the highest porosity of any rock type, with sandstones having up to 40% pore space (Cone and Kersey, 1992). The porosity of carbonates varies widely but is usually between 5 and 25% (Cone and Kersey, 1992).

Shales, which generally are potential sealing formations, usually have higher porosity than sandstones upon deposition (up to 80%) but experience rapid decreases in porosity with burial compaction and additional diagenesis (Avseth et al., 2010). The mean porosity for over 100 samples of Devonian-age shale was 3.6–4.1%, with extremes of 1.2–7.6% when measured using helium gas resaturation (Davies et al., 1990). However, the study also noted difficulties in measuring shale porosity because low values may be near the resolving limit of some techniques and small pore size (averaging 0.05  $\mu\text{m}$  in some shales (Soeder, 1988)) can complicate some techniques.

The method of sample collection can influence the measured porosity. For lithologies with greater than 30% porosity, samples collected with sidewall cores tend to yield porosity measurements that are below actual values by a few percentage points because of compaction during coring (Almon, 1992). Damage to samples collected with percussion methods can further distort results. For low porosity units, measured porosities can be over-represented because porosity is enhanced by damage that occurs during coring, while for high porosity formations, compaction and grain shattering can reduce measured porosity (Almon, 1992).

Igneous and metamorphic rocks usually have low porosities. However, some volcanic tuffs are very porous and pumice can have up to 87% absolute porosity (Fetter, 1988). Weathering can also greatly increase porosity of these lithologies; weathered ultramafic and plutonic rocks can have porosities up to 60% due to the breakdown of minerals such as mica (Fetter, 1988).

## Porosity Measurement

### *Field Methods*

In the field, neutron logs, density logs, and sonic logs are well-suited to help estimate porosity (Aguilera, 1992). Neutron logs can be used in cased or uncased wells. With this method, a neutron-emitting probe is lowered into a well, and neutrons are captured by the hydrogen atoms in trapped pore water, gas, and hydrocarbons and are re-emitted as gamma rays. The probe logs the total amount of gamma radiation and estimates the pore fluid volume. One downside to this method is that water bound to clays can over-represent porosity in shales, siltstones, and other clay-rich units. As a result, a neutron log is collected and processed with other logs such as density logs or gamma ray logs to ensure accuracy. Porosity values collected from neutron logs are also absolute porosity; space in isolated, disconnected vugs that is not available for fluid storage is captured in the measurement. Another potential problem is that the neutron log cannot be used to determine the type of pore fluid present, which may be an important consideration when determining total storage capacity and injectivity.

Density log data are collected using a sonde equipped with a source of gamma radiation and at least one gamma ray detector deployed in a well. As it enters the formation, the radiation is scattered according to bulk density. Porosity can be calculated from density log data if the lithology of the subsurface and the saturating fluid are known:

$$\text{Porosity} = \frac{(\rho_{\text{matrix}} - \rho_{\text{bulk}})}{(\rho_{\text{matrix}} - \rho_{\text{fluid}})} \quad \text{Equation 1}$$

where  $\rho_{\text{matrix}}$  is estimated based on the lithology (e.g. sandstone = 2.65 g/cm<sup>3</sup>, limestone = 2.71 g/cm<sup>3</sup>, and dolomite = 2.87 g/cm<sup>3</sup>, etc.),  $\rho_{\text{bulk}}$  is from the density log, and  $\rho_{\text{fluid}}$  is estimated based on the salinity and hydrocarbon makeup of the saturating fluid (e.g. water = 1 g/cm<sup>3</sup>, etc.) (Alberty, 1992a; Dewan, 1983).

Sonic logs measure the speed of sound in a formation. As a sonic probe is pulled up a well, it emits a sound wave and logs the time any reflected sonic waves arrive back at the receiver. If the lithology of the layer is known, the porosity can be deduced from deviation from the theoretical sonic travel time for a layer of the same lithology with zero porosity. The Wyllie time average method or the Raymer-Hunt-Gardner methods are two common methods used with sonic logs. Sonic logs work best when the pore fluid is water or brine. Additional descriptions of these logs are provided in Section A7.

## ***Laboratory Methods***

Several laboratory methods are available to determine porosity. These methods provide values for effective porosity. However, there is no good laboratory method for determining absolute porosity. Because porosity is stress dependent, laboratory measurements should be taken at stress conditions similar to in situ conditions (Cone and Kersey, 1992). Furthermore, core samples represent point measurements. For reliable results, measurements are best made on a number of cores, and the applicant might consider submitting a statistical representation of measurements such as a variogram.

If an unaltered, fresh sample of the formation of interest is available, the summation method can be used. Gas, oil, water, and any other fluids are extracted from the rock using a vacuum or other method. The sum of extracted fluids is assumed to equal the sum of the pore space. This method is potentially problematic, however, because the sample is not cleaned and because core samples are often subject to damage (e.g., mud intrusion, etc.) during retrieval, which can displace pore fluids.

With a less pristine sample, a resaturation method can be used. First, the sample is cleaned and dried, which allows for the remediation of some damage incurred during drilling. Hydrocarbons are generally removed from samples using toluene. The sample is then heated until it maintains a constant weight. One potential problem with this method is that if brines are present, precipitation of salts can reduce the porosity (Cone and Kersey, 1992). If smectite, gypsum, or clay minerals are present, samples should be dried at 63° C and 45% humidity to prevent removal of structural water and damage to clay minerals (Cone and Kersey, 1992).

Once the sample remains at a constant weight, indicating that all fluids have been driven off, the sample is then saturated with either a liquid (usually water) or a gas. Helium is usually the gas of choice because it does not adhere to mineral surfaces and its small molecule size allows it to diffuse into micropores. If liquid resaturation is chosen, the sample is saturated with liquid and re-weighed. For rock samples with very small pore sizes, the choice of displacing and saturating fluid used during the porosity measurement may introduce variability into the final results because of the attraction between pore surfaces and displacing fluids. The amount of pore space is deduced from the density of the saturating liquid. In gas resaturation, the sample is placed in a confined volume and resaturated with gas from a referenced cell. The volume of pore space is determined from the change in the pressure in the reference cell through the ideal gas law ( $pV = nRT$ ). Gas resaturation should not be used with vuggy or fractured samples.

Dry methods are also available. Thin sections of rocks made from core samples can be analyzed under a polarized light microscope or scanned and analyzed with specialized software (petrographic image analysis). Less commonly used laboratory methods to determine porosity include X-ray computerized tomography (CT scanning) and nuclear magnetic resonance imaging.

## Permeability

Permeability refers to the property of a porous medium to transmit fluids under a hydraulic gradient (USGS, 1989). Several physical factors can influence permeability. These include median pore size and connectivity of the pore space within the material (e.g., Bachu and Bennion, 2008). Grain size is also a significant factor; because all wetted grains have a boundary layer of fluid with a velocity of zero, more energy is expended in overcoming shear forces between the boundary layer and through fluids when the grain size is small (Schlumberger, 2006).

### Absolute (Intrinsic) Permeability

Absolute permeability, also known as intrinsic permeability, is the permeability of a material when only one fluid is present. It is dependent only on the properties of the material and not the fluid. Absolute permeability can be calculated from laboratory analyses of a core sample as:

$$\text{Absolute Permeability} = \frac{Q\mu L}{A_f \times (p_2 - p_1)} \quad \text{Equation 2}$$

where  $Q$  is the flow rate through the core,  $\mu$  is the fluid viscosity,  $L$  is the length of the core,  $A_f$  is the cross sectional area of the core, and  $(p_2 - p_1)$  is the pressure difference on either side of the core. Permeability values of different lithologies can vary by orders of magnitude (Table A-1), with salts and shales typically exhibiting lower permeability values and sandstones having the highest values.

**Table A-1: Typical Permeability for Various Lithologies.**  
From: Davis (1988).

Lithology	Permeability (mD)
Shale (unfractured)	$4.7 \times 10^{-5}$
Sandstone	3.8-4,740
Coal	334
Salt	$9.61 \times 10^{-5}$

Because geologic materials are inherently heterogeneous, absolute permeability will vary spatially. Furthermore, permeability is an anisotropic property that varies in the x, y, and z directions and typically shows the greatest variation in the direction perpendicular to layering. For the computational modeling performed for AoR delineation, a realistic representation of the permeability distribution is needed. Approaches for handling the distribution of permeability, including geostatistical approaches are discussed below and in Section 2 of the *UIC Program Class VI Well Area of Review Evaluation and Corrective Action Guidance*.

## Effective Permeability

Effective permeability measures the permeability of a material to one fluid when more than one fluid phase is present (such as carbon dioxide in brine or oil). In addition to pore size distribution, effective permeability is affected by the relative saturation of fluids within a material and the interfacial tension (IFT) between the fluids (Bachu and Bennion, 2008). Because IFT is influenced by in situ conditions such as pressure and temperature, these variables can also influence effective permeability. Due to its dependence on the IFT and the relative saturation of fluids, effective permeability in a GS project is expected to vary spatially and temporally as the pressure and distribution of brine and carbon dioxide change.

## Relative Permeability

Relative permeability is the dimensionless ratio of the effective permeability to absolute permeability. It varies from 0 to 1. Relative permeability is relevant to site characterization for GS because one phase or fluid can inhibit or facilitate the preferential flow of another phase or fluid. Because relative permeability varies with the relative saturations of the fluids, it may be expressed as a relative permeability-saturation function for incorporation into computational modeling. See the *UIC Program Class VI Well Area of Review Evaluation and Corrective Action Guidance* for more information. Relative permeability has been studied extensively due to its importance in hydrocarbon extraction (Schlumberger, 2006). For GS, changes in the relative permeability may result in improved or reduced injectivity into reservoir rocks and/or improved or reduced sealing capacity for confining formations.

Many mathematical methods for obtaining relative permeability are available. One of the simplest is the Pirson model, which uses the saturation of the wetting phase before and after drainage of a core sample to determine the relative permeability of the wetting phase:

$$K_{r(i)} = S_i^3 \left[ \frac{(S_i - S_{ir})}{(1 - S_{ir})} \right]^{1.5} \quad \text{Equation 3}$$

where  $S_i$  and  $S_{ir}$  are the initial saturation and residual saturation of the fluid.

Relative permeability measured in the laboratory is often found to depend on many factors, including pore size and IFT, which in turn depends on in situ pressure, temperature, overburden pressure, wettability, and salinity conditions (Bachu and Bennion, 2008; Hawkins, 1992). A lower IFT encourages the transport of the non-wetting phase through the pore space, leading to an increase in the relative permeability. Hysteresis effects may also influence relative permeability (Hawkins, 1992). This may be important for fields with previous water and carbon dioxide flooding histories or if injection of carbon dioxide is not done at a constant rate.

Permeability data for several different fluids/mixtures within the reservoir may be needed to fully characterize behavior of the injectate at carbon dioxide storage sites as injection progresses. These fluids/mixtures are:

- Brine, hydrocarbon, or other initial reservoir fluid;

- Carbon dioxide/reservoir fluid mixture; and
- Pure carbon dioxide.

Initially, the permeability depends only on the behavior of the reservoir fluid. Next, permeability becomes dependent on a mixture of two or more liquids as injectate is introduced into the reservoir. Bachu and Bennion (2008) found that the permeability of sandstone, carbonate, and shale core samples taken from a typical intracratonic sedimentary basin to carbon dioxide at irreducible water conditions was one-fifth that of brine at 100% brine conditions for lithologies with permeabilities greater than 1 mD.

As large volumes of carbon dioxide are injected, a new zone may form near the injection well as the carbon dioxide saturation increases and the reservoir fluid is completely displaced. Once again, the permeability is dependent on a single fluid: this time the injected carbon dioxide as opposed to the native reservoir fluid. This zone is called the “dry-out” zone. Salts will precipitate out of the migrating brines, potentially decreasing permeability (Burton et al., 2009). However, the presence of a dry-out zone may increase injectivity because the effective permeability (the product of intrinsic and relative permeability) of carbon dioxide in the dry-out zone exceeds the effective permeability of carbon dioxide in the two-phase region (Burton et al., 2009).

### Measuring Permeability

Permeability can be quantified using in situ field measurement techniques (e.g., well tests, well logging) or laboratory methods (using cores). Unlike other parameters (e.g., viscosity, temperature, pressure), permeability is calculated indirectly from values derived from other measurements (e.g., capillary pressure, IFT). As a consequence, permeability can vary depending on the method used. Additional discussion is provided below.

It should be noted that permeability measurements can differ by scale. Well tests are representative of a much greater area (scale) than core samples, which represent a much smaller scale (sampling point) (Ellis and Singer, 2007). As such, well testing tends to provide composite representations of localized variability. Permeability derived from well logs represents an intermediate scale between core logs and well tests.

### Field Methods

Permeability can be estimated in situ using a variety of methods. Pressure changes during drawdown tests can be analyzed quantitatively or, if multiple wells are available, variable flow test analysis can be used to determine permeability provided that the reservoir pressure, flowing bottomhole pressure, flow rates, and the total time of the test are known (Smolen, 1992; Matthews and Russell, 1967).

The absolute permeability can also be determined from the hydraulic conductivity (Lewis et al., 2006) using the relationship:

$$\text{Absolute Permeability} = \frac{K\mu}{\rho g} \quad \text{Equation 4}$$

where  $K$  is the hydraulic conductivity,  $\mu$  is the dynamic viscosity of the liquid,  $\rho$  is the density of the liquid, and  $g$  is the acceleration due to gravity.

An important consideration in field measurements pertains to the effective permeability of the existing well bores. Gasda et al. (2008) present a method to determine the permeability of the near-well bore region, which may differ due to damage during drilling (skin effect), using the pressure in units above and below confining formations. The method can identify permeability along the well bore even when it is greater than reservoir permeability. Additional discussion of skin effects is provided later in this Appendix (Section A8).

Permeability can also be estimated from well log data. This is accomplished with an estimator of porosity such as a density log. Several empirical approaches have been developed to relate porosity, resistivity, and other parameters (e.g., irreducible water saturation) to permeability, with early work starting in the 1920s. Some empirical relationships are more suitable for certain rock types or textures; a summary and comparison of the various empirical methods are given by Balan et al. (1995). Nelson and Batzle (2006) also provide a description of methods for permeability estimation from well logs. These include multiple linear regression approaches using porosity and other variables and involve dividing the formation into zones with different lithologies, compositions, and flow histories.

## ***Laboratory Methods***

### ***Absolute Permeability***

Permeability measurements in the laboratory can be conducted with water, brines, gases, or other fluids when core samples are available. However, determining permeability from downhole cores may be difficult if damage has occurred during drilling. Permeability in core material can be reduced by as much as 80% due to the infiltration of mud, fine material, or other particles into the pore spaces of the core. Plug samples taken from the center of the core may be the best way to avoid such damage and generate a representative measure of permeability. Sandblasting the outside of whole-core samples may remove some built-up fines and improve results, but it cannot remediate mud that may have worked into the pores (Almon, 1992). Permeability can also be measured from sidewall cores. However, sidewall permeability measurements are often erroneously high for hard, dense formations because of grain shattering and other damage during the coring and extraction of the side wall core. Conversely, permeability measurements taken from sidewall cores for loose, friable (crumbly) formations are often erroneously low due to grain shattering introducing fines into pore spaces (Almon, 1992).

Once an appropriate lithologic sample has been isolated, it can be analyzed. The most common laboratory methods involve isolating a sample of core in a non-permeable sleeve while injecting a fluid material into the core. Measurements taken using a single fluid yield information on absolute permeability. Lead sleeves are often used because traditional sleeve materials allow the diffusion of carbon dioxide across the sleeve. Also, lead sleeves transfer pressure radially throughout the core if experiments are conducted at in situ pressure conditions.

Gas (air) and brine are the most common fluids used for injection in conducting permeability tests. Gas permeability is the industry standard for hydrocarbon exploration because it is the easiest to produce. While gas and brine tests produce similar permeability results when permeability is high, gas permeability tends to be higher when the permeability is low because frequent collisions of gas molecules with the pore walls help propel the gas molecules forward. Gas methods are also corrected for gas slippage effects at low pressures and inertial effects at high pressures (Ohen and Kersey, 1992).

The pressure difference across the core after the flow has stabilized can be transformed into a permeability measurement using a modified version of Darcy's Law. A non-steady-state variant of this method measures the gas pressure decay across the core. Non-steady-state methods usually produce more accurate results. Experiments can be conducted in a temperature controlled environment to simulate reservoir conditions when measuring effective permeability.

When permeability is measured from a whole core, measurements are usually reported in two directions: one parallel to the major fracture planes and other at 90 degrees perpendicular to this direction (Almon, 1992). Measurements may also be needed along the core in order to gain a representative understanding of permeability within the unit.

#### *Relative Permeability*

Although both effective and relative permeability can be measured in the laboratory, relative permeability is more commonly measured and reported (Abaci et al., 1992; Ahmed, 2006). Several methods are available. One common method uses a setup similar to absolute permeability methods except that after initial saturation and pressure equilibration, a second fluid is introduced and driven through the sample until the saturation and pressure differential across the sample returns to a constant value. A faster alternative is the unsteady-state method, in which a stream of gas is injected into a sample to displace a liquid. However, mathematical calculations are more complex when using the unsteady-state method.

Several types of corrections have been applied to core data. The Klinkenberg correction, which is important for low-permeability rocks, relates permeability for liquids to gas permeability. The pore fluid chemistry, especially salinity, may also affect permeability. Another type of adjustment is a correction for the dependence of permeability on pressure. For example, unconsolidated rocks can collapse, reducing permeability. These corrections are described by Nelson and Batzle (2006).

#### **Petrographic Image Analysis**

Petrographic image analysis (PIA) is an established method employed in the oil and gas industry to derive 3D petrophysical properties (porosity, capillary pressure, permeability, relative permeability) from 2D measurements of pore size and geometry. It can be used for characterization of sandstones, carbonates, and conglomerates, and it is inexpensive and rapid (Gies, 1993).

To collect PIA data, standard petrographic thin sections are viewed under a petrographic microscope or SEM in backscatter mode (BSE), and the images are stored and analyzed using image analysis software. The sample will need to have been impregnated with epoxy to fill the pore spaces prior to making the thin section. If light microscopy is to be used, adding dye to the epoxy will make pore spaces easily visible and will facilitate the image analysis. In BSE images, the pore spaces will be darker grey than the mineral grains. During image measurement, a number of fields of view on the thin section will be examined to obtain a representative sampling of pore spaces. The number of images needed may vary according to the rock type and magnification (Solyman and Fabricius, 1999). The images allow quantification of the number, size, and structures of pores. Macroporosity can be determined, and, with the high magnification and excellent resolution achievable with SEM, microporosity can also be determined. Pore size distribution can be measured, as well as pore circumference and area. These properties can be used to estimate capillary pressure and permeability. Capillary pressure can be expressed as a function of porosity, pore perimeter, and pore surface (Cerepi et al., 2001). Permeability can be derived using the Carman-Kozeny model (Cerepi et al., 2001; Solyman and Fabricius, 1999), which relates permeability to the porosity, the pore area, and pore perimeter. Cerepi et al. (2001) have also evaluated an alternate model for permeability ("bundle of capillary tubes"), but achieved better results using the Carman-Kozeny model.

PIA has been found to produce porosity values that agree closely with data from other methods (core analysis, wireline logs data, petrographic methods) (Layman, 2004). With respect to permeability, Solyman and Fabricius (1999) found that PIA tends to yield higher values than measurements of liquid permeability. This method has become well established, and additional literature is available that further explores the basis of PIA methods and the relationship between PIA-derived parameters and those measured in the laboratory.

### **Other Permeability Estimation Methods Based on Petrophysical Data**

In addition to the Carman-Kozeny model noted above, there are several equations that make use of the results of petrophysical analysis, including information that can be gained from PIA. Krumbein and Monk's equation uses mean grain diameter and the standard deviation of grain diameter (an indication of sorting). Berg's model links grain size, shape, and sorting to permeability. Van Baaren's model is an empirical variation on the Carman-Kozeny model and is similar to Berg's (Nelson and Batzle, 2006).

Some models are based on pore dimension and use capillary pressure and pore size. For example, Winland's equation relates permeability to porosity and capillary pressure. Katz and Thompson's equation addresses the influence of pore structure on flow properties. Details are provided by Nelson and Batzle (2006).

### **Geostatistical Methods**

Analyses of formation properties such as porosity and permeability from logs or core samples provide point measurements that cannot fully capture subsurface variability. However, representation of the distribution of porosity and permeability is valuable for the multiphase modeling required for AoR delineation under 40 CFR 146.84. Subsurface heterogeneity is

difficult to represent using conventional models, and if adequate data are available, owners or operators may consider use of geostatistical approaches such as semivariograms, kriging, and stochastic simulations to estimate porosity and permeability distributions at the project site:

- *Semivariograms* characterize spatial correlations and are developed from field measurements. A semivariogram model can then be fit to an empirical semivariogram. A number of semivariogram models exist including nugget, spherical, exponential, Gaussian, and power models. Individual models or combinations of models may be fit to the data;
- *Kriging* and stochastic (see next bullet point) methods may be used to estimate parameter values at unsampled locations once a semivariogram model has been developed. Kriging is an interpolation method that calculates a statistically unbiased, best-fit estimate at each point, accounting for the hard data values and the correlations between the data. Kriging results are artificially smooth because the variability between estimated locations is not considered (Khan, 2003); and
- *Stochastic simulation* is a probabilistic approach that generates multiple, equally probable realizations of a variable. The result from this method is not a single best answer, but a range of possible outcomes. Examples of stochastic simulations include Monte Carlo and Sequential Gaussian Simulation. Stochastic simulations can also be employed after kriging to correct for the artificially smooth output from kriging (Khan, 2003).

Though geostatistical methods may be helpful for approximating parameter values at unsampled locations, the results may not always accurately capture the complexities of the subsurface geologic heterogeneities such as faults, lenses, and varying lithologies. Geostatistical methods are optimal when the data are normally distributed and stationary (i.e., mean and variance do not vary significantly in space). To improve the results, a number of alternative methods have been proposed for use in combination with geostatistics, including the coupled Markov chain (Park et al., 2003) and the use of artificial neural networks (ANN) (Wang and Wong, 1999). Owners or operators may also consider using cross-validation to validate the modeling results (Malvic, 2005).

## Capillary Pressure

Several established methods are available for measurement of capillary pressure:

- *Mercury injection* - a dried core sample is injected with mercury in increasing pressure steps up to 60,000 psi. The pressure versus the mercury saturation is measured. This method is quicker than some of the other methods and can achieve much higher pressures. The disadvantages are that it uses mercury, and results need to be extrapolated to reservoir fluids. This method is effective for measuring pore throat size distributions, although not as effective for measuring capillary pressure in some formations such as tight sands;
- *Centrifuge* - core samples are centrifuged and the fluid forced out is measured. This test is relatively rapid, taking hours instead of days or longer. It can be performed at reservoir temperatures and pressures. The disadvantage is that this test has a maximum pressure

limit that is lower than mercury injection. Additionally, there may be cavitation if the capillary pressure is greater than atmospheric pressure. However, this test is well suited for poorly consolidated samples;

- *Porous plate* - a porous membrane is used, and pressure is increased with a fluid. The pressure required to displace the pore fluid is measured. This method offers the advantage of using native fluids and does not require cleaning or drying of the cores. It can test a lower maximum pressure than mercury injection, and it is well suited for shales and clays. However, samples need to reach equilibrium, which can result in test lengths of days to weeks; and
- *Restored state cell* - the sample is initially saturated with brine. A non-wetting fluid is then introduced in small pressure steps. The pressure is increased until no more water is released. This method has the advantage that the electrical properties of the fluid can be measured as well. Furthermore, native fluids can be used. However, the disadvantage is that it takes longer than the centrifuge or mercury tests.

Newer techniques such as nuclear magnetic resonance and a vapor deposition technique may also be considered.

## A4. Information to Support Geomechanical Characterization of the Confining Zone

The Class VI Rule requires geomechanical information to be submitted on fractures, stress, ductility, rock strength, and in situ fluid pressures within the confining zone [40 CFR 146.82(a)(iv)]. This section provides background information for understanding in situ fluid pressure and downhole stresses; this information supplements Section 2.3.6 of the guidance on Geomechanical Characterization. Data on pore pressure and stress data may also be used for analysis of fault stability (see Section A5 below and Section 2.3.2 of the guidance). References and methods are summarized in Table A-2.

**Table A-2: Parameters and Data Needed to Define the Stress Tensor and the Geomechanical Model.**  
After Chiaramonte et al. (2008).

Parameter	Data Collection Methods	Additional Information
Pore pressure	Measurement of downhole pressure by drill stem testing and production testing	Smolen (1992); Borah (1992); Lancaster (1992); Harrison & Chauvel (2007)
Vertical stress ( $S_v$ )	Integration of density logs over the desired depth	Zoback et al. (2003); Chiaramonte et al. (2008); Streit et al. (2005); Herring (1992)
Minimum horizontal stress ( $S_{hmin}$ )	Leak-off tests (LOT), Extended LOT (XLOT)	Chiaramonte et al. (2008); Zoback et al. (2003); Streit et al. (2005)
Maximum horizontal stress ( $S_{Hmax}$ )	Modeling well bore failure features such as drilling-induced tensile fractures (if $S_v$ , $S_{hmin}$ and pore pressure values are known) or stress-induced well bore breakouts (if $S_v$ , $S_{hmin}$ , pore pressure, and the rock strength are known)	Moos & Zoback (1990); Goetz (1992); Streit & Hillis (2004); Zoback et al. (2003); Streit et al. (2005)

### Pore Pressure

Pore pressure can be measured by formation testers or by performing drill stem tests. Formation testers are specialty wireline tools used for measuring the pressure of the formation in an open hole (Smolen, 1992). In drill stem testing, the formation pressure is measured by sealing the zone of interest with well bore packers (Borah, 1992). After completing the well, additional pressure testing can be conducted by production testing such as single-point, multi-point, and swab testing (Lancaster, 1992). Bottomhole pressure may also be measured by pressure transducers. Transducers convert a pressure change into a mechanical displacement or deformation, which is then converted into an electrical signal (Harrison and Chauvel, 2007). Additional information regarding types of pressure transducers is available in Harrison and Chauvel (2007) and from commercial manufacturers as well as in the *UIC Program Class VI Well Testing and Monitoring Guidance*.

## In Situ Stress Determination

The three principal stresses commonly assumed to characterize the geomechanical model of a site at depth are the vertical stress,  $S_v$ , the maximum horizontal stress,  $S_{Hmax}$ , and the minimum horizontal stress,  $S_{hmin}$  (Zoback et al., 2003; Streit et al., 2005). Fault slip occurs in normal faulting regions (gravity-driven faulting) when the minimum stress reaches a low value relative to the vertical stress ( $S_v \geq S_{Hmax} \geq S_{hmin}$ ); folding and reverse faulting can occur in compressive stress fields when both of the horizontal stresses exceed the vertical stress and the maximum horizontal stress is sufficiently large relative to the vertical stress ( $S_{Hmax} \geq S_{hmin} \geq S_v$ ); and strike-slip faulting occurs when the difference between  $S_{Hmax}$  and  $S_{hmin}$  is sufficiently large ( $S_{Hmax} \geq S_v \geq S_{hmin}$ ) (Zoback et al., 2003).

The magnitude and orientation of the vertical stress, the minimum horizontal stress, and the maximum horizontal stress can be determined from drilling data and well logs. Methods for quantifying the magnitude and orientation of these principal stresses are summarized below.

### Vertical Stress

Vertical (orientation) stress ( $S_v$ ) can be obtained from density logs (Zoback et al., 2003). The magnitude of  $S_v$  can be obtained by integrating data collected from density logs over depth. Density logs measure the bulk density of the rocks in the well bore walls through gamma ray emissions (Chiaramonte et al., 2008; Herring, 1992; Streit et al., 2005). Vertical stress at the depth of interest can be calculated by the following equation (Chiaramonte et al., 2008; Streit et al., 2005; Zoback et al., 2003):

$$S_v(z_0) = \int_0^{z_0} \rho g dz \quad \text{Equation 5}$$

where  $z_0$  is the depth of interest. In some cases (e.g., offshore wells), the analyst needs to account for the lower density of the water column and the transition to higher density with depth when evaluating the magnitude of vertical stress (Zoback et al., 2003). Additional editing and extrapolation of data may be necessary; for example, when borehole conditions are unfavorable and density data exhibit high levels of variability (Zoback et al., 2003).

### Minimum Horizontal Stress

The magnitude of the minimum horizontal stress ( $S_{hmin}$ ) in normal and strike-slip faulting regions can be determined with considerable accuracy through direct in situ formation stress tests (see Zoback et al., 2003). For deep wells where conventional in situ formation stress tests are not available, information about  $S_{hmin}$  can be collected by leak-off tests. A leak-off test is conducted by pumping into a well at a constant rate and recording the well bore pressure as a function of cumulative volume (or time if pumped at a constant rate). As described by Zoback et al. (2003), the pressure will increase linearly with volume (or time) until a distinct departure from a linear increase occurs (leak-off point or LOP) (Figure A-7). As pumping continues at constant rate, the maximum pressure reached is termed the formation breakdown pressure (FBP) and the pressure

then falls below the FBP to a relatively constant value called the fracture pumping pressure (FPP). The FPP value should be similar to the LOP.

**Figure A-7: Schematic Illustration of an Extended Leak-off Test and Associated Terms.**

Where: LT= Limit Test; LOP= Leak-Off Point; FIT= Formation Integrity Test; FBP= Formation Break-down Pressure; FPP= Fracture Pumping Pressure; ISIP= Instantaneous Shut-in Pressure; FCP= Fracture Closure Pressure. From: Zoback et al. (2003); © Elsevier, reproduced with permission.

The extent that leak-off tests can be used to estimate  $S_{hmin}$  can be assessed by evaluating the data collected. Zoback et al. (2003) noted that test data that show that the leak-off point was reached can be considered “an approximate measure” of  $S_{hmin}$ . Further, Zoback et al. (2003) noted that, if the test data shows that a stable FPP was achieved, the test can be considered “a good measure” of  $S_{hmin}$ . Chiaramonte et al. (2008) described the use of information from leak-off tests to determine the fracture pressure limit of the confining zone at the Teapot Dome oil field in Wyoming.

Another technique, which uses annular pressure measurements during drilling operations, is described by Zoback et al. (2003) as a potential method for estimating the magnitude of  $S_{hmin}$ .

### Maximum Horizontal Stress

In addition to the use of in situ stress testing, the magnitude of the maximum horizontal stress ( $S_{Hmax}$ ) can be estimated based on knowledge of the vertical stress,  $S_v$ , and the minimum horizontal stress,  $S_{hmin}$ . The stress polygon method, as described by Zoback et al. (2003), can be used to estimate possible  $S_{Hmax}$  values associated with normal-gravity, reverse faulting, and

strike-slip faulting environments, given the pore pressure at depth and available results of in situ formation stress tests or leak-off tests. Chiaramonte et al. (2008) applied the polygon method at the Teapot Dome oil field in Wyoming.

The orientation of  $S_{Hmax}$  can be determined from the orientation of borehole breakouts and drilling-induced tensile fractures. Borehole breakouts and drilling-induced tensile fractures can form in the well bore during drilling operations. Zoback et al. (2003) provide a theoretical discussion of effective stresses acting in a vertical well bore. Streit et al. (2005) provide an illustration of the occurrence of well bore breakouts (formation loss in the area of minimum horizontal stress) and drilling-induced tensile fractures (along the axis of maximum horizontal stress) in a borehole relative to the orientation of maximum and minimum horizontal stresses.

**Figure A-8: Schematic Cross Section through Borehole.**

(a) borehole breakout due to spalling of borehole wall indicating the  $S_{hmin}$  direction. (b) drilling-induced tensile fractures indicating the  $S_{Hmax}$  direction. From: Streit et al. (2005); © Elsevier, reproduced with permission.

Well bore breakouts and drilling-induced tensile fractures can be detected through the use of image logs (Zoback et al., 2003). Figure A-9(a) is a standard “unwrapped” well bore image from an ultrasonic borehole televiewer. Borehole breakouts can be seen as dark bands on opposite sides of the well in Figure A-8(a), and as out-of-focus zones on opposite sides of the well in the formation microresistivity image (FMI) in Figure A-9(b). The orientation and opening angles of the breakouts are shown in Figure A-9(c). Figure A-9(a) also shows fractures oriented  $90^\circ$  from the well bore breakouts, which indicates the occurrence of failures associated with both well bore breakouts and drilling-induced tensile fractures (Zoback et al., 2003).

**Figure A-9: Image Logs of a Well with Well Bore Breakouts.**

Another method that can be used to estimate  $S_{Hmax}$  is referred to as a frictional limit calculation (Zoback et al., 2003; Streit et al. 2005; Streit and Hillis, 2004). The relation equates the ratio of the maximum-to-minimum principal stresses to frictional sliding on cohesionless, optimally oriented faults (Streit et al., 2005; Streit and Hillis, 2004):

$$\frac{\sigma_1 - P_p}{\sigma_3 - P_p} = \left[ (\mu^2 + 1)^{1/2} + \mu \right]^2 \quad \text{Equation 6}$$

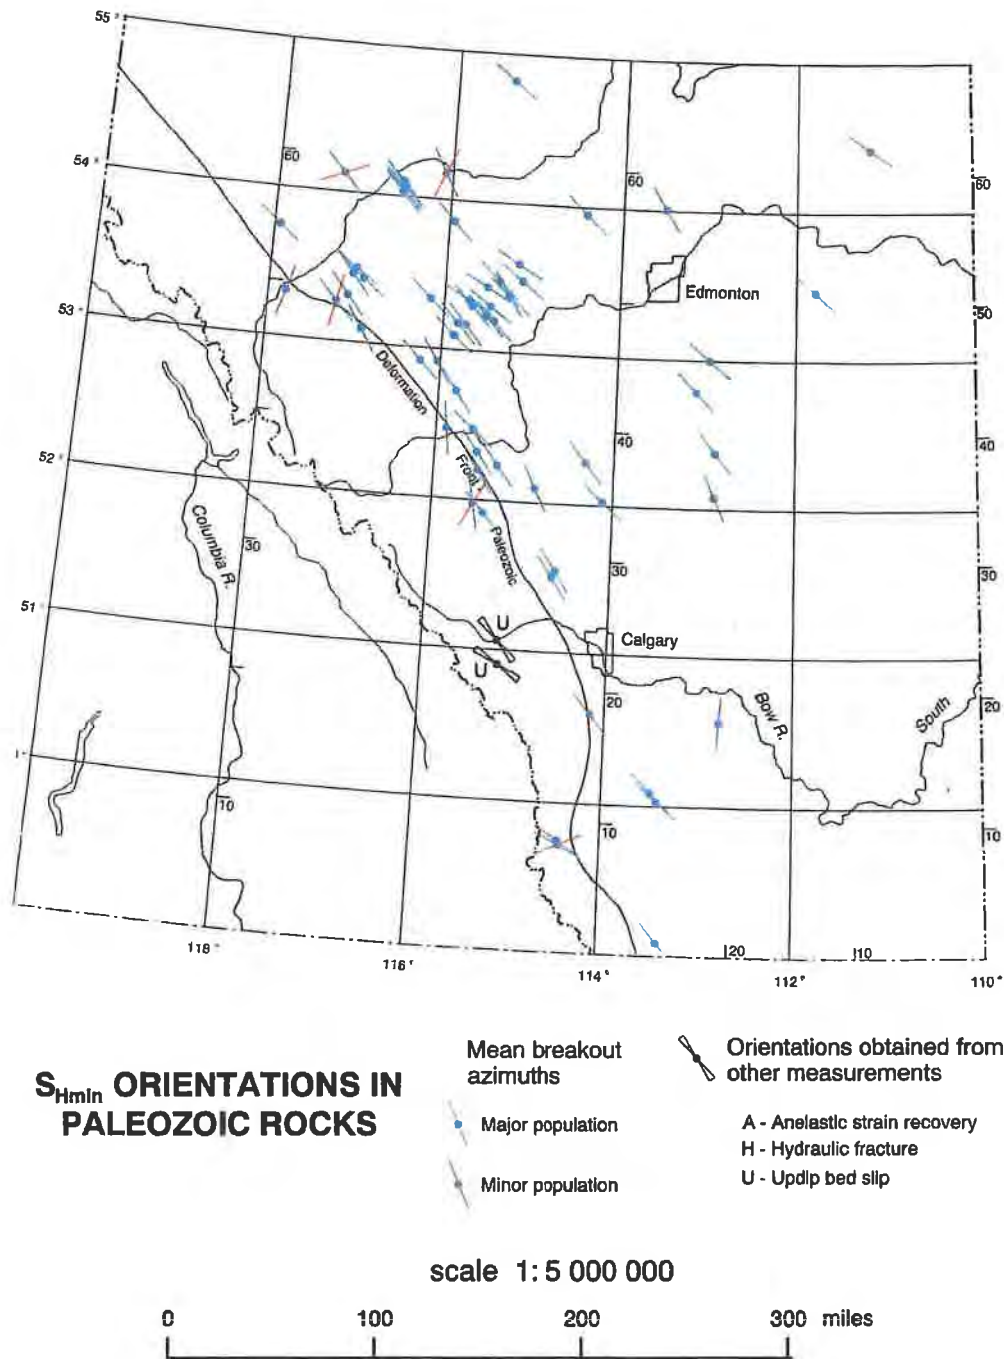

where  $\sigma_1$  and  $\sigma_3$  are the maximum and minimum principal stresses, respectively,  $P_p$  is the pore fluid pressure, and  $\mu$  is the coefficient of static friction. The coefficient of static friction is generally considered between 0.6 and 1.0 for a range of rocks and faulting environments (Zoback et al., 2003).

The specific parameters used in Equation 6 for  $\sigma_1$  and  $\sigma_3$  are defined by the faulting environment (Zoback et al., 2003), as described previously. For example, a strike-slip faulting environment would be characterized  $\sigma_1 = S_{Hmax}$  and  $\sigma_3 = S_{hmin}$ , while a normal faulting environment would be characterized by  $\sigma_1 = S_v$  and  $\sigma_3 = S_{hmin}$ . An example plot of data used for estimating frictional limits is given in Figure A-10 (Streit et al., 2005). Example plots of stress magnitudes as a function of depth for various faulting environments are provided by Zoback et al. (2003). Techniques for stress determination in deviated wells (e.g., horizontal or wells drilled with complex trajectories) are described by Zoback et al. (2003).

**Figure A-10: Example Plot of Data Used for Estimating Frictional Limits (Petrel Sub-Basin, Australia).**  $S_{min}$  estimates are derived from pressure leak-off tests, and  $S_v$  estimates were obtained by examining density logs. R values are Pearson correlation coefficients. Vertical axis is meters. From: Streit et al. (2005); © Elsevier, reproduced with permission.

The orientation of borehole breakouts and tensile fractures (Figure A-11) can be determined from image logs and four-arm caliper logs. Six-arm caliper logs are also available, which may be able to provide more accurate and detailed data on borehole breakouts if four-arm caliper logs are not sufficient. FMI logs generate an electrical image of the borehole from microresistivity measurements, which penetrate about 30 inches from the well bore. FMI data are used to identify drilling-induced features and breakouts (Schlumberger, 2002). An application using FMI logs for the analysis of tensile fractures was described by Chiaramonte et al. (2008). Caliper logs (two-, three-, four-, or six-arm) can measure the enlargement of boreholes in the presence of natural fractures (Aguilera, 1992). Choosing a caliper log with a greater number of arms can increase the accuracy and level of detail in the resulting data. Breakout and tensile fracture data collected at depth from various wells can be used to develop stress maps such as those shown in Figure A-11.

## A5. Information to Support Fault Stability Analysis and Analysis of Confining Zone Integrity

The Class VI Rule, at 40 CFR 146.82(a)(3)(ii), requires owners or operators to determine that any faults or fractures that may transect the confining zone(s) in the area of review will not interfere with containment. The Class VI Rule also, at 40 CFR 146.83(a)(2), requires the owner or operator to demonstrate the presence of a confining zone(s) free of transmissive faults or fractures and that has sufficient integrity to contain the injected carbon dioxide stream and formation fluids. These topics are addressed in Sections 2.3.2 and 3.5 of the guidance. Additional background information is presented here describing various methods that may prove useful to owners or operators. Examples of case studies are also presented.

### Fault Stability Analysis

Below are three examples of methods for analyzing fault stability and evaluating the pore pressure that should be maintained to minimize the chances of fault activation.

#### Failure Plots

Failure plots (Figure A-12) can be used to identify faults within a carbon dioxide storage reservoir that are relatively stable as a function of fault angle. Failure plots are developed by plotting differential stress (i.e., the difference between the maximum and minimum principal stresses,  $\sigma_1 - \sigma_3$ ) versus fault angle, thus identifying conditions that permit fault reactivation (failure) versus formation of new fractures (or relatively stable fault conditions) (Streit et al., 2005). Streit (1999) described the method for constructing failure plots for various rock types and fault strengths. Although the failure plot method has been applied to study sites for carbon dioxide storage, 3D methods should also be used to estimate fault slip tendency (Streit et al., 2005).

**Figure A-12: Example Failure Plot Indicating Scenarios where Fault Reactivation is Possible.**  
Adapted from: Streit et al. (2005); © Elsevier, reproduced with permission.

### 3D Fault Slip Tendency

The parameter referred to as slip tendency ( $T_s$ ) can be used to assess the potential for reactivating a fault associated with carbon dioxide injection (Streit and Hillis, 2004). The fault slip tendency depends upon the effective normal stress, shear stress, and pore fluid pressure. This method can also be used to calculate fault slip tendency along the grid orientation of a fault when 3D seismic surveys are available, and the fault slip tendency can be displayed in 3D graphical form using commercially available software (e.g., TrapTester, Badley Geoscience Ltd, UK, <http://www.badleys.co.uk>). Figure A-13 is an example fault slip tendency image in 3D form.

The fault slip tendency equation provided by Streit and Hillis (2004) can be used to predict the maximum sustainable pore pressure to avoid fault reactivation. This estimation may be compared to anticipated (simulated) pore pressure at the fault under the proposed operating conditions. The predicted pore pressure at the location of the fault should be less than the maximum sustainable pore pressure, with a margin of safety to account for uncertainties in both the fault slip tendency calculation and modeling results. The margin of safety will depend upon the precision of the data available and should be discussed in the submission materials.

**Figure A-13: Example Fault Slip Tendency Image.**  
From Streit et al. (2005); © Elsevier, reproduced with permission.

### Critical Pore Fluid Pressure Increase

The Mohr diagram (Figure A-14) can be used to evaluate the effects of increasing fluid pressure on fault stability (Streit et al., 2005; Streit and Hillis, 2004). The diameter of a semicircle represents the differential stress ( $\sigma_1 - \sigma_3$ ), and the curve to the left represents the rock failure envelope. A change in fluid pressure (as indicated by the arrow) can shift the Mohr envelope toward the failure envelope, which indicates a condition of fault failure. In the figure, the decrease in the effective normal stress (from increasing pore pressure or other causes) needed to reactivate an existing fault is indicated by  $a$ . The additional decrease in effective normal stress needed to create a new rupture is indicated by  $b$ .

**Figure A-14: Example Mohr Diagram.**

The maximum injection pressure that can be considered safe and sustainable is site-specific and depends on the seismic history and current state (or pressure-depleted condition) of the site (Benson and Cook, 2005).

### Sealing Potential of Faults

Section 3.5.2 of the guidance presents several factors that may be evaluated in order to understand the sealing potential of existing faults; juxtaposition of units, capillary pressure of sediments in the fault zone, catalysis and diagenesis in the fault zone, the SGR, and pore pressure compartmentalization. Below is additional detail on use of Allan charts, calculation of the SGR, and pore pressure compartmentalization.

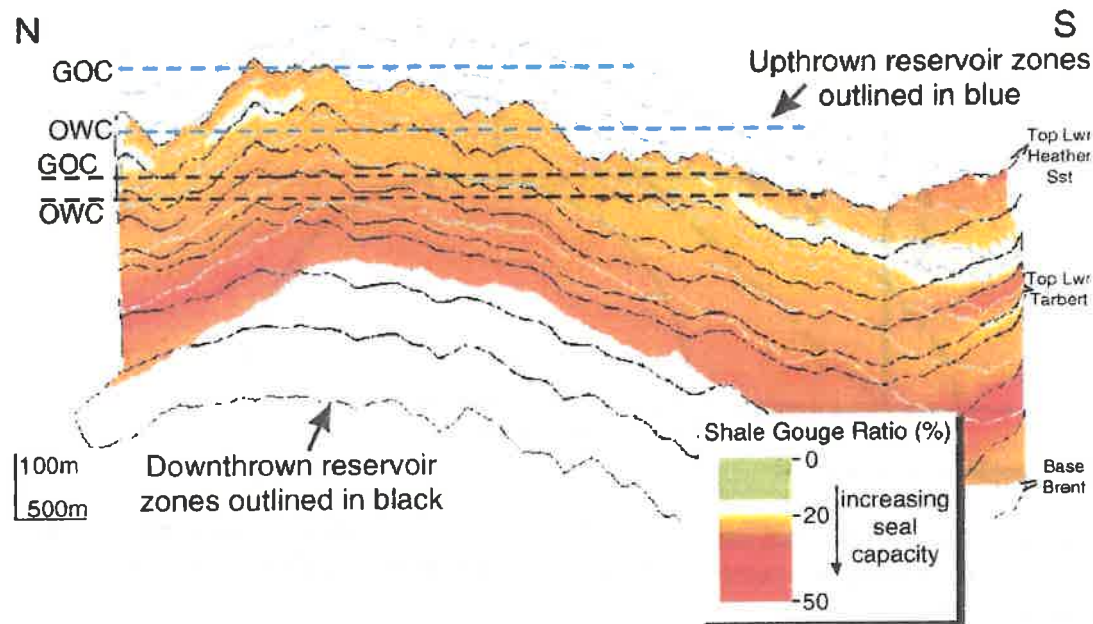

#### Allan chart

An Allan chart can be developed from detailed fault geometry (available from maps, cross sections, and other interpretive aids) and a detailed stratigraphic column (developed from well bores, outcrops, and other data). The quality of an Allan chart is highly dependent on data quality, especially if layers are thin or when uncertainties in the amount of displacement along the fault may make it difficult to obtain a good understanding of juxtaposition. Leakage may still occur along the fault even when juxtaposition of permeable/impermeable units across the faults successfully limits the lateral migration of carbon dioxide.

Figure A-15 shows an example of heterogeneity across a fault plane. The area has layer-cake stratigraphy on either side of the fault. In the figure, the footwall and hanging wall boundaries are indicated by solid lines; the vertical exaggeration is a factor of five. The area that juxtaposes potentially conductive units is shaded, with the colored region showing the SGR (see below), which is one indication of sealing potential. Note that the SGR changes dramatically over the

surface of the fault. It is often more important to determine if the fault is sealing or non-sealing in the area or areas that have a critical impact on the integrity of the seal (e.g., above or below structural spill points) than for the entire surface of the fault.

**Figure A-15: An Isometric View of a Fault Plane.**

GOC=Gas-Oil Contact, OWC=Oil Water Contact. From: Freeman et al. (1998); reproduced with permission from the Geological Society: London.

### Shale Gouge Ratio

In Figure A-16, the fault crosses shale (gray) and sandstone (white) layers. As displacement occurs along the fault (*a* and *b*), portions of the shale layers are incorporated into the fault zone. As the displacement increases (*c*), the amount of shale along the fault thins. The direction of fault slip is indicated by arrows, and the fault plane is idealized as a dotted line.

**Figure A-16: Simplified Shale Smearing Along a Fault.**  
Modeled after Koledoye et al. (2003).

### Pore Pressure Compartmentalization

Using this method, it is also possible to evaluate if sealing behavior changes along the fault (Figure A-17). In the figure, faults are interpreted in the seismic image in (A), then mapped as lines onto the pore pressure determination (B). The color ramp is from low pressure (green) to high pressure (red). While the major fault (labeled with arrow Y and Z) at right compartmentalizes pressure, indicating that it may be sealing, the fault at left (labeled with arrow X), does not separate regions of different pressure, suggesting that it may not be sealing. The apparent non-compartmentalization of high pressure near the tip of the Z arrow may be due to poor resolution of the pressure data. Vertical red lines above X and Z are assumed to be wells.

## Case Studies and Applications

This section provides example applications of geomechanical characterization studies for helping to predict any potential impacts of carbon dioxide injection on fault stability and confining zone integrity as required by the Class VI Rule at 40 CFR 146.83(a)(2).

### *Fault Stability Case Studies*

Chiaramonte et al. (2008) evaluated the fault slip potential of the injection zone for the Teapot Dome oil field to determine the risk of leakage through the fault. The authors also conducted a critical pressure perturbation sensitivity analysis to understand possible impacts of horizontal stress estimates ( $S_{Hmax}$  and  $S_{hmin}$ ) and faulting environments on the probability of fault slip potential. Their study illustrates the potential for using geomechanical modeling to estimate the pore pressure required for a fault to slip during a GS project.

Gibson-Poole et al. (2008) summarized a geomechanical assessment of a basin-scale carbon dioxide geological storage system in southeast Australia. Using data and information regarding the site's rock strength, in situ stresses and fault orientation, Gibson-Poole et al. (2008) estimated the maximum sustainable pore pressure and risk of fault reactivation. Results showed large variability due to data uncertainties. The authors recommended additional work (e.g., laboratory testing of tensile and compressive core strength) to reduce uncertainties and constrain the geomechanical model.

Rutqvist et al. (2007) demonstrated the use of two numerical modeling approaches for analyzing geomechanical fault slip (i.e., continuum stress-strain analysis and discrete fault analysis) coupled with fluid flow to estimate the maximum sustainable injection pressure during geological sequestration of carbon dioxide. The results of these two numerical approaches were compared to conventional analytical fault-slip analysis. The authors concluded that the numerical methods provided a more accurate estimation of the maximum sustainable carbon dioxide injection pressure than the conventional analytical method because the numerical models can better account for the spatial evolution of both in situ stresses and fluid pressure.

### ***Confining Zone Integrity Case Studies***

Haug et al. (2007) described a geomechanical characterization of a potential carbon dioxide injection site at an existing oil and gas field in Alberta, Canada, which included determination of the principal stresses ( $S_v$ ,  $S_{Hmax}$ ,  $S_{Hmin}$ ) and discussion of laboratory testing determinations of rock strength and deformation behavior. The study also included a sensitivity analysis regarding potential success for carbon dioxide containment based on data variability. The authors concluded that laboratory triaxial tests should be conducted to confirm the accuracy of the correlations.

Smith et al. (2009) described the program components of geomechanical testing and modeling of reservoir and confining zone integrity for a carbon dioxide sequestration project at an existing oil and gas field in Alberta, Canada. This work described the overall geomechanical workflow process and provided specific examples of log-derived rock strength and elastic properties, cores used for geomechanical testing, stress versus strain data measured on cores, linear Mohr-Coulomb failure envelopes, rock strength measurements, and uniaxial pore volume compressibility tests. In situ stresses, formation pressures and mechanical properties were input into a finite-differences-based geomechanical simulator to predict conditions leading to deformation of reservoir and confining zone, induced stresses, and to assess the propensity for fault reactivation and movements.

Orlic (2009) discussed the impacts of geomechanical changes in a reservoir associated with pressure depletion and rock compression during hydrocarbon production. Computational modeling examples were used to illustrate the mechanical impact of carbon dioxide injection on confining zone integrity, fault stability, and well integrity. This study illustrates the use of computational modeling for predicting effects of carbon dioxide injection on containment capacity of the reservoir, taking into account previous stresses from depletion.

Rutqvist and Tsang (2002) demonstrated the use of computational modeling to study the geomechanical effects of injecting carbon dioxide into a hypothetical sandstone formation. The authors provided discussion of the rock and fluid input parameters and simulation results assuming a homogeneous confining zone without intersecting fracture zone, and the effects of a vertical fracture zone in the confining zone. The analysis provided a better understanding of possible mechanisms affecting geomechanical changes associated with carbon dioxide injection processes.

## **A6. Information to Support Geophysical Characterization**

To support the requirement at 40 CFR 146.82(a)(3)(iii) to submit data on the injection and confining zone(s), this section provides background information on available geophysical methods that owner or operator may use, including seismic, gravity, magnetic, and electrical/EM methods. This section supplements the information provided in Section 2.3.10 of the guidance, which discusses geophysical characterization.

Geophysical methods gather information about subsurface features in lieu of physically sampling the region of interest. Depending on the scale and resolution of the investigation, geophysical methods may help to provide the required information on the stratigraphy, structure, extent, thickness, porosity, and permeability of subsurface units to be submitted to the UIC Program Director with a Class VI injection well permit application [40 CFR 146.82(a)(1)–(21)]. There are four main types of geophysical methods: seismic, gravity, magnetic, and electrical/EM. These methods can image a large volume of the subsurface without penetrations (i.e., wells or boreholes). These methods can provide good spatial coverage of a project area and may be especially useful in regions where subsurface geology is heterogeneous and/or wells are sparse. Geophysical methods are widely used for subsurface exploration and characterization in the hydrocarbon industry, archeology, engineering, and other fields.

Methods used to characterize sites for carbon dioxide storage will not differ substantially from methods used to characterize subsurface geology for other purposes. The choice of storage formation (e.g., depleted reservoir, coal seam, saline formation, etc.) will not likely strongly influence the suitability of geophysical techniques. Site-specific considerations such as depth, geologic complexity, and overlying lithologies are more likely to influence the choice of methodology. Two notable exceptions to this generalization are seismic methods, for which this technology may be hampered in depleted gas reservoirs, and gravity methods, which work especially well in most brine-filled formations.

The need to characterize features at depth is likely to be the most uniformly limiting factor in selecting an appropriate geophysical method for site characterization. Most carbon dioxide is likely to be stored at a depth of at least 800–1000 m, depending on site-specific conditions, and resolution at depth varies greatly among techniques and among different deployment techniques within the same method. Geophysical methods used primarily to image the shallow subsurface (e.g., ground penetrating radar (GPR), shallow seismic refraction, etc.) are not discussed in this section.

### **Overview of Geophysical Techniques**

Data gathered with geophysical techniques may aid in the creation of geologic maps and cross sections that illustrate the regional geology, hydrogeology, and geologic structure. Table 2-1 of the guidance summarizes the types of data produced by the various methods.

The different geophysical methods vary in quality, the surface and subsurface environments in which they can be used, and the types of data they produce. For example, unlike other

geophysical methods, seismic data may allow estimates of pore pressure in the injection formation, confining zone(s), and other zones.

Lithology and rock properties cannot be determined solely using geophysical data. Data gathered from geophysical surveys can indicate certain lithologies but are not conclusive. Information from stratigraphic wells, stratigraphic columns, or other sources is required to be submitted to the UIC Program Director with a Class VI injection well permit application. Such information can help to confidently assign rock types and properties to formations imaged using geophysical methods. Some of the required materials (e.g., maps and cross sections, available field data such as well logs) may help in interpreting geophysical data [40 CFR 146.82(a)].

Regardless of the geophysical method type, aerial, surface, and borehole deployments of each method are typically available. There are common advantages and disadvantages to each. Aerial surveys can cover large areas at low cost, they require no site preparation, but they often produce surveys of lower resolution than those produced by surface or borehole methods. Surface methods offer higher resolution in most situations and still offer coverage over a large areal extent. However, cost may be high, especially in areas with topographic relief, infrastructure, and/or environmentally sensitive cultural areas. Borehole methods often offer the highest resolution and can also often be acquired at a low cost. However, they do not image a large volume of the subsurface and they depend upon subsurface penetrations that cross the formations of interest. For all survey types, increasing the density of measurements, sources, or receivers will generally increase the quality of the survey but will also increase cost.

## Seismic Methods

A seismic survey uses seismic waves to produce 2D sections or 3D images of the subsurface. Both seismic reflection and seismic refraction techniques are available. Refraction techniques are generally used for imaging shallow features (less than 100 m) and are less useful than reflection techniques for interpreting complex geologic structures. The remainder of this section focuses on reflection techniques. More information on refraction techniques is available in *An Introduction to Geophysical Exploration* (Kearey et al., 2002).

Seismic reflection techniques measure the time it takes for seismic waves emitted from a source to bounce off a subsurface reflector and be detected at a geophone. This method is by far the most established, commonly deployed, varied, and advanced of the geophysical methods. More detailed information on seismic methods and processing is available from numerous sources, including introductory guides such as: *A Handbook for Seismic Data Acquisition* (Evans, 1997), *Environmental Geology – A Handbook* (Knödel et al., 2007), and *An Introduction to Geophysical Education* (Kearey et al., 2002).

Different source/receiver deployment configurations can be used to maximize data quality depending on terrain and other factors (see Short, 1992 for more details). Newer, fully portable (cableless) data acquisition systems are also available (Criss, 2007) and may be used in regions with surface infrastructure and/or rough terrain.

Seismic reflection systems are recognized as having the highest resolution of all geophysical imaging techniques in most situations (Benson and Myer, 2002). Seismic methods work best when characterizing simple, homogenous geologic settings where supplementary sources of data such as well logs, outcrop data, and other geophysical surveys are available. Increasing subsurface complexity may increase survey cost or decrease the resolution of survey results. Areas with accumulations of loose sediments such as thick sands or unconsolidated sandstones, conglomerates, well sorted gravels, or weathered horizons are challenging to image and may require more detailed consideration of seismic source and detector (see Short, 1992 or Knödel et al., 2007 for further information on selecting a proper seismic source). Seismic surveys are also complicated by noise contamination from roads, airports, railroads, mines, and other human activities that cause mechanical vibration.

Difficulty also increases when imaging through salts, basalts, coal seams, carbonates, and non-sedimentary units (Cooper, 2009; Hyne, 2001). Non-clastic rocks (i.e., metamorphic or igneous rocks) and coal seams cannot be imaged well. If such lithologies are present in the area of interest, seismic data may need to be supplemented with additional data. For example, if salt bodies are present, gravity data can be co-analyzed with seismic data to accurately determine their size and location (Nester and Padgett, 1992). Basalts pose a problem for seismic methods because traditional seismic approaches have resulted in severe energy scattering and wave interference. Some success has been reported in imaging basalts using multicomponent systems and wave component analysis (Sullivan et al., 2008). Carbonates often have minimal changes in seismic properties even when there are changes in texture, permeability, and porosity. High quality surveys, multicomponent methods, or other additional data collection steps may be needed to obtain sufficient accuracy and resolution in difficult environments.

Both surface and subsurface seismic methods can use additional wave types to improve data quality. Most seismic data acquisition systems collect only p-wave (compressional wave) data unless otherwise specified, usually in two vibrational directions (called components). Other seismic wave types and components may also be collected to improve survey results. Special sources, receivers, and recording capacity are usually the only changes required to modify a seismic survey for additional wave types. Geophones that measure additional seismic components (such as direction of vibration) may also be added. The main disadvantage of these methods is that they increase processing time and are not as well-developed as standard approaches.

Wave choice depends largely on subsurface geology. P-waves remain the best option for imaging bulk changes such as porosity. However, p-waves are distorted by gases in rock. In such cases, shear waves (s-waves), which are not distorted by subsurface gases, can be used (Thompson, 2005). This may be advantageous when characterizing some depleted gas reservoirs for carbon dioxide storage. S-waves are also appropriate for heavily faulted or fractured sites due to their greater sensitivity to continuous features such as fractures. Stoneley waves can help to identify fractures and changes in permeability (Cheng, 1992). Because s-waves provide information in the waveform as well as in the arrival time of the wave, a smaller number of geophones may be needed to gather the same amount of information.

S-waves can also help improve seismic pore-pressure prediction. S-wave data can aid in determining which seismic velocity variations are due to variations in fluid content and which are due to variations in fluid pressure (Sayers et al., 2000). In complex areas such as shallow, grossly undercompacted sediments, zones of severe unloading with minimal effective stress, and areas near gas chimneys and clouds, s-wave data may also help improve results (Huffman, 2002; Thompson, 2005).

## Seismic Deployments

Seismic data can be collected with many different source/receiver configurations. Deployment can be done on the surface, in boreholes, or in a combination of both. 2D and 3D seismic profiling are the leading options available for surface-based seismic imaging. 2D surveys produce “slices” of the subsurface while 3D surveys produce subsurface models that can be rotated and viewed from different perspectives. 2D seismic surveys are less expensive than 3D surveys because they require less site preparation, shooting time, and post-collection data processing. The chief disadvantage of 2D imaging is that, because it is collected in a line on the surface, it is difficult to determine the location of out-of-plane features. Therefore, 2D surveys are not optimal in settings where significant lateral heterogeneity is expected (e.g., areas with salt domes, intrusions, or where sedimentary layers are expected to thin or thicken). Application of 2D seismic profiling may also be problematic in faulted regions, where the choice of line orientation is more critical to capture faults. 3D surveys are preferable to 2D surveys when characterizing sites with complex or variable subsurface geology, where subsurface geology is not well constrained, where improved resolution or greater certainty in subsurface characterization is needed.

Both 2D and 3D seismic methods have been used at GS sites. 2D seismic surveys were used for site characterization and baseline data at the Sleipner project in the North Sea (Hellevang et al., 2005). The Weyburn project in Saskatchewan, Canada also used 2D seismic lines for site characterization and as baseline measurements (Wilson and Monea, 2004). 3D seismic surveys were used for both site characterization and as baseline data at the carbon dioxide storage by injection into a natural saline aquifer project at Ketzin, Germany (CO2SINK) and for site characterization at the Kallirachi oil field in Greece, which is being considered for EOR/carbon dioxide storage (Koukoulas et al., 2009).

A larger number of downhole seismic techniques are available. VSPs are the most common borehole seismic method. A VSP is conducted with one component located on the surface (usually the source) and the remaining component placed downhole. A VSP can be conducted in a vertical or deviated well to a depth of at least 3,000 m (Balch et al., 1982). The source may be directly adjacent to the borehole or, for an offset VSP, located at a fixed distance away. A VSP can resolve features 3–4.5 m in size or smaller.

A VSP can also help increase the resolution and accuracy of other seismic surveys. First, a VSP can provide an accurate determination of the seismic velocity within the area of interest (seismic refraction techniques can also provide this information in simple geologic settings). This determination can help with seismic migration and pore pressure estimation. A VSP can also

help confirm the depth at which upgoing reflections are generated, which can be used to link geology derived from other bore logs to seismic attributes (Kearey et al., 2002).

Crosswell seismic methods deploy sources and receivers in different wells, producing a survey that images the plane between the wells. The Ketzin project used crosswell surveys and VSP surveys for site characterization and baseline monitoring data. Crosswell surveys between multiple wells can be used to produce a fence diagram. Equipment is generally deployed in monitoring wells located within 500 m of each other (Hoversten et al., 2002), although deployment down active injection wells is also possible (Daley et al., 2007).

Crosswell seismic surveys combine most of the advantages of VSP with additional lateral extent. Crosswell seismic profiling can achieve a maximum resolution of 3 m (Harris and Langan, 1997), which may provide data 10–100 times more detailed than surface seismic data (Martin et al., 2002). Crosswell seismic profiling may also be the best option available for imaging thin beds. The data can be used to fill the resolution gap between high-resolution well cores and 3D surface data (Washbourne and Bube, 1998) or to help correlate structures between well bores. However, because of the need for multiple wells, crosswell seismic profiling will not be suitable in areas that do not already have abundant subsurface penetrations. Furthermore, the distribution of wells will determine the potential planes for crosswell imaging. These orientations may not be optimal for imaging the relevant features. Crosswell imaging was used successfully for both site characterization and baseline monitoring at the Nagaoka pilot project in Japan, which injected and monitored 0.01 megatonne (Mt) of carbon dioxide.

The borehole microseismic method relies completely on subsurface deployment and uses passive seismic energy. A string of geophones is deployed down a monitoring well and used to sense seismic events, typically on the order of  $M -3$  to  $-1$ . Microseismic events can be detected up to 1 km from the well on average (Downie et al., 2009). The period of data collection is variable and depends upon the frequency of seismic events, but typically lasts from several weeks to several months. This is disadvantageous compared to other seismic methods that collect data over a period of hours. Generally, the greater number of microseismic events, the more accurate the result.

After collection, the hypocenters of the seismic events are projected onto a subsurface map to image fracture networks, faults, and other regions actively undergoing strain or deformation. The quality of the geologic model used to transform the time data and locate each hypocenter largely controls the accuracy of the result (Warpinski et al., 2009).

### **Processing of Seismic Data**

Post-collection processing techniques provide control over the final quality of the survey and its applicability to the project site characterization. In some cases, old data may even be re-processed with newer techniques to uncover additional information. Choice of processing techniques will largely depend on site-specific factors other than the type of carbon dioxide storage reservoir being investigated. For example, certain types of processing (such as pre-stack migration) are more appropriate in regions where steep faults or other features are anticipated (such as near salt domes). Seismic processing techniques are immensely varied; the following is

an overview. For more detailed information, a number of handbooks on seismic processing are available (e.g., Upadhyay, 2004).

If information about faults or other discontinuities in the subsurface is desired, special processing techniques can be used to mine the data for this information. Seismic crustal anisotropy processing can be used in areas where aligned fractures, joints, or fluid inclusions recur in the subsurface at a distance smaller than the wavelength of the seismic wave. As the wave passes through such a region, it is split into two waves with different polarization and velocities (Crampin and Lovell, 1991), in a manner similar to the effects of diffraction gratings on light waves. Studying the split waves can reveal information about the magnitude, consistency, and orientation of recurring subsurface features. Alternatively, p-wave data can be processed with a technique called p-wave amplitude variation with offset and azimuth (abbreviated pAVAZ or pAVOA) (Gray et al., 2002) to reveal information about fracture and pore orientations. However, these techniques are not fully developed. These techniques may have the potential to be adapted to image cleats and other discontinuities common in coal seams or columnar joint in basaltic flows if either type of formation is used as a potential carbon dioxide reservoir.

Coherence processing can be used to detect faults. This method suppresses continuous features and highlights discontinuities, such as faults, within seismic sections. Although discontinuities in high-quality seismic data are often indicative of faults and lithologic breaks, discontinuities in low-quality seismic data may be due to a range of data collection and processing errors. As a result, coherence is very sensitive to the quality of input seismic data and is not suitable for low-quality surveys.

Other advanced processing techniques, such as difference analysis with data normalization (DADN) (Onishi et al., 2009) are also available.

### **Pore Pressure Interpretation**

Seismic data can be processed to remotely determine subsurface pore pressures. This is accomplished using the relationship between pore pressure and effective stress:

$$\text{pore pressure} = \text{total stress (i.e., overburden stress)} - \text{effective stress}$$

Any seismic data that yield an accurate velocity for the seismic wave in the subsurface can be used to approximate effective stress. However, not all seismic data meet this criterion because accurate velocity values are not needed to image the subsurface. Ensuring that seismic data can also be used for pore pressure prediction may not greatly increase the survey cost, but it does require planning.

Once accurate velocity data have been obtained, numerous methods are available to convert velocity to pore pressure. These methods tend to work best in developed basins filled with shales and sands. In regions with high sedimentation rates like the Gulf of Mexico, tectonically complex regions, or regions with abundant carbonates, the transforms to convert velocity to pressure may introduce significant error. (See Sayers et al., 2005; Young and Lepley, 2005; and Sayers et al., 2000 for more information.)

The overburden pressure in the area of interest is needed for accurate pore-pressure determination. The overburden pressure is closely related to the density of the overlying material and can be determined from well density logs. Gravity measurements can also be used to estimate the overburden pressure (Huffman, 2002). This is especially advantageous in areas with complex geology (e.g., regions with salt domes or other intrusive structures) where individual boreholes are likely to miss significant features.

Under optimal conditions, pore pressure analysis can resolve pressure data for strata 30–60 m thick at medium depth in clastic basins with relatively simple stratigraphy (Huffman, 2002). Pressure information can also be used to help determine the integrity of sealing layers and the sealing behavior of faults (Huffman, 2002; Sayers et al., 2002). Additionally, if pore pressure appears compartmentalized by a fault in a 3D subsurface pressure map, this may support the interpretation that the fault is sealing. Subsurface pressure data may also help to inform estimates of risks associated with induced seismicity and estimates of total storage capacity, both of which require estimates of subsurface pressure.

The main disadvantages to this technique are the extensive data processing and interpretation, which may introduce large errors, and the need for basin-specific correction factors during velocity processing. Saline formations and depleted reservoirs are the storage formations of interest where a potential Class VI injection well applicant would be most likely to utilize this technique.

### **Additional Seismic Data Analysis - Seismic Stratigraphy**

Seismic stratigraphy identifies stratigraphic units based on their seismic characteristics. Because seismic reflections follow large-scale bedding, the geometry of the reflections allows the delineation of features such as unconformities, depositional sequences, and unit thicknesses. Seismic reflections will not indicate facies shifts, but can show fluid changes or diagenetic changes (Emery and Myers, 1996). The principles of seismic stratigraphy are presented in a classic paper by Vail et al. (1977).

Stratigraphic features identified in seismic surveys can be integrated with lithologic data from cores, well logs, and other data to allow interpretation of depositional environments. Lithologies and other characteristics identified at wells and boreholes can be correlated to seismic attributes, which can then be used to predict subsurface properties at other locations through the use of neural networks, regression, or other methods. Stratigraphic features identified in this manner may help in identifying features (e.g., barriers, channels, fans) that might affect storage capacity and migration of carbon dioxide.

There are different processing and display options that can be employed for stratigraphic interpretation, and the choice of method will depend upon acquisition parameters, seismic sources, and site geology (Emery and Myers, 1996).

## Gravity Methods

Gravity-based methods image differences in density among subsurface materials. Because density is related to gravity, changes in the distribution of fluids, cementation, and porosity of subsurface materials can be measured as changes in gravity. Gravity data can be collected from land-based stations, aerially, or directly from the subsurface using boreholes. Choice of deployment is usually controlled by factors such as desired resolution and site-specific geology and is not limited by choice of carbon dioxide storage formation type.

Gravity is measured with a gravimeter; information on how measurements are obtained can be found in Paterson and Reeves (1985). Figure A-18 is an example of a typical surface deployment pattern.

**Figure A-18: A Gravity Map of an Area Ore Deposit and Mine.**

From: Yarger and Jarjur (1972); Reproduced with permission from the Kansas Geological Survey.

Because detection of faults and structural features using gravity data depends upon contrasts in density, gravity methods work best in basins with varied lithologies. Salt domes and igneous intrusions are the easiest types of lithologic features to image because they usually have a high-density contrast with surrounding formations. Figure A-18 illustrates the gravity anomaly associated with an ore deposit and mine. Faults may be detected with gravity data if units with contrasting density or regions with different sedimentary thicknesses are juxtaposed. Small faults or faults with large displacement occurring in discrete steps are more difficult to detect with

gravity data than large planar faults. Vertical faults are especially difficult to detect using surface gravity methods (Barbosa et al., 2007).

Because gravity measurements are not unique to specific lithologies, additional data from other types of geophysical surveys or other sources (e.g., boreholes, outcrops) can greatly improve the interpretation of gravity data (Jordan and Hare, 2002). One advantage relative to seismic data is that, because processing of gravity data is much more straightforward, it generally introduces much less interpretive error.

### **Aerial and Surface Gravity Methods**

For aerial methods, data are typically collected along parallel lines in the area of interest. Closer spacing will generally increase resolution. For surface deployments, measurements are typically taken at discrete stations across the area of investigation. Broad gravity surveys may suffice for detecting large-scale changes in the thickness of basin fill and other basin-wide features, while more detailed surveys will be needed to detect finer features such as the distribution and thickness of specific formations.

### **Borehole Gravity Methods**

Borehole surveys can be used to determine layer thickness and aid in determination of lithologic composition. Borehole gravity methods collect information from a larger subsurface volume than other types of borehole logs. This is useful for characterizing porosity and other formation parameters in carbonate and fractured reservoirs (LaFehr, 1992; Chapin and Ander, 1999) or other situations where poor borehole conditions, problematic casings, cementing problems, and well bore washouts are likely to affect the quality of other borehole formation-testing tools (LaFehr, 1992).

Borehole gravity surveys are conducted in a manner similar to borehole seismic surveys. A gravimeter is lowered down the borehole and measurements are taken as the device is raised, usually at set intervals between 3 m and 15 m (Herring, 1990). Borehole surveys have been conducted in wells 2,000 m deep (Seigel et al., 2009) and inclined up to 60 degrees (Seigel et al., 2009). Resolution is usually high. Special techniques (i.e., gravity gradiometry) are needed to characterize non-horizontal strata.

In regions that are laterally variable geologically, borehole gravity data may indicate features such as salt domes and reefs even if they do not intersect the borehole (LaFehr, 1992). As a rule of thumb, borehole gravity surveys can detect anomalies as far away as one to two times the height of the body in question. For example, a sandstone lens 50 m high could be detected 100 m from the well bore under good conditions (Herring, 1992). When using a single well, however, it is only possible to know the radial distance from the well of a feature and not the direction.

### **Electrical/Electromagnetic Geophysical Methods**

Electrical and EM methods use the conductive properties of subsurface materials to infer fluid distribution, stratigraphy, and/or structural information. Data can be collected aerially,

surficially, or from the subsurface. Electrical/EM methods can use either natural electric fields or a controlled source (man-made). Deployment of survey equipment may either be temporary (for one survey) or permanent (e.g., installed during well construction).

Electrical methods transmit a pulse of electrical energy into the subsurface using electrodes or other means; changes in properties such as galvanic potential that are registered when the signal arrives at a receiver are used to infer subsurface resistivity, which is then mapped and interpreted. EM methods measure the induction effect (generation of current and electric fields) in the subsurface by another EM field or electric current (Jordan and Hare, 2002). Depending upon the method, results can be presented either as a surface map or cross section. Figure A-19 provides an example of the end result from an EM survey.

**Figure A-19: A Subsurface Cross Section of Electromagnetic Resistivity Data.**  
From: Lucius and Bisdorf (1997).

Fluid saturation and composition are the two most important factors controlling the conductivity/resistivity in the subsurface and, accordingly, the response to electric and EM fields. Therefore, electrical and EM methods are most sensitive to fluid composition, distribution, and saturation and less responsive to lithologic or structural changes (Wynn, 2003). Detailed determination of subsurface lithologies or structural features is usually only possible when the flow and distribution of formation fluids are controlled by lithology and structure. For example, fractures and faults are generally considered significant for electric/EM studies in low permeability and low porosity formations, where they can act as the primary pathways for conductive fluids (Orange, 1992). Accordingly, electrical/EM data are more likely to be used to characterize saline formations and depleted reservoirs than other types of potential carbon dioxide storage formations. Interpretation of electrical data is primarily qualitative and generally attempts to explain the shape of an anomaly in terms of fluid flow direction and magnitude (Orange, 1992). Values such as flow volume and composition cannot typically be quantified.

Deployment method is more strongly influenced by the desired resolution than the type of carbon dioxide storage formation. Most surface methods for electrical data collection yield poor results compared to subsurface methods because surface conditions are highly heterogeneous and tend to attenuate the signal (Wilt et al., 1995). Near-surface changes in saturation (e.g., from

rainstorms) can also greatly affect survey results, although this is more problematic for time-lapse monitoring than site characterization.

For subsurface deployments, the survey depth is typically two to three times the length of the dipole used to generate the current (Jordan and Hare, 2002). Resolution is usually 5–20% of the electrode depth (Jordan and Hare, 2002). Resolution is low for most electrical/EM methods compared to seismic methods. However, the depth and breadth of electrical/EM surveys can provide valuable information on the regional geologic framework at low cost (Orange, 1992).

Highly conductive and magnetic rocks may introduce error into electric/EM methods (Jordan and Hare, 2002). Additional care should be taken if magnetite, iron-rich sands, graphite, or other conductive and/or magnetic constituents are present (at levels as low as 1%) within the area of interest. For further information, Jordan and Hare (2002) and the U.S. Army Corps of Engineers (1995) provide a detailed discussion of electrical and EM methods.

### **Natural Source Electrical/Electromagnetic Methods**

The self-potential (SP) method is an electrical technique that detects the current (in millivolts) generated by electrochemical reactions (i.e., oxidation/reduction reactions) in the subsurface (Orange, 1992). Measurements should not be taken within 500 m of power plants, substations, pipelines, telephone lines, or power lines (Jordan and Hare, 2002). The result is a surface map of electric potential. (see U.S. Army Corps of Engineers, 1995, for further details on SP surveys.)

Magnetotellurics is an EM method that measures resistivity in the subsurface based on the strength and wave impedance of naturally propagating low-frequency EM fields in the Earth (Orange, 1992). Data are usually displayed as a cross section. Magnetotelluric surveys can image 10 km or more into the subsurface (Orange, 1992), allowing deep structures to be identified. Rock types can also be inferred when resolution is high and an existing knowledge of regional stratigraphy is available.

Methods that use naturally occurring electric fields avoid the expense and logistics of choosing and operating a source. However, naturally occurring fields are unpredictable, and the total energy level of the field cannot be controlled (Orange, 1992).

### **Controlled Source Electrical/Electromagnetic Methods**

Controlled source methods use external sources to generate electrical energy and direct it into the subsurface or to induce EM fields in the subsurface. These methods can image the subsurface up to 1–2 km deep (Orange, 1992) with low resolution. Electrical controlled-source methods use a variety of sources channeled into the subsurface using source and receiver electrodes (U.S. Army Corps of Engineers, 1995). Induced polarization (IP) and complex resistivity (CR) are subtypes of this method and are most often used in known hydrocarbon reservoirs (Orange, 1992).

Electrical methods can also be used in a crosswell configuration. One such technique is electrical resistance tomography (ERT). Deployment is similar to crosswell seismic imaging with a source of electric current in one well and a receiver in another. Resistivity changes on the order of 30%

can generally be detected, although under optimal conditions resistivity changes as little as 10% can be measured (Newmark et al., 2001). Figure A-20 presents an example permanent downhole ERT array used to characterize and monitor carbon dioxide injection into a depleted reservoir.

**Figure A-20: Permanently Installed ERT Array at the CO2SINK Pilot Site at Ketzin.**

The diagram uses blue boxes to represent geophones, while the red star is the source. VSP = Vertical Seismic Profile, DTS = Distributed Thermal Sensor, VERA = Vertical Electrical Resistance Array, MSP = Moving Source Profile. From: Forster et al. (2006); © AAPG 1992, reprinted by permission of the AAPG whose permission is required for further use.

Surface EM controlled-source methods use coils and/or grounded wires to generate an EM field on or above the surface. This field induces currents in the subsurface, which, in turn, generate their own EM fields. The induced subsurface EM fields are then quantified by the disturbance they create in other fields (frequency domain methods) or as they decay (time domain methods). Resistivity can be calculated through inversion and modeling of these measurements (Orange, 1992). EM methods can be used to detect changes down to 1 km or more (Orange, 1992; Jordan and Hare, 2002). Data can be collected aerially, although the maximum depth decreases to 100–200 m when using aerial data collection. Aerial data collection usually cannot resolve anomalies smaller than 50–100 m<sup>2</sup> (Jordan and Hare, 2002).

Controlled source audio-frequency magnetotellurics (CSAMT) is similar to the magnetotellurics method mentioned above, but the EM wave is generated and introduced into the ground by a dipole or pair of dipoles, usually 10–200 m in length (Jordan and Hare, 2002). A linear array of receivers located several kilometers away collects the signal from the subsurface. Data are

displayed as a cross section. CSAMT is less affected by infrastructure-related noise than other electrical/EM depth-profiling methods.

Using a controlled source allows the operator to control the source strength and, to some degree, the signal-to-noise ratio. However, because the field is induced, the field geometry is determined and accounted for during processing. This increases the difficulty of the survey and may introduce processing errors. Also, determining the geometry of the field becomes increasingly difficult in geologically complex regions.

### **Processing of Electrical/Electromagnetic Data**

Depending upon the exact deployment, electrical methods require various amounts of post-collection data processing. Advanced processing techniques are also available if high resolution in single or time-lapse studies is needed (Onishi et al., 2009). Processing methods are not affected by the type of carbon dioxide storage formation being investigated.

### **Magnetic Geophysical Methods**

Magnetic methods use natural variations in the Earth's magnetic field to map features at the shallow, sedimentary, and basement levels. The magnetic field is affected by the distribution of iron-bearing minerals in subsurface formations. The distribution of iron-bearing minerals is usually controlled by the occurrence of igneous rocks, the prevalence of mineralization along faults, and the separation of detrital minerals during fluvial and other sedimentary processes.

The type of storage formation is not likely to influence the suitability of magnetic methods for site characterization purposes, although basalts may have a slight affinity for magnetic methods since igneous rocks can have a high content of potentially magnetic minerals.

Magnetic intensity surveys are usually collected aerially using a magnetometer, although ground-based surveys can also be collected using a portable magnetometer. Figure A-21 presents an example of the type of data an aerial survey can provide. Paterson and Reeves (1985) provide a detailed discussion of magnetic methods.

**Figure A-21: An Aerial Gravity Map.**

The data can then be interpreted for faults (the dashed and solid lines) and other structures. From: Goussev et al. (2004).

Faults and other structural features in both basement rocks and overlying sedimentary cover can be imaged, but formation characteristics are difficult to determine using magnetic data (Ugalde, undated). Faults can be identified either because displacement along the fault juxtaposes units with different magnetic signatures or, more commonly, because secondary mineralization of magnetite or demineralization along the fault plane alters the magnetic signal in the region of the fault. Information on the dip of faults can also be gathered in some cases. One common interpretive error in magnetic surveys is wrongly identifying paleochannels filled with detrital magnetite as faults. Therefore, extra care should be taken in interpreting regions with sandstones and other fluvial lithologies.

Because magnetic data are non-unique and do not represent specific lithologies, additional data from other types of geophysical surveys or other sources (boreholes, outcrops etc.) can improve magnetic data interpretation (Jordan and Hare, 2002). This approach was taken at the Weyburn Project in Saskatchewan. At the site, co-processing of low quality gravity and seismic data allowed positive identification of faults that were ambiguous using either data set alone (Goussev et al., 2004) during site characterization. This data interpretation approach may be a good solution for characterizing areas with vintage data sets such as oil and gas reservoirs.

Magnetic methods are sensitive to human infrastructure. As a result, they are not useful in populated or developed areas because buildings, pipes, and wires obscure the geologic signal. The one advantage to this sensitivity is that magnetic surveys may be used to find abandoned, cased wells. This can help in identifying abandoned wells that may need corrective action, as

required at 40 CFR 146.84(c). See the *UIC Program Class VI Well Area of Review Evaluation and Corrective Action Guidance* for further details on locating abandoned wells and performing the required corrective action activities.

### **Processing of Magnetic Data**

After collection, magnetic intensity data undergo processing. Processing methods are not influenced by the type of carbon dioxide reservoir under investigation. High frequency anomalies can be attributed to near-surface and shallow subsurface effects, intermediate frequency anomalies can be attributed to the composition of the sedimentary basins, and low-frequency anomalies can be ascribed to changes in the basement rocks. Most surveys collected today are of sufficient resolution to detect anomalies in all three ranges.

## A7. Information to Support Demonstration of Storage Capacity

To support a demonstration that the site meets the requirement that the injection zone or zones are of sufficient areal extent, thickness, porosity, and permeability to receive the total anticipated volume of the carbon dioxide stream per 40 CFR 146.83(a)(1), this section provides background on the concept of storage capacity and some of the methods that have been used to estimate storage capacity for different formation types. This section includes definitions of terms, references for information on various parameters, methods for estimating carbon dioxide storage capacity, and case studies. For additional information and recommendations, see Section 3.4 of the guidance, *Demonstration of Storage Capacity*.

### Resources and Reserves

The concepts of resources and reserves are used to estimate the availability of mineral resources (e.g., in the oil and gas and mining fields). Similarly, the concepts of resources and reserves can be applied to carbon dioxide storage capacity. USDOE (2008a) makes a distinction between carbon dioxide resource estimates and carbon dioxide capacity estimates. A carbon dioxide resource estimate is defined as the volume of porous and permeable sedimentary rocks available for carbon dioxide storage and accessible to injected carbon dioxide via drilled and completed well bores. This assessment includes physical constraints, but it does not include economic or regulatory constraints. A carbon dioxide storage capacity estimate is an attempt to realistically include both the physical and economic constraints that determine the volume of rock available for storing carbon dioxide. The level of detail in storage capacity estimates depends on the scale and resolution of the assessment as illustrated in Figure A-22 (Bachu et al., 2007). Storage capacity estimates can be classified by degrees of certainty (Bachu et al., 2007; Bradshaw et al., 2007) as described below and illustrated in Figure A-22.

*Theoretical Storage Capacity* – This storage capacity estimate results in the least certainty. Bachu et al. (2007) describe it as representing the physical limit of what the geologic system can accept (e.g., entire pore space) or only the space from which the original fluids can be displaced (i.e., pore space minus the irreducible residual saturation of the initial fluid). The theoretical storage capacity typically represents a maximum upper limit to the capacity estimate; however, it is an unrealistic number as in practice there will always be physical, technical, and practical limitations that prevent full utilization of the theoretical storage capacity.

**Figure A-22: Variation in Size and Resolution of Various Storage Capacities.**

(a) resource pyramid and (b) data and assessment scales. From: Bachu et al. (2007); © Elsevier, reproduced with permission.

*Effective Storage Capacity* – This estimate is also known as “realistic capacity.” Bachu et al. (2007) note that it is obtained by applying a range of technical (geological and engineering) cut-off limits to a storage capacity assessment, which usually changes with the acquisition of new data and/or knowledge.

*Practical Storage Capacity* – This estimate is also known as “viable capacity.” Bachu et al. (2007) describe it as obtained by considering both technical and practical challenges to safe carbon dioxide geological storage. This estimate is prone to changes over the life of a GS project as technology, policy, regulations and/or economics change.

*Matched Storage Capacity* – This estimate yields the greatest certainty regarding carbon dioxide storage capacity. Bachu et al. (2007) describe it as a detailed matching of large stationary carbon dioxide sources with geological storage sites that are adequate in terms of capacity, injectivity and supply rate.

Additionally, USGS has released a report on risk-based capacity estimates, which differs from the above estimates in that it uses fully probabilistic methods to incorporate geologic uncertainty in calculations of storage potential (Brennan et al., 2010).

This section focuses on some methods that may be used to develop estimates of storage capacity for a GS project with the greatest certainty and highest level of detail.

## Parameters and Data Interpretation

This section provides brief information on parameters that may be needed to estimate the volume (or mass) of carbon dioxide storage capacity, depending upon the method selected. Table A-3 provides a summary of the types of methods available for quantifying parameters, such as laboratory methods and field testing, and estimating or predictive tools. Porosity, permeability, and injectivity (flow rate) are discussed in the guidance (Sections 2.3.5 and 4.5.2) and in Section

A3 of this Appendix. Some recommended data sources for determining injection zone thickness, area, and background hydraulic gradient are discussed in Sections 2.3.1 and 2.3.3 of the guidance and Section A1 of this Appendix. Several of these parameters, such as capillary pressure, temperature, compressibility, water saturation, intrinsic and relative permeability, and porosity are also needed for the multiphase fluid modeling required for proposed Class VI injection well AoR delineations [40 CFR 146.84]. For more information on the required AoR modeling for a proposed Class VI injection well, see the *UIC Program Class VI Well Area of Review Evaluation and Corrective Action Guidance*.

**Table A-3: Parameters and Methods for Quantifying Storage Capacity.**

Parameter	Methods for Quantifying Parameters			Parameters for Estimating Storage Capacity

## Pressure

Formation pressure measurements are required by the Class VI Rule as part of the logging, sampling and testing required prior to injection well operation [40 CFR 146.87(c)]. Information on obtaining pore pressure measurements is provided in Section A4 of this Appendix. Additional information regarding types of pressure transducers is available in Harrison and Chauvel (2007) and from commercial manufacturers as well as in the *UIC Program Class VI Well Testing and Monitoring Guidance*.

## Fracture Pressure

Field methods such as step rate tests (see Section 4.4 of the guidance) can provide the required calculated information about the fracture pressure of both the injection and the confining zone(s) [40 CFR 146.87(d)(1)] that will support injection pressure limits in the Class VI permit. As noted by USDOE (2008a), all geological formations will begin propagating fractures upon reaching a threshold pressure; this site-specific threshold-pressure constraint is an important consideration in estimating carbon dioxide storage capacity.

A step rate test is performed by first shutting-in the well long enough for the bottom hole pressure to reach equilibrium with the formation pressure. This can be done by using a downhole pressure gauge with a surface readout and watching the gauge until the pressure stabilizes. Theoretical calculations of the time required to reach equilibrium are also available. A fluid is then injected at a constant rate while the downhole pressure is measured. The injection rate is held constant for a period of time that depends on the formation permeability. A typical injection step would be 1 hour for low permeability formations (less than 5 mD) and ½ hour for permeable formations (greater than 10 mD) (USEPA, 1999). After one injection step is completed, the injection rate is raised and another step is conducted. The pressure increments should be great enough to yield measurable pressure differences in the well and should cover the entire planned injection range. Injection rate is plotted versus pressure. The plot should initially be linear. Injection steps are continued until at least two data points are gathered past the point where the plot shows deviations from the linear trend; the intersection point of the two curves is the fracture pressure. After the last injection step, the well is shut-in again and the instantaneous pressure is recorded.

## Temperature

Temperature sensors include mechanical (obsolete), thermistors (semiconductor material and highly sensitive), and resistance temperature detectors (wide temperature range and excellent accuracy). Prenskey (1992) has described the determination of formation temperature and temperature gradients by the two-point or multiple-point average temperature gradient, whereby a linear relationship is assumed between the ambient surface temperature and the bottomhole temperature. Regression techniques can be used to calculate geothermal gradients for large data sets (Speece et al., 1985). Information regarding local and regional thermal gradients can also be obtained from reports generated by academic institutions and government agencies such as Nuccio and Condon (1996). The reader is referred to Bachu and Haug (2005) and Harrison and Chauvel (2007) for additional discussion and examples.

## Compressibility

Rock compressibility data for a given reservoir can be obtained from laboratory measurements on core samples. In situations where laboratory analysis is not practical, rock compressibility values can be estimated from porosity overburden pressure as described by Craft and Hawkins (1959). Harrell and Cronquist (2007) provide a substitute correlation for estimating rock compressibility that depends on rock properties. Other values of rock compressibility have been reported as case studies in the literature (e.g., Law and Bachu, 1996; Ross et al., 2009).

For carbon dioxide, equation-of-state models have been developed to predict carbon dioxide compressibility in multi-component two-phase systems (Firoozabadi et al., 1988). The compressibility of carbon dioxide can also be affected by SO<sub>x</sub> and NO<sub>x</sub> impurities, potentially affecting the estimated volume of carbon dioxide for storage; the reader is referred to Benson and Cook (2005) and Sass et al. (2005).

## Transmissibility

In the field, vertical permeability (or transmissibility) can be estimated by transient tests generally classified as vertical interference testing or vertical pulse testing (Earlougher, 1977). For these types of tests, part of the well may be used for injection and part of the well may be used for pressure observation as illustrated in Figure A-23. Earlougher (1977) described several applications of vertical testing using type-curve matching methods. Additional discussion of pressure testing and analysis in gas injection wells is provided by Matthews and Russell (1967).

**Figure A-23: Vertical Interference or Pulse Test.**

From: Earlougher (1977); © SPE, 1977, reproduced with permission; further reproduction prohibited without permission.

## Interfacial Tension

Knowledge regarding the IFT between carbon dioxide and brine at in situ conditions is needed for precise measurements of capillary pressure, which in turn impacts relative permeability

(Bachu and Bennion, 2008). IFT is the surface tension at the interface of two immiscible fluids. Surface tension can be measured by a variety of laboratory methods such as the Du Noüy Ring method, the Wilhelmy Plate method, the spinning drop method, the pendant drop method, and other techniques. For additional information, see Bachu and Bennion (2008), del Rio and Neumann (1997), and Nobakht et al. (2007).

IFT can also be estimated mathematically by an empirical power function of pressure, whereby the values of the coefficient and exponent depend on temperature and water salinity (Bachu and Bennion, 2009). Bachu and Bennion (2009) provide parameters for a range of temperature and salinity conditions representative of in situ carbon dioxide-brine systems.

### **Water Saturation**

Water saturation ( $S_w$ ) describes the fraction of water in a given pore space. It depends on particle size and interparticle porosity (Lucia, 1992). Water saturation is most often determined from resistivity log measurements combined with knowledge of porosity, water resistivity, and shale volume (Alberty, 1992b). Water saturation values range from 0 (completely dry) to 1 (completely saturated). For additional information, see Alberty (1992b). Water saturation can also be determined from cores, for example from capillary pressure testing and other laboratory methods that involve expelling and measuring the formation water or other fluids (Ringin et al., 2001).

### **Wettability**

In a solid, porous medium in contact with two or more fluid phases, wettability is the ability of one of the fluid phases (the wetting phase) to contact the solid preferentially over other phase(s) (Donaldson and Tiab, 2003) (Figure A-24). Wettability has important consequences for the relative permeability and  $P_e$  (see below) of pore fluids. These two parameters, in turn, affect the sealing and storage capacities of subsurface units (Chiquet et al., 2007; Li et al., 2005).

Wettability can be observed directly in the laboratory by measuring the contact angle between the solid portions of the formation and formation fluids (Chiquet et al., 2007) or can be inferred using either the Amott method or the USBM (United States Bureau of Mines) test (Donaldson and Tiab, 2003). There are no established techniques for downhole field measurement of wettability.

Salinity, temperature, and pressure can all affect wettability (Donaldson and Tiab, 2003), and wettability measurements will be most applicable if they are taken under conditions that approximate those found within the formation of interest. Additionally, micromodels are currently being developed that will be able to predict changes in wetting phase behavior as reservoir conditions change (PNNL, 2010). These may be useful if the reproduction of reservoir conditions is not possible in the laboratory.

**Figure A-24: A Diagram Demonstrating Wetting Angle.**

The wetting angle is  $(180-\theta)$ . A fluid with a low wetting angle (at right) and a fluid with a moderate wetting angle (at left) on the same substrate. The fluid with the lower wetting angle would be the wetting phase if both fluids were present in the interconnected pore space of a solid made of the material upon which the wetting angle is being measured.

## Capillary Pressure

Capillary pressure is the minimum pressure required for an immiscible non-wetting fluid to overcome capillary and interfacial forces and enter pore space containing the wetting fluid. For carbon dioxide injection into a saline formation, the non-wetting fluid is carbon dioxide and the wetting fluid is the native brine. Capillary pressure has been shown to be affected by IFT and pore-size characteristics, as well as in situ pressure, temperature, and water salinity (Bachu and Bennion, 2008; Wollenweber et al, 2010). Capillary pressure relationships for porous media are typically reported as a function of the wetting phase saturation, and the capillary pressure curves generated by laboratory testing can be used to estimate the irreducible wetting phase saturation of the carbon dioxide/brine/rock system. Mathematical models have also been developed to predict capillary pressure relationships (e.g., Van Genuchten, 1980). Figure A-25 shows capillary pressure curves used in a simulation of carbon dioxide storage in saline formations (Ide et al., 2007).

**Figure A-25: Capillary Pressure (Drainage and Imbibitions) as a Function of Wetting Phase Saturation.** Generated using the Van Genuchten Formulation. From: Ide et al. (2007); © Elsevier, reproduced with permission.

Reservoir capillary pressure relationships can be evaluated in the laboratory using the porous plate or centrifuge method (which uses actual or simulated fluids), or the mercury injection method (which simulates the wetting characteristics of the reservoir) (Vavra et al., 1992); descriptions are provided in Section A3.

Several techniques have been developed to measure capillary pressure in situ. Kuchuk et al. (2008) used a permanent downhole electrode array using time lapse resistivity in combination with pressure and flow readings to determine the capillary pressure and other properties of the formation downhole. Vinegar and Waxman (1984) mention the use of polarization logging measurements to determine pore size distribution. The capillary pressure is estimated from the pore size distribution. Others have used nuclear magnetism logging (NML) to estimate capillary pressure. NML has a very short effective range and returns a volume average of the capillary pressure. Freeman (1984) used wireline data consisting of pressure readings with water saturation and porosity data to estimate capillary pressure. Proett et al. (2003) proposed the use of data from a pump-out of drilling mud after drilling to determine capillary pressure. They measured pressure, flow, and fluid properties during the pump-out and used an algorithm to determine the capillary pressure.

Most of the available in situ methods determine the capillary pressure indirectly using data from downhole logs and algorithms based on certain assumptions. The accuracy of the methods likely depends on how closely the formation being tested resembles the assumptions made in developing the algorithm. These methods may not be as accurate as laboratory data, but generally can be done more quickly under in situ conditions.

## **Viscosity**

Viscosity is a property of a fluid that measures resistance to shear stress. In the centimeter gram second (CGS) system, the unit of viscosity is the poise, which is  $1 \text{ g} \cdot \text{cm}^{-1} \cdot \text{s}^{-1}$ . The ratio of viscosity to density is called the kinematic viscosity, which has the units of stoke or  $\text{cm}^2 \cdot \text{s}^{-1}$ . Viscosity can be measured in the laboratory with various types of viscometers (e.g., u-tube, falling piston, oscillating, vibrational, rotational, bubble, and other types of viscometers). Close temperature control is essential for accurate measurements. ASTM International maintains standard methods for viscosity measurements ([www.astm.org](http://www.astm.org)).

In situ, real-time direct measurements of viscosity can be collected at reservoir conditions using a wireline formation tester such as a tool described by O'Keefe et al. (2007). The tool measures the thermophysical properties of the fluid by the vibration of a mechanical resonator submersed in the flowline fluid, and the instrument measures viscosity in the range of 0.25 to 50 cP with a reported accuracy of  $\pm 10\%$ .

## **Density and Specific Gravity**

In the field, the in situ density of the formation fluid can be measured during open-hole sampling of reservoir fluids using a wireline formation tester (O'Keefe et al., 2007). The density of subsurface formations can be determined by formation density and combined neutron and density logs (Hancock, 1992; Section A7) and the borehole gravity meter (Herring, 1992).

Carbon dioxide density can be estimated by the Peng-Robison equation of state (Peng and Robinson, 1976) using available software such as the CMG Winprop module (Computer Modeling Group, Ltd., Canada) as described by Nobakht et al. (2007). Carbon dioxide density increases with depth (local pressure gradient) (Figure A-26) and decreases with increasing geothermal gradient (Kovscek, 2002). Brine density can be predicted at in situ temperature, salinity, and pressure conditions by several algorithms as discussed by Adams and Bachu (2002). Other algorithms for predicting density of carbon dioxide-brine mixtures are described by Hassanzadeh et al. (2008).

### Mobility and Mobility Ratio

The mobility of a phase is defined as its relative permeability divided by its viscosity (Warner, 2007; Kopp et al., 2009a; 2009b; Craig, 1980). Mobility combines a rock property, relative permeability (dependent only on the saturation of the two fluid phases and the capillary pressure)

(Bachu and Bennion, 2008), with a fluid property, viscosity. Mathematically, mobility is expressed as:

$$\lambda_i = \frac{k_i}{\mu_i} \quad \text{Equation 7}$$

where  $\lambda_i$  is the mobility of fluid phase  $i$ ,  $k_i$  is the effective permeability of fluid phase  $i$ , and  $\mu_i$  is the viscosity of fluid phase  $i$ . (Relative permeability is discussed in Section 2.3.5 of the guidance and in Section A3 of this Appendix.) Low-viscosity fluids generally have high mobility and high-viscosity fluids generally have low mobility. The mobility ratio ( $M$ ) generally is defined as the mobility of the displacing phase (carbon dioxide for sequestration) divided by the mobility of the displaced phase (e.g., fluid in a saline formation).

$M$  is considered to be either “favorable” or “unfavorable.” A favorable mobility ratio is a low value ( $M \leq 1$ ), which means that the displaced fluid (water) has a higher mobility than the displacing phase (carbon dioxide). An unfavorable mobility ratio ( $M > 1$ ) means that the displacing fluid has a higher mobility than the displaced fluid. In practical terms, a favorable mobility ratio means that the displaced water phase can move more quickly through the reservoir rock than the displacing carbon dioxide phase. More importantly, an unfavorable or large  $M$  value tends to give rise to rapid migration of carbon dioxide along paths of least resistance. Typical values for  $M$  for reservoir conditions of interest in sequestration are 2–10.

Viscous fingering can cause carbon dioxide to bypass much of the pore space, depending on the heterogeneity and anisotropy of rock permeability, because supercritical carbon dioxide is much less viscous than water and oil. Benson and Cook (2005) noted that only some of the resident oil or water will be displaced during carbon dioxide injection because of the comparatively high mobility of carbon dioxide, thus leading to an average saturation of carbon dioxide in the range of 30–60% during storage in the reservoir.

### Capillary and Gravitational Numbers

In addition to mobility, the displacement process will be driven by capillary and buoyancy forces. The capillary number ( $Ca$ ) is defined as the ratio of capillary forces to viscous forces (Kopp et al., 2009a). As carbon dioxide migrates through a formation, some of it is retained in the pore space by capillary forces, known as residual carbon dioxide trapping.

The  $Ca$  is defined as the ratio of capillary forces to viscous forces and can be used to characterize the extent of carbon dioxide trapping in an injection zone. As carbon dioxide migrates through a formation, some of it is retained in the pore space by capillary forces, known as residual carbon dioxide trapping. Kopp et al. (2009a) examined the effect of  $Ca$  on storage capacity and concluded that a higher  $Ca$  is expected to be associated with a lower average carbon dioxide saturation. This expectation is based on the occurrence of stronger capillary forces associated with higher  $Ca$  values, thus leading to a smoother displacement front during the imbibition process, and resulting in a lower, non-wetting phase (carbon dioxide) saturation in the swept area behind the brine displacement front.

The Gravitational number ( $Gr$ ) is defined as the ratio of the gravitational (buoyancy) forces to the viscous forces (Kopp et al., 2009a; Bryant and Lake, 2005, Chp 18). The type of fluid in the reservoir will influence the magnitude of the buoyancy forces that drive vertical flow of carbon dioxide in an injection zone (Benson and Cook, 2005). For example, the comparatively large density difference between carbon dioxide and formation water creates strong buoyancy forces that drive carbon dioxide upwards. In oil reservoirs, the density difference and buoyancy forces are less, particularly if oil and carbon dioxide are miscible. In gas reservoirs, carbon dioxide migrates downward because carbon dioxide is more dense than natural gas.  $Gr$  can therefore be used to predict the tendency of flow direction during the injection phase.

## Number of Wells

Projects that employ multiple injection wells at a site can accelerate the volume of carbon dioxide injected into storage reservoirs. According to Michael et al. (2010), comparable carbon dioxide injection rates can be achieved in a low-permeability storage reservoir as in a high-permeability reservoir by increasing the number of injection wells. Bachu et al. (2007) and Gibson-Poole et al. (2005) also discussed the benefits of increasing the number of injection wells to improve injectivity in low-permeability rocks. However, if a storage reservoir already has a number of wells that penetrate the reservoir, then there may be a risk of leakage during carbon dioxide injection. For example, Gasda et al. (2004) studied clusters of wells that were previously drilled for hydrocarbon extraction in the Viking Formation, and they concluded that the number of wells that could potentially serve as leakage pathways during injection depends upon whether the injection well is located in an area with a high or low density of pre-existing wells.

## Skin Factor

The skin effect or skin factor represents restricted entry into the formation associated with damaged formation near the well bore. In well bores where skin effects are a concern, injectivity can be enhanced by stimulating (e.g., by acid treatment) or by performing a workover (e.g., added perforations) of the injection well (Gidley, 1992; Osborne, 1992).

The concept of skin effect is illustrated in Figure A-27, which shows the pressure distribution from the well bore (bottomhole) flowing pressure,  $p_{wf}$ , to the reservoir pressure,  $p_R$  for ideal and actual conditions (Golan, 1992). The difference between actual and ideal conditions in the damaged near-well bore region corresponds with the pressure drop associated with the skin effect. For additional information, including estimation of the skin factor, see Golan (1992), Lancaster (1992), Lee (1992), and Lee (2007).

**Figure A-27: A Schematic of the Skin Effect.**

$P_R$  = Reservoir Pressure,  $P_{wf}$  = well bore (bottomhole) flowing pressure,  $P'_{wf}$  = ideal well bore flowing pressure,  $\Delta P_{skin} = P'_{wf} - P_{wf}$ ,  $r_w$  = well bore radius,  $r_x$  = radius of skin zone,  $r_e$  = radius of drainage.  $q$  represents pressure profile under steady state conditions with no skin effect. ## Diffusion Coefficient and Dispersivity

Molecular diffusion is defined as the net transport of a molecule in a liquid or gas medium as a result of intermolecular collisions and driven by a gradient through the medium such as temperature, pressure, or concentration (Tucker and Nelken, 1990). The diffusion coefficient or diffusivity is defined as the ratio of the net mass flux per unit gradient, and the rate of diffusion is a function of the properties of the compound as well as the medium through which the compound moves (Tucker and Nelken, 1990). Dispersion is controlled by the intensity of turbulent mixing rather than molecular diffusion. Methods for estimating values of diffusion coefficient and dispersivity are summarized by Tucker and Nelken (1990).

## Sweep Efficiency

Volumetric sweep efficiency  $E_V$  is a term commonly used in the petroleum industry to represent the ratio of the volume of fluid contacted by a displacing agent to the volume of fluid originally in place. Values of  $E_V$  range from 0 to 1 (or 0 to 100%) and are typically in the range of 40% to 60% for water flooding processes for hydrocarbon extraction from reservoirs (Lake, 1989). Volumetric sweep efficiency can be further defined as the product of areal sweep efficiency  $E_A$  and vertical sweep efficiency  $E_I$  whereby (Lake, 1989; Craig, 1980; Warner, 2007):

$$E_V = E_A E_I \quad \text{Equation 8}$$

Areal sweep efficiency  $E_A$  is generally used in the petroleum industry to represent the ratio of the area contacted by the displacing agent to the total area, and vertical sweep efficiency  $E_I$  is used to characterize the ratio of the cross-sectional area contacted by the displacing agent to the total cross-sectional area (Lake, 1989; Craig, 1980; Warner 2007). Several correlations have been

developed and reported in the petroleum literature for estimating sweep efficiency through porous media for various well field injection patterns and simplifying assumptions (Craig, 1980).

## Methods for Storage Capacity Estimation

Methods for estimating carbon dioxide storage capacity can be divided into static and dynamic models (USDOE, 2008a). Static models are typically used for estimating carbon dioxide storage capacity prior to injection, although static models can also be used for estimating storage after injection commences. Dynamic models are typically employed after injection commences. The application of static and dynamic models for estimating carbon dioxide storage capacity is based on methods routinely used for estimating petroleum reserves, ground water resources, underground natural gas storage, and in the UIC Program. Parameters typically used to calculate storage capacity are listed in Table A-3. Additional discussion regarding static and dynamic modeling methods for estimating carbon dioxide storage is provided below.

### Static Models

Static models are typically used for estimating carbon dioxide storage capacity prior to the startup of injection. Static models, which include volumetric and compressibility methods, rely on parameters that are directly related to the geologic description of the area for injection such as porosity, area, thickness and compressibility (USDOE, 2008a and 2008b). Standardized methodologies for estimating carbon dioxide storage capacity in geological media (coal beds, oil and gas reservoirs, and deep saline formations) using static models have been adopted the Carbon Sequestration Leadership Forum (<http://www.cslforum.org>). These methodologies, as described by Bachu et al. (2007), are summarized below.

#### Coal Beds

The carbon dioxide storage capacity of a suitable coal bed can be estimated based on analogy with estimating the total gas in place (capacity) and reservoir deliverability (White et al., 2005). For a coal bed with gas already adsorbed by the coal, the initial gas in place (IGIP) can be calculated by the relation (Bachu et al., 2007; White et al., 2005):

$$\text{IGIP} = A \times h \times n_C \times G_C \times (1 - f_a - f_m) \quad \text{Equation 9}$$

where  $A$  is the area and  $h$  is the effective thickness of the coal zone,  $n_C$  is the bulk coal density (generally assumed to be  $1.4 \text{ t/m}^3$ ),  $G_C$  is the coal gas content, and  $f_a$  and  $f_m$  are the ash and moisture weight content fractions of the coal, respectively. The coal gas adsorption capacity can be assumed to follow a pressure-dependent Langmuir isotherm in the form:

$$G_{CS} = V_L \frac{P}{P + P_L} \quad \text{Equation 10}$$

where  $G_{CS}$  is the gas content at saturation,  $P$  is the pressure, and  $V_L$  and  $P_L$  are Langmuir volume and pressure, respectively. These relations are based on the assumptions that coal has a high affinity for carbon dioxide, 100% saturation is achieved, and all of the coal is accessed by the

injected carbon dioxide. To estimate the *effective* carbon dioxide storage capacity in coal beds, the analogy is drawn to the estimation of the producible gas in place (PGIP) from the IGIP with the relation:

$$\text{PGIP} = R_f \times C \times \text{IGIP} \quad \text{Equation 11}$$

where  $R_f$  is the recovery factor and  $C$  is the completion factor (or effective contact area). The completion factor is an estimate of the coal thickness that will contribute to gas production or storage. It should be noted that there are limited field data for quantification of the recovery factor (Bachu et al., 2007).

### ***Oil and Gas Reservoirs***

Calculation of carbon dioxide storage capacity for depleted oil and gas reservoirs is based on the assumption that the same storage volume is available for injected carbon dioxide as was previously occupied by the extracted hydrocarbons (Bachu et al., 2007). This condition may be altered, for example, in the case of formation water invading a pressure-depleted reservoir. Another assumption is that carbon dioxide injection will continue until the pressure is restored to its original reservoir condition. As discussed previously, the re-pressurization of a depleted reservoir may be problematic with regard to the integrity of the reservoir and/or cap rock; thus, the maximum sustainable pore pressure may need to be lower than the original reservoir pressure.

An equation for calculating the carbon dioxide storage capacity in oil and gas reservoirs is based on the geometry of the reservoir (Bachu et al., 2007):

$$M_{CO_2t} = \rho_{CO_2r} [R_f A h \phi (1 - S_w) - V_{iw} + V_{pw}] \quad \text{Equation 12}$$

where:

$M_{CO_2t}$  = theoretical mass storage capacity for carbon dioxide in a reservoir at in situ conditions [M]

$\rho_{CO_2r}$  = carbon dioxide density at reservoir conditions [ $\text{ML}^{-3}$ ]

$R_f$  = recovery factor [dimensionless]

$A$  = reservoir area [ $\text{L}^2$ ]

$h$  = thickness [L]

$\phi$  = porosity [dimensionless]

$S_w$  = water saturation [dimensionless]

$V_{iw}$  = volume of injected water [ $\text{L}^3$ ]

$V_{pw}$  = volume of produced water [ $\text{L}^3$ ]

Bachu et al. (2007) provide alternative relations that account for fluid compressibility in gas reservoirs:

$$M_{CO_2t} = \rho_{CO_2r} R_f (1 - F_{IG}) \times \text{OGIP} \times \left[ \frac{(P_s Z_r T_r)}{P_r Z_s T_s} \right] \quad \text{Equation 13}$$

and for fluid compressibility in oil reservoirs:

$$M_{CO_2t} = \rho_{CO_2r} \times \left[ \frac{R_f OOIP}{B_f} - V_{iw} + V_{pw} \right] \quad \text{Equation 14}$$

where OGIP and OOIP represent the original gas and oil in place at surface conditions,  $F_{IG}$  is the fraction of injected gas,  $B_f$  is the formation volume factor that converts oil volume from standard conditions to in situ conditions,  $V_{iw}$  and  $V_{pw}$  are the volumes of injected and produced gas,  $P$ ,  $T$ , and  $Z$  are pressure, temperature, and gas compressibility, respectively, and the subscripts  $r$  and  $s$  represent reservoir and surface conditions.

The effective storage capacity can be influenced by the historical operation of the oil and gas reservoir (i.e., pressure depletion and formation water influx), thus reducing the total available capacity for carbon dioxide storage. The effective carbon dioxide storage capacity can also be influenced by carbon dioxide mobility, fluid density differences, reservoir heterogeneity, and residual water saturation. These influences can be combined to represent an efficiency factor for estimating an effective storage capacity (Bachu et al., 2007; Doughty and Pruess, 2004):

$$M_{CO_2e} = C_m C_b C_h C_w C_a M_{CO_2t} \equiv C_e M_{CO_2t} \quad \text{Equation 15}$$

where  $M_{CO_2e}$  is the effective reservoir carbon dioxide storage capacity,  $M_{CO_2t}$  is the theoretical mass storage capacity of carbon dioxide in a reservoir at in situ conditions, and the coefficient  $C_e$  is a single effective capacity coefficient that incorporates the cumulative effects of the other coefficients represented by subscripts  $m$  for mobility,  $b$  for buoyancy,  $h$  for heterogeneity,  $w$  for water saturation, and  $a$  for formation strength. Currently, limited data are available for estimating values for  $C_e$ .

### ***Deep Saline Formations***

For deep saline formations, carbon dioxide storage capacity estimates can be developed for structural and stratigraphic traps, residual gas traps, solubility traps, mineral traps, and hydrodynamic traps (Bachu et al., 2007) as described below.

For *structural and stratigraphic traps*, the formation is initially saturated with water (instead of hydrocarbons), and the theoretical volume available for carbon dioxide storage,  $V_{CO_2t}$ , can be calculated by the relation (Bachu et al., 2007):

$$V_{CO_2t} = Ah\phi(1 - S_{wirr}) \quad \text{Equation 16}$$

where  $A$  is the reservoir area,  $h$  is thickness,  $\phi$  is porosity, and  $S_{wirr}$  is the irreducible water saturation. Similar to oil and gas reservoirs, the effective carbon dioxide storage volume,  $V_{CO_2e}$ , can be estimated by:

$$V_{CO_2e} = C_e V_{CO_2t} \quad \text{Equation 17}$$

where  $C_c$  is a capacity coefficient that represents the effects of heterogeneity, buoyancy, and sweep efficiency, and it can be determined through numerical simulation and/or field study.

Okwen et al. (2010) developed a method for estimating carbon dioxide storage efficiency applicable to structural and stratigraphic trapping that can be characterized by carbon dioxide mobility, buoyancy forces, and residual saturation. The mass of carbon dioxide that corresponds to the effective storage volume can be estimated by multiplying  $V_{CO2e}$  by carbon dioxide density at storage temperature and pressure conditions.

*Residual gas traps* form within a saline formation when injected carbon dioxide migrates through the porous media and water moves back into the pore space. For example, during injection, carbon dioxide can migrate laterally and upward due to buoyancy forces. Once injection stops, carbon dioxide can continue to migrate, water enters the pore space, and residual, immobile carbon dioxide is left behind the plume (Juanes et al., 2006). Qi et al. (2009) proposed an injection strategy whereby carbon dioxide and brine are injected together and thus maximize storage efficiency in formations. The theoretical carbon dioxide storage volume of the residual gas traps can then be estimated by the relation (Bachu et al., 2007):

$$V_{CO2t} = \Delta V_{trap} \phi S_{CO2t} \quad \text{Equation 18}$$

where  $\Delta V_{trap}$  represents the carbon dioxide-invaded rock volume and  $S_{CO2t}$  is the trapped carbon dioxide saturation.  $\Delta V_{trap}$  and  $S_{CO2t}$  can be estimated through numerical simulations (e.g., Juanes et al., 2006). The mass of stored carbon dioxide can be estimated by multiplying the storage volume by carbon dioxide density at in situ conditions.

*Solubility trapping* of carbon dioxide is a relatively slow process and is assumed to become significant after cessation of injection (Bachu et al., 2007). Although dissolution of free-phase carbon dioxide occurs rapidly, and water in direct contact with injected carbon rapidly becomes saturated with carbon dioxide, the available contact area between free-phase carbon dioxide and unsaturated water is small, greatly limiting solubility trapping. When migration of carbon dioxide has stopped (thus reducing the influence of dispersion), then diffusion, which is very small, becomes the only mechanism enabling unsaturated water to contact carbon dioxide unless the water itself is moving. If a hydraulic gradient within the formation replaces the carbon dioxide-saturated water with unsaturated water, or the rock permeability and thickness are conducive to the development of convection within the pore system, then carbon dioxide will continue to dissolve into the unsaturated water that passes the contact area. The theoretical mass carbon dioxide storage capacity can be estimated using a simplified relation and average values for formation thickness, porosity, and carbon dioxide content in formation fluid as (Bachu et al., 2007):

$$M_{CO2t} = Ah\phi(\rho_S X_S^{CO2} - \rho_0 X_0^{CO2}) \quad \text{Equation 19}$$

where  $\rho$  is the density of the formation water,  $X^{CO2}$  is the mass fraction carbon dioxide content in formation water, and the subscripts 0 and S represent initial and saturated carbon dioxide content, respectively. Similar to the relations for coal beds and oil and gas reservoirs, the mass carbon

carbon dioxide storage capacity can be estimated by multiplying the theoretical value by a coefficient that includes the effects of spreading and dissolution of carbon dioxide in the whole formation. However, for a site-specific application, the theoretical carbon dioxide storage capacity associated with solubility trapping should be assessed by numerical modeling (Bachu et al., 2007).

*Mineral trapping* of carbon dioxide depends on the chemical composition of the rock matrix and formation waters, in situ temperature and pressure conditions, the interface between the mineral grains and the formation water containing dissolved carbon dioxide, and the flow of fluids past the interface (Bachu et al., 2007). For site-specific applications, the amount and time frame of carbon dioxide storage associated with mineral trapping should be estimated by numerical modeling and supported, where possible, with laboratory testing and field data.

*Hydrodynamic trapping* of carbon dioxide is a combination of mechanisms (structural and stratigraphic trapping, dissolution, mineral precipitation, residual gas trapping) operating simultaneously, but at different rates, while an injected plume of carbon dioxide expands and migrates in a storage reservoir (Bachu et al., 2007). Carbon dioxide storage capacity associated with hydrodynamic trapping therefore needs to be evaluated at a specific point in time as the sum of the component mechanisms by numerical simulations.

## Dynamic Models

Dynamic models are generally considered applicable for estimating carbon dioxide storage capacity after initiation of carbon dioxide injection (USDOE, 2008a). They would therefore be useful after receiving a permit to operate a Class VI injection well, as a way to monitor storage capacity over time. Dynamic models include decline curve analysis, material balance, and reservoir simulation.

### *Decline Curve Analysis*

The decline curve analysis is a dynamic method for estimating subsurface storage volumes based on a simple exponential relation of injection rate and time (USDOE, 2008a):

$$q_{CO2} = q_{CO2i}e^{-Dt} \quad \text{Equation 20}$$

where  $q_{CO2}$  is the carbon dioxide injection rate and the subscript  $i$  denotes the initial injection rate,  $D$  is a decline coefficient that represents flow characteristics of the formation, and  $t$  represents time. Carbon dioxide storage capacity,  $G_{CO2}$ , can be estimated by the relation:

$$G_{CO2} = \frac{(q_{CO2i} - q_{CO2})}{D} \quad \text{Equation 21}$$

where the decline coefficient  $D$  is determined from the exponential decline equation for a given injection rate history. This decline curve analysis is generally considered applicable to individual wells or entire fields, provided the exponential trend exists. Additional information regarding theory and application of decline curve analysis techniques is provided in Arps (1962), Campbell

and Campbell (1978), and Li and Horne (2003). This relation can be used to estimate carbon dioxide storage capacity likely to be attained with continued injection.

### ***Material Balance***

The material balance method for estimating carbon dioxide storage capacity is based on the relationship between cumulative carbon dioxide injection and the corresponding pore pressure as a function of time (USDOE, 2008a). The relation is analogous to the  $p/z$  plots used in gas reservoirs and underground gas storage reservoirs (e.g., Harrell and Cronquist, 2007), where  $z$  is the gas compressibility factor of carbon dioxide evaluated at pressure  $p$ . A straight line is expected on a plot of  $p/z$  versus cumulative carbon dioxide gas injection. The carbon dioxide storage capacity can be estimated from this plot by extrapolating the curve and determining the value of cumulative carbon dioxide gas injection that corresponds to the maximum  $p/z$  value at capacity pressure.

### ***Reservoir Simulation***

Reservoir simulation is considered the most advanced method for estimating carbon dioxide storage capacity, provided the input data adequately represent the injection formation and operating conditions (USDOE, 2008a). The purpose of simulation is to estimate field performance under one or more operational schemes (Batycky et al., 2007). For example, the simulation can be used to study actual field or pilot performance and thus improve estimates for carbon dioxide storage capacity. As discussed previously, reservoir simulation can be also used to develop estimates of specific carbon dioxide storage trapping mechanisms (e.g., hydrodynamic trapping). Reservoir simulation is the most resource-intensive method of estimating carbon dioxide storage. However, it requires the input of data at a scale and resolution appropriate for obtaining results at formation scale. Additional discussion regarding reservoir simulation is provided in the *UIC Program Class VI Well Area of Review Evaluation and Corrective Action Guidance*.

## A8. Information to Support Pre-Injection Logging and Testing

To support submittal of the well logs required at 40 CFR 146.87, this section describes various types of logs that can be used during formation testing. This information supplements Section 4.1 of the guidance.

**Gamma ray logs** measure the natural radioactivity emitted by radioactive isotopes (e.g., potassium, thorium, and uranium) in minerals. Gamma ray logs are the most common log run for stratigraphic correlation because they are relatively unambiguous and easy to interpret by a qualified analyst (Evenick, 2008) (Figure A-28). The intensity of radioactivity is measured by a scintillation counter in American Petroleum Institute (API) units (Evenick, 2008). Because clays tend to have higher concentrations of potassium and thorium than other minerals, gamma ray logs can provide information on the clay and mica content (or “shaliness”) of the formation (Johnson and Pile, 2006). The log curve can also be compared to a section with 100% or 0% shale saturation to determine a “shale baseline” and calculate the percent of shale present in other regions of the log (Johnson and Pile, 2006).

The spectral gamma ray tool, an advanced version of the gamma ray tool, allows for the identification of gamma ray counts caused by specific elements. This allows for the removal of gamma ray counts caused by uranium, which is often deposited by formation fluids, although it is also found in some sandstones and carbonates (Johnson and Pile, 2006). Gamma ray logs are virtually unaffected by changes in porosity (Johnson and Pile, 2006).

**Spontaneous potential (SP) logs** show naturally occurring differences in electric potential (usually measured in millivolts, mV) due to salinity differences between the drilling mud and formation fluids, and between formation fluids in different units (Johnson and Pile, 2006). The SP response can be used to correlate formations between wells, determine permeability, and estimate formation fluid resistivity (Evenick, 2008; Alberty, 1992b; Hancock, 1992). Because SP logs reflect differences in electric potential, contrasts in permeability and salinity between formations are critical (see Figure A-28). Although not good for identifying general lithology, SP logs can help in differentiating shales from carbonates or sandstones, and they work best when shale layers separate more permeable formations (Evenick, 2008; Johnson and Pile, 2006). Hancock (1992) describes other conditions where SP logs are not applicable or difficult to interpret.

The SP response typically varies by lithology and can be used to correlate formations between wells, determine permeability, and estimate formation fluid resistivity (Alberty, 1992b; Hancock, 1992). Because SP logs reflect differences in electric potential, contrasts in permeability and salinity between formations are critical (see Figure A-28). SP logs are influenced by the presence of impermeable limestones and work best when shale layers separate more permeable formations (Johnson and Pile, 2006). Hancock (1992) describes other conditions where SP logs are not applicable or difficult to interpret.

SP logs can be challenging to correlate because they are not good indicators of lithologic boundaries (Evenick, 2008). With the advent of other more specialized and better resolved techniques, the role of SP logs has been gradually diminished (Blackbourn, 1990).

**Figure A-28: Example of Geophysical Well Logs.**

**Caliper logs** show the measured diameter of the borehole. A caliper log can be used as a crude lithologic indicator by comparing the caliper reading to the size of the drill bit, as shown in Table A-4. Different rock and sediment types show different responses on the caliper log, depending on properties such as permeability and level of consolidation. Hancock (1992) describes the various responses that indicate specific lithologies. In general, shales, coals, and bentonites tend to wash out with drilling (Evenick, 2008).

**Table A-4: Interpreting Borehole Condition from Caliper Readings.**

	Well Bore Larger than Expected	Well Bore as Expected	Well Bore Smaller than Expected
Indicated by	Caliper > Bit size	Caliper = Bit size	Caliper < Bit size
Possible Rock Characteristics	Soft or Fractured	Hard / Unfractured	Permeable
Possible Cause	Wash Out		Mud-cake Accumulation

## Porosity Logs

Porosity logs are a class of geophysical logs that indirectly measure formation porosity, and include density, neutron, sonic, and magnetic resonance logs, which are individually described below. Typically, multiple logs are run simultaneously, and the results from the multiple logs can be interpreted to estimate porosity and formation lithology (AAPG, 2004). All of these logs would not necessarily need to be run to comply with the Class VI Rule porosity logging requirements. Rather, a suite of porosity logs may be run based on site conditions, owner or operator preferences, and as approved by the UIC Program Director.

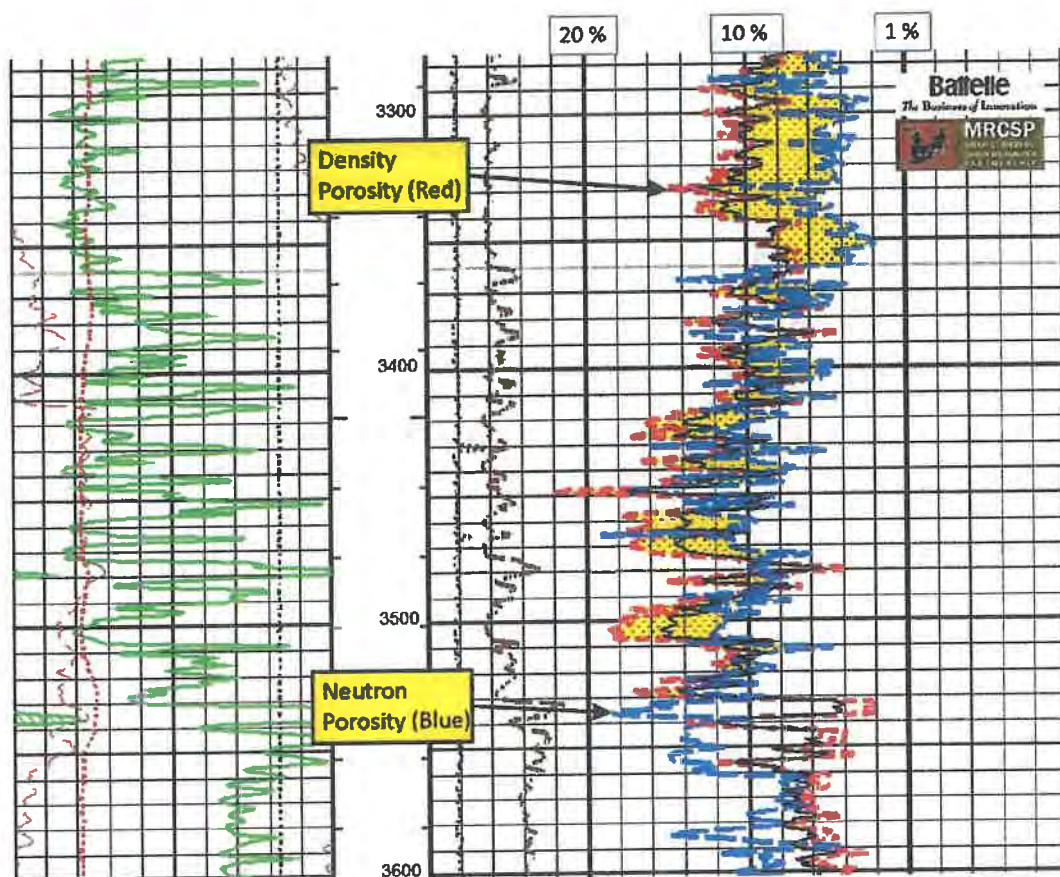

- **Sonic logs** record the sound wave transit time between a source and receiver(s) through the rock formation. The transit time depends on the lithology and porosity of the formation, so it is necessary to determine or estimate lithology to measure porosity from a sonic log. Lithology may be known through core analysis, interpretation of other logs, or interpretation of sonic logs simultaneously with other porosity logs. For shale-free lithologies, the transit time is frequently related to porosity and mineral fractions. Estimates of porosity provided by sonic logs are categorized as primary porosities which excludes vugs and fractures that can be important in many carbonate sequences. Additionally, the presence of hydrocarbons in a formation will increase the interval transit time, and this effect is corrected for prior to estimating porosity (AAPG, 2004); owners or operators of GS projects in depleted reservoirs should bear this in mind when selecting porosity logs;
- **Density logs** measure the bulk density of the formation, including the densities of the rock and the pore fluid. The logs reflect changes in the rock composition, the porosity, and the contained fluids. The logging device consists of a gamma ray source and two detectors; this arrangement allows the results to be compensated for variable rugosity (roughness) and mud-cake thickness (Johnson and Pile, 2006). Porosity determination requires an average value for matrix density which may vary both between and within formations. Bulk densities from logs and laboratory-measured core porosities can be used to establish correlations between density and porosity for a particular interval. An example with density log included as a component of a porosity log is presented in Figure A-29;
- **Neutron logs** measure the hydrogen concentration in both pore fluids and in chemically bound water. In shale-free formations, hydrogen atoms are present primarily in the water phase, and neutron logs therefore measure aqueous fluid-filled porosity. Low measurement results from the neutron logger correspond to larger porosity values.

Similar to density logs and sonic logs, neutron log responses are dependent on formation lithology. Additionally, the presence of gas within the pores affects the neutron log response and also needs to be considered in selecting appropriate logs. The neutron log measure of porosity is overestimated in shales because hydrogen atoms are present within the clay structure in addition to pore water. An example neutron porosity log included as a component of a porosity log is presented in Figure A-29; and

- **Nuclear magnetic resonance (NMR)** logs measure the free precession of proton nuclear magnetic moments in the earth's magnetic field. Hydrogen protons in solids or bound to surfaces show differences in responses compared to bulk fluids in pore space. Therefore, these logs can be used to determine residual water saturation, the effective porosity, permeability, pore size distribution, and residual oil saturation. Compared to the other porosity logging techniques discussed below, NMR logging porosity estimates are insensitive to formation lithology type, and therefore the NMR log may be run alone as a porosity log.

As noted above, the response of sonic logs, density logs, and neutron logs depend not only on the porosity of the formation, but also the lithology. Common lithologies that may be encountered include sandstone, limestone, dolomite, anhydrite, and salt. Accurately calculating porosity from the measurement response requires that the lithology at each depth be known or estimated based on core analyses or other available information (see Sections 2.3.4 and 4.2). However, both lithology and porosity can be inferred if at least two of the above-mentioned logs are run and interpreted concurrently. This is possible using established relationships for the response from several logging tools. See AAPG (2004) for detailed information regarding porosity log measurement combinations and interpretation.

**Figure A-29: Example Porosity Log, Including Density (Red) and Neutron (Blue) Logs, for the Cincinnati Arch Validation Test Well.**

From: Battelle Memorial Institute.

## Fracture Finder Logs

Several types of logs may be used for fracture detection, including sonic logs and a number of borehole imaging logs (Telford et al., 1990; AAPG, 1994). Not all logs discussed below must be run to comply with the Class VI Rule fracture finder logging requirements. Rather, a single type of fracture finder log may be run based on site conditions and operator preferences, and as approved by the UIC Program Director.

- **Sonic logs**, described above, can also be used for fracture detection. The logging tool provides a sonic signal, and the resulting log is a vertical graph of the amplitude and travel time of the reflected signal. A decrease in amplitude where sonic travel time is constant may indicate open fractures (Telford et al., 1990). As described above, sonic logs measure primary porosity, which excludes fractures. However, used with either neutron or density logs, both of which provide an estimate of the total porosity, sonic logs would yield an estimate of the proportion of vugs and fractures as secondary porosity;
- **Borehole viewers**, also termed acoustic borehole images, make use of reflected sonic waves. The recorded sonic amplitude and travel time are assigned colors to create an image. The resulting logs are color-relief images of the borehole wall, based on acoustic

travel time and amplitude. Low-amplitude, high travel-time features, including fractures, are typically assigned dark colors. As with sonic fracture finder logs, shales and other features that result in a low sonic amplitude are considered during log interpretation;

- **Electrical borehole imaging logs** operate under a similar principle as acoustic imaging logs. Because this is an electrical log, the test is conducted in boreholes filled with a conductive drilling fluid. Measured resistivity values are assigned colors to develop an image. The resulting log is a color-relief image of the resistivity of the borehole wall. Low-resistivity features, including shales and fluid-filled fractures, are typically displayed as dark colors; and
- **Borehole video imaging logs** have become more common in recent years and may be used to detect fractures. A video log is conducted by lowering a video camera into the well. The video is seen in real time and recorded at the surface, allowing for detailed focus on features of interest. Video logs can be conducted in liquid-filled or open boreholes, as long as the borehole fluids are relatively clear. Fractures are evident on borehole video logs (Figure A-30).

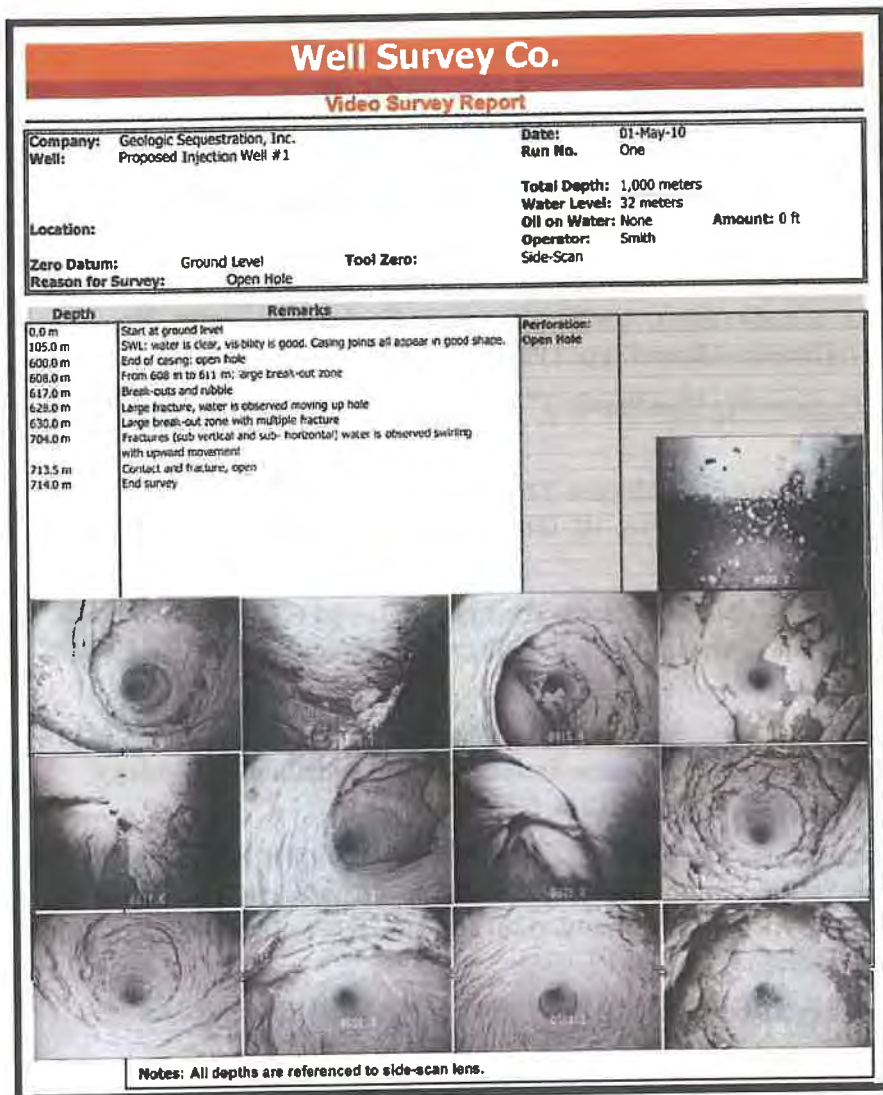

Figure A-30: Example of Borehole Video Imaging Log Showing Formation Fractures.

## Geologic Sequestration Data Tool (GSDT)

### Background

Under the Class VI Rule at [40 CFR 146.91\(e\)](#), owners or operators of Class VI wells must submit geologic sequestration (GS) project information directly to EPA in an electronic format approved by EPA. **This requirement applies regardless of whether the project is located in a state with primary enforcement responsibility (primacy) for Class VI wells.**

EPA's Geologic Sequestration Data Tool (GSDT) is a centralized, web-based system that receives, stores, and manages Class VI data, to:

- Fulfill the requirement at 40 CFR 146.91(e);
- Facilitate data access, sharing, and technical evaluations of submitted materials;
- Develop and manage a comprehensive administrative record, consisting of all documents and communications supporting permitting decisions; and
- Ensure continuity over the potentially long lifespans of Class VI projects.

The GSDT provides a national, transparent, comprehensive, and cost-saving solution for Class VI data and records management.

### Class VI Users and Data

The GSDT is currently designed for two main groups of users; permit applicants/owners or operators and permitting authorities.

#### Owners or Operators

The Class VI Rule requires owners or operators to submit certain types of information during each phase of a GS project:

- The **pre-construction phase**, prior to well construction or conversion;
- The **pre-injection phase**, prior to operation;
- The **injection phase**, during which CO<sub>2</sub> injection operations occur; and
- The **post-injection phase**, including post-injection site care (PISC) and site closure.

Beginning with the permit application and continuing through the life of the project, owners or operators must submit materials related to:

- **Site characterization** and pre-injection logging and testing;
- **Area of Review (AoR)** modeling and corrective action;
- **Well construction** and operation;
- **Financial responsibility** demonstrations;
- **Testing and monitoring** during the injection and post-injection phases;
- **Well plugging and site closure**, including non-endangerment demonstrations; and
- **Emergency and remedial response.**

Class VI well schematic.

If applicable, owners or operators may also submit information related to alternative post-injection site care (PISC) timeframe demonstrations, injection depth waivers, and/or aquifer exemption expansion requests. Each of these categories of information must be evaluated both individually and in the context of the other types of submissions.

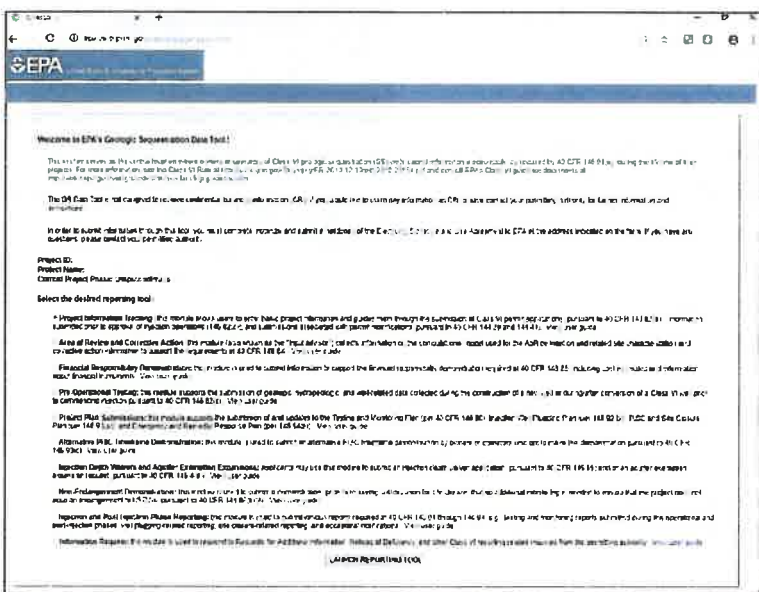

### Permitting Authorities

Permitting authorities—primacy states and EPA regional offices—also generate information when permitting, managing, and overseeing Class VI projects. These materials may include:

- **Permitting documents**, including permit conditions and docket support materials;
- **Reports** generated during technical evaluation of materials submitted by permit applicants/owners or operators;
- **Communications** with owners or operators, such as responses to Notices of Deficiency (NODs) or Requests for Additional Information (RAIs);
- **Public participation/outreach materials**, including comment/response documents; and
- **Compliance-related materials**, including inspection and violation records.

### GSDT User Access

All users access the GSDT at <https://gsdt.pnnl.gov/>, where they are directed to separate areas for owners or operators and permitting authorities.

*Example project landing page.*

Owners or operators have access limited to their project site, which allows them to submit information. This group of users submits information via a series of topic-specific modules, accessed from a central landing page for their projects (see image at left).

Permitting authorities have full access, which allows them to access all the files and other information submitted via the modules. They can also use the tool to conduct technical evaluations, manage communications, and store all information related to a project. The GSDT allows permitting authorities to review and

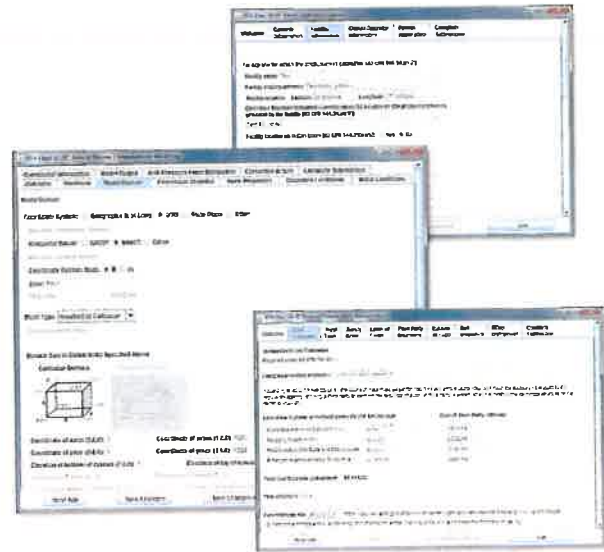

manipulate information while preserving the integrity of the original submitted data.

### GSDT Modules

All information submitted by permit applicant/owner or operator users is submitted via a series of modules that are designed to address certain components of Class VI data (AoR modeling, financial responsibility, etc.). Permit applicants/owners or operators can submit data using the following modules (see images on the following page):

- Project information tracking;
- AoR and corrective action;
- Financial responsibility demonstration;
- Pre-operational testing;
- Project plan submissions;
- Alternative PISC timeframe demonstration;
- Injection depth waivers and aquifer exemption expansions;
- Non-endangerment demonstration;
- Injection and post-injection phase reporting; and
- Information requests.

Depending on the topic and the type of data that must be submitted, some modules (such as the AoR and corrective action module) consist of fairly detailed proscriptive workflows to collect highly technical information. Others (such as the project plan submissions module) allow the user a great deal of flexibility in uploading required files and supplemental materials.

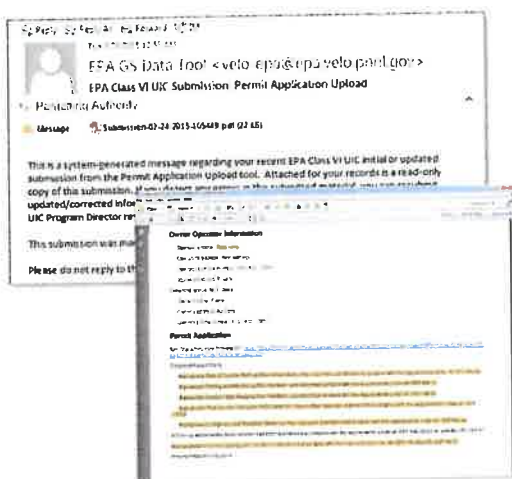

*Examples of GSDT modules.*

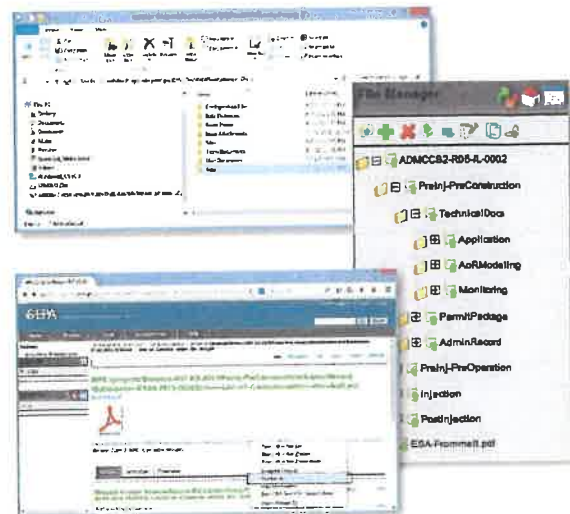

### Permitting Authority Capabilities

Permitting authority users have multiple options for viewing, downloading, and sharing files. When submissions are made, the designated permit writer(s) for a project will receive an email with a summary of the submission. The summary highlights any changes since the previous submission and includes links to uploaded files.

The version control features of the GSDT allow permitting authorities to more easily identify the most current version of a submitted file. Also, because all submissions are made through the tool, the tool supports the development of a comprehensive administrative record for a permitting decision.

*Automatic email notifications and versioning capabilities for permitting authorities.*

*Examples of options for accessing files.*

SALTWATER DISPOSAL  
LEASE AGREEMENT

EXH 567 EX 1382

INDEXED

STATE OF MONTANA, COUNTY OF SHERIDAN  
RECORDED *September 30 1991 at 5:00 PM*  
MILTON E. HOWLAND, COUNTY RECORDER  
BY *Sharon L. Howland* DEPUTY, FEE \$20

Please record &amp; return to: Continental Resources, Inc., P. O. Box 10549, Enid, OK 73706

THIS LEASE AGREEMENT is entered into this 30th day of August, 19 91, by and between Brandon G. Smithson and Debra J. Smithson, husband and wife, HCR 276, Box 36, Westby, MT 59275 LESSOR, and Continental Resources, Inc., P.O. Box 10549, Enid, Oklahoma 73706, LESSEE.

1. In consideration of the sum of ten and more dollars (\$10.00+) and other good and valuable consideration, the receipt of which is hereby acknowledged, LESSOR hereby grants, demises, leases and lets unto LESSEE a tract of land situated in Sheridan County, Montana, as described below, and the well bore known as the Allen #1-14 located thereon, to-wit:

Township 37 North, Range 56 East of the M.P.M.  
Section 14: NE4

2. It is agreed that this lease shall commence on the date first written above and shall remain in force for so long as saltwater and other associated liquids (SALTWATER) are being disposed, or until terminated by LESSEE, according to the following terms.

3. LESSEE is hereby granted the right to use the Allen #1-14 well bore as situated on the above described tract, to maintain, equip, repair and operate the same, and to use the above described tract for the purpose of collecting and disposing below the surface SALTWATER. LESSEE may construct, maintain, replace and repair such facilities and equipment, including, but not limited to underground flowlines, power poles and lines, buildings, injection pump and tank and emergency pit, on such portions of the above described land as are reasonably necessary for or in connection with the gathering, storing and injection of SALTWATER into said disposal well.

4. It is agreed that payment to LESSOR for the disposal of SALTWATER shall be at the rate of \$.05 (five cents) per barrel disposed. Payments for the disposal of SALTWATER will be made monthly. SALTWATER delivered to the premises shall be metered and reported monthly and LESSOR shall be entitled to meter reports on a periodic basis and shall be entitled to inspect the meters and the reports and the well operations at all reasonable times. Payment for the current month will be made to LESSOR at the address above set forth within thirty (30) days after the close of the current month, and payments will be made by check to LESSOR.

5. In consideration of the payment by LESSEE of the sum as hereinabove described, LESSOR hereby grants unto the LESSEE the right of ingress and egress to and from the leased tract and over any adjoining lands owned by LESSOR together with right-of-way over and across and the right from time to time to lay, maintain, replace, repair and remove pipelines over and across the leased tract and adjacent lands of LESSOR for the purpose of transporting SALTWATER to the disposal well. This right shall be exercisable by LESSEE so long as this LEASE AGREEMENT is in good standing.

6. The consideration paid as provided herein covers all surface damage to said tract due to the initial installation of buried flowlines and equipment thereon, payment for any subsequent damage shall be in the amount as negotiated between the parties hereto.

7. LESSEE shall, within a reasonable time after expiration of this lease, plug and abandon the said well bore and fill all existing pits located upon the above described tract and repair the lands as nearly practical to its original condition.

8. LESSEE further agrees to keep the site free of weeds and debris and to promptly clean up any and all spills.

9. LESSEE shall have a reasonable time, upon termination of this lease, to remove any and all structures, equipment and materials owned by the LESSEE from the lands herein described as leased lands or the rights-of-way herein granted.

## SALTWATER DISPOSAL FACILITY LEASE AGREEMENT

THIS SALTWATER DISPOSAL FACILITY LEASE AGREEMENT (the "Agreement") is made and entered into this 16 day of June, 2019 by and between Lyle H. Langseth, as Trustee of the Lyle H. Langseth Revocable Trust UDT August 10, 2010, whose address is 405 13th Ave. W, Williston, ND 58801-4610, hereinafter called "Lessor" and CONTINENTAL RESOURCES, INC., whose address is P. O. Box 269000, Oklahoma City, Oklahoma 73126, hereinafter called "Lessee."

Witnesseth:

WHEREAS, Lessor is the owner of the surface of the following described land located in Williams County, North Dakota, to-wit, (the "Leased Premises"):

Township 153 North, Range 99 West of the 5th P.M.  
Section 2: SW¼

WHEREAS, Lessor is desirous of leasing a saltwater disposal well site upon the Leased Premises and the Lessee is desirous of leasing such property.

NOW, THEREFORE, for and in consideration of the sum of Ten Dollars (\$10.00), the mutual promises contained herein, and other good and valuable consideration, the receipt and sufficiency of which is hereby acknowledged, it is agreed between the parties as follows:

1. **LEASED PREMISES.** The Lessor hereby leases, lets and rents unto the Lessee and the Lessee agrees to lease the following tract of land located on the Leased Premises described as follows:

a. **Tank Battery and Injection Well Site:** The Lessor hereby grants to Lessee the rights to the surface and subsurface of the Leased Premises located in the SW¼ of Section 2, Township 153 North, Range 99 West of the 5<sup>th</sup> P.M., Williams County, North Dakota, as depicted on the attached Exhibit "A". Lessor further grants to Lessee the rights to the surface and subsurface of the Leased Premises to equip, maintain, and operate the Saltwater Disposal Well for the purpose of disposing saltwater into the Saltwater Disposal Well. The Lessor also grants to Lessee the right to use the surface and subsurface of the Leased Premises for the purpose of equipping, operating and maintaining thereon all necessary facilities for a saltwater system, including, but not limited to, tanks, pumps and other structures and equipment necessary or convenient to save, take care of, treat, collect, store, transport, or dispose of saltwater from oil and gas wells on or off of the Leased Premises for disposal into the Saltwater Disposal Well, together with the right of ingress and egress across the Leased Premises from the county road.

b. **Easement Property:** The Lessor hereby grants to Lessee rights-of-way and easements for use of the surface and subsurface of the Leased Premises for the purpose of constructing, installing, operating, maintaining, replacing and removing pipelines, communication lines and poles, electric lines other utilities and for the purpose of transporting saltwater from oil and gas wells on or off of the Leased Premises to the Saltwater Disposal Well.

2. **PAYMENT.** Lessee agrees to pay the Lessor and the Lessor agrees to accept a one-time payment in the amount of Thirty Thousand Five Hundred and 00/100 Dollars (\$30,500.00) (the "Initial Payment") for any and all damages, including, but not limited to, all damages relating to the construction, operation or use of the Saltwater Disposal Well site location and access road and all other damages related thereto, including, but not limited to, damages incurred in the operation, maintenance and development of the Saltwater Disposal Well and related facilities. In the event the acreage utilized by the Lessee exceeds the 6.1 acres, for the Saltwater Disposal Well site location, upon which this payment is based, the Lessee agrees to make a further payment to the Lessor for the extra acreage, based on the amount of \$5,000.00 per acre. In addition, Lessee agrees to pay the Lessor and Lessor agrees to accept a payment of \$0.06 cents per barrel for each barrel of saltwater disposed of in the Saltwater Disposal Well (the "Royalty Payment"). The Royalty Payment shall be paid by the 30th day of the following month for the life of the Saltwater Disposal Well (the "Monthly Payment"). In the event the Monthly Royalty Payment does not exceed \$500.00, the minimum Monthly Payment shall be Five Hundred and 00/100 Dollars (\$500.00) after the Saltwater Disposal Well is put into operation and for the life of the Saltwater Disposal Well. The parties agree the payments set forth in this paragraph are intended to cover all payments and damages arising from or related to surface and subsurface operations conducted by Lessee hereunder on the Leased Premises. Further, Lessor acknowledges and agrees the Initial Payment and Annual Payment paid under this Agreement are in full and complete settlement of any and all claims for loss, damage, or injury arising from or related to surface and subsurface operations conducted by Lessee hereunder on the Leased Premises. These payments will be paid proportionate to the interest the undersigned owns in the surface. Lessor and Lessee agree the payments hereunder shall be made upon receipt by Lessee of its executive management's approval to operate the Saltwater Disposal Well and upon commencement of construction activities on the Leased premises

3. **TERM.** This Agreement shall remain in effect until Lessee permanently abandons the Saltwater Disposal Well and/or gathering system

4. **USE.** The Lessee shall have the right to use the Leased Premises for the storage of saltwater and other deleterious substances produced from oil and gas wells on or off of the Leased Premises; and for the disposal of saltwater and other deleterious substances produced from oil and gas wells on or off of the Leased Premises, and the easement for the transportation of saltwater and other deleterious substances produced from oil and gas wells on or off of the Leased Premises, including, but not limited to, the right of ingress and egress to said properties and premises, the right to lay, maintain and remove the pipeline or pipelines to and from said Saltwater Disposal Well site, the right to install, operate, maintain and remove pumping equipment, tankage and such other equipment as may be necessary or useful in the operation of the Saltwater Disposal Well facility.

5. **UTILITY EASEMENTS.** The Lessor agrees to execute all easements required by utility companies to affect the laying, maintaining and removing of utility lines, including, but not limited to, electric and telephone lines, for operating equipment necessary in Lessee's saltwater disposal operations.

6. **LIMITATION.** It is understood and agreed the disposal of saltwater and other deleterious substances will be made into a formation or formations which are not productive of fresh water, and which are approved for disposal purposes by the North Dakota Industrial Commission.

7. **FIXTURES OF LESSEE.** All pumping equipment, tankage and other equipment as may be necessary and useful in the operation of the Saltwater Disposal Well may be placed or attached on the Leased Premises by the Lessee and shall remain the property of the Lessee. Upon termination of this Agreement, or at any prior time, the Lessee may remove any and all of such equipment.

8. **DEFAULT.** The Lessee agrees upon its failure to comply with the provisions of this Agreement, the Lessor, at its option, may declare this Agreement at an end and void and terminate the same, and take possession of said premises. This Agreement shall not terminate until Lessor has given written notice of the alleged default(s) and of its intention to terminate the Agreement and Lessee has failed to cure the default(s) within sixty (60) days after receipt of the default notice. If Lessee cures the default within the sixty (60) days, the Agreement shall remain in full force and effect.

9. **ASSIGNMENT.** Lessee shall have the right to assign this Agreement without Lessor's consent. In the event of Lessee's assignment of its rights hereunder, Lessee shall have no further obligations under this Agreement. Lessor may assign, sell or transfer its rights in this Agreement and the property subject to the terms and conditions of this Agreement.

10. **NOTICE.** Any notice required to be given hereunder, must be given in writing and may be given personally or by certified or registered mail addressed to the parties as follows:

If to Lessor: Lyle H. Langseth, as Trustee of the Lyle H. Langseth  
Revocable Trust UDT August 10, 2010  
405 13th Ave. W  
Williston, ND 58801-4610

If to Lessee: Continental Resources, Inc.  
P.O. Box 269000  
Oklahoma City, Oklahoma 73126  
Attention: Contract Notices (Legal)

11. **INDEMNIFICATION, DAMAGES AND COVENANTS.** The Lessee, its successors or assigns, shall be solely responsible for damages arising from or related to Lessee's operation of the Saltwater Disposal Well and shall indemnify, defend and hold Lessor harmless from and against any liability, damages, claims, suits or causes of action, including but not limited to any reasonable attorney fees or expenses of Lessor, arising from any suit brought against Lessor related to Lessee's operation of the Saltwater Disposal Well. The Lessee will maintain the Saltwater Disposal Well and all appurtenances thereto in accordance with the rules and regulations of the North Dakota Industrial Commission, and comply with applicable environmental laws, rules or regulations that govern such operations.

12. **OWNERSHIP OF EQUIPMENT.** The Lessor agrees the Lessee has the right, at the termination of this Agreement, to remove any and all equipment and personal property that the Lessee places on the Leased Premises.

13. **TERMINATION.** When this Agreement terminates, Lessee shall remove all debris, machinery and equipment introduced by Lessee, and restore the Leased Premises as near to the condition, as reasonably practicable, it was in prior to Lessee's operations.

14. **WARRANTIES.** Lessor warrants it owns all of the surface title to the Leased Premises and said property is not the homestead of the property.

15. **BINDING EFFECT.** This Agreement shall be binding upon the heirs, executors, administrators, successors and assigns of the parties hereto.

16. **EROSION CONTROL.** Lessee shall take reasonable measures to prevent erosion and disturbance of drainage areas, including but not limited to the installation of culverts, straw wattles, or other practicable applications. If an erosion problem develops, Lessor shall inform Lessee immediately, so the necessary corrective measures can be performed.

17. **WEED CONTROL.** Lessee agrees to make reasonable efforts to keep the well site and access road for the Saltwater Disposal Well free of noxious weeds, trash, and debris associated with Lessee's operations.

18. **DUST CONTROL.** During periods of heavy activity (e.g., drilling operations, hydraulic fracturing) and upon reasonable request by Lessor, Lessee shall make reasonable efforts to control dust on the access road leading to the Salt Water Disposal Well.

19. **ROAD MAINTENANCE.** Lessee agrees to make reasonable efforts to maintain the Salt Water Disposal Well access road in good condition.

IN WITNESS WHEREOF, this Agreement is executed in counterparts, each, of which will constitute an original on the date and year first above written.

### SURFACE AND ACCESS AGREEMENT

In that Wyoming Resources Corporation (WRC) desires continued access and use of the Bowman #1-D (SE/4 Sec. 10, T129N-R103W, Bowman County, North Dakota), Dr. Robert C. Thom grants access and use to this disposal site under the following terms and conditions:

1. Dr. Thom shall be paid a monthly access fee of \$200.00 plus a \$.05 fee for every barrel disposed during the month over and above 8,000 barrels. (i.e. 9,258 Bbls disposed, Dr. Thom to receive \$200.00 plus  $(9,258 - 8,000) \times .05 = \$262.90$ ).
2. Fee's shall be paid automatically by WRC within 45 days of the close of the month, and shall be based on barrels reported to the North Dakota Oil and Gas Commission.
3. This agreement is to commence the first month WRC has reportable disposed barrels, and Dr. Thom is to receive the agreed upon fees from this month onward.
4. WRC shall assume all responsibility for maintenance and up-keep of the site.
5. This agreement in no way compromises prior commitments by WRC for plugging, abandoning, and reclamation of the Bowman #1 site, once operations have ceased.
6. This agreement shall be in effect so long as WRC continues operations at the Bowman #1 site, is assignable by WRC to another party, and is binding should Dr. Thom dispose of the property covered by this agreement.
7. WRC shall notify Dr. Thom or his successor in writing as to succession of operations or sale of the property.

## SALTWATER DISPOSAL FACILITY LEASE AGREEMENT

THIS SALTWATER DISPOSAL FACILITY LEASE AGREEMENT (the "Agreement") is made and entered into this 5<sup>th</sup> day of June, 2018 by and between Bruce G. Brandvik as AIF for Mavis Brandvik, a widow, whose address is 10789 Highway 22 North, Killdeer, ND 58640, hereinafter called "Lessor" and CONTINENTAL RESOURCES, INC., whose address is P. O. Box 268870, Oklahoma City, Oklahoma 73126, hereinafter called "Lessee."

### Witnesseth:

WHEREAS, Lessor is the owner of the surface of the following described land located in Dunn County, North Dakota, to-wit, (the "Leased Premises"):

Township 147 North, Range 96 West of the 5th P.M.  
Section 25: W2SW4, SW4NW4

WHEREAS, Lessor is desirous of leasing a saltwater disposal well site upon the Leased Premises and the Lessee is desirous of leasing such property.

NOW, THEREFORE, for and in consideration of the sum of Ten Dollars (\$10.00), the mutual promises contained herein, and other good and valuable consideration, the receipt and sufficiency of which is hereby acknowledged, it is agreed between the parties as follows:

1. **LEASED PREMISES:** The Lessor hereby leases, lets and rents unto the Lessee and the Lessee agrees to lease the following tract of land located on the Leased Premises described as follows:
  - a. **Tank Battery and Injection Well Site:** The Lessor hereby grants to Lessee the rights to the surface and subsurface of the Leased Premises located in Section 25, W2SW4, SW4NW4, Township 147 North, Range 96 West, Dunn County, North Dakota, as depicted on the attached Exhibit "A". Lessor further grants to Lessee the rights to the surface and subsurface of the Leased Premises to equip, maintain, and operate the Saltwater Disposal Well for the purpose of disposing saltwater into the Saltwater Disposal Well. The Lessor also grants to Lessee the right to use the surface and subsurface of the Leased Premises for the purpose of equipping, operating and maintaining thereon all necessary facilities for a saltwater system, including, but not limited to, tanks, pumps and other structures and equipment necessary or convenient to save, take care of, treat, collect, store, transport, or dispose of saltwater from oil and gas wells on or off of the Leased Premises for disposal into the Saltwater Disposal Well, together with the right of ingress and egress across the Leased Premises from the county road.
  - b. **Easement Property:** The Lessor hereby grants to Lessee rights-of-way and easements for use of the surface and subsurface of the Leased Premises for the purpose of constructing, installing, operating, maintaining, replacing and removing pipelines, communication lines and poles, electric lines other utilities and for the purpose of transporting saltwater from oil and gas wells on or off of the Leased Premises to the Saltwater Disposal Well.
2. **PAYMENT:** Lessee agrees to pay the Lessor and the Lessor agrees to accept compensation in the amount of \$38,580.00 for the location (\$6,000.00 per acre for 6.43 acres), and \$529.50 for the access road (21.18 rods @ \$25.00 per rod) for any and all damages, including, but not limited to, all damages relating to the Saltwater Disposal Well, roadway, tank battery, pipelines, utilities and all other damages related thereto, incurred in the conversion, operation, maintenance and development of the Saltwater Disposal Well. In addition, Lessee agree to pay the Lessor and the Lessor agrees to accept a \$0.06 cent per barrel royalty on each barrel of salt water disposed of in the Salt Water Disposal Well. The \$0.06 cent per barrel royalty for the previous year will become due and payable on January 31<sup>st</sup> of the upcoming year until the well is plugged and abandoned. Lessee agrees to pay the Lessor and the Lessor agrees to accept a payment of \$200.00 per linear rod for pipelines located in Township 147 North, Range 96 West, Section 25 – W2, Dunn County, North Dakota. The parties agree this payment is intended to cover all damages arising from or related to surface and subsurface operations conducted by Lessee hereunder on the Leased Premises. Lessor and Lessee agree the payment hereunder shall be made upon receipt by Lessee of its executive management's approval to drill a Saltwater Disposal Well and upon commencement of construction activities on the Leased Premises.

from oil and gas wells on or off of the Leased Premises, including, but not limited to, the right of ingress and egress to said properties and premises, the right to lay, maintain and remove the pipeline or pipelines to and from said Saltwater Disposal Well site, the right to install, operate, maintain and remove pumping equipment, tankage and such other equipment as may be necessary or useful in the operation of the Saltwater Disposal Well facility.

5. **UTILITY EASEMENTS:** The Lessor agrees to execute all easements required by utility companies to affect the laying, maintaining and removing of utility lines, including, but not limited to, electric and telephone lines, for operating equipment necessary in Lessee's saltwater disposal operations.
6. **LIMITATION:** It is understood and agreed the disposal of saltwater and other deleterious substances will be made into a formation or formations which are not productive of fresh water, and which are approved for disposal purposes by the North Dakota Industrial Commission.
7. **FIXTURES OF LESSEE:** All pumping equipment, tankage and other equipment as may be necessary and useful in the operation of the Saltwater Disposal Well may be placed or attached on the Leased Premises by the Lessee and shall remain the property of the Lessee. Upon termination of this Agreement, or at any prior time, the Lessee may remove any and all of such equipment.
8. **DEFAULT:** The Lessee agrees upon its failure to comply with the provisions of this Agreement, the Lessor, at its option, may declare this Agreement at an end and void and terminate the same, and take possession of said premises. This Agreement shall not terminate until Lessor has given written notice of the alleged default(s) and of its intention to terminate the Agreement and Lessee has failed to cure the default(s) within sixty (60) days after receipt of the default notice. If Lessee cures the default within the sixty (60) days, the Agreement shall remain in full force and effect.
9. **ASSIGNMENT:** Lessee shall have the right to assign this Agreement without Lessor's consent. In the event of Lessee's assignment of its rights hereunder, Lessee shall have no further obligations under this Agreement. Lessor may assign, sell or transfer its rights in this Agreement and the property subject to the terms and conditions of this Agreement.
10. **NOTICE:** Any notice required to be given hereunder, must be given in writing and may be given personally or by certified or registered mail addressed to the parties as follows:  
  
If to Lessor: Mavis Brandvik  
10789 Highway 22 North  
Killdeer, ND 58640  
  
If to Lessee: Continental Resources, Inc.  
P.O. Box 268836  
Oklahoma City, Oklahoma 73126  
Attention: Contract Notices (Legal)
11. **INDEMNIFICATION, DAMAGES AND COVENANTS:** The Lessee, its successors or assigns, shall be solely responsible for damages arising from or related to Lessee's operation of the Saltwater Disposal Well and shall indemnify, defend and hold Lessor harmless from and against any liability, damages, claims, suits or causes of action, including but not limited to any reasonable attorney fees or expenses of Lessor, arising from any suit brought against Lessor related to Lessee's operation of the Saltwater Disposal Well. The Lessee will maintain the Saltwater Disposal Well and all appurtenances thereto in accordance with the rules and regulations of the North Dakota Industrial Commission, and comply with applicable environmental laws, rules or regulations that govern such operations.
12. **OWNERSHIP OF EQUIPMENT:** The Lessor agrees the Lessee has the right, at the termination of this Agreement, to remove any and all equipment and personal property that the Lessee places on the Leased Premises.
13. **TERMINATION:** When this Agreement terminates, Lessee shall remove all debris, machinery and equipment introduced by Lessee, and restore the Leased Premises as near to the condition, as reasonably practicable, it was in prior to Lessee's operations.
14. **WARRANTIES:** Lessor warrants it owns all of the surface title to the Leased Premises and said property

applications. If an erosion problem develops, Lessor shall inform Lessee immediately, so the necessary corrective measures can be performed.

17. **WEED CONTROL:** Lessee agrees to make reasonable efforts to keep the well site and access road for the Saltwater Disposal Well free of noxious weeds, trash, and debris associated with Lessee's operations.
18. **DUST CONTROL:** During periods of heavy activity (e.g., drilling operations, hydraulic fracturing) and upon reasonable request by Lessor, Lessee shall make reasonable efforts to control dust on the access road leading to the Salt Water Disposal Well.
19. **ROAD MAINTENANCE:** Lessee agrees to make reasonable efforts to maintain the Salt Water Disposal Well access road in good condition.

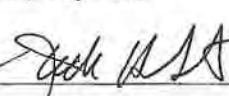

IN WITNESS WHEREOF, this Agreement is executed in counterparts, each, of which will constitute an original on the date and year first above written.

## SALTWATER DISPOSAL FACILITY LEASE AGREEMENT

THIS SALTWATER DISPOSAL FACILITY LEASE AGREEMENT (the "Agreement") is made and entered into this 15th day of Jan, 2019 by and between David Davidson, a/k/a David E. Davidson whose address is, P.O. Box 26, Tioga, ND 58852-0026, hereinafter called "Lessor" and CONTINENTAL RESOURCES, INC., whose address is P. O. Box 268870, Oklahoma City, Oklahoma 73126, hereinafter called "Lessee."

### Witnesseth:

WHEREAS, Lessor is the owner of the surface of the following described land located in Williams County, North Dakota, to-wit, (the "Leased Premises"):

Township 156 North, Range 95 West of the 5<sup>th</sup> P.M.  
Section 12: SE $\frac{1}{4}$

WHEREAS, Lessor is desirous of leasing a saltwater disposal well site upon the Leased Premises and the Lessee is desirous of leasing such property.

NOW, THEREFORE, for and in consideration of the sum of Ten Dollars (\$10.00), the mutual promises contained herein, and other good and valuable consideration, the receipt and sufficiency of which are hereby acknowledged, it is agreed between the parties as follows:

1. **LEASED PREMISES.** The Lessor hereby leases, lets and rents unto the Lessee and the Lessee agrees to lease the following tract of land located on the Leased Premises described as follows:

a. **Tank Battery and Injection Well Site:** The Lessor hereby grants to Lessee the rights to the surface and subsurface of the Leased Premises located in the SE $\frac{1}{4}$  of Section 12, Township 156 North, Range 95 West, Williams County, North Dakota, as depicted on the attached Exhibit "A". Lessor further grants to Lessee the rights to the surface and subsurface of the Leased Premises to equip, maintain, and operate the Saltwater Disposal Well for the purpose of disposing saltwater and other deleterious substances produced from oil and gas wells on or off of the Leased Premises into the Saltwater Disposal Well. For purposes of this Agreement, the "Saltwater Disposal Well" is the David 1-12 SWD which is depicted on the attached Exhibit "A". The Lessor also grants to Lessee the right to use the surface and subsurface of the Leased Premises for the purpose of equipping, operating and maintaining thereon all necessary facilities for a saltwater system, including, but not limited to, tanks, pumps and other structures and equipment necessary or convenient to save, take care of, treat, collect, store, transport, or dispose of saltwater and other deleterious substances produced from oil and gas wells on or off of the Leased Premises for disposal into the Saltwater Disposal Well, together with the right of ingress and egress across the Leased Premises from the county road.

b. **Easement Property:** The Lessor hereby grants to Lessee rights-of-way and easements for use of the surface and subsurface of the Leased Premises for the purpose of constructing, installing, operating, maintaining, replacing and removing pipelines, communication lines and poles, electric lines, other utilities, and other necessary or convenient fixtures or operations for the purpose of transporting saltwater from oil and gas wells on or off of the Leased Premises to the Saltwater Disposal Well.

2. **PAYMENT.** Lessee agrees to pay the Lessor and the Lessor agrees to accept a one-time payment in the amount of One Hundred Thousand and 00/100 Dollars (\$100,000.00) (the "Initial Payment") for any and all damages, including, but not limited to, all damages relating to the operation or use of the Saltwater Disposal Well site location and access road and all other damages related thereto, including, but not limited to, damages incurred in the operation, maintenance and development of the Saltwater Disposal Well and related facilities. In addition, Lessee agrees to pay the Lessor and Lessor agrees to accept a monthly payment of \$0.055 cents per barrel for each barrel of saltwater disposed of in the Saltwater Disposal Well (the "Monthly Payment"). The Monthly Payment shall be paid by the 30<sup>th</sup> day of the following month after the filing of State injection reports. Upon request, Lessee shall furnish Lessor with copies of all reports of liquids received on site or injected as filed with the North Dakota Industrial Commission, Oil & Gas Division, for the previous month via email. The parties agree the payments set forth in this paragraph are intended to cover all payments and damages arising from or related to surface and subsurface operations conducted by Lessee hereunder on the Leased Premises. Further, Lessor acknowledges and agrees the Initial Payment and Annual Payment paid under this Agreement are in full and complete settlement of any and all claims for loss, damage, or injury arising from or related to surface and subsurface operations conducted by Lessee hereunder on the Leased Premises. Lessor and Lessee agree the payments hereunder shall be made upon receipt by Lessee of its executive management's approval to operate the Saltwater Disposal Well.

3. **TERM.** This Agreement shall remain in effect until Lessee permanently abandons the Saltwater Disposal Well and/or gathering system.

INDUSTRIAL COMMISSION

STATE OF NORTH DAKOTA

DATE 6/13/24 CASE NO 30869-880

Introduced by Braaten

Exhibit LO-36

Identified By Stockman

4. **USE.** The Lessee shall have the right to use the Leased Premises for the storage of saltwater and other deleterious substances produced from oil and gas wells on or off of the Leased Premises; and for the disposal of saltwater and other deleterious substances produced from oil and gas wells on or off of the Leased Premises, and the easement for the transportation of saltwater and other deleterious substances produced from oil and gas wells on or off of the Leased Premises, including, but not limited to, the right of ingress and egress to said properties and premises, the right to lay, maintain and remove the pipeline or pipelines to and from said Saltwater Disposal Well site, the right to install, operate, maintain and remove pumping equipment, tankage and such other equipment as may be necessary or useful in the operation of the Saltwater Disposal Well facility. Lessee shall transport and dispose of all produced water volumes from wells operated by Lessee, which are connected to the Saltwater Disposal Well via pipeline, provided the Saltwater Disposal Well is mechanically and/or volumetrically able to accept such produced water volumes, which shall be determined in Lessee's sole reasonable discretion. In the event, the Saltwater Disposal Well is not mechanically and/or volumetrically able to accept produced water from Lessee, then Lessee shall have the right to take such produced water to a third party for disposal until the mechanical and/or volumetric issue is resolved. Notwithstanding the anything in this paragraph to the contrary, Lessee shall not be required to connect any wells operated by Lessee to the Saltwater Disposal Well via pipeline if such connection is not economically feasible, which shall be determined in Lessee's sole reasonable discretion.

5. **UTILITY EASEMENTS.** The Lessor agrees to execute all easements requested by utility companies to affect the laying, maintaining and removing of utility lines, including, but not limited to, electric and telephone lines, for operating equipment necessary in Lessee's saltwater disposal operations.

6. **LIMITATION.** It is understood and agreed the disposal of saltwater and other deleterious substances by Lessee will be made into a formation or formations which are not productive of fresh water, and which are approved for disposal purposes by the North Dakota Industrial Commission.

7. **FIXTURES OF LESSEE.** All pumping equipment, tankage and other equipment as may be necessary and useful in the operation of the Saltwater Disposal Well may be placed or attached on the Leased Premises by the Lessee and shall remain the property of the Lessee. Upon termination of this Agreement, or at any prior time, the Lessee may remove any and all of such equipment.

8. **DEFAULT.** The Lessor agrees Lessee's failure to comply with the provisions of this Agreement shall not result in termination of this Agreement. If Lessor believes Lessee has failed to comply with the terms of this Agreement, prior to commencing any legal action to enforce the terms of this Agreement, Lessor shall give Lessee written notice of the alleged default(s) and allow Lessee sixty (60) days to being curing the alleged default(s).

9. **ASSIGNMENT.** Lessee shall have the right to assign this Agreement without Lessor's consent. In the event of Lessee's assignment of its rights hereunder, Lessee shall have no further obligations under this Agreement. Lessor may assign, sell or transfer its rights in this Agreement and the property subject to the terms and conditions of this Agreement.

10. **NOTICE.** Any notice required to be given hereunder, must be given in writing and may be given personally or by certified or registered mail addressed to the parties as follows:

If to Lessor: David E. Davidson  
P.O. Box 26  
Tioga, ND 58852-0026

If to Lessee: Continental Resources, Inc.  
P.O. Box 268836  
Oklahoma City, Oklahoma 73126  
Attention: Contract Notices (Legal)

11. **INDEMNIFICATION, DAMAGES AND COVENANTS.** The Lessee, its successors or assigns, shall be solely responsible for actual damages arising from or related to Lessee's physical operation of the Saltwater Disposal Well from and after the date of this Agreement and shall indemnify, defend and hold Lessor harmless from and against any liability, damages, claims, suits or causes of action, including but not limited to any reasonable attorney fees or expenses of Lessor, arising from any suit brought against Lessor related to Lessee's physical operation of the Saltwater Disposal Well from and after the date of this Agreement. The Lessee will maintain the Saltwater Disposal Well and all appurtenances thereto in accordance with the rules and regulations of the North Dakota Industrial Commission, and comply with applicable environmental laws, rules or regulations that govern such operations.

12. **TERMINATION.** When this Agreement terminates, Lessee shall remove all debris, machinery and equipment introduced by Lessee, and restore the Leased Premises as near to the condition, as reasonably practicable, it was in prior to Lessee's operations.

13. **WARRANTIES.** Lessor warrants it owns all of the surface title to the Leased Premises and said property is not the homestead of the property.
14. **BINDING EFFECT.** This Agreement shall be binding upon the heirs, executors, administrators, successors and assigns of the parties hereto.
15. **EROSION CONTROL.** Lessee shall take reasonable measures to prevent erosion and disturbance of drainage areas, including but not limited to the installation of culverts, straw wattles, or other practicable applications. If an erosion problem develops as a result of Lessee's operations, Lessor shall inform Lessee immediately, so the necessary corrective measures can be performed.
16. **WEED CONTROL.** Lessee agrees to make reasonable efforts to keep the well site and access road for the Saltwater Disposal Well free of noxious weeds, trash, and debris associated with Lessee's operations.
17. **DUST CONTROL.** During periods of heavy activity by Lessee on the Leased Premises (e.g., drilling operations, hydraulic fracturing) and upon reasonable request by Lessor, Lessee shall make reasonable efforts to control dust on the access road leading to the Saltwater Disposal Well.
18. **ROAD MAINTENANCE.** Lessee agrees to make reasonable efforts to maintain the Saltwater Disposal Well access road in good condition.
19. **TAX LIABILITY.** Lessee shall retain ownership of all improvements, fixtures and equipment placed within the leased site and shall reimburse Lessor for all taxes levied and assessed against the site and the improvements thereon.
20. **CONFIDENTIALITY.** Lessor expressly acknowledges, warrants, and agrees the provisions of this Agreement, including, but not limited to, any and all provisions regarding payments to be made by Lessee to Lessor, shall remain strictly confidential.
21. **ENTIRE AGREEMENT.** This Agreement embodies the entire agreement between the parties hereto with respect to the matters involved herein. This Agreement was not executed in reliance upon any statement or representation by any of the parties other than those set forth above. The parties agree this Agreement supersedes and replaces all prior agreements and understandings with respect to the subject matter hereof, including, but not limited to, the Surface Use and Salt Water Disposal Agreement executed July 10, 2012, between Femco SWD, Inc. and David Davidson, and any amendments, documents, or agreements related thereto.

IN WITNESS WHEREOF, this Agreement is executed in counterparts, each, of which will constitute an original on the date and year first above written.

## SALTWATER DISPOSAL FACILITY LEASE AGREEMENT

THIS SALTWATER DISPOSAL FACILITY LEASE AGREEMENT (the "Agreement") is made and entered into this 26 day of February, 2019 by and between Kyle R. Hawkinson, a single man, whose address is 11036 8<sup>th</sup> Street NW, Killdeer, ND 58640, hereinafter called "Lessor" and CONTINENTAL RESOURCES, INC., whose address is P. O. Box 268870, Oklahoma City, Oklahoma 73126, hereinafter called "Lessee."

### Witnesseth:

WHEREAS, Lessor is the owner of the surface of the following described land located in Dunn County, North Dakota, to-wit, (the "Leased Premises"):

Township 147 North, Range 96 West of the 5th P.M.  
Section 22: SW4NW4 (top hole location)  
Section 22: SW4NE4 (bottom hole location)

WHEREAS, Lessor is desirous of leasing a saltwater disposal well site upon the Leased Premises and the Lessee is desirous of leasing such property.

NOW, THEREFORE, for and in consideration of the sum of Ten Dollars (\$10.00), the mutual promises contained herein, and other good and valuable consideration, the receipt and sufficiency of which is hereby acknowledged, it is agreed between the parties as follows:

1. **LEASED PREMISES.** The Lessor hereby leases, lets and rents unto the Lessee and the Lessee agrees to lease the following tract of land located on the Leased Premises described as follows:

a. **Tank Battery and Injection Well Site:** The Lessor hereby grants to Lessee the rights to the surface and subsurface of the Leased Premises located in Township 147, Range 96, Section 22 in Dunn County, North Dakota, as depicted on the attached Exhibit "A". Lessor further grants to Lessee the rights to the surface and subsurface of the Leased Premises to equip, maintain, and operate the Saltwater Disposal Well for the purpose of disposing saltwater into the Saltwater Disposal Well. The Lessor also grants to Lessee the right to use the surface and subsurface of the Leased Premises for the purpose of equipping, operating and maintaining thereon all necessary facilities for a saltwater system, including, but not limited to, tanks, pumps and other structures and equipment necessary or convenient to save, take care of, treat, collect, store, transport, or dispose of saltwater from oil and gas wells on or off of the Leased Premises for disposal into the Saltwater Disposal Well, together with the right of ingress and egress across the Leased Premises from the county road.

b. **Easement Property:** The Lessor hereby grants to Lessee rights-of-way and easements for use of the surface and subsurface of the Leased Premises for the purpose of constructing, installing, operating, maintaining, replacing and removing pipelines, communication lines and poles, electric lines other utilities and for the purpose of transporting saltwater from oil and gas wells on or off of the Leased Premises to the Saltwater Disposal Well.

2. **PAYMENT.** Lessee agrees to pay the Lessor and the Lessor agrees to accept compensation in the amount of \$46,500.00, (\$6,000.00 for 7.75 acres) for the location, and \$513.00 for the access road (20.52 rods @ \$25.00 per rod) for any and all damages, including, but not limited to, all damages relating to the Saltwater Disposal Well, roadway, tank battery, pipelines, utilities and all other damages related thereto, incurred in the conversion, operation, maintenance and development of the Saltwater Disposal Well. In addition, Lessee agree to pay the Lessor and the Lessor agrees to accept a \$0.06 cent per barrel royalty on each barrel of salt water disposed of in the Salt Water Disposal Well. The \$0.06 cent per barrel royalty for the previous year will be become due and payable on January 31st of the upcoming year until the well is plugged and abandoned. The parties agree this payment is intended to cover all damages arising from or related to surface and subsurface operations conducted by Lessee hereunder on the Leased Premises. Lessor and Lessee agree the payment hereunder shall be made upon receipt by Lessee of its executive management's approval to drill a Saltwater Disposal Well and upon commencement of construction activities on the Leased Premises.

3. **TERM.** This Agreement shall remain in effect until Lessee permanently abandons the Saltwater Disposal Well and/or gathering system

4. **USE.** The Lessee shall have the right to use the Leased Premises for the storage of saltwater and other deleterious substances produced from oil and gas wells on or off of the Leased Premises; and for the disposal of saltwater and other deleterious substances produced from oil and gas wells on or off of the Leased Premises, and the easement for the transportation of saltwater and other deleterious substances produced from oil and gas wells on or off of the Leased Premises, including, but not limited to, the right of ingress and egress to said properties and premises, the right to lay, maintain and remove the pipeline or pipelines to and from said Saltwater Disposal Well

site, the right to install, operate, maintain and remove pumping equipment, tankage and such other equipment as may be necessary or useful in the operation of the Saltwater Disposal Well facility.

5. **UTILITY EASEMENTS.** The Lessor agrees to execute all easements required by utility companies to affect the laying, maintaining and removing of utility lines, including, but not limited to, electric and telephone lines, for operating equipment necessary in Lessee's saltwater disposal operations.

6. **LIMITATION.** It is understood and agreed the disposal of saltwater and other deleterious substances will be made into a formation or formations which are not productive of fresh water, and which are approved for disposal purposes by the North Dakota Industrial Commission.

7. **FIXTURES OF LESSEE.** All pumping equipment, tankage and other equipment as may be necessary and useful in the operation of the Saltwater Disposal Well may be placed or attached on the Leased Premises by the Lessee and shall remain the property of the Lessee. Upon termination of this Agreement, or at any prior time, the Lessee may remove any and all of such equipment.

8. **DEFAULT.** The Lessee agrees upon its failure to comply with the provisions of this Agreement, the Lessor, at its option, may declare this Agreement at an end and void and terminate the same, and take possession of said premises. This Agreement shall not terminate until Lessor has given written notice of the alleged default(s) and of its intention to terminate the Agreement and Lessee has failed to cure the default(s) within sixty (60) days after receipt of the default notice. If Lessee cures the default within the sixty (60) days, the Agreement shall remain in full force and effect.

9. **ASSIGNMENT.** Lessee shall have the right to assign this Agreement without Lessor's consent. In the event of Lessee's assignment of its rights hereunder, Lessee shall have no further obligations under this Agreement. Lessor may assign, sell or transfer its rights in this Agreement and the property subject to the terms and conditions of this Agreement.

10. **NOTICE.** Any notice required to be given hereunder, must be given in writing and may be given personally or by certified or registered mail addressed to the parties as follows:

If to Lessor: Kyle R. Hawkinson  
11036 8<sup>th</sup> Street NW

Oklahoma City, Oklahoma 73126  
Attention: Contract Notices (Legal)

11. **INDEMNIFICATION, DAMAGES AND COVENANTS.** The Lessee, its successors or assigns, shall be solely responsible for damages arising from or related to Lessee's operation of the Saltwater Disposal Well and shall indemnify, defend and hold Lessor harmless from and against any liability, damages, claims, suits or causes of action, including but not limited to any reasonable attorney fees or expenses of Lessor, arising from any suit brought against Lessor related to Lessee's operation of the Saltwater Disposal Well. The Lessee will maintain the Saltwater Disposal Well and all appurtenances thereto in accordance with the rules and regulations of the North Dakota Industrial Commission, and comply with applicable environmental laws, rules or regulations that govern such operations.

12. **OWNERSHIP OF EQUIPMENT.** The Lessor agrees the Lessee has the right, at the termination of this Agreement, to remove any and all equipment and personal property that the Lessee places on the Leased Premises.

13. **TERMINATION.** When this Agreement terminates, Lessee shall remove all debris, machinery and equipment introduced by Lessee, and restore the Leased Premises as near to the condition, as reasonably practicable, it was in prior to Lessee's operations.

14. **WARRANTIES.** Lessor warrants it owns all of the surface title to the Leased Premises and said property is not the homestead of the property.

15. **BINDING EFFECT.** This Agreement shall be binding upon the heirs, executors, administrators, successors and assigns of the parties hereto.

16. **EROSION CONTROL.** Lessee shall take reasonable measures to prevent erosion and disturbance of drainage areas, including but not limited to the installation of culverts, straw waddles, or other practicable applications. If an erosion problem develops, Lessor shall inform Lessee immediately, so the necessary corrective measures can be performed.

17. **WEED CONTROL.** Lessee agrees to make reasonable efforts to keep the well site and access road for the Saltwater Disposal Well free of noxious weeds, trash, and debris associated with Lessee's operations.

18. **DUST CONTROL.** During periods of heavy activity (e.g., drilling operations, hydraulic fracturing) and upon reasonable request by Lessor, Lessee shall make reasonable efforts to control dust on the access road leading to the Salt Water Disposal Well.

19. **ROAD MAINTENANCE.** Lessee agrees to make reasonable efforts to maintain the Salt Water Disposal Well access road in good condition.

IN WITNESS WHEREOF, this Agreement is executed in counterparts, each, of which will constitute an original on the date and year first above written.

## SALTWATER DISPOSAL FACILITY LEASE AGREEMENT

THIS SALTWATER DISPOSAL FACILITY LEASE AGREEMENT (the "Agreement") is made and entered into this 17 day of March, 2017 by and between Mary Ann Kjorstad and Diane Mary Kjorstad, as Joint Tenants, whose address is 12906 42<sup>nd</sup> Street NW, Williston, North Dakota, 58801, hereinafter called "Lessor" and CONTINENTAL RESOURCES, INC., whose address is P. O. Box 268870, Oklahoma City, Oklahoma 73126, hereinafter called "Lessee."

### Witnesseth:

WHEREAS, Lessor is the owner of the surface of the following described land located in Williams County, North Dakota, to-wit, (the "Leased Premises"):

Township 154 North, Range 100 West of the 5<sup>th</sup> P.M.  
Section 35: W $\frac{1}{4}$ SW $\frac{1}{4}$

WHEREAS, Lessor is desirous of leasing a saltwater disposal well site upon the Leased Premises and the Lessee is desirous of leasing such property.

NOW, THEREFORE, for and in consideration of the sum of Ten Dollars (\$10.00), the mutual promises contained herein, and other good and valuable consideration, the receipt and sufficiency of which is hereby acknowledged, it is agreed between the parties as follows:

1. **LEASED PREMISES.** The Lessor hereby leases, lets and rents unto the Lessee and the Lessee agrees to lease the following tract of land located on the Leased Premises described as follows:
  - a. **Tank Battery and Injection Well Site:** The Lessor hereby grants to Lessee the rights to the surface and subsurface of the Leased Premises to drill, complete, equip, maintain, and operate a saltwater disposal well located in the W $\frac{1}{4}$ SW $\frac{1}{4}$  of Section 35, Township 154 North, Range 100 West, Williams County, North Dakota, as depicted on the attached Exhibit A (the "Saltwater Disposal Well" herein), for the purpose of disposing saltwater into the Saltwater Disposal Well. The Lessor also grants to Lessee the right to use the surface and subsurface of the Leased Premises for the purpose of equipping, operating and maintaining thereon all necessary facilities for a saltwater system, together with the right of ingress and egress across the Leased Premises from the county road.
  - b. **Easement Property:** The Lessor hereby grants to Lessee a right of way and easement for use of the surface and subsurface of the Leased Premises for the purpose of building and maintaining a road, and for the transporting of saltwater, building and maintaining electric service, telephone service and other utilities and for the purpose of constructing, laying, maintaining, operating, relaying, replacing and removing a pipeline or pipelines for the purpose of transporting saltwater from oil and gas leases and wells in the area to the Saltwater Disposal Well site.
2. **PAYMENT:** Lessee agrees to pay the Lessor and the Lessor agrees to accept a one-time payment of Fifty Thousand and 00/100 Dollars (\$50,000.00) for any and all damages, including, but not limited to, all damages relating to the construction of the well site, roadway, tank battery, pipelines, utilities and all other damages related thereto, incurred in the drilling, completion, operation, maintenance and development of the Saltwater Disposal Well. In addition, Lessee agrees to pay the Lessor and the Lessor agrees to accept a \$0.06 cent per barrel royalty on each barrel of salt water disposed of in the Salt Water Disposal Well. The parties agree this payment is intended to cover all damages arising from or related to surface and subsurface operations conducted by Lessee hereunder on the Leased Premises. Lessor and Lessee agree the payment hereunder shall be made upon receipt by Lessee of its executive management's approval to drill the Saltwater Disposal Well and upon commencement of construction activities on the Leased Premises.
3. **TERM:** This Agreement shall remain in effect until Lessee permanently abandons the Saltwater Disposal Well and/or gathering system
4. **USE:** The Lessee shall have the right to use the Leased Premises for the storage of saltwater and other deleterious substances produced from oil and gas wells on or off of the Leased Premises; and for the disposal of saltwater and other deleterious substances produced from oil and gas wells on or off of the Leased Premises, and the easement for the transportation of saltwater and other deleterious substances produced from oil and gas wells on or off of the Leased Premises, including, but not limited to, the right of ingress and egress to said properties and premises, the

Identified By Stackness

right to lay, maintain and remove the pipeline or pipelines to and from said Saltwater Disposal Well site, the right to install, operate, maintain and remove pumping equipment, tankage and such other equipment as may be necessary or useful in the operation of the Saltwater Disposal facility.

5. **UTILITY EASEMENTS:** The Lessor agrees to execute all easements required by utility companies to affect the laying, maintaining and removing of utility lines, including, but not limited to, electric and telephone lines, for operating equipment necessary in Lessee's saltwater disposal operations.
6. **LIMITATION:** It is understood and agreed the disposal of saltwater and other deleterious substances will be made into a formation or formations which are not productive of fresh water, and which are approved for disposal purposes by the North Dakota Industrial Commission.
7. **FIXTURES OF LESSEE:** All pumping equipment, tankage and other equipment as may be necessary and useful in the operation of a saltwater disposal well may be placed or attached on the Leased Premises by the Lessee and shall remain the property of the Lessee. Upon termination of this Agreement, or at any prior time, the Lessee may remove any and all of such equipment.
8. **DEFAULT:** The Lessee agrees upon its failure to comply with the provisions of this Agreement, the Lessor, at its option, may declare this Agreement at an end and void and terminate the same, and take possession of said premises. This Agreement shall not terminate until Lessor has given written notice of the alleged default(s) and of its intention to terminate the Agreement and Lessee has failed to cure the default(s) within sixty (60) days after receipt of the default notice. If Lessee cures the default within the sixty (60) days, the Agreement shall remain in full force and effect.
9. **ASSIGNMENT:** Lessee shall have the right to assign this Agreement without Lessor's consent. In the event of Lessee's assignment of its rights hereunder, Lessee shall have no further obligations under this Agreement. Lessor may assign, sell or transfer her rights in this Agreement and the property subject to the terms and conditions of this Agreement.
10. **NOTICE:** Any notice required to be given hereunder, must be given in writing and may be given personally or by certified or registered mail addressed to the parties as follows:

If to Lessor: Mary Ann Kjorstad and Diane Mary Kjorstad  
12906 42<sup>nd</sup> Street NW

If to Lessee: \_\_\_\_\_  
\_\_\_\_\_  
Continental Resources, Inc.  
P.O. Box 268870  
Oklahoma City, Oklahoma 73126

11. **INDEMNIFICATION, DAMAGES AND COVENANTS:** The Lessee, its successors or assigns, shall be solely responsible for damages arising from or related to Lessee's operation of the Saltwater Disposal Well and shall indemnify, defend and hold Lessor harmless from and against any liability, damages, claims, suits or causes of action, including but not limited to any reasonable attorney fees or expenses of Lessor, arising from any suit brought against Lessor related to Lessee's operation. The Lessee will maintain the Saltwater Disposal Well and all appurtenances thereto in accordance with the rules and regulations of the North Dakota Industrial Commission, and comply with applicable environmental laws, rules or regulations that govern such operations.
12. **OWNERSHIP OF EQUIPMENT:** The Lessor agrees the Lessee has the right, at the termination of this Agreement, to remove any and all equipment and personal property that the Lessee places on the Leased Premises.
13. **TERMINATION:** When this Agreement terminates, Lessee shall remove all debris, machinery and equipment introduced by Lessee, and restore the Leased Premises as near to the condition, as reasonably practicable, it was in immediately prior to Lessee's operations.
14. **WARRANTIES:** Lessor warrants it owns all of the surface title to the above described property and said property is not the homestead of the property.
15. **BINDING EFFECT:** This Agreement shall be binding upon the heirs, executors, administrators, successors and assigns of the parties hereto.

16. **EROSION CONTROL:** Lessee shall take measures to prevent erosion and disturbance of drainage areas, including but not limited to the installation of culverts, straw wattles, or other practicable applications. If an erosion problem develops, Lessor shall inform Lessee immediately so the necessary corrective measures can be performed.
17. **WEED CONTROL:** Lessee agrees to make reasonable efforts to keep the well site and access road free of noxious weeds, trash, and debris associated with Lessee's operations.
18. **DUST CONTROL:** During periods of heavy activity (e.g., drilling operations, hydraulic fracturing) and upon reasonable request by Lessor, Lessee shall make reasonable efforts to control dust on the well access road leading to the Salt Water Disposal Well.
19. **ROAD MAINTENANCE:** Lessee agrees to make reasonable efforts to maintain the Salt Water Disposal Well access road.

IN WITNESS WHEREOF, this Agreement is executed in counterparts, each, of which will constitute an original on the date and year first above written.

## PRODUCED WATER DISPOSAL FACILITY LEASE AGREEMENT

THIS PRODUCED WATER DISPOSAL FACILITY LEASE AGREEMENT (the "Agreement") is made and entered into this 4<sup>th</sup> day of June, 2020 by and between Jason J. Bang, a single man, whose address is 11129 5<sup>th</sup> St NW, Killdeer, ND 58640, hereinafter called "Lessor" and CONTINENTAL RESOURCES, INC., whose address is P. O. Box 268870, Oklahoma City, Oklahoma 73126, hereinafter called "Lessee."

### Witnesseth:

WHEREAS, Lessor is the owner of the surface estate of the following described land located in Dunn County, North Dakota, to-wit:

Township 147 North, Range 96 West of the 5th P.M.  
Section 32: N2

(the "Subject Property").

WHEREAS, Lessor is desirous of leasing a disposal well site upon the Subject Property and the Lessee is desirous of leasing such property.

NOW, THEREFORE, for and in consideration of the sum of Ten Dollars (\$10.00), the mutual promises contained herein, and other good and valuable consideration, the receipt and sufficiency of which is hereby acknowledged, it is agreed between the parties as follows:

1. **LEASED PREMISES.** The Lessor hereby leases, lets and rents unto the Lessee and the Lessee agrees to lease an 8.29 acre surface acre parcel of land as depicted on Exhibit "A" (the "Leased Premises") located on the Subject Property subject to the following terms and conditions:

a. **Tank Battery and Disposal Well Site:** Lessor hereby grants to Lessee the rights to the surface and subsurface of the Leased Premises to equip, maintain, and operate the disposal well ("Produced Water Disposal Well") for the purpose of disposing produced water into the Produced Water Disposal Well. The Lessor also grants to Lessee the right to use the surface and subsurface of the Leased Premises for the purpose of equipping, operating and maintaining thereon all necessary or convenient facilities for a disposal well, including, but not limited to, tanks, pumps and other structures and equipment necessary or convenient to save, take care of, treat, collect, store, transport, or dispose of produced water from oil and gas wells on or off of the Leased Premises for disposal into the Produced Water Disposal Well.

b. **Rights-of-Way and Easements:** The Lessor hereby grants to Lessee rights-of-way and easements for use of the surface and subsurface of the Subject Property for the purpose of constructing, installing, operating, maintaining, replacing and removing pipelines, communication lines and poles, electric lines, other utilities, and for the purpose of transporting produced water from oil and gas wells on or off of the Leased Premises to the Produced Water Disposal Well, together with the rights-of-way and easements necessary to use and maintain existing roads and/or to use, construct, and maintain new roads for ingress and egress to the Produced Water Disposal Well. Lessor also grants Lessee a subsurface easement under the Subject Property and lands outside of the Subject Property which is owned by Lessor which is necessary for Lessee to drill the Produced Water Disposal Well and dispose of produced water and other deleterious substances into the Produced Water Disposal Well.

2. **PAYMENT.** Lessee agrees to pay the Lessor and the Lessor agrees to accept compensation in the amount of \$49,740.00 (8.29 acres @ \$6,000.00 per acre) for the location, \$2,594.50 for the access road (103.78 rods @ \$25.00 per rod) for any and all damages to the Subject Property, including, but not limited to, all damages relating to the Produced Water Disposal Well, roads, tank battery, pipelines, utilities and all other damages related thereto, incurred in the conversion, operation, maintenance and development of the Produced Water Disposal Well. In the event the acreage utilized by the Lessee exceeds 8.29 acres for the Produced Water Disposal Well, upon which this payment is based, the Lessee agrees to make a further payment to Lessor for the extra acreage, based on the amount of \$6,000.00 per acre. In addition, Lessee shall pay Lessor \$0.06 per barrel for each barrel of produced water disposed into the Produced Water Disposal Well, which shall be paid by January 31<sup>st</sup> for any produced water disposed into the Produced Water Disposal Well for the previous year. The parties agree this payment is intended to cover all damages arising from or related to surface and subsurface operations conducted by Lessee hereunder. Lessor and Lessee agree the payment hereunder shall be made upon receipt by Lessee of its executive management's approval to drill a Produced Water Disposal Well and upon commencement of construction activities on the Leased Premises. This payment will be paid proportionate to the interest the undersigned owns in the surface.

3. **RELEASE.** Lessor acknowledges the receipt and sufficiency of all compensation paid by Lessee pursuant to this Agreement as full and complete settlement for, and as a release of, all claims for loss, damage, or injury to the surface and/or subsurface of the Subject Property arising out of Lessee's oil and gas operations, including those categories of loss, damage, or injury described in Chapter 38-11.1 of the North Dakota Century Code. Lessor

KD SWD

hereby releases, acquits, and forever discharges Lessee and its parent, subsidiary, and other affiliated companies, and their employees, contractors, subcontractors, agents, and representatives from any and all losses, liabilities, claims, damages, demands, and causes of action for injuries or damages to the surface and/or subsurface of the Subject Property and to the appurtenances, improvements, and vegetation on the Subject Property owned or possessed by the Lessor and/or tenants, arising directly or indirectly in connection with the Lessee's oil and gas operations on the Subject Property.

4. **TERM.** This Agreement shall remain in effect until Lessee permanently abandons the Produced Water Disposal Well.

5. **UTILITY EASEMENTS.** The Lessor agrees to execute all easements required by utility companies to affect the laying, maintaining and removing of utility lines, including, but not limited to, electric and telephone lines, for operating equipment necessary in Lessee's disposal operations.

6. **LIMITATION.** It is understood and agreed the disposal of produced water and other deleterious substances will be made into a formation or formations which are not productive of fresh water, and which are approved for disposal purposes by the North Dakota Industrial Commission.

7. **FIXTURES OF LESSEE.** All pumping equipment, tankage and other equipment as may be necessary, useful or convenient in the operation of the Produced Water Disposal Well may be placed or attached on the Leased Premises by the Lessee and shall remain the property of the Lessee. Upon termination of this Agreement, or at any prior time, the Lessee may remove any and all of such equipment.

8. **ASSIGNMENT.** Lessee shall have the right to assign this Agreement without Lessor's consent. In the event of Lessee's assignment of its rights hereunder, Lessee shall have no further obligations under this Agreement. Lessor may assign, sell or transfer its rights in this Agreement and the property subject to the terms and conditions of this Agreement.

9. **NOTICE.** Any notice required to be given hereunder, must be given in writing and may be given personally or by certified or registered mail addressed to the parties as follows:

If to Lessor: Jason J. Bang  
11129 5<sup>th</sup> St NW  
Killdeer, ND 58640

If to Lessee: Continental Resources, Inc.  
P.O. Box 268836  
Oklahoma City, Oklahoma 73126  
Attention: Contract Notices (Legal)

10. **INDEMNIFICATION, DAMAGES AND COVENANTS.** The Lessee shall indemnify, defend and hold Lessor harmless from and against any liability, damages, claims, suits or causes of action, related to Lessee's operation of the Produced Water Disposal Well, except to the extent caused by the negligence or intentional misconduct of Lessor. The Lessee will maintain the Produced Water Disposal Well and all appurtenances thereto in accordance with the rules and regulations of the North Dakota Industrial Commission, and comply with applicable environmental laws, rules or regulations that govern such operations.

11. **TERMINATION.** When this Agreement terminates, Lessee shall remove all debris, machinery and equipment introduced by Lessee, and restore the Leased Premises to as near the condition it was in prior to Lessee's operations, as is reasonably practicable.

12. **GOVERNING LAW.** This Agreement shall be governed by, and construed in accordance with, the laws of the State of North Dakota, without giving effect to conflict of law principles. Any suit or proceeding hereunder shall be brought exclusively in and each party consents to the personal jurisdiction of the courts, state and federal, located therein. Each party agrees to waive any objection the state and federal courts are an inconvenient forum.

13. **WARRANTIES.** Lessor warrants it owns all of the surface title to the Leased Premises and said property is not the homestead of the property.

14. **SEVERABILITY.** The provisions of this Agreement shall be severable if any of the provisions hereof are held by a court of competent jurisdiction to be invalid, void, or otherwise unenforceable, and the remaining provisions shall remain enforceable to the fullest extent permitted by law.

15. **ENTIRE AGREEMENT.** This Agreement embodies the entire agreement of the Parties related to the subject matter hereof and supersedes all prior agreements, understandings, negotiations and discussions, whether oral or written, of the Parties related to the subject matter hereof.

16. **BINDING EFFECT.** This Agreement shall be binding upon the heirs, executors, administrators, successors and assigns of the parties hereto.

17. **COUNTERPARTS.** This Agreement may be executed in any number of counterparts, each of such counterparts shall for all purposes be deemed an original and all such counterparts shall together constitute but one and the same instrument. Signatures transmitted by facsimile or e-mail shall be acceptable to evidence acceptance of the terms and conditions herein.

IN WITNESS WHEREOF, Lessor and Lessee have executed this Agreement as of the date first referenced above.

## SALTWATER DISPOSAL FACILITY LEASE AGREEMENT

THIS SALTWATER DISPOSAL FACILITY LEASE AGREEMENT (the "Agreement") is made and entered into this 10 day of January, 2019 by and between **Marvin Keith Johnson**, whose address is 5893 120th Ave. NW, Ray, ND 58849, hereinafter called "Lessor" and **CONTINENTAL RESOURCES, INC.**, whose address is P. O. Box 269000, Oklahoma City, Oklahoma 73126, hereinafter called "Lessee."

### Witnesseth:

WHEREAS, Lessor is the owner of the surface of the following described land located in Williams County, North Dakota, to-wit, (the "Leased Premises"):

Township 155 North, Range 97 West of the 5th P.M.  
Section 20: E $\frac{1}{4}$ SE $\frac{1}{4}$

WHEREAS, Lessor is desirous of leasing a saltwater disposal well site upon the Leased Premises and the Lessee is desirous of leasing such property.

NOW, THEREFORE, for and in consideration of the sum of Ten Dollars (\$10.00), the mutual promises contained herein, and other good and valuable consideration, the receipt and sufficiency of which is hereby acknowledged, it is agreed between the parties as follows:

1. **LEASED PREMISES.** The Lessor hereby leases, lets and rents unto the Lessee and the Lessee agrees to lease the following tract of land located on the Leased Premises described as follows:

a. **Tank Battery and Injection Well Site:** The Lessor hereby grants to Lessee the rights to the surface and subsurface of the Leased Premises located in the E $\frac{1}{4}$ SE $\frac{1}{4}$  of Section 20, Township 155 North, Range 97 West of the 5th P.M., Williams County, North Dakota, as depicted on the attached Exhibit "A". Lessor further grants to Lessee the rights to the surface and subsurface of the Leased Premises to equip, maintain, and operate the Saltwater Disposal Well for the purpose of disposing saltwater into the Saltwater Disposal Well. The Lessor also grants to Lessee the right to use the surface and subsurface of the Leased Premises for the purpose of equipping, operating and maintaining thereon all necessary facilities for a saltwater system, including, but not limited to, tanks, pumps and other structures and equipment necessary or convenient to save, take care of, treat, collect, store, transport, or dispose of saltwater from oil and gas wells on or off of the Leased Premises for disposal into the Saltwater Disposal Well, together with the right of ingress and egress across the Leased Premises from the county road.

b. **Easement Property:** The Lessor hereby grants to Lessee rights-of-way and easements for use of the surface and subsurface of the Leased Premises for the purpose of constructing, installing, operating, maintaining, replacing and removing pipelines, communication lines and poles, electric lines other utilities and for the purpose of transporting saltwater from oil and gas wells on or off of the Leased Premises to the Saltwater Disposal Well.

2. **PAYMENT.** Lessee agrees to pay the Lessor and the Lessor agrees to accept a one-time payment in the amount of Forty Thousand and 00/100 Dollars (\$40,000.00) (the "Initial Payment") for any and all damages, including, but not limited to, all damages relating to the construction, operation or use of the Saltwater Disposal Well site location and access road and all other damages related thereto, including, but not limited to, damages incurred in the operation, maintenance and development of the Saltwater Disposal Well and related facilities. In the event the acreage utilized by the Lessee exceeds the 8.00 acres, for the Saltwater Disposal Well site location, upon which this payment is based, the Lessee agrees to make a further payment to the Lessor for the extra acreage, based on the amount of \$5,000.00 per acre. In addition, Lessee agrees to pay the Lessor and Lessor agrees to accept a payment of \$0.06 cents per barrel for each barrel of saltwater disposed of in the Saltwater Disposal Well (the "Royalty Payment"). The Royalty Payment shall be paid by the 30th day of the following month for the life of the Saltwater Disposal Well (the "Monthly Payment"). The parties agree the payments set forth in this paragraph are intended to cover all payments and damages arising from or related to surface and subsurface operations conducted by Lessee hereunder on the Leased Premises. Further, Lessor acknowledges and agrees the Initial Payment and Annual Payment paid under this Agreement are in full and complete settlement of any and all claims for loss, damage, or injury arising from or related to surface and subsurface operations conducted by Lessee hereunder on the Leased Premises. These payments will be paid proportionate to the interest the undersigned owns in the surface. Lessor and Lessee agree the payments hereunder shall be made upon receipt by Lessee of its executive management's approval to operate the Saltwater Disposal Well and upon commencement of construction activities on the Leased premises

3. **TERM.** This Agreement shall remain in effect until Lessee permanently abandons the Saltwater Disposal Well and/or gathering system

4. **USE.** The Lessee shall have the right to use the Leased Premises for the storage of saltwater and other deleterious substances produced from oil and gas wells on or off of the Leased Premises; and for the disposal of saltwater and other deleterious substances produced from oil and gas wells on or off of the Leased Premises, and the easement for the transportation of saltwater and other deleterious substances produced from oil and gas wells on or off of the Leased Premises, including, but not limited to, the right of ingress and egress to said properties and premises, the right to lay, maintain and remove the pipeline or pipelines to and from said Saltwater Disposal Well site, the right to install, operate, maintain and remove pumping equipment, tankage and such other equipment as may be necessary or useful in the operation of the Saltwater Disposal Well facility.

5. **UTILITY EASEMENTS.** The Lessor agrees to execute all easements required by utility companies to affect the laying, maintaining and removing of utility lines, including, but not limited to, electric and telephone lines, for operating equipment necessary in Lessee's saltwater disposal operations.

6. **LIMITATION.** It is understood and agreed the disposal of saltwater and other deleterious substances will be made into a formation or formations which are not productive of fresh water, and which are approved for disposal purposes by the North Dakota Industrial Commission.

7. **FIXTURES OF LESSEE.** All pumping equipment, tankage and other equipment as may be necessary and useful in the operation of the Saltwater Disposal Well may be placed or attached on the Leased Premises by the Lessee and shall remain the property of the Lessee. Upon termination of this Agreement, or at any prior time, the Lessee may remove any and all of such equipment.

8. **DEFAULT.** The Lessee agrees upon its failure to comply with the provisions of this Agreement, the Lessor, at its option, may declare this Agreement at an end and void and terminate the same, and take possession of said premises. This Agreement shall not terminate until Lessor has given written notice of the alleged default(s) and of its intention to terminate the Agreement and Lessee has failed to cure the default(s) within sixty (60) days after receipt of the default notice. If Lessee cures the default within the sixty (60) days, the Agreement shall remain in full force and effect.

9. **ASSIGNMENT.** Lessee shall have the right to assign this Agreement without Lessor's consent. In the event of Lessee's assignment of its rights hereunder, Lessee shall have no further obligations under this Agreement. Lessor may assign, sell or transfer its rights in this Agreement and the property subject to the terms and conditions of this Agreement.

10. **NOTICE.** Any notice required to be given hereunder, must be given in writing and may be given personally or by certified or registered mail addressed to the parties as follows:

If to Lessor: Marvin Keith Johnson  
5893 120th Ave. NW  
Ray, ND 58849

If to Lessee: Continental Resources, Inc.  
P.O. Box 269000  
Oklahoma City, Oklahoma 73126  
Attention: Contract Notices (Legal)

11. **INDEMNIFICATION, DAMAGES AND COVENANTS.** The Lessee, its successors or assigns, shall be solely responsible for damages arising from or related to Lessee's operation of the Saltwater Disposal Well and shall indemnify, defend and hold Lessor harmless from and against any liability, damages, claims, suits or causes of action, including but not limited to any reasonable attorney fees or expenses of Lessor, arising from any suit brought against Lessor related to Lessee's operation of the Saltwater Disposal Well. The Lessee will maintain the Saltwater Disposal Well and all appurtenances thereto in accordance with the rules and regulations of the North Dakota Industrial Commission, and comply with applicable environmental laws, rules or regulations that govern such operations.

12. **OWNERSHIP OF EQUIPMENT.** The Lessor agrees the Lessee has the right, at the termination of this Agreement, to remove any and all equipment and personal property that the Lessee places on the Leased Premises.

13. **TERMINATION.** When this Agreement terminates, Lessee shall remove all debris, machinery and equipment introduced by Lessee, and restore the Leased Premises as near to the condition, as reasonably practicable, it was in prior to Lessee's operations.

14. **WARRANTIES.** Lessor warrants it owns all of the surface title to the Leased Premises and said property is not the homestead of the property.

15. **BINDING EFFECT.** This Agreement shall be binding upon the heirs, executors, administrators, successors and assigns of the parties hereto.

16. **EROSION CONTROL.** Lessee shall take reasonable measures to prevent erosion and disturbance of drainage areas, including but not limited to the installation of culverts, straw wattles, or other practicable applications. If an erosion problem develops, Lessor shall inform Lessee immediately, so the necessary corrective measures can be performed.

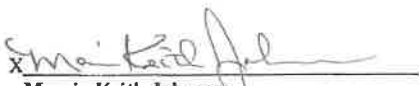

17. **WEED CONTROL.** Lessee agrees to make reasonable efforts to keep the well site and access road for the Saltwater Disposal Well free of noxious weeds, trash, and debris associated with Lessee's operations.

18. **DUST CONTROL.** During periods of heavy activity (e.g., drilling operations, hydraulic fracturing) and upon reasonable request by Lessor, Lessee shall make reasonable efforts to control dust on the access road leading to the Salt Water Disposal Well.

19. **ROAD MAINTENANCE.** Lessee agrees to make reasonable efforts to maintain the Salt Water Disposal Well access road in good condition.

IN WITNESS WHEREOF, this Agreement is executed in counterparts, each, of which will constitute an original on the date and year first above written.

## PRODUCED WATER DISPOSAL FACILITY LEASE AGREEMENT

THIS PRODUCED WATER DISPOSAL FACILITY LEASE AGREEMENT (the "Agreement") is made and entered into this 24 day of November, 2020 by and between Janice V. Joseph, fka Janice V. Fredrickson, a single person, whose address is, 718 1<sup>st</sup> Avenue East, Williston, ND 58801-5408, hereinafter called "Lessor" and CONTINENTAL RESOURCES, INC., whose address is P. O. Box 268870, Oklahoma City, Oklahoma 73126, hereinafter called "Lessee."

### Witnesseth:

WHEREAS, Lessor is the owner of the surface estate of the following described land located in McKenzie County, North Dakota, to-wit:

Township 152 North, Range 102 West of the 5th P.M.  
Section 1: Lots 3, 5, 6, 11

(the "Subject Property").

WHEREAS, Lessor is desirous of leasing a disposal well site upon the Subject Property and the Lessee is desirous of leasing such property.

NOW, THEREFORE, for and in consideration of the sum of Ten Dollars (\$10.00), the mutual promises contained herein, and other good and valuable consideration, the receipt and sufficiency of which is hereby acknowledged, it is agreed between the parties as follows:

1. **LEASED PREMISES.** The Lessor hereby leases, lets and rents unto the Lessee and the Lessee agrees to lease a 8.61 acre surface acre parcel of land as depicted on Exhibit "A" (the "Leased Premises") located on the Subject Property subject to the following terms and conditions:
  - a. **Tank Battery and Disposal Well Site:** Lessor hereby grants to Lessee the rights to the surface and subsurface of the Leased Premises to equip, maintain, and operate the disposal well ("Produced Water Disposal Well") for the purpose of disposing produced water into the Produced Water Disposal Well. The Lessor also grants to Lessee the right to use the surface and subsurface of the Leased Premises for the purpose of equipping, operating and maintaining thereon all necessary or convenient facilities for a disposal well, including, but not limited to, tanks, pumps and other structures and equipment necessary or convenient to save, take care of, treat, collect, store, transport, or dispose of produced water from oil and gas wells on or off of the Leased Premises for disposal into the Produced Water Disposal Well.
  - b. **Rights-of-Way and Easements:** The Lessor hereby grants to Lessee rights-of-way and easements for use of the surface and subsurface of the Subject Property for the purpose of constructing, installing, operating, maintaining, replacing and removing pipelines, communication lines and poles, electric lines other utilities and for the purpose of transporting produced water from oil and gas wells on or off of the Leased Premises to the Produced Water Disposal Well, together with the rights-of-way and easements necessary to use and maintain existing roads and/or to use, construct, and maintain new roads for ingress and egress to the Produced Water Disposal Well. Lessor also grants Lessee a subsurface easement under the Subject Property and lands outside of the Subject Property which is owned by Lessor which is necessary for Lessee to drill the Produced Water Disposal Well and dispose of produced water and other deleterious substances into the Produced Water Disposal Well.
2. **PAYMENT.** Lessee agrees to pay the Lessor and the Lessor agrees to accept compensation in the amount of \$51,660.00 (8.61 acres @ \$6,000.00 per acre) for the location, \$4,760.35 for the access road (136.01 rods @ \$35.00 per rod) for any and all damages to the Subject Property, including, but not limited to, all damages relating to the Produced Water Disposal Well, roads, tank battery, pipelines, utilities and all other damages related thereto, incurred in the conversion, operation, maintenance and development of the Produced Water Disposal Well. In the event the acreage utilized by the Lessee exceeds 8.61 acres for the Produced Water Disposal Well, upon which this payment is based, the Lessee agrees to make a further payment to Lessor for the extra acreage, based on the amount of \$6,000.00 per acre. In addition, Lessee shall pay Lessor \$0.06 per barrel for each barrel of produced water disposed into the Produced Water Disposal Well, which shall be paid by January 31<sup>st</sup> for any produced water disposed into the Produced Water Disposal Well for the previous year. The parties agree this payment is intended to cover all damages arising from or related to surface and subsurface operations conducted by Lessee hereunder. Lessor and Lessee agree the payment hereunder shall be made upon receipt by Lessee of its executive management's approval to drill a Produced Water Disposal Well and upon commencement of construction activities on the Leased Premises. This payment will be paid proportionate to the interest the undersigned owns in the surface.
3. **RELEASE.** Lessor acknowledge the receipt and sufficiency of all compensation paid by Lessee pursuant to this Agreement as full and complete settlement for, and as a release of, all claims for loss, damage, or injury to the surface and/or subsurface of the Subject Property arising out of Lessee's oil and gas operations, including those categories of loss, damage, or injury described in Chapter 38-11.1 of the North Dakota Century Code. Lessor

hereby release, acquit, and forever discharge Lessee and its parent, subsidiary, and other affiliated companies, and their employees, contractors, subcontractors, agents, and representatives from any and all losses, liabilities, claims, damages, demands, and causes of action for injuries or damages to the surface and/or subsurface of the Subject Property and to the appurtenances, improvements, and vegetation on the Subject Property owned or possessed by the Lessor and/or tenants, arising directly or indirectly in connection with the Lessee's oil and gas operations on the Subject Property.

4. **TERM.** This Agreement shall remain in effect until Lessee permanently abandons the Produced Water Disposal Well.

5. **UTILITY EASEMENTS.** The Lessor agrees to execute all easements required by utility companies to affect the laying, maintaining and removing of utility lines, including, but not limited to, electric and telephone lines, for operating equipment necessary in Lessee's disposal operations.

6. **LIMITATION.** It is understood and agreed the disposal of produced water and other deleterious substances will be made into a formation or formations which are not productive of fresh water, and which are approved for disposal purposes by the North Dakota Industrial Commission.

7. **FIXTURES OF LESSEE.** All pumping equipment, tankage and other equipment as may be necessary, useful or convenient in the operation of the Produced Water Disposal Well may be placed or attached on the Leased Premises by the Lessee and shall remain the property of the Lessee. Upon termination of this Agreement, or at any prior time, the Lessee may remove any and all of such equipment.

8. **ASSIGNMENT.** Lessee shall have the right to assign this Agreement without Lessor's consent. In the event of Lessee's assignment of its rights hereunder, Lessee shall have no further obligations under this Agreement. Lessor may assign, sell or transfer its rights in this Agreement and the property subject to the terms and conditions of this Agreement.

9. **NOTICE.** Any notice required to be given hereunder, must be given in writing and may be given personally or by certified or registered mail addressed to the parties as follows:

If to Lessor: Janice V. Joseph  
718 1<sup>st</sup> Avenue East  
Williston, ND 58801-5408

If to Lessee: Continental Resources, Inc.  
P.O. Box 268836  
Oklahoma City, Oklahoma 73126  
Attention: Contract Notices (Legal)

10. **INDEMNIFICATION, DAMAGES AND COVENANTS.** The Lessee shall indemnify, defend and hold Lessor harmless from and against any liability, damages, claims, suits or causes of action, related to Lessee's operation of the Produced Water Disposal Well, except to the extent caused by the negligence or intentional misconduct of Lessor. The Lessee will maintain the Produced Water Disposal Well and all appurtenances thereto in accordance with the rules and regulations of the North Dakota Industrial Commission, and comply with applicable environmental laws, rules or regulations that govern such operations.

11. **TERMINATION.** When this Agreement terminates, Lessee shall remove all debris, machinery and equipment introduced by Lessee, and restore the Leased Premises to as near the condition it was in prior to Lessee's operations, as is reasonably practicable.

12. **GOVERNING LAW.** This Agreement shall be governed by, and construed in accordance with, the laws of the State of North Dakota, without giving effect to conflict of law principles. Any suit or proceeding hereunder shall be brought exclusively in and each party consents to the personal jurisdiction of the courts, state and federal, located therein. Each party agrees to waive any objection the state and federal courts are of an inconvenient forum.

13. **WARRANTIES.** Lessor warrants it owns all of the surface title to the Leased Premises and said property is not the homestead of the property.

14. **SEVERABILITY.** The provisions of this Agreement shall be severable if any of the provisions hereof are held by a court of competent jurisdiction to be invalid, void, or otherwise unenforceable, and the remaining provisions shall remain enforceable to the fullest extent permitted by law.

15. **ENTIRE AGREEMENT.** This Agreement embodies the entire agreement of the Parties related to the subject matter hereof and supersedes all prior agreements, understandings, negotiations and discussions, whether oral or written, of the Parties related to the subject matter hereof.

16. **BINDING EFFECT.** This Agreement shall be binding upon the heirs, executors, administrators, successors and assigns of the parties hereto.

17. **COUNTERPARTS.** This Agreement may be executed in any number of counterparts, each of such counterparts shall for all purposes be deemed an original and all such counterparts shall together constitute but one and the same instrument. Signatures transmitted by facsimile or e-mail shall be acceptable to evidence acceptance of the terms and conditions herein.

See Addendum to Produced Water Disposal Facility Lease Agreement for additional provisions.

IN WITNESS WHEREOF, Lessor and Lessee have executed this Agreement as of the date first referenced above.

I, the undersigned authority, a Notary Public in and for said County in said State, hereby certify that Janice V. Joseph, fka Janice V. Fredrickson, a single person, whose name is signed to the foregoing instrument, and who is known to me, acknowledged before me on this day that, being informed of the contents of the instrument, she executed the same voluntarily.

Given under my hand and official seal, this the 24 day of November, 2020.

Notary Public

STATE OF Oklahoma )  
COUNTY OF Oklahoma ) ss. **CORPORATE ACKNOWLEDGMENT**

The foregoing document was acknowledged before me this 17 day of March, 2021, by Sonia Thomas, as Attorney-in-Fact for Continental Resources, Inc. an Oklahoma corporation, on behalf of the corporation.

Notary Public

**ADDENDUM TO  
PRODUCED WATER DISPOSAL FACILITY LEASE AGREEMENT**

This Addendum to Produced Water Disposal Facility Lease Agreement ("Addendum") is made and entered into this 24 day of November, 2020, between **JANICE V. JOSEPH, fka, Janice V. Fredrickson** (Lessor), whose address is 718 1<sup>st</sup> Avenue East, Williston, North Dakota 58801-5408, and **CONTINENTAL RESOURCES, INC.** (Lessee), whose address is PO Box 268870, Oklahoma City, Oklahoma 73126.

The provisions of this Addendum shall prevail wherever in conflict with the provisions of the Produced Water Disposal Facility Lease Agreement ("Agreement").

1. The consideration paid as stated in the Agreement is for normal damages to the surface and/or subsurface of the Subject Property, including the Leased Premises, associated with construction of the access road, installation of pipelines and electrical lines (including communication lines and/or other utilities), and for the disposal of produced water on the Leased Premises. Lessor acknowledges the receipt and sufficiency of the consideration paid by Lessee as full and complete settlement for, and as a release of, all claims related to normal damages to the surface and/or subsurface of the Subject Property, including those categories of loss, damage, or injury described in Chapter 38-11.1 of the North Dakota Century Code, associated with construction of the access road, installation of pipelines and electrical lines (including communication lines and/or other utilities), and for the disposal of produced water on the Leased Premises.

2. The Agreement allows for the construction of an access road and the Produced Water Disposal Well, which includes those things associated with the well site as stated in the Agreement and the installation of pipelines and electrical lines (including communication lines and/or other utilities). In the event Lessee's activities on the Subject Property result in any further damages to the Subject Property not related to the initial construction of the access road and Leased Premises, such damages shall not be covered by the Agreement and shall require further settlement. The consideration paid herein is only for the Subject Property directly affected by Leased Premises in Exhibit A.

3. Lessee will comply with all applicable Federal, State and local law, rules and regulations, which govern Lessee's oil and gas and salt water disposal operations on the Subject Property.

4. The access road is only for the Leased Premises and the access road shall be only used for purposes of access to the Leased Premises. Lessee agrees to place appropriate signs on the access road designating said road as a "private road" and to reasonably assist Lessor in the control of the use of the access road by any unauthorized personnel. Lessee shall give Lessor the opportunity to keep the access road placed on the Subject Property once Lessee discontinues disposal of produced water on the Leased Premises. Upon Lessee's discontinuance of disposal of produced water on the Leased Premises, unless Lessor elects to keep the road, Lessee shall restore and reclaim the access road to its original contour, replace topsoil, and reseed said access road.

5. Lessee agrees to indemnify and hold Lessor, its successors and assigns, harmless, including reimbursement of reasonable attorney fees and costs, from any claims, by any persons or entities, for damages to persons or property resulting from Lessee's activities or the activities of Lessee's parent, subsidiary and other affiliated companies, their employees, contractors, subcontractors agents and representatives on the Leased Premises except to the extent caused by Lessor's negligence or willful misconduct. This indemnification shall include Lessee indemnifying and holding Lessor harmless for any and all environmental damage caused by Lessee's activities hereunder, including but not limited to liability for water, soil, and air pollution, seepage, fire, spills and use of hazardous or toxic materials. Lessee assumes the liability for costs incurred by third parties required to contain or correct such damages (e.g. fire department), provided Lessee receives documentation supporting the costs incurred by such third parties.

6. Lessee shall make every reasonable effort to save all topsoil for the benefit of the land disturbed and stockpile topsoil on the land disturbed by building the access road and the Produced Water Disposal Well. All rocks 4 inches or larger unearthed by Lessee must be either removed by Lessee at its expense or buried.

7. Lessee shall not use any gravel or scoria belonging to Lessor for access roads or fill without prior express written consent by Lessor.

8. Lessee shall not use any fresh water, including but not limited to, groundwater or water from springs, dams or wells, from any property of Lessor or water from wells drilled on Lessor's property without the consent of Lessor. If operations by Lessee cause damages to any water well of the Lessor or restrict the supply of water to Lessor or its tenants for domestic livestock or any other agricultural purpose, or which would do injury to any potable ground water supply, Lessee shall pay for all damages, including the cost of one or more new water wells if deemed necessary.

9. Lessee shall maintain the access road and Leased Premises to ensure that it is free from noxious weeds. Lessee shall use Roundup or a similar product to control weeds and ensure that Lessor is in agreement with such usage.

10. No agent of the Lessee may be in possession of a firearm while on the Subject Property. No activities, including hunting, shall be allowed on the Subject Property that are not related to operation and maintenance of the Produced Water Disposal Well and access road as stated in the Agreement. Entry by Lessee's personnel is only granted while they are working in their official capacity.

11. Facilities and equipment not necessary for Lessee's operations on the Leased Premises are excessive facilities and such equipment and facilities shall be promptly removed from the location. All facilities (equipment and associated accessories) shall be functional and maintained or shall be promptly removed from the location. All trash on the Subject Property, which results from Lessee's operations will be hauled off site.

12. Lessee agrees to repair all existing fences damaged by its operations. Lessee agrees to fence all areas used for the Leased Premises Fencing (including repair) shall be completed without unreasonable delay taking into consideration the needs of Lessor

13. Lessee shall take all practicable steps to control and eliminate erosion and washouts caused by its operations upon Subject Property. If erosion or washouts occur, Lessee agrees to mitigate the affected area, within thirty (30) days of the occurrence.

14. Lessee shall minimize (and shall fully remediate, if it occurs) the release or discharge of any toxic or hazardous chemicals, water generated, drill grindings or other materials generated in connection with the creation or operation of the Produced Water Disposal Well, including any spills of oil, petroleum, or produced products, or other damage to or on the Leased Premises. In the event of any release or discharge outside the Leased Premises, Lessee shall compensate Lessor the actual damages suffered by Lessor to the Subject Property resulting from any such release or discharge, including, but not limited to, removing the contaminated material, reclaiming the contaminated area in accordance with applicable Federal, State and local statutes, rules and ordinances, and all other injuries to the Subject Property and other destruction to crops or damages to the ability of the Subject Property to produce crops going forward.

15. No pipelines and electrical facilities other than as needed for disposal operations as provided in the Agreement on the Subject Property are allowed.

16. All operations hereunder shall be conducted so as to cause the least inconvenience and interference with Lessor's existing surface use and the most practicable accommodation of Lessor's existing surface use.

17. Lessor reserves all rights to quiet enjoyment of the land and to use said land for any purpose that does not unreasonably interfere with Lessee's use of the land pursuant to this agreement.

18. Lessee further agrees to make a separate payment for crop loss on the Subject Property caused by Lessee during construction or operations. In the event Lessor's tenant suffers any damages to crops on the Subject Property due to Lessee's construction or operations, Lessee shall make a separate payment for such crop loss directly to Lessor's tenant.

19. Lessee shall pay the Lessor's attorney fees and any damages to defend a construction lien that is placed on the Subject Property due to work performed by Lessee, its parent, subsidiary and other affiliated companies, and their employees, contractors, subcontractors agents and representatives.

20. The rights granted in the Agreement shall be for only as long as Lessee uses the Subject Property for the purposes stated herein. Upon abandonment of the Produced Water Disposal Well, the Agreement shall terminate with the exception of Lessee's obligation to restore the Leased Premises to its original condition including re-contouring and re-seeding as well as any obligation to pay additional damages that may result from Lessee's activities. To the maximum extent possible, Lessee will coordinate its restoration efforts with Lessor. At Lessor's option, any access road, fence, gate or cattle guard constructed or installed by Lessee shall be left in place. All restoration and reclamation shall be completed within one (1) year of cessation of operational activities or six (6) months after the Produced Water Disposal Well is plugged and abandoned, weather permitting, whichever occurs later. The foregoing provisions are not intended to relieve Lessee from any more stringent restoration and reclamation requirements pursuant to applicable federal, state or local laws, rules or regulations.

21. Except for the release set forth in Paragraph 1 of this Addendum, nothing in the Agreement releases, acquits, and forever discharges Lessee and its parent, subsidiary and other affiliated companies, and hereby their employees, contractors, subcontractors agents and representatives from any and all losses, liabilities, claims, damages, demands, and causes of action for injuries or damages to the surface and/or subsurface of the Subject Property and to the appurtenances, improvements, and vegetation on the Subject Property owned or possessed by

the Lessor and/or tenants, arising directly or indirectly in connection with the Lessee's Produced Water Disposal Facility on the Leased Premises.

CARBON DIOXIDE SEQUESTRATION AGREEMENT

This Carbon Dioxide Sequestration Agreement (this "Agreement") is made and entered into effective as of \_\_\_\_\_, 20\_\_ (the "Effective Date"), by and between \_\_\_\_\_, whose address is \_\_\_\_\_ (the foregoing, and sometimes collectively, referred to herein as "Landowner"), and DENBURY CARBON SOLUTIONS, LLC, a Delaware Limited Liability Company, whose address is 5851 Legacy Circle, Suite 1200, Plano, Texas 75024 (sometimes referred to herein as "Denbury"). Landowner and Denbury may be referred to in this Agreement, individually, as a "Party" and, together, as the "Parties".

Capitalized terms used but not otherwise defined herein, in Schedule 1 or in Schedule 2 shall have the meaning given to such terms in Schedule 3.

1. Grant. Landowner, in consideration of Ten Dollars, the mutual covenants and agreements contained herein and other good and valuable consideration, the receipt and sufficiency of which are hereby acknowledged, does hereby convey, grant, demise, and deliver exclusively unto Denbury a personal servitude in the nature of a right of use in and to the surface and subsurface of the Land (as defined below) unto Denbury as follows: (a) the right to, subject to the terms and provisions of this Agreement, use the surface and subsurface of the Land, including, without limitation, the Sequestration Formation, for the Purposes, together with (b) the right for ingress and egress to, from and across the Land, to access the Facilities, in each case, as may be reasonably necessary for permitting, installing, operating, maintaining, monitoring, and removing any Facilities and electric and other utility lines for the Purposes. Landowner further grants unto Denbury, insofar as the same are owned or controlled by Landowner, any and all rights reasonably necessary for the Purposes (it being understood that the rights and privileges granted herein are not sole and exclusive to Denbury to the extent unrelated to or not used for the Purposes).

TO HAVE AND TO HOLD the same unto Denbury, its successors and assigns, for the Term, and so long thereafter as Denbury is required by applicable law, regulation or order of a governmental entity to continue monitoring or other activities.

The lands covered by this Agreement include the surface and subsurface interests of Landowner in the following described lands located in Vernon Parish, Louisiana (the "Land") including the Sequestration Formation underlying the Land:

SEE EXHIBIT "A"  
ATTACHED HERETO

This Agreement shall also extend and apply to any interest therein which Landowner may hereinafter acquire, and includes battures, accretions, alluvian, rights of reclamation, roads, highways, rights-of-way and all land, if any, contiguous or adjacent to, or adjoining the Land particularly described herein, including as acquired by acquisitive prescription, whether properly or specifically described or not. Landowner agrees to execute any supplemental instrument requested by Denbury for a more complete or accurate description of said Land.

2. Term. The initial term of this Agreement shall be the Pre-Injection Term. During the Pre-Injection Term, Denbury may terminate the Pre-Injection Term upon thirty (30) days' prior written notice to Landowner (upon which termination this Agreement shall immediately enter the Sequestration Term). This Agreement shall enter the Injection Term on the date that Denbury commences injection (as determined by Denbury in its reasonable discretion) of Carbon Dioxide. Denbury may terminate the Injection Term upon thirty (30) days prior written notice to Landowner and Denbury shall be under no further obligation to make any Annual Injection Payments (upon which termination this Agreement shall immediately enter the Sequestration Term); *provided that*, Denbury shall remain liable to Landowner for any Annual Injection Payments with respect to the period before the effective date of such termination. This Agreement shall enter the Sequestration Term on the date of the termination or expiration of the Pre-Injection Term or the Injection Term, as applicable.

INDUSTRIAL COMMISSION  
STATE OF NORTH DAKOTA  
DATE 6/13/24 CASE NO. 30869-880  
Introduced By Draaten  
Exhibit LO-42  
Identified By Stockwell

3. Denbury's Operations. Denbury will conduct all operations in, on, above, or under the Land for the Purposes as a reasonably prudent operator, in a good and workmanlike manner, and in compliance with all Applicable Laws.

4. Establishment of Sequestration Unit(s). The Parties agree that Denbury may, in its sole discretion, and from time-to-time during the Term, pool or unitize this Agreement and the Land or the Sequestration Formation with others (whether or not such agreements contain similar provisions) or other lands (including where rights are acquired by eminent domain), whether owned by Landowner or by third parties, to form one or more sequestration units and, at the option (and in the sole discretion) of Denbury, to file a designation of any such unit in the official public records of Vernon Parish, Louisiana, or request the Louisiana Office of Conservation or other applicable governmental authority to form one or more sequestration units with other lands. Denbury's determination of the geographic boundaries of a sequestration unit shall be final and conclusive for all purposes under this Agreement, including for purposes of calculating Injection Payments in Schedule 1.

5. Payments To Landowner. In consideration of the rights granted hereunder, Denbury will pay Landowner the amounts set forth in Schedule 1 attached hereto. Schedule 1 will not be recorded without the specific prior written consent of both Landowner and Denbury, which consent may be granted or withheld in each Party's sole discretion.

6. Landowner's Retained Rights. In consideration of the rights granted hereunder, the Landowner retains the rights described in Schedule 2 attached hereto.

7. Liens and Title. Denbury, may, at its option, pay, discharge and/or redeem any mortgage, overdue tax, or other lien or encumbrance on the Land in the event of default in payment by Landowner, and shall be subrogated to the rights of the holder thereof or reimbursed by Landowner for any payments thereafter accruing hereunder. Denbury may acquire for its own benefit, deeds, agreements, or assignments covering any interest or claim in the Land which Denbury or any other party contends is outstanding and not covered hereby and even though such outstanding interest or claim be invalid or adverse to Landowner.

8. Termination. Denbury may fully terminate the Pre-Injection Term or the Injection Term at any time by giving Landowner thirty (30) days' written notice as described in Section 2 above. In addition, Denbury may partially terminate this Agreement at any time and from time to time execute and deliver to Landowner or file for recordation a release or releases of this Agreement as to any part or all of the Land or of any portion of the Sequestration Formation thereunder. In the event Denbury fully or partially terminates this Agreement, Denbury will remain responsible for any accrued obligations relative to such released acreage, the Parties' respective rights and obligations hereunder will remain in full force and effect as to any right, title and interest of Denbury not so terminated, and all Carbon Dioxide injected by or on behalf of Denbury into the Sequestration Formation will remain permanently sequestered in the subsurface of the Land.

9. Force Majeure. Denbury will not be liable for, and this Agreement will not terminate due to, delays in performance or for non-performance due to unforeseen circumstances or causes beyond the reasonable control of Denbury, including, without limitation, strikes, work stoppages, acts of war or terrorism, civil or military disturbances, fire, flood, earthquake, storm, hurricane, natural or nuclear catastrophes, acts of God, loss or malfunction of utilities, material travel restrictions or limitations, governmental actions, orders, or recommendations, health epidemics or pandemics, the lack of availability of any required equipment and/or personnel (such as the specific type of rig or specific type of casing or drill pipe), the orders of any court, regulatory body or Governmental Authority having jurisdiction, the delay in obtaining necessary orders or permits from any court, regulatory body or Governmental Authority having jurisdiction (including a UIC Class VI injection well permit necessary for any Well(s)), or any other cause, similar or dissimilar to the foregoing, which could not have been prevented by Denbury with reasonable care. In such event, this Agreement may be extended thereafter, at Denbury's sole option, as if such delay had not occurred.

10. Indemnity. Denbury will defend, protect and indemnify, hold harmless and release Landowner from and against each and every claim, demand, action, cause of action, or lawsuit, and any liability, cost, expense, damage or loss (including, without limitation, court costs, reasonable experts' fees and reasonable attorneys' fees), whether arising in equity, at common law, or by statute, or under the law of contracts, torts, or property, of every kind or character (including, without limitation, claims for personal injury or death, real and personal property damage, environmental contamination and other environmental liability) (collectively, "Losses") arising from or in any way related to (i) any operations, activities, use or enjoyment by Denbury or for the benefit of Denbury under this Agreement, (ii) any default or breach of this Agreement by Denbury, and (iii) any non-compliance by Denbury with any federal, state or other governmental or regulatory body's or agency's laws, rules and regulations, either now in effect or hereinafter enacted or promulgated, unless such claims or Losses result from (i) the activities or operations of any mineral lessee of Landowner or any owner of a mineral servitude created after the Effective Date, or (ii) the gross negligence or willful misconduct of Landowner. Denbury's indemnity obligations will survive termination of this Agreement.

11. Memorandum For Recording: Covenant Running With The Land. This Agreement shall not be recorded in the public records of any parish or in any public forum. The terms, conditions, rights and easements contained herein shall be real rights and obligations and covenants running with the Land. The Parties have executed a Memorandum of Carbon Dioxide Sequestration Agreement (the "Memorandum") giving public notice of this Agreement, which Memorandum shall be filed by Denbury in the official public records of Vernon Parish, Louisiana. The Memorandum shall be recorded against the Land, and the terms and conditions contained herein shall bind, inure to the benefit of, and be enforceable by, the Parties hereto and their respective successors and assigns. Landowner agrees to execute any amendments, supplements or additional Memorandum as may be necessary to make this Agreement binding upon third parties.

12. Assignments. The rights and interests of either Party hereto may be assigned from time to time in whole or in part and as to any portion of the Land or the Sequestration Formation. All of the covenants, obligations, and considerations of this Agreement will extend to and be binding upon the Parties hereto, their heirs, successors, assigns, and successive assigns; *provided, however*, that no change by Landowner in the ownership of the Land or assignment of payments due hereunder shall be binding upon Denbury until after Denbury has been furnished with (i) written notice thereof and (ii) either (x) the original recorded instrument of conveyance or (y) a duly certified copy thereof, in each case of (x) and (y), together with like proof of any and all intermediate transfers showing a complete chain of title back to Landowner of the full interest claimed. In the event Landowner sells, conveys or otherwise transfers the Land, any undivided interest therein or any portion thereof, Landowner agrees that any such sale, conveyance or transfer shall be made expressly subject to this Agreement and to require the purchaser, grantee or transferee to assume the obligations under this Agreement to the extent of the interest or portion of the Land acquired. No change or division in the ownership of said Land, or any part thereof, howsoever effected, will increase the obligations or diminish the rights of Denbury under this Agreement.

13. Notice and Cure Rights. In the event Landowner considers that Denbury has failed to perform any of the material covenants or obligations imposed on it pursuant to this Agreement, then Landowner may, at its option, cause a written notice to be served on Denbury, setting out specifically in what respects Denbury has failed to perform. Denbury shall have sixty (60) days after its receipt of such notice in which to cure the alleged failure or to commence corrective activities if the same cannot be completed within the sixty-day (60) period, and thereafter diligently pursue such cure to completion.

The service of said notice shall be precedent to the bringing of any action by Landowner for any cause, and no such action shall be brought until the lapse of sixty (60) days after service of such notice on Denbury. If following the lapse of sixty (60) days after service of such notice on Denbury, Denbury has still failed to cure the alleged failure, then Landowner may seek to impose liability or a remedy on Denbury under applicable law whether in equity or otherwise, but this Agreement shall not be subject to cancellation for any such cause. Neither the service of said notice nor the doing of any acts by Denbury aimed to meet all or any of the alleged failures shall be deemed an admission or presumption that Denbury has failed to perform all its obligations hereunder.

14. Further Cooperation. Landowner and Denbury will execute and deliver such further instruments, and will take such other actions as either Party may reasonably request, to accomplish the orderly transfer of the rights to Denbury in the manner contemplated by this Agreement, including, without limitation, approvals, permits and other documentation required by governmental entities which may have jurisdiction under Applicable Law.

15. Governing Law; Jurisdiction and Venue. This Agreement will be governed by and construed and enforced in accordance with the laws of the State of Louisiana, regardless of the conflict of laws, principles or the residence, location, domicile or place of business of any party or its constituent principals. The exclusive venue for any dispute arising out of or in connection with this Agreement including, without limitation, the validity, interpretation, and performance of this Agreement, will be the state and federal courts in Lafayette Parish, Louisiana and if necessary, the corresponding appellate courts.

*[Remainder of page intentionally blank; Signature pages follow]*

IN WITNESS WHEREOF, the Parties have executed this Agreement as of the date set forth in their respective acknowledgment blocks but effective as of the Effective Date.

Exhibit "A" – Land Description

Schedule 1 – Payments to Landowner

Schedule 2 – Landowner's Retained Rights in the Land

Schedule 3 – Definitions

**Exhibit "A"**  
**To that certain Carbon Dioxide Sequestration Agreement**  
**by and between Landowner, \_\_\_\_\_,**  
**and DENBURY CARBON SOLUTIONS, LLC,**  
**dated effective \_\_\_\_\_, 20\_\_**

**LAND**

[Insert description]

**SEQUESTRATION FORMATION**

All formations between the base of the Frio Formation and the base of the Midway Group, defined herein as that stratigraphic interval or its correlative equivalent lying between 4,620 feet and 13,160 feet, as shown on the electric log from the Yuma Exploration & Production Crosby 14 No. 1 Well (API 17115202290000), located in Section 14, T2S-R7W in Vernon Parish, LA.

Schedule 1  
To that certain Carbon Dioxide Sequestration Agreement  
by and between Landowner, \_\_\_\_\_,  
and DENBURY CARBON SOLUTIONS, LLC,  
dated effective \_\_\_\_\_, 20\_\_

**PAYMENTS TO LANDOWNER**

1. **BONUS PAYMENT.** Denbury will pay Landowner the amount of \$ \_\_\_\_\_ as lump sum bonus consideration for this Agreement and all rights, and options hereunder. Accordingly, Landowner accepts the total amount of \$ \_\_\_\_\_ as lump sum bonus consideration for this Agreement and all rights, and options hereunder.

2. **PAID-UP AGREEMENT.** This is a paid-up agreement. In consideration of the bonus payment described in Paragraph 1 of this Schedule 1, Landowner agrees that Denbury will not be obligated, except as otherwise provided herein, to commence or continue any operations or activities related to the Purposes or make any payments to Landowner during the Initial Pre-Injection Term, other than any applicable Property Damage Payments.

3. **OPTION TO EXTEND PRE-INJECTION TERM.** Prior to the expiration of the Initial Pre-Injection Term of this Agreement, Denbury has the option to extend the Pre-Injection Term of this Agreement for the Extended Pre-Injection Term as to all or any part of the Land then covered hereby, by written notification of exercise of the option and by making payment to Landowner or to the credit of Landowner or such successor in interest in any depository bank named herein or in any amendatory instrument in the amount of \$300 for each acre as to which this Agreement is so extended. Subject to any termination or release, the Land shall be deemed to contain \_\_\_\_\_ acres, whether actually containing more or less. If this option is exercised by Denbury, this Agreement shall be extended for the Extended Pre-Injection Term. In consideration of the extension payment described in this Paragraph 3 of this Schedule 1, Landowner agrees that Denbury will not be obligated to make any payments to Landowner during the Extended Pre-Injection Term, other than any applicable Property Damage Payments.

4. **INJECTION TERM PAYMENTS.** On or before January 31<sup>st</sup> of each calendar year during the Injection Term and on January 31<sup>st</sup> of the calendar year following the termination or expiration of the Injection Term, Denbury will pay Landowner an annual payment (each an "Annual Injection Payment" and, collectively, the "Annual Injection Payments") equal to (i) the Injection Fee, *multiplied by* (ii) Landowner's pro rata share of Carbon Dioxide (in metric tons) injected during the immediately preceding calendar year. The Annual Injection Payment will be reduced proportionately as described in Paragraph 9 of this Schedule 1.

5. **SEQUESTRATION TERM PAYMENTS.** Landowner agrees that Denbury will not be obligated to make any payments to Landowner during the Sequestration Term, other than any applicable Property Damage Payments.

6. **PROPERTY DAMAGE PAYMENTS.** During the Term, Denbury will pay Landowner the following amounts (each a "Property Damage Payment" and, collectively, the "Property Damage Payments") as full and complete compensation for property damage resulting from Denbury's operations on the Land:

a. **Right-of-Way for Pipelines:**

One-time payment of \$600 per rod and \$2,500 per acre for lost timber acreage (if applicable).

b. **Surface locations for the Facilities (including, without limitation, Well sites, meter stations and other associated well and/or pipeline equipment):**

One-time payment of \$2,500 per acre.

c. **Well Site Access Roads (new roads constructed by Denbury on the Land):**

One-time payment of \$3.00 per linear foot and \$2,500 per acre for lost timber acreage (if applicable).

7. PAYMENT/DEPOSITORY BANK. Each payment or tender made hereunder will be made to Landowner at Landowner's address or may be deposited to Landowner's credit in the N/A Bank at N/A, or its successors, which will continue as the depositories, regardless of changes in the ownership of the Land.

8. DAMAGE RELEASE. Denbury's delivery to Landowner of any Property Damage Payment under Paragraph 6 of this Schedule 1, will constitute full and complete compensation to Landowner of all use and damage claims related to any such right-of-way, well site, road or Facility for which such payment is delivered. Further, at Denbury's request, Landowner will execute and deliver a damage release, servitude and right of way Agreement in a form satisfactory to Denbury. Such settlement of damages will be binding upon all persons or entities currently having or in the future acquiring any right, title or interest in and to the surface of the Land by or through Landowner. Landowner will hold Denbury harmless from and against any and all claims of its tenant(s) for damages to the surface of the Land.

9. PROPORTIONATE REDUCTION.

a. In the event that Landowner owns less than full ownership in the Land (i.e., surface or fee ownership), the validity of this Agreement shall not be affected; rather, the payments provided herein (except for the bonus payment described in Paragraph 1 of this Schedule 1) shall be reduced or adjusted in proportion to Landowner's undivided interest in the Land.

b. In the event that all or any portion of the Land is pooled and/or unitized to form a sequestration unit, then the Injection Payments described in Paragraph 4 of this Schedule 1 shall (in addition to any proportionate reduction under Paragraph 9.a of this Schedule 1) be paid to Landowner only in the proportion to which the gross acreage covered by the Land bears to the total gross acreage covered by the whole sequestration unit; *provided* that in the event the Louisiana Office of Conservation or other applicable governmental authority forming a sequestration unit, allocates participation on a basis other than solely surface acreage, the proportionate reduction under this paragraph shall be based on the allocation for the Land included in the sequestration unit under the allocation method utilized versus the total unit allocation (i.e., 100%).

c. Denbury shall have the right, but not the obligation, to cause a current survey of the Land to be prepared at its own cost or conduct title research for the Land at its sole cost. In the event that it is determined that there are any inaccuracies in or changes required to the legal description of the Land, upon Denbury's request, Landowner and Denbury will amend the legal description of the Land and the acreage amount under Paragraph 3 of this Schedule 1 to reflect the accurate legal description. Thereafter, the amended legal description shall control as the definition of the Land for all purposes under this Agreement.

10. LANDOWNER SUBSEQUENT TRANSFERS. If the Land shall hereafter be owned in severalty or in separate tracts, the Land may nevertheless be developed and operated as an entirety, and the payments hereunder shall be paid to each separate owner in the proportion that the acreage owned by each such owner bears to all of the Land.

**Schedule 2**  
**To that certain Carbon Dioxide Sequestration Agreement**  
**by and between Landowner, \_\_\_\_\_,**  
**and DENBURY CARBON SOLUTIONS, LLC,**  
**dated effective \_\_\_\_\_, 20\_\_**

**LANDOWNER'S RETAINED RIGHTS IN THE LAND**

1. **Retained Surface and Subsurface Rights.** Subject to any limitations specifically set forth herein, all other rights not expressly granted by this Agreement are hereby reserved to Landowner. Except as otherwise provided in this Agreement and the attached Schedules, Landowner reserves the right to use and occupy the surface and subsurface of the Land for any purpose other than for the rights and privileges granted to Denbury herein; *provided, however*, Landowner's use of the surface and subsurface of the Land shall not interfere with Denbury's operations. Further, Landowner agrees it will not grant rights, engage in or otherwise permit activities, that could result in the breach, penetration or compromise of the Facilities or injected Carbon Dioxide or that would unreasonably interfere with Denbury's rights.

2. **Exploration of Oil and Gas.** Landowner retains the right to develop the oil, gas and other minerals and like hydrocarbons (excluding sequestered Carbon Dioxide) underlying the Land above or below (but not within) the Sequestration Formation, including the right to penetrate and drill through the Sequestration Formation, provided that the foregoing rights are to be exercised (i) in accordance with Applicable Laws, (ii) so as not to unreasonably interfere with, and with due regard for, the operations conducted by Denbury in accordance with this Agreement, and (iii) in compliance with all necessary well design requirements under any applicable permit of Denbury or its affiliates applicable to Denbury's operations under this Agreement, including any Class VI well permit. Further, Landowner and any future owner of a mineral servitude or mineral lease shall reasonably cooperate with Denbury on well design for any such wells proposed to be drilled above or below or through the Sequestration Formation and provide information reasonably requested by Denbury regarding such well design. In the event there is an existing mineral servitude and/or mineral lease on the Land, Denbury and Landowner agree to work cooperatively together to ensure that Landowner or mineral servitude owner can benefit from the exploitation of the minerals under the Land and to ensure that Denbury can undertake operations under this Agreement with reasonable certainty that the exploitation of the minerals will not interfere with Denbury's rights under this Agreement. Any new mineral servitude, lease, renewal and or extension of existing servitudes, leases, options to agree or any other agreement made by Landowner or a future mineral servitude owner with a third party regarding the Land (including any of the foregoing related to water, oil, gas or other minerals) shall contain language that states that such third party shall not disturb or interfere with Denbury's rights hereunder and will agree to comply with the provisions of this paragraph.

3. **Ownership of Facilities, Improvements and Equipment.** Notwithstanding anything to the contrary in this Agreement or this **Schedule 2**, Landowner shall have no ownership interest in Denbury's Facilities, Denbury's Improvements and Equipment installed in, on or under the Land, or any profits, credits (e.g. renewable, environmental or tax) derived therefrom, and Denbury may remove any or all such Facilities, Improvements and Equipment at any time.

**Schedule 3**  
**To that certain Carbon Dioxide Sequestration Agreement**  
**by and between Landowner, \_\_\_\_\_,**  
**and DENBURY CARBON SOLUTIONS, LLC,**  
**dated effective \_\_\_\_\_, 20\_\_**

**DEFINITIONS**

Each of the terms below are defined and incorporated into this Agreement and any attached Schedules:

**"Agreement"** is defined in the preamble of this Agreement.

**"Applicable Law(s)"** means any applicable, valid, final, and non-appealable federal or Louisiana statute, law, rule, regulation, or order, or any judicial decision, as may now be in effect or which may be enacted, adopted, or made effective at a future date.

**"Annual Injection Payment"** and **"Annual Injection Payments"** are defined in Schedule 1.

**"Carbon Dioxide"** means carbon dioxide (regardless of its source) including its derivatives, associated gases, substances and vapors, and all mixtures, combinations and phases, whether liquid or gaseous, stripped, segregated, or divided from any other streams thereof.

**"Denbury"** is defined in the preamble of this Agreement.

**"Effective Date"** is defined in the preamble of this Agreement.

**"Equipment"** is defined within the definition of the term Purposes.

**"Extended Pre-Injection Term"** means the extended initial term of this Agreement which, if exercised by Denbury in accordance with Paragraph 3 of Schedule 1, commences on the fifth anniversary of the Effective Date and continues until the earlier of (i) the seventh anniversary of the Effective Date, or (ii) the date that Denbury commences injection (as determined by Denbury in its reasonable discretion) of Carbon Dioxide.

**"Facilities"** is defined within the definition of the term Purposes.

**"Improvements and Equipment"** means all wells, pads, fixtures, trade fixtures, equipment, machinery, and tools, including all Pipelines, pipe, pipe casing, separators, condensers, evaporators, holding tanks, generators, monitoring, sampling, compression, pumping and testing facilities, devices or equipment, power lines, telephone lines, electrical lines and transmitters, towers, platforms, and any other surface or subsurface structures or downhole equipment, and all alterations, additions, constructions, buildings or other improvements, and all materials, parts and components thereof, made, placed, or installed in, on the surface of or underneath the Land by or on behalf of Denbury.

**"Initial Pre-Injection Term"** means the initial term of this Agreement which commences on the Effective Date and continues until the earlier of (i) the fifth anniversary of the Effective Date, or (ii) the date that Denbury commences injection (as determined by Denbury in its reasonable discretion) of Carbon Dioxide.

**"Injection Fee"** means the sum of \$1.75 per metric ton.

**"Injection Term"** means that period of time from the date Denbury commences injection of Carbon Dioxide and continuing until Denbury terminates the Injection Term by ceasing operations related to the injection of Carbon Dioxide for the Purposes specified herein for a period of two (2) consecutive calendar years.

**"Land"** is defined in Section 1 of this Agreement.

**"Landowner"** is defined in the preamble of this Agreement.

**"Losses"** is defined in Section 10 of this Agreement.

**"Party"** and **"Parties"** are defined in the preamble of this Agreement.

**"Pipelines"** is defined within the definition of the term Purposes.

**"Pre-Injection Term"** means the Initial Pre-Injection Term and the Extended Pre-Injection Term (if exercised by Denbury in accordance with Paragraph 3 of Schedule 1), collectively.

**"Property Damage Payment"** and **"Property Damage Payments"** are defined in Schedule 1.

**"Purposes"** shall mean the purposes of (i) developing, maintaining, and operating a Carbon Dioxide injection, disposal, and sequestration project in the Sequestration Formation, including, without limitation, the drilling of wells located on the Land (or re-establishing, reopening, reconditioning, plugging, or replugging, any existing non-commercial wells located thereon) (collectively, the **"Wells"**) and the construction and/or placement of facilities, roads, fixtures, structures, equipment and appurtenances related to the injection, pumping, sequestration, testing, monitoring, reporting and verifying the sequestration of Carbon Dioxide from any source, (ii) operating the Wells and the Facilities (as defined below), (iii) drilling, completing, and equipping the Wells as disposal wells or monitoring wells for the injection, disposal, and permanent sequestration of Carbon Dioxide in the Sequestration Formation or the monitoring thereof, (iv) transporting, injecting, disposing of, and permanently sequestering into the Wells, Carbon Dioxide that Denbury transports across the Land to the Wells (including, without limitation, from sources other than the Land), (v) laying and maintaining pipelines on or below the surface of the Land (collectively, the **Pipelines**), (vi) constructing, repairing, maintaining, altering, operating, and removing Carbon Dioxide injection stations, monitoring equipment, and other structures and equipment on the Land necessary or convenient in connection with the transportation, drilling, injection, disposal, and permanent sequestration of Carbon Dioxide in the Sequestration Formation (collectively, the **"Equipment"**; the Equipment, the Wells and the Pipelines, collectively, the **"Facilities"**), (vii) conducting geological and geophysical surveys to determine the suitability and performance of the area for the sequestration of Carbon Dioxide and to monitor operations in connection with the sequestration of Carbon Dioxide; (viii) performing tests, studies, and environmental assessments related to permitting, Carbon Dioxide sequestration and Carbon Dioxide sequestration operations; (ix) placing, constructing, using and maintaining roads, power lines, transmission lines, fiber optic, communication and other utility lines, together with all valves, valve boxes, connections, meter stations, appurtenances and/or Equipment to be attached to or installed in connection with or as a part of the Facilities; (x) drilling wells on the Land for the production or injection of water as necessary or useful for Carbon Dioxide sequestration operations; (xi) transporting through the Pipelines, Carbon Dioxide, water, and other fluids as necessary or useful for its operations; (xii) injecting water into, or removing, transporting or disposing of produced water from, the Sequestration Formation as necessary or useful for Carbon Dioxide sequestration operations; (xiii) re-entering and using plugged and abandoned (or simply abandoned) well bores, casing, tubing and other facilities on the Land; and (xiv) at Denbury's sole discretion, plugging abandoned well bores, casing or tubing that has the potential to cause releases from the Sequestration Formation.

**"Sequestration Formation"** means all formations between the base of the Frio Formation and the base of the Midway Group, defined herein as that stratigraphic interval or its correlative equivalent lying between 4,620 feet and 13,160 feet, as shown on the electric log from the Yuma Exploration & Production Crosby 14 No. 1 Well (API 17115202290000), located in Section 14, T2S-R7W in Vernon Parish, LA.

**"Sequestration Term"** means that period of time commencing on the termination or expiration of the Pre-Injection Term or the Injection Term, as applicable, and continuing for so long thereafter as is reasonably necessary for Denbury to monitor the Carbon Dioxide sequestered in the Land to the extent required by this Agreement and Applicable Law(s) and the establishment of monitoring equipment and protocols, and for taking any other action, all in compliance with Applicable Law(s), applicable regulations and industry standards to ensure the continued, safe sequestration of Carbon Dioxide in the Facilities and the Sequestration Formation.

**"Term"** means the Pre-Injection Term, the Injection Term and the Sequestration Term, collectively.

**"Wells"** is defined within the definition of the term Purposes.

STATE OF LOUISIANA  
PARISH OF VERNON

MEMORANDUM OF CARBON DIOXIDE SEQUESTRATION AGREEMENT

THIS MEMORANDUM OF CARBON DIOXIDE SEQUESTRATION AGREEMENT (this "Memorandum") is executed on this \_\_\_\_\_ day of \_\_\_\_\_, 2023, to be effective as of \_\_\_\_\_, 2023 (the "Effective Date"), by and between \_\_\_\_\_, whose address is \_\_\_\_\_ (the foregoing, and sometimes collectively, referred to herein as "Landowner"), and DENBURY CARBON SOLUTIONS, LLC, a Delaware limited liability company (sometimes referred to herein as "Denbury"), whose address is 5851 Legacy Circle, Suite 1200, Plano, Texas 75024. Landowner and Denbury may be referred to in this Memorandum, individually, as a "Party" and, together, as the "Parties".

WHEREAS, the Parties entered into that certain Carbon Dioxide Sequestration Agreement dated effective as of the Effective Date (the "Agreement"); and

WHEREAS, the Parties now desire to record this Memorandum in the Conveyance Records of Vernon Parish, Louisiana, in order to memorialize certain material terms in the Agreement and to put third-parties on notice of the existence of the Agreement and of the material terms of the Agreement memorialized herein.

NOW THEREFORE, in consideration of Ten Dollars, the mutual covenants and agreements contained herein and other good and valuable consideration, the receipt and sufficiency of which are hereby acknowledged, the Parties agree as follows:

1. Capitalized terms used, but not defined, in this Memorandum have the meanings as defined in the Agreement.

2. Subject to the other provisions of the Agreement, Landowner by the Agreement did convey, grant, demise and deliver exclusively unto Denbury a personal servitude in the nature of a right of use in and to the surface and subsurface of the land located in Vernon Parish, Louisiana, more particularly described in Exhibit "A" attached hereto and made a part hereof by reference (the "Land") including the Sequestration Formation (as defined on Exhibit "A") underlying the Land, as follows: (a) the right to, subject to the terms and provisions of the Agreement, use the surface and subsurface of the Land, including, without limitation, the Sequestration Formation, for the Purposes, together with (b) the right for ingress and egress to, from and across the Land, to access the Facilities, in each case, as may be reasonably necessary for permitting, installing, operating, maintaining, monitoring, and removing any Facilities and electric and other utility lines for the Purposes. Landowner further grants unto Denbury, insofar as the same are owned or controlled by Landowner, any and all rights reasonably necessary for the Purposes, (it being understood that the rights and privileges granted in the Agreement are not sole and exclusive to Denbury to the extent unrelated to or not used for the Purposes). The "Purposes" shall mean the purposes of (i) developing, maintaining, and operating a Carbon Dioxide injection, disposal, and sequestration project in the Sequestration Formation, including, without limitation, the drilling of wells located on the Land (or re-establishing, reopening, reconditioning, plugging, or replugging, any existing non-commercial wells located thereon) (collectively, the "Wells") and the construction and/or placement of facilities, roads, fixtures, structures, equipment and appurtenances related to the injection, pumping, sequestration, testing, monitoring, reporting and verifying the sequestration of Carbon Dioxide from any source, (ii) operating the Wells and the Facilities (as defined below), (iii) drilling, completing, and equipping the Wells as disposal wells or monitoring wells for the injection, disposal, and permanent sequestration of Carbon Dioxide in the Sequestration Formation or the monitoring thereof, (iv) transporting, injecting, disposing of, and permanently sequestering into the Wells, Carbon Dioxide that Denbury transports across the Land to the Wells (including, without

limitation, from sources other than the Land), (v) laying and maintaining pipelines on or below the surface of the Land (collectively, the "Pipelines"), (vi) constructing, repairing, maintaining, altering, operating, and removing Carbon Dioxide injection stations, monitoring equipment, and other structures and equipment on the Land necessary or convenient in connection with the transportation, drilling, injection, disposal, and permanent sequestration of Carbon Dioxide in the Sequestration Formation (collectively, the "Equipment"; the Equipment, the Wells and the Pipelines, collectively, the "Facilities"), (vii) conducting geological and geophysical surveys to determine the suitability and performance of the area for the sequestration of Carbon Dioxide and to monitor operations in connection with the sequestration of Carbon Dioxide; (viii) performing tests, studies, and environmental assessments related to permitting, Carbon Dioxide sequestration and Carbon Dioxide sequestration operations; (ix) placing, constructing, using and maintaining roads, power lines, transmission lines, fiber optic, communication and other utility lines, together with all valves, valve boxes, connections, meter stations, appurtenances and/or Equipment to be attached to or installed in connection with or as a part of the Facilities; (x) drilling wells on the Land for the production or injection of water as necessary or useful for Carbon Dioxide sequestration operations; (xi) transporting through the Pipelines, Carbon Dioxide, water, and other fluids as necessary or useful for its operations; (xii) injecting water into, or removing, transporting or disposing of produced water from, the Sequestration Formation as necessary or useful for Carbon Dioxide sequestration operations; (xiii) re-entering and using plugged and abandoned (or simply abandoned) well bores, casing, tubing and other facilities on the Land; and (xiv) at Denbury's sole discretion, plugging abandoned well bores, casing or tubing that has the potential to cause releases from the Sequestration Formation.

3. The initial term of the Agreement shall be the Pre-Injection Term. During the Pre-Injection Term, Denbury may terminate the Pre-Injection Term upon thirty (30) days' prior written notice to Landowner (upon which termination the Agreement shall immediately enter the Sequestration Term). The Agreement shall enter the Injection Term on the date that Denbury commences injection (as determined by Denbury in its reasonable discretion) of Carbon Dioxide. Denbury may terminate the Injection Term upon thirty (30) days prior written notice to Landowner (upon which termination the Agreement shall immediately enter the Sequestration Term). The Agreement shall enter the Sequestration Term on the date of the termination or expiration of the Pre-Injection Term or the Injection Term, as applicable.

4. The "Pre-Injection Term" means the Initial Pre-Injection Term and the Extended Pre-Injection Term, collectively. The "Initial Pre-Injection Term" means the initial term of the Agreement which commences on the Effective Date and continues until the earlier of (i) the fifth anniversary of the Effective Date, or (ii) the date that Denbury commences injection (as determined by Denbury in its reasonable discretion) of Carbon Dioxide. The "Extended Pre-Injection Term" means the extended initial term of the Agreement which, if exercised by Denbury, commences on the fifth anniversary of the Effective Date and continues until the earlier of (i) the seventh anniversary of the Effective Date, or (ii) the date that Denbury commences injection (as determined by Denbury in its reasonable discretion) of Carbon Dioxide.

5. The "Injection Term" means that period of time from the date Denbury commences injection of Carbon Dioxide and continuing until Denbury terminates the Injection Term by ceasing operations related to the injection of Carbon Dioxide for the Purposes specified in the Agreement for a period of two (2) consecutive calendar years.

6. The "Sequestration Term" means that period of time commencing on the termination or expiration of the Pre-Injection Term or the Injection Term, as applicable, and continuing for so long thereafter as is reasonably necessary for Denbury to monitor the Carbon Dioxide sequestered in the Land to the extent required by the Agreement and Applicable Law(s) and the establishment of monitoring equipment and protocols, and for taking any other action, all in compliance with Applicable Law(s), applicable regulations and industry standards to ensure the continued, safe sequestration of Carbon Dioxide in the Facilities and the Sequestration Formation.

7. Denbury may fully terminate the Pre-Injection Term or the Injection Term at any time by giving Landowner thirty (30) days' written notice. In addition, Denbury may partially terminate the Agreement at any time and from time to time execute and deliver to Landowner or

file for recordation a release or releases of the Agreement as to any part or all of the Land or of any portion of the Sequestration Formation thereunder.

8. Under the Agreement, Landowner retains the right to develop the oil, gas and other minerals and like hydrocarbons (excluding sequestered Carbon Dioxide) underlying the Land above or below (but not within) the Sequestration Formation, including the right to penetrate and drill through the Sequestration Formation, provided that the foregoing rights are exercised (i) in accordance with Applicable Laws, (ii) so as not to unreasonably interfere with, and with due regard for, the operations conducted by Denbury in accordance with the Agreement, and (iii) in compliance with all necessary well design requirements under any applicable permit of Denbury or its affiliates applicable to Denbury's operations under the Agreement, including any Class VI well permit. Further, Landowner and any future owner of a mineral servitude or mineral lease shall reasonably cooperate with Denbury on well design for any such wells proposed to be drilled above or below or through the Sequestration Formation and provide information reasonably requested by Denbury regarding such well design. In the event there is an existing mineral servitude and/or mineral lease agreement on the Land, Denbury and Landowner agree to work cooperatively together to ensure that Landowner or mineral servitude owner can benefit from the exploitation of the minerals under the Land and to ensure that Denbury can undertake operations under the Agreement with reasonable certainty that the exploitation of the minerals will not interfere with Denbury's rights under the Agreement. Any new mineral servitude, lease, renewal and or extension of existing servitudes, leases, options to agree or any other agreement made by Landowner or a future mineral servitude owner with a third party regarding the Land (including any of the foregoing related to water, oil, gas or other minerals) shall contain language that states that such third party shall not disturb or interfere with Denbury's rights and will agree to comply with the provisions of this paragraph.

9. The Parties agreed that Denbury may, in its sole discretion, and from time-to-time during the Term, pool or unitize the Agreement and the Land or the Sequestration Formation with others (whether or not such agreements contain similar provisions) or other lands (including where rights are acquired by eminent domain), whether owned by Landowner or by third parties, to form one or more sequestration units and, at the option (and in the sole discretion) of Denbury, to file a designation of any such unit in the official public records of Vernon Parish, Louisiana, or request the Louisiana Office of Conservation or other applicable governmental authority to form one or more sequestration units with other lands. Denbury's determination of the geographic boundaries of a sequestration unit shall be final and conclusive for all purposes under the Agreement, including for purposes of calculating Injection Payments.

10. The Agreement contains no option, right of first refusal, or other agreement of Landowner to transfer all or part of the Land.

11. This Memorandum is not a complete summary of the Agreement. The provisions of this Memorandum are subject in all respects to the provisions of the Agreement. Nothing in this Memorandum in any way amends or modifies any provisions of the Agreement. In the event of any conflict between the Agreement and this Memorandum, the provisions of the Agreement shall control. Landowner agrees to amend and supplement this Memorandum upon request in the future to the extent necessary to ensure that the Agreement is effective as to third parties.

12. This Memorandum may be executed in any number of counterparts, each of which shall be deemed an original. All counterparts, taken together, constitute one single agreement.

### MEMORANDUM OF LEASE

State: Texas  
County: Jefferson  
Lessor: State of Texas  
General Land Office  
1700 North Congress Avenue  
Austin, TX 78701  
Lessee: Bayou Bend CCS LLC  
Effective Date: April 1, 2022

1. This Memorandum of Lease (this "Memorandum") is entered into effective as of April 1, 2022 (the "Effective Date") by and between the State of Texas, acting by and through the Commissioner of the Texas General Land Office ("Lessor") and Bayou Bend CCS LLC ("Lessee"). Lessor and Lessee are hereinafter sometimes referred to singularly as a "Party" and collectively as the "Parties". Capitalized terms used in this Memorandum but not defined herein have the meaning ascribed to such terms in the Lease (defined below).

2. The Parties hereby acknowledge and give notice that Lessor and Lessee have entered into a Carbon Dioxide Transportation and Storage Lease dated April, 1 (the "Lease"), related to carbon dioxide sequestration operations by Lessee in, on, and under certain the Permanent School Fund lands in Jefferson County, Texas, which lands are more fully described in Exhibit A attached hereto (the "Leased Property"). In addition to the lease of the Leased Property to Lessee, Lessor hereby agrees that it will grant to Lessee the necessary easements, ingress and egress rights, rights-of-way, and surface locations over, across, and under certain tracts of land owned by the Permanent School Fund (the "Easement Tracts"), for the construction, installation, maintenance, and operation of pipelines, meters, and related equipment which are necessary for the transportation of CO<sub>2</sub> from its source to the Leased Property and the measurement thereof. The Parties hereby agree to amend Exhibit A to this Memorandum to reflect any Easement Tracts conveyed by Lessor to Lessee. The Leased Property and the Easement Tracts are, collectively referred to herein and therein as, the "Property".

3. The Lease has been duly executed by Lessor and Lessee, but it has not been filed of record in the County Clerk's office of Jefferson County, Texas. Duplicate originals of the Lease are in possession of the Lessor and Lessee.

4. In the Lease, Lessor grants, leases and lets unto Lessee the exclusive right to geologically store anthropogenic carbon dioxide ("CO<sub>2</sub>") in a reservoir(s) and pore space in the

Miocene Formation (as such term is defined under the most expansive definition required to ensure certification or classification of the CO2 sequestration as permanent under any protocols, standards, regulations or laws relevant to Lessee and its storage activities conducted pursuant to the Lease, the "Storage Unit"), together with the exclusive right to drill and to construct, maintain, and operate pipelines, flowlines, wells, fixtures, machinery, and any other equipment Lessee deems necessary for the purposes herein and in connection with such geologic storage (such Storage Unit, together with associated pipelines, wells, fixtures, machinery, and equipment, called the "Facility" herein, and the permitting, construction, and operation of the Facility, sometimes called the "Project" herein). It is the intent of Lessor and Lessee that all equipment, pipe, supports, facilities, meters, systems and ancillary items placed or maintained by Lessee on the Property shall be considered part of the Facility and shall be owned and controlled by Lessee except as provided for in the Lease.

5. The Term (as used herein) of the Lease begins on April 1, 2022, and shall consist, collectively, of each of the Development Term, Construction Term, and Operations Term, as well as the accompanying Development Term Extension Period and Construction Term Extension Period (as those terms are defined in the Lease), as well as the closure and monitoring period following the Operations Term.

6. The Lease contains certain payment terms and obligations, as well as specific termination rights exercisable by one or more of the Parties.

7. Section 1.05(a) of the Lease provides, in part, that during the Term, under no circumstance shall any well bore be drilled through the Storage Unit, nor shall the Storage Unit be exposed to communication with any well bore (each of which, a "Drill-Through Restriction"). PRIOR TO CONDUCTING ANY HYDROCARBON DRILLING OR EXTRACTION ACTIVITIES ON OR NEAR THE PROPERTY, A LESSEE OR OPERATOR OF A STATE LEASE OR OPERATING AGREEMENT MUST FORBEAR FROM ANY ACTIVITIES THAT VIOLATE OR POTENTIALLY VIOLATE THE DRILL-THROUGH RESTRICTIONS.

8. Section 1.05(b) of the Lease provides, in part, that as a condition of any future state lease on any part of the Property or the grant of any lease, easement or access rights to the Property, Lessor shall require the lessee or holder of such lease, easement or access rights to expressly indemnify and defend Lessee for all claims for damages or losses (including losses attributable to Carbon Credits previously realized by Lessee which are recaptured or otherwise disallowed) that Lessee may suffer or incur as a result of such party's activities, including such losses or damages, including legal fees, that result from any Leak Event. Such indemnity shall be (A) set forth in a separate written agreement between Lessee and the lessee or holder of such lease, easement or access right, and (B) be backed by adequate financial security (i.e. posting of bonds, letters-of-credit, or other financial assurance) in favor of Lessee and its designees, in each case of (A) and (B), in a form reasonably acceptable to Lessee. PRIOR TO CONDUCTING ANY HYDROCARBON DRILLING OR EXTRACTION ACTIVITIES ON OR NEAR THE PROPERTY, A LESSEE OR OPERATOR OF A STATE LEASE OR OPERATING AGREEMENT SHALL (1) DELIVER A SEPARATE WRITTEN INDEMNITY AGREEMENT TO LESSEE, AND (2) OBTAIN ADEQUATE FINANCIAL SECURITY IN FAVOR OF

LESSEE AND ITS DESIGNEES, IN EACH CASE OF (1) AND (2), IN SUBSTANCE AND FORM REASONABLY ACCEPTABLE TO LESSEE.

9. The interests of Lessor under the Lease may be freely assigned. The interests of Lessee under the Lease may be assigned on the prior written consent of Lessor (not to be unreasonably withheld, conditioned, delayed, or denied), but not otherwise; provided, however, the interests of Lessee may, upon written notice thereof provided to Lessor, be freely assigned without the prior consent of Lessor to any affiliate (as such term is defined in the Lease) of Lessee that agrees in writing to assume and be bound by the obligations of "Lessee" hereunder (with a copy of such assumption provided to Lessor). Nothing contained in the Lease will be construed as creating a partnership, joint venture, association, trust, mining partnership, or other entity, whether for state law or federal income tax purposes.

10. The Lease contains other terms and provisions not herein set forth but incorporated by reference herein for all purposes. This Memorandum is executed for the purposes of placing all parties dealing with the Property, or with the improvements constructed on said Property, on notice of the existence of the referenced Lease and, where appropriate, its contents. This Memorandum does not modify the Lease. In the event of any conflict between the terms of this Memorandum and the Lease, the Lease shall control.

## CARBON DIOXIDE TRANSPORTATION AND STORAGE LEASE

This Carbon Dioxide Transportation and Storage Lease (this “**Lease**”) is granted by virtue of the authority granted in Chapters 33 and 51 Tex. Nat. Res. Code, 31 TAC Chapter 13 (Land Resources) et seq., Tex. Health and Safety Code Sec. 382.501 et seq., and all other applicable statutes and rules, as the same may be amended from time to time, is subject to all applicable State regulations promulgated from time to time, and is dated to be effective as of April 1, 2022 (the “**Effective Date**”), by and between the State of Texas, acting by and through the Commissioner of the Texas General Land Office, on behalf of the Permanent School Fund of the State of Texas, with its primary address at 1700 North Congress Avenue, Austin, Texas 78701 (“**Lessor**”), and Bayou Bend CCS LLC with its primary address at 333 Clay Street, Suite 3300, Houston, Texas 77002 (“**Lessee**”). Lessor and Lessee are sometimes individually referred to in this Lease as a “**Party**” and collectively as the “**Parties**.”

### RECITALS

A. Pursuant to Texas Natural Resources Code, Ch. 33, the Texas School Land Board (the “**SLB**”) is authorized to lease submerged land for any purpose that is in the best interests of the State, subject to the applicable notice requirements of that chapter.

B. Texas Health & Safety Code, Sections 382.501 et seq. allow the SLB to lease Permanent School Fund (“**PSF**”) land for the construction of any necessary infrastructure for the transportation and offshore deep subsurface geologic storage of anthropogenic carbon dioxide.

C. On April 7, 2021, the SLB issued RFP No. 21-SLB-1-ST (the “**RFP**”) and provided the appropriate public notice of the opportunity to lease PSF land for offshore storage of anthropogenic carbon dioxide in compliance with applicable law and as set out in the RFP.

D. On August 24, 2021, following receipt and review of responses to the RFP, the SLB approved a staff recommendation to proceed with lease negotiations with Lessee consistent with the terms of the RFP and with the SLB’s approval of the recommendation.

E. Lessee responded to the RFP and applied to become the “**Lessee**” hereunder, and the SLB, finding at its meeting held on March 1, 2022, that the award of this Lease to Lessee would be in the best interests of the State, approved this Lease.

### AGREEMENT

Now, therefore, in consideration of the premises, and for other good and valuable consideration, the receipt and sufficiency of which are hereby acknowledged, the Parties agree as follows:

### ARTICLE I. GRANT

**1.01 Lease of Property.** In consideration of the mutual covenants contained herein and other good and valuable consideration, and subject to all of the terms and conditions of this Lease and for the term of this Lease, Lessor hereby grants, leases and lets unto Lessee the Permanent School Fund lands described in Exhibit A attached hereto (the “**Leased Property**”) for the exclusive right to geologically store anthropogenic carbon dioxide (“**CO<sub>2</sub>**”) in a reservoir(s) and pore space in the Miocene Formation (as such term is defined under the most expansive definition required to ensure certification or classification of the CO<sub>2</sub> sequestration as permanent under any protocols, standards, regulations or laws relevant to Lessee

and its storage activities conducted pursuant to this Lease, the “**Storage Unit**”), together with the exclusive right to drill and to construct, maintain, and operate pipelines, flowlines, wells, fixtures, machinery, and any other equipment Lessee deems necessary for the purposes herein and in connection with such geologic storage (such Storage Unit, together with associated pipelines, wells, fixtures, machinery, and equipment, called the “**Facility**” herein, and the permitting, construction, and operation of the Facility, sometimes called the “**Project**” herein). The intent of the Parties is that all equipment, pipe, supports, facilities, meters, systems and ancillary items placed or maintained by Lessee on the “**Property**” (defined below) shall be considered part of the Facility and shall be owned and controlled by Lessee except as provided for in Section 9.03 and Section 4.01 of this Lease. If Lessee proposes to construct or cause the construction of any infrastructure required to provide electricity or other power to an injection well or other component of the Facility (other than by running power lines to the Facility from an existing onshore connection to the power grid), Lessee will notify Lessor prior to such construction and include in such notification the timing, size, location, and pathways of power generation and distribution.

**1.02 Surface Access and Easements.** In addition to the lease of the Leased Property to Lessee, Lessor hereby agrees that it will grant to Lessee the necessary easements, ingress and egress rights, rights-of-way, and surface locations over, across, and under certain tracts of land owned by the Permanent School Fund (the “**Easement Tracts**”), for the construction, installation, maintenance, and operation of pipelines, meters, and related equipment for the transportation of CO<sub>2</sub> from its source to the Leased Property and the measurement thereof. The Parties hereby agree to amend Exhibit A to this Lease and the Memorandum to reflect any Easement Tracts conveyed by Lessor to Lessee. The Leased Property and the Easement Tracts are, collectively, the “**Property**”.

**1.03 Permits.** As more fully set forth in Section 2.02 (Development Term) below, Lessee may seek and obtain such federal, state, or local permits, rights, and approvals as are necessary for the Project and the Facility. Upon expiration or earlier termination of this Lease, to the extent permitted by law, Lessor and Lessee shall cooperate to transfer any such permit rights to Lessor. Lessee’s obligation to transfer permits to Lessor shall survive the termination of this Lease. Lessee’s obligations under this Section 1.03 shall not require Lessee to incur any unreasonable expenses or costs. Subject to the provisions of Sections 2.05 and 4.01(a), from and after the effective date of the transfer of such permits to Lessor, Lessor shall (i) assume responsibility for complying with said permits and all applicable regulatory requirements and (ii) release Lessee from all claims, losses, and other liabilities for actions or non-compliance arising under the permits that (a) are the result of acts or omissions of Lessee that are actually known to and expressly accepted by Lessor, (b) could have been known by Lessor in the exercise of reasonable due diligence, or (c) are the result of acts or omissions occurring after the date of such transfer and that relate to compliance or noncompliance with all federal, state, or local permits, rights and approvals as are necessary for the Project and the Facility.

**1.04 Carbon Credits.** Except as provided in Section 4.01(b) below, Lessor will not claim ownership of any Carbon Credits (defined below) attributable to CO<sub>2</sub> captured and stored in the Storage Unit. Subject to the terms of this Lease regarding control and monetization of stored CO<sub>2</sub> in the Storage Unit, Lessor and Lessee agree to use reasonable efforts to assist each other, at the cost of the requesting party, in efforts to obtain any such Carbon Credits (defined below) that are attributable to the Facility, including Carbon Credits earned or utilized by emitters, direct or indirect members of an emitter, Lessor or Lessee, tax equity investors or others.

**1.05 Reserved Rights.**

(a) Subject to Section 1.05(b), Lessor expressly reserves the following from the rights in the Property and in the Easement Tracts otherwise granted to Lessee in this Lease (the “**Reserved Rights**”):

(i) **Mineral Leases.** The right to retain existing leases or execute and enter into new leases for the exploration, development, production, treatment, marketing, sale and transportation of oil, gas, and other minerals to third persons, and to grant to such mineral lessees the right to use the surface and subsurface of the Property for ancillary purposes in a manner that does not materially or unreasonably interfere with the rights granted to Lessee in this Lease, with Lessee's operations hereunder, or Lessee's ability to obtain Carbon Credits attributable to the Facility. Lessee agrees and acknowledges that this Lease does not prohibit a lessee or operator of a state lease or operating agreement granted for the development and production of minerals, oil, or gas on the Property from conducting hydrocarbon drilling or extraction activities (1) above the ceiling of the Storage Unit, or (2) beneath the base of Storage Unit; provided, however, during the Term, under no circumstance shall any well bore be drilled through the Storage Unit, nor shall the Storage Unit be exposed to communication with any well bore (the "**Drill-Through Restriction**"). During the Operations Term, Lessor may request modifications to the Drill-Through Restrictions by providing no less than ten (10) business days' notice to Lessee. Promptly thereafter, Lessor and Lessee shall (A) meet in good faith to discuss such modifications and their potential impact on (1) the integrity of the Storage Unit, (2) the then-current location of the Plume, (3) the forecasted migration of the Plume in the Storage Unit, and (B) enter into a separate agreement as to the modifications to the Drill-Through Restrictions to the extent any such modifications are mutually agreeable to the Parties. In the event Lessee is unable to obtain, in the ordinary course and without undue delay, hardship, or expense, a Class VI Permit from the applicable governmental agency, and such agency indicates that the terms of this Lease are the reason for such denial, then the Parties shall amend, in good faith, the terms of this Lease objected to by the applicable governmental agency. Lessor (i) will not authorize any lessee or operator of a state oil and gas lease or operating agreement to conduct, and shall contractually prohibit and ensure that any such oil and gas leases or operating agreement prohibits, any activities that might reasonably be anticipated to cause the escape or migration of CO<sub>2</sub> from the Storage Unit (any such occurrence, a "**Leak Event**"), and (ii) acknowledges that such prohibition is necessary given the applicable laws and regulations including the rules and regulations required for a Class VI Permit, as hereafter defined. If following the reasonable operation of the Storage Unit, Lessee discovers that the Plume has extended beyond the boundary of the Leased Property, Lessee shall notify Lessor of such occurrence and Lessor shall thereafter exercise its reserved rights hereunder in a way reasonably intended to avoid the occurrence of a Leak Event with respect to the area located outside of the boundary of the Leased Property. Lessor agrees and acknowledges that Lessee shall have the right to drill through, but not commercially produce any oil, gas, mineral, water, or any other substance from, any geologic formations, reservoirs, saline aquifers and/or pore spaces in the lands comprising the Property down to the base of the Storage Unit, subject to the rules for a Class VI well and other applicable regulatory requirements. Lessor acknowledges the importance of Carbon Credits to this Lease and will undertake reasonable steps to enforce the obligations of its mineral lessees under their respective State leases. Lessee shall immediately notify Lessor in writing if Lessee receives any notice from the IRS that an action or omission could lead, or has led, to Recaptured Amounts. Following all closure and monitoring requirements in accordance with Section 2.05 and Section 4.01(a), Lessor shall have the unrestricted right to drill through the Storage Unit.

(ii) **Other Uses of the Property.** Except with respect to mineral rights which are covered by Section 1.05(a)(i) above, the right to enter into, or to grant easements or other access rights to third parties to enter into, the Property and/or the Easement Tracts for any use, to conduct any activity, or to construct, maintain, and operate any facility or infrastructure, provided that such easements and access rights do not materially or unreasonably interfere with (A) the rights granted to Lessee in this Lease, (B) Lessee's operations hereunder, or (C) subject to Art. III, below, Lessee's ability to obtain Carbon Credits attributable to the Facility.

(b) Lessor shall give advance written notice to Lessee prior to (i) entering into any lease on some or all of the Property for the exploration or production of oil, gas, and other minerals or (ii) granting easements or other access rights to third parties to enter into the Leased Property and/or the Easement Tracts for any use, to conduct any activity, or to construct, maintain, and operate any facility or infrastructure. Lessor shall not enter into any such lease or grant any such easement or access rights to third parties for any activity that might reasonably be anticipated to cause a Leak Event or would materially or unreasonably interfere with the rights granted to Lessee in this Lease, with Lessee's operations hereunder, or Lessee's ability to obtain Carbon Credits attributable to the Facility. Notwithstanding the foregoing, and for the avoidance of doubt and to provide additional clarity, the Parties agree that (1) hydrocarbon drilling or extraction by any lessee or operator of a state oil and gas lease or operating agreement granted for the development and production of minerals that exposes the Storage Unit to communication with the well bore, or which might reasonably be anticipated to cause a Leak Event is expressly prohibited, and (2) as a condition of any future state lease on any part of the Property or the grant of any lease, easement or access rights to the Property, Lessor shall require the lessee or holder of such lease, easement or access rights to expressly indemnify and defend Lessee for all claims for damages or losses (including losses attributable to Carbon Credits previously realized by Lessee which are recaptured or otherwise disallowed) that Lessee may suffer or incur as a result of such party's activities, including such losses or damages, including legal fees, that result from any Leak Event. Such indemnity shall be (A) set forth in a separate written agreement between Lessee and the lessee or holder of such lease, easement or access right, and (B) be backed by adequate financial security (i.e. posting of bonds, letters of credit, or other financial assurance) in favor of Lessee and its designees, in each case of (A) and (B), in a form reasonably acceptable to Lessee.

## ARTICLE II. TERM

**2.01 Term.** Subject to all of the terms and conditions of this Lease, the "Term" (herein so called) of this Lease shall consist, collectively, of each of the Development Term, Construction Term, and Operations Term (as those terms are defined below), as well as the closure and monitoring period following the Operations Term, as and to the extent that each such portion of the Term is in effect pursuant to the terms of this Lease.

### **2.02 Development Term.**

(a) **Due Diligence.** Subject to earlier expiration because of the commencement of the Construction Term, the first three (3) years following the Effective Date of this Lease shall be the "**Development Term**", as extended by the Development Term Extension Period pursuant to Section 2.02(f). During the Development Term, and at no cost or expense to Lessor, Lessee may conduct its due diligence and take any action that Lessee believes is reasonably necessary to determine whether the Property is suitable for the Project, including, without limitation, conducting engineering studies, economic studies, seismic or geological studies, applying for permits, marketing, and drilling test wells; provided, however, that, during the Development Term, (x) Lessee shall consult with Lessor regarding the location and spacing of test wells prior to drilling, and (y) except to the extent in connection with the drilling of a test well, Lessee may not make any material physical changes to the Property that would materially or unreasonably (i) interfere with Lessor's Reserved Rights, or (ii) damage the storage capacity of the Property, in each case, without the prior written approval of Lessor, which approval may be given or not in Lessor's sole discretion; and provided further that Lessee may not, without the prior written approval of Lessor, apply for a permit the issuance of which would preclude use of the Property by Lessor or its lessees for any purpose that is reserved to Lessor pursuant to Section 1.04 of this Lease.

(b) **Permits.** Lessee shall be responsible for applying for, obtaining, and thereafter maintaining, any and all necessary permits for construction and operation of the Facility, including, without limitation and to the extent required by applicable law or regulation, a Class VI UIC well permit as defined in 75 Federal Register 77229 ("**Class VI Permit**"); provided, however, Lessor shall use reasonable efforts (but without the obligation to incur any out-of-pocket costs, expenses, or the obligation to undertake any liability or other obligations to or by Lessor) to assist Lessee to the extent necessary to obtain any and all necessary permits for the Project and the construction and operation of the Facility, including a Class VI Permit or other applicable underground injection control (UIC) permit. Likewise, until such time that ownership of the CO2 is transferred to Lessor pursuant to Section 4.01(a), Lessee shall be responsible for ongoing compliance with all federal, State, and local laws, ordinances, and regulations that are or become applicable to the Project and/or the Facility. Lessee must be able to demonstrate to Lessor, to Lessor's reasonable satisfaction, that all such permits have been obtained or have been applied for and are being diligently pursued for approval, and that Lessee is in material compliance with all such applicable laws, ordinances, and regulations at the time that Lessee proposes to begin the Construction Term under this Lease. With regard to its obligations under this paragraph, "Lessee" includes the named Lessee as well as its agents and contractors.

(c) **Termination by Lessee.** Lessee may terminate this Lease at any time during the Development Term upon thirty (30) days' prior written notice thereof delivered to Lessor. Lessor acknowledges and agrees that Lessee has provided to Lessor sufficient and independent consideration for such option to terminate. Upon such termination by Lessee, this Lease and the obligations of the Parties under it, shall terminate, except for any obligation of Lessor or Lessee that expressly survives termination hereof pursuant to the other terms and conditions of this Lease, including, without limitation, any such surviving obligations pertaining to indemnification of Lessor, removal of equipment, and remediation, and any accrued obligation to make payments provided hereunder shall survive the termination of this Lease. Following such termination, Lessee shall retain all necessary and incidental rights to access the Property and the Facility to undertake all obligations required under this Lease or applicable law.

(d) **No Warranties.** Lessor expressly makes no representations or warranties whatsoever that Lessee or Lessee's proposed providers of CO2 for storage will be able to satisfy any requirements of Sec. 45Q of the Internal Revenue Code. Regardless of the availability of any such tax credit, Lessee's payment obligations under Section 3.01 of this Lease shall continue hereunder until such time as such payment obligations are no longer due and payable hereunder pursuant to the other terms and conditions of this Lease.

(e) **Progress Report.** Beginning with the first such report due on the six-month anniversary of the Effective Date, and every six months thereafter during the Development Term, Lessee shall prepare and submit to Lessor a "**Development Term Progress Report**". Each Development Term Progress Report shall provide Lessee with a general update of how development activities are progressing, including with regard to permitting activities, possible sources of CO2 for storage, and the results of studies regarding engineering for and upcoming construction of the Facility; provided, however, Lessor shall maintain the Development Term Progress Reports strictly confidential, and shall not disclose all or any portion of the Development Term Progress Reports to any third party without the prior written consent of Lessee, which consent may be withheld in Lessee's sole discretion (provided that all of Lessor's foregoing obligations are subject to the Texas Open Records Act and to any relevant order of a court of competent jurisdiction). Notwithstanding the foregoing provision regarding the qualified confidentiality of the Development Term Progress Reports, Lessor may analyze those reports, draw conclusions from them, and develop General Land Office best practices standards and requirements that may be

shared by Lessor with the general public, including future CO2 storage space lessees, even if those General Land Office-developed "best practices" standards and requirements are, ultimately, identical or substantially similar to Lessee's reported development activities. Subject to the notice and cure provisions of this Lease, Lessee's failure to provide Lessor with a Development Term Progress Report shall be a Default under this Lease.

**(f) Deadline to Apply for and Obtain Class VI Permit; Extension of Development Term.** Notwithstanding any other provision of this Lease to the contrary, if Lessee has not applied for a Class VI Permit or other applicable UIC permit within thirty-six (36) months after the Effective Date, then Lessor may terminate this Lease upon thirty (30) days written notice thereof delivered to Lessee; provided, however, that if Lessee has not obtained the necessary UIC permit for the Facility by the expiration of the Development Term but, at that time, is diligently pursuing such permit and is otherwise not in Default of this Lease, then upon delivery of (A) written notice, and (B) extension consideration of four hundred and fifty thousand dollars (\$450,000) to Lessor on or before the date that is thirty (30) days prior to such Development Term expiration, Lessee may elect to extend the Development Term for a period of twelve (12) months (a "**Development Term Extension Period**"); provided, however, and subject to the foregoing notice requirements, the Development Term may only be extended once pursuant to this Section 2.02(f).

### **2.03 Construction Term.**

**(a) Duration.** Subject to the other provisions of this Lease, the "**Construction Term**" shall (a) begin on the earlier of (i) the expiration of the Development Term (if Lessor or Lessee have not earlier terminated this Lease as provided above), or (ii) the date on which Lessee gives written notice to Lessor of Lessee's intent to proceed with construction of the Facility (regardless if Lessee has actually obtained the Class VI Permit at such time), and shall (b) end on the earlier of (1) the date that the Facility is complete and fully permitted such that Lessee may begin receiving and storing CO2 in the Storage Unit pursuant to its permits and this Lease (the "**Complete Date**"), or (2) the expiration of three (3) years after the commencement of the Construction Term (the "**Long Stop Date**"), as such Long Stop Date may be extended pursuant to Section 2.03(b). Notwithstanding any other provision of this Lease to the contrary, if Lessee has not obtained a Class VI Permit by the sixth anniversary of the Effective Date, then Lessor may terminate this Lease upon thirty (30) days written notice thereof delivered to Lessee; provided, however, that, Lessor agrees that it will weigh, among other factors, (i) Lessee's diligence in pursuing approval of a Class VI Permit or other applicable UIC permit, (ii) any delays in the approval process that were not reasonably foreseeable, and (iii) the exigencies of permitting an offshore sequestration site which is novel in the continental United States (the "**Offshore Exigencies**"), in making its decision whether or not to elect to terminate this Lease.

**(b) Termination by Lessor.** If the Complete Date has not occurred on or before the Long Stop Date, then Lessor may terminate this Lease upon thirty (30) days written notice thereof delivered to Lessee; provided, however, that if at the time of such Long Stop Date (or Construction Term Extension Period, as applicable) Lessee is diligently pursuing completion of the Facility and is otherwise not in Default of this Lease, then upon delivery of (A) written notice, and (B) extension consideration of four hundred and fifty thousand dollars (\$450,000) per extension period to Lessor on or before the date that is thirty (30) days prior to such Construction Term (or Construction Term Extension Period, as applicable) expiration, Lessee may elect to extend the Construction Term (or Construction Term Extension Period, as applicable) for a period of twelve (12) months (each a "**Construction Term Extension Period**"); provided, further, however, and subject to the foregoing notice requirements, the Construction Term may only be extended pursuant to this Section 2.03(b),

in the aggregate, for an additional twenty-four (24) months, (or two (2) Construction Term Extension Periods). If Lessee has not achieved the Complete Date prior to the expiration of the Construction Term Extension Period(s), then Lessor may elect to terminate this Lease upon thirty (30) days written notice thereof delivered to Lessee. Prior to electing to terminate this Lease in accordance with the prior sentence, Lessor agrees that it will (i) weigh, among other factors, Lessee's diligence in pursuing completion of the Facility and the Offshore Exigencies in making its decision whether or not to elect to terminate this Lease, and (ii) consider, in good faith, whether granting Lessee an additional Construction Term Extension Period in exchange for reasonable additional extension consideration is warranted. Following such termination, Lessee shall retain all necessary and incidental rights to access the Property and the Facility to undertake all obligations required under this Lease or applicable law.

(c) **Lessee Solely Responsible.** Lessee shall be solely responsible for designing, manufacturing, procuring, permitting, fabricating, constructing, erecting, installing, operating, maintaining and paying for the Facility.

(d) **Diligent Pursuit.** During the Construction Term, at no cost or expense to Lessor, Lessee shall construct and complete the Facility. If the Complete Date has not occurred on or before the Long Stop Date, as extended pursuant to Section 2.03(b), and if Lessor has not exercised its right to terminate this Lease pursuant to Section 2.03(b), Lessee shall, nevertheless, continue diligently working during the Operations Term (defined below) to construct the Facility, achieve the Complete Date, and begin operating the Project.

(e) **Construction Plans.** Lessee acknowledges that, as the owner of the Property, Lessor has a reasonable and legitimate interest in remaining informed about the location, design, construction, and operation of the Facility. Lessee shall (i) maintain and retain, and provide Lessor with reasonable access to, an online repository for the documents prepared and submitted for the approval and maintenance of the Class VI Permit or other applicable UIC permit for the Facility, as well as all plans and documents prepared for obtaining an approved Monitoring, Reporting, and Verification Plan ("MRV") from the relevant governmental authority, (ii) provide Lessor with copies of all relevant permits, plans, schematics, as-builts, and all other materials reasonably requested by Lessor that pertain to the design, construction, location, and operation of the Facility (collectively, the "Plans"); provided, however, Lessor shall maintain the Plans strictly confidential, and shall not disclose all or any portion of the Plans to any third party without the prior written consent of Lessee, which consent may be withheld in Lessee's sole discretion (provided that all of Lessor's foregoing obligations, including obtaining Lessee's prior written consent for disclosure, are subject to (A) the provisions of Section 10.16, and (B) the Texas Open Records Act and to any relevant order of a court of competent jurisdiction). Notwithstanding the foregoing, however, Lessee shall be solely responsible and liable for the permitting, design, and construction of the Facility, and the receipt by Lessor of the Plans and any commentary by Lessor to Lessee regarding the Plans shall not be construed in any way as the undertaking by Lessor of any professional or legal responsibility whatsoever for either the completeness or adequacy of the Plans or the Facility as it is actually constructed and operated by or on behalf of Lessee. Lessee shall be solely responsible for all performing and/or obtaining all testing, inspections, and approvals necessary for Lessee to achieve the Complete Date and to begin operating the Facility as intended by this Lease.

(f) **Minimum Construction Requirements.** All work done by or on behalf of Lessee with regard to the Project shall be (i) pursued diligently and timely, and performed in a good and workmanlike manner, and (ii) undertaken in material compliance with (A) at a minimum, the requirements of 40 CFR Sec. 146.86—93, if applicable, regarding construction, testing, operating, monitoring, reporting and closure (which shall also apply, as appropriate, to the Operations Term),

and (B) all other applicable laws and regulations, and as a reasonably prudent operator, including as set out in the approved UIC permit and MRV.

#### **2.04 Operations Term**

(a) **Duration.** The “Operations Term” shall begin immediately upon the expiration of the Construction Term (the “Operations Commencement Date”), and shall end upon the earlier of (i) the date that is thirty (30) years after the Operations Commencement Date, (ii) the Maximum Capacity Date, or (iii) as otherwise terminated pursuant to the terms hereof.

(b) **Lessee’s General Obligations.** During the Operations Term, Lessee shall (i) maintain all permits necessary under applicable law for the initial and continued operation of the Facility, including, without limitation, a Class VI Permit or other applicable UIC permit, (ii) obtain, operate, maintain, repair, and replace all pipelines, meters, equipment, and machinery as necessary for the safe and effective operation of the Facility, (iii) satisfy all requirements on Lessee under this Lease, including, without limitation, with regard to metering and reporting, (iv) pay all amounts owing to Lessor pursuant to the terms of this Lease, and (v) when it becomes appropriate, and with sufficient time prior to the expiration or earlier termination of this Lease, prepare for and, as applicable, perform all actions and install all equipment reasonably necessary for the post-injection period, including for closure of the Facility and post-closure monitoring, in each case, as required by applicable laws and regulations.

(c) **Limit of Facility.** At such time as the Storage Unit has reached the limit of its capacity to store injected CO<sub>2</sub> (the “Maximum Capacity Date”), Lessee shall cease transporting CO<sub>2</sub> to the Facility for injection, and shall otherwise cease injecting CO<sub>2</sub> into the Storage Unit. With the cessation of injection of CO<sub>2</sub> into the Storage Unit as the result of reaching the maximum technically accessible storage volume, the Operations Term shall terminate.

(d) **Removal of Property.** Subject to Lessor’s remedies in the event of a Default hereunder by Lessee, Lessee shall have the right, at any time during the term of this Lease, to remove any personal property, improvements, equipment and fixtures placed by Lessee on the Property, provided, however, that no such removal may materially adversely affect the operation or safety of the Project.

(e) **Low Injection Period.** During the Operations Terms, if Lessee fails to inject at least the Standard Annual Volume into the Storage Unit for three (3) consecutive Lease Years (such time period to be extended, day-for-day, during the pendency of any Force Majeure event affecting Lessee) then either Party shall have the right to terminate the Operations Term by delivering written notice to the other Party no less than sixty (60) days following the commencement of the immediately subsequent Lease Year.

**2.05 Closure and Monitoring.** Following the expiration or earlier termination of the Operations Term, the Term of this Lease shall remain in effect, and Lessee shall remain responsible for closure of the Facility and the establishment of monitoring equipment and protocols, and for taking any other action, all in compliance with applicable regulations and generally accepted industry standards to ensure the continued, safe storage of CO<sub>2</sub> in the Storage Unit as required by the terms of this Lease. To the extent that Lessee’s compliance with its closure and monitoring obligations hereunder (including under applicable State and federal statutes and rules) requires the posting of bonds, letters of credit, or other financial assurance, Lessee shall remain responsible for satisfying such fiscal assurance requirements. Lessee’s monitoring and financial assurance obligations under this Section 2.05 expressly survive the expiration or earlier termination of this Lease, provided however, notwithstanding the foregoing, such

obligations shall terminate in accordance with applicable laws and regulations related to monitoring and financial assurances requirements; provided, further, that such obligations shall terminate at such time that the ownership of the CO<sub>2</sub> is transferred to Lessor pursuant to Section 4.01(a). Following the end of the Term, Lessee shall retain all necessary and incidental rights to access the Property and the Facility to undertake all obligations required under this Lease or applicable law.

**2.06 Authority of Lessor and No Warranty.** Pursuant to Texas Natural Resources Code, Ch. 33, the SLB has the authority to lease the Property for the purposes set forth in this Lease and Lessor, which provides the staff for the SLB, confirms that, other than as set forth on Schedule 2.06 to this Lease, the SLB has not granted any conflicting rights on the Property to any other party. Subject to the foregoing, Lessee expressly accepts and assumes all risk and liability for penalty, civil or criminal fines or charges, or any other consequence, whether in connection with environmental damage, misreporting to governmental entities, or any other context, arising in connection with operation of the Project, including its ultimate closure. The obligations of Lessee under this section expressly survive expiration or earlier termination of this Lease.

### ARTICLE III. Bonus Payments and Royalty

**3.01 Bonus Payments and Royalty.** During the Term of this Lease, Lessee shall pay consideration to Lessor as follows:

(a) **Initial Bonus Payment.** Within five (5) business days of the execution of this Lease, Lessee shall deliver, or cause to be delivered, to Lessor a wire transfer in the amount equal to \$4,500,000.00 (the "Initial Bonus Payment").

(b) **Second Bonus Payment.** Within five (5) business days of the First Hurdle Date (defined below), Lessee shall deliver, or cause to be delivered, to Lessor a wire transfer in the amount equal to \$4,500,000.00 (the "Second Bonus Payment").

(c) **Third Bonus Payment.** Within five (5) business days of the Second Hurdle Date (defined below), Lessee shall deliver, or cause to be delivered, to Lessor a wire transfer in the amount equal to \$4,500,000.00 (the "Third Bonus Payment" and together with the Initial Bonus Payment and the Second Bonus Payment, the "Bonus Payments").

(d) **Royalty.** Lessee shall deliver, or cause to be delivered to Lessor, in each case as provided for in Section 3.03, (i) with respect to the Initial Injection Period, a monthly royalty equal to the product of the amount of Facility Proceeds for such month times three percent (3%), and (ii) with respect to the Subsequent Injection Period, a monthly royalty equal to the product of the amount of Facility Proceeds for such month times six percent (6%) (as applicable, the "Royalty" or "Royalties") (as Facility Proceeds, Initial Injection Period, and Subsequent Injection Period are defined below).

(e) **True-Up Payment.** Following the Second Hurdle Date, within thirty (30) business days following the end of each Lease Year, Lessee shall deliver, or cause to be delivered to Lessor, an annual payment (if any) equal to the following (as applicable, the "True-Up Payment"):

(i) with respect to each Lease Year during the Initial Injection Period, if the Standard Annual Volume exceeds the Annual Injected Volume for such Lease Year, the product of (A) the excess of the Standard Annual Volume over the Annual Injected Volume for such Lease Year, multiplied by (B) the Average Tonnage Price, multiplied by (C) three percent (3%), and

(ii) with respect to each Lease Year during the Subsequent Injection Period, if the Standard Annual Volume exceeds the Annual Injected Volume for such Lease Year, the product of (A) the excess of the Standard Annual Volume over the Annual Injected Volume for such Lease Year, multiplied by (B) the Average Tonnage Price, multiplied by (C) six percent (6%).

(iii) Notwithstanding the above, the calculation of the True-Up Payment shall be adjusted proportionally, day for day, based upon the number of days in the period ending prior to, on or after the occurrence of any of the following in a particular Lease Year: (i) the Second Hurdle Date, (ii) commencement of the Subsequent Injection Period, and/or (iii) the expiration of the Operations Term.

### 3.02 Definitions.

(a) Annual Injected Volumes. "Annual Injected Volumes" means the actual volume of CO<sub>2</sub> injected into the Storage Unit during a given Lease Year.

(b) Applicable Procedure. "Applicable Procedure(s)" means the valid, final, and non-appealable standards, public processes, procedures, and rules applicable to the regulation of the Facility or the Project, to the extent applicable, by the U.S. Environmental Protection Agency ("EPA"), the Railroad Commission of Texas ("RRC"), the Texas Commission on Environmental Quality ("TCEQ"), and the Internal Revenue Service ("IRS") as well as any other state or federal regulatory bodies having jurisdiction over all or a part of the Facility or the Project.

(c) Average Tonnage Price. "Average Tonnage Price" means the average Facility Proceeds paid or delivered to Lessee, on a per metric ton of injected CO<sub>2</sub> basis, over the relevant Lease Year. (Unless expressly provided otherwise, references in this Lease to a "ton", a "tonne", or a "metric ton/tonne" are deemed to mean a metric unit of mass equivalent to 1,000 kg.)

(d) Carbon Credit. "Carbon Credit" means any rights, credits, revenues, offsets, (including, without limitation Section 45Q Credits or other federal, state or local tax credits), greenhouse gas rights or similar rights related to the production, capture or sequestration of CO<sub>2</sub> or the ownership or operation of the Facility or the Project, including such rights to sell or trade any of the aforementioned domestically or internationally, and including the right to count or claim any applicable reductions pursuant to the Department of Energy's Climate Challenge Program, to register all such reductions pursuant to §1605 of the Energy Policy Act of 1992, and any other program of a governmental authority designed to encourage or reward the reduction of greenhouse gas emissions, provided, however, that "Carbon Credit" shall not include any "Subsequent Carbon Offsets" as defined below.

(e) Facility Proceeds. "Facility Proceeds" means the aggregate gross cash, cash equivalent, or other consideration paid or delivered to Lessee, without duplication, under all Injection Contracts, including, without limitation, any portion of a Carbon Credit that is assigned or the value of which is otherwise conveyed to Lessee by a third party or an affiliate of Lessee in return for Lessee's services under an Injection Contract; provided, however, for the avoidance of doubt, "Facility Proceeds" shall not include proceeds received by Lessee in connection with authorized transfers of this Lease or the Facility. Lessee will make commercially reasonable efforts to enforce its Injection Contracts, including with regard to Lessee receiving all of the consideration due to it under an Injection Contract.

(1) Cash Section 45Q Credits. If Section 45Q Credits are paid by the U.S Treasury in cash under then-applicable law, then such cash Section 45Q Credit payments shall be treated like

any other cash consideration, and shall be included in Facility Proceeds for Royalty calculation purposes by no later than the 12th month after such cash Section 45Q Credit is generated.

(2) Non-Cash Section 45Q Credits. With respect to any portion of the Facilities Proceeds in the form of non-cash Section 45Q Credits transferred to Lessee, (i) the value of such Section 45Q Credits shall be the federal cash tax savings recognized by the Lessee or its direct or indirect equity owners as a result of the utilization of the Section 45Q Credits, provided that if a cash contribution is received by Lessee in exchange for the future allocation of such Section 45Q Credits (e.g., a tax equity investment), the value of such Section 45Q Credits shall be the amount of cash received in exchange for such Section 45Q Credits, and (ii) the timing of the recognition of the value of the Section 45Q Credits shall be when such non-cash Section 45Q Credits have been utilized to offset cash tax liability or generated a contribution of cash to the Lessee in exchange for allocations of such Section 45Q Credits. If Lessor and Lessee fail to agree on the value of, or the timing of the recognition of, the reasonable non-cash Section 45Q Credits as defined in this Section 3.02(e) within 60 days after the last month of the Lease Year in which such Section 45Q Credits were transferred to the Lessee, the Parties shall refer such dispute to a mutually acceptable independent accounting firm (the “**Accounting Expert**”), and the Parties shall direct the Accounting Expert to make the determination of the value or timing of the non-cash Section 45Q Credits in dispute, and only such matter in dispute between the Parties, on a timely basis (and in any event within 60 days after its engagement) and to promptly notify the Parties in writing of its determination. The Parties shall provide the Accounting Expert all information reasonably necessary and available for the Accounting Expert to determine the value or timing of such non-cash Section 45Q Credits.

(3) Other Non-Cash Consideration. If any portion of the value to be paid to Lessee under an Injection Contract is in the form of an in-kind delivery (other than Section 45Q Credits), a non-arm’s length cash payment from an affiliate of Lessee, or any other non-cash or cash equivalent consideration, then Lessor and Lessee will determine a cash value for such consideration based on the fair market value, arm’s-length cash consideration to be paid to Lessee under its Injection Contract(s) during the applicable month (the “**Determined Cash Value**”). If Lessor and Lessee fail to agree on the Determined Cash Value within a reasonable amount of time after the last month of the Lease Year in which such amounts were includable in Facility Proceeds, the Parties shall refer such dispute to a mutually acceptable independent valuation expert (the “**Independent Expert**”), and the Parties shall direct the Independent Expert to make a determination as to the appropriate Determined Cash Value (and only such matter) on a timely basis (and in any event within 60 days after its engagement) and to promptly notify the Parties in writing of its determination. Thereafter, the Determined Cash Value shall be included in Facility Proceeds, as it is the intent of the Parties that the Royalty hereunder be applied in a timely manner against the full value received by Lessee for its service of transporting CO<sub>2</sub> to, and sequestering CO<sub>2</sub> in, the Storage Unit.

(4) Effect of Recaptured Amounts. Facility Proceeds for any month shall be reduced by any Recaptured Amounts for such month. If Facility Proceeds for any month is a negative dollar amount due to the reduction for any Recaptured Amounts in any month or otherwise, such negative dollar amount shall be carried forward and reduce the amount of Facility Proceeds in each subsequent month until such negative dollar amount is fully offset against future Facility Proceeds.

(f) First Hurdle Date. The “**First Hurdle Date**” means the date on which the aggregate volumes of CO<sub>2</sub> contractually committed to the Facility, pursuant to an Injection Contract, or Injection Contracts, whether or not such volumes have actually been injected into the Storage Unit, exceeds 4 million metric tons per annum. Lessee shall notify Lessor as and when volumes have

been committed, although only the volumes, and not the identity of the emitter(s), need to be disclosed in such notices.

(g) **Initial Injection Period.** The "Initial Injection Period" means the period beginning immediately upon the Second Hurdle Date, and ending upon the date Lessee has injected an aggregate amount of 50 million metric tons of CO<sub>2</sub> in the Storage Unit.

(h) **Injection Contract.** An "Injection Contract" means a contract or agreement between Lessee and any third party for (i) the receipt, transportation, and/or injection of CO<sub>2</sub> by Lessee into any portion of the Storage Unit, or (ii) the re-delivery of CO<sub>2</sub> to Lessee. An Injection Contract may include a contract between Lessee and an affiliate of Lessee for the described service(s) so long as the proceeds payable to Lessee by an affiliate under such contract equal at least the proceeds payable to the affiliate by a third party under an arm's-length contract.

(i) **Lease Year.** A "Lease Year" means each successive twelve (12) month period commencing on the Effective Date.

(j) **Miocene Formation.** The "Miocene Formation" means all depths from the base of the Amphistegina B Shale, as found at 5,873 feet measured depth to the base of the Siphonina Davisi Sand as found at 8,765 feet measured depth, in each case, in the HI 4L Transco (Forest) #1 well (API No. 427083032500) located in Jefferson County, Texas State Waters (or the stratigraphic equivalent thereof, including each such stratigraphic equivalent shown on Exhibit C, recognizing that actual depths may vary across the Leased Property.

(k) **Plume.** The "Plume" means the physical and forecasted extent of the free-phase and dissolved CO<sub>2</sub> stream, in three dimensions, that has been injected into the Storage Unit.

(l) **Recaptured Amounts.** The "Recaptured Amounts" means the dollar amounts, if any, attributed to any Carbon Credits, the value of which were previously included in the definition of Facility Proceeds for purposes of calculating the Royalty paid to Lessor and which are subsequently recaptured or otherwise disallowed for the relevant period due to the actions or omissions of Lessor, the SLB, the PSF and/or any third party lessee of Lessor.

(m) **Second Hurdle Date.** The "Second Hurdle Date" means the first date on which Lessee actually injects CO<sub>2</sub> into the Storage Unit for permanent storage.

(n) **Section 45Q Credits.** The "Section 45Q Credits" means any tax credits under 26 U.S.C. § 45Q, as amended.

(o) **Standard Annual Volume.** The "Standard Annual Volume" means a volume of CO<sub>2</sub> equal to 1,000,000 metric tons.

(p) **Subsequent Injection Period.** The "Subsequent Injection Period" means the period beginning immediately upon the date Lessee has injected an aggregate amount of 50 million tons of CO<sub>2</sub> in the Storage Unit, and ending upon the termination of this Lease.

**3.03 Payments and Statements.** All Royalties that are required to be paid hereunder shall be due and payable sixty (60) days after the end of the month for each month during the Term (the "Due Date"), and shall be accompanied by a statement ("Monthly Statement") setting out the components of the Facility Proceeds and any Recaptured Amounts for the month for which Royalty is being paid. If Lessee and Lessor agree at any time that Royalties have been overpaid to Lessor (including as a result of any

Recaptured Amounts), Lessee shall recoup the overpaid Royalties by deducting the amount of the overpayment, without interest, from future Royalty payments; provided that if Royalty payments have concluded and Lessee has not recouped all Recaptured Amounts, Lessor shall be obligated to make a one-time payment to Lessee, without interest, for such Recaptured Amounts. Recoupment of overpaid Royalties shall be made as promptly as possible out of future Royalty payments. If the amount of agreed, overpaid Royalties and/or Recaptured Amounts to be recouped during any one month should exceed the amount of Royalties that otherwise would have been payable that month to Lessor, Lessee shall provide a written explanation to Lessor as to the nature and amount of the overpayment and the month during which it is reasonably expected that a resumption of Royalty payments to Lessor will occur. Lessor, at its option and in lieu of recoupment being made in the above manner, may promptly repay such overpayment in full or may request that the overpaid Royalties and/or Recaptured Amounts be recouped out of future Royalty payments on a mutually-agreeable schedule and in mutually-agreeable monthly amounts which will not create an undue hardship or burden on either Lessor or Lessee; provided that if Royalty payments have concluded and Lessee has not recouped all Recaptured Amounts, Lessor shall be obligated to make a one-time payment to Lessee, without interest, for such Recaptured Amounts. Lessor expressly reserves the right and Lessee expressly grants to Lessor the right to audit Facility Proceeds and the calculation and payment of Facility Proceeds upon Lessor giving Lessee notice of the exercise of this right. Within sixty (60) days after receipt of such notice, Lessee shall make available to Lessor during reasonable business hours all information requested by Lessor which in the commercially reasonable judgment of Lessor is reasonably necessary to audit such Facility Proceeds and the calculation and payment of Facility Proceeds in order that Lessor may fully and completely audit such Royalty. In the event the Parties reasonably dispute in good faith all or any portion of a Monthly Statement, then the undisputed portion, if any, shall be paid by the Due Date. Thereafter, the Parties shall cooperate with each other to resolve the dispute within sixty (60) days of the Due Date. In the event the Parties cannot reach agreement within 60 days of the Due Date (or earlier if by mutual written agreement), then the Parties will pursue resolution of the dispute pursuant to the terms of Section 10.11. The terms of this section shall survive expiration or earlier termination of this Lease.

**3.04 Interest and Penalty.** Any undisputed amount of Royalty that is not timely paid shall accrue simple interest at prime plus one percent (1%) per annum beginning on the date that the amount of unpaid Royalty is thirty (30) days overdue, and shall continue to accrue interest at that rate until paid (subject to the terms of this Lease, including Section 9.01(b)(ii), below, with regard to amounts determined to be due following an audit). For every month that a Monthly Statement or a monthly report described in Section 7.01, below, is not submitted when due as described in this Lease, each such non-filed report or Monthly Statement shall incur a penalty of \$25 for every month (or part thereof) until filed. As used in this Section 3.04, "prime" means the prime interest rate, as published daily in the Wall Street Journal that is not a Saturday, Sunday, or legal holiday. For royalties due on a Saturday, "prime" shall refer to the prime interest rate published on the next business day that is not a legal holiday

## **ARTICLE IV. OWNERSHIP OF CO2**

### **4.01 Ownership of Stored CO2.**

(a) **General.** Subject to the terms of Section 4.01(b), below, regarding the use of stored CO2 in connection with Subsequent Carbon Offsets (as defined below), the CO2 transported to and stored in the Storage Unit remains the property and responsibility of Lessee or the generator or emitter of the CO2 according to the agreements between them, until such time as the SLB may elect to accept ownership of the CO2 pursuant to Texas Health & Safety Code, Sec. 382.507, or otherwise. Lessor, Lessee and/or the generator or emitter, as the case may be, even while owning the CO2, may not withdraw or make any other use of the CO2 in storage, including, without limitation, for enhanced recovery purposes, as the Parties agree that CO2 storage in the Storage Unit as contemplated by this Lease is intended to be permanent; provided, however, Lessee may

withdraw certain amounts of CO<sub>2</sub> for the purpose of pressure maintenance or environmental or public safety concerns, in each case in accordance with Applicable Procedure and applicable law. Any Recaptured Amounts resulting from such a withdrawal will be borne entirely by Lessee. If the SLB has not previously elected to accept ownership of the CO<sub>2</sub>, once (i) CO<sub>2</sub> has been delivered into storage into the Storage Unit, (ii) the Storage Unit has met all applicable state and federal requirements for closure of CO<sub>2</sub> storage sites, and (iii) Lessee has received the relevant "closure certificate" from the applicable state or federal regulatory agency, the SLB shall acquire title to the CO<sub>2</sub> stored in the Storage Unit and shall assume all obligations and liabilities with respect to such CO<sub>2</sub>, and Lessee shall be released thereafter from all liabilities related to the ownership of the CO<sub>2</sub>, provided that, notwithstanding the foregoing, delivery of CO<sub>2</sub> into the Storage Unit or acceptance of ownership of the CO<sub>2</sub> by the SLB on behalf of the PSF does not relieve Lessee of liability for any act or omission regarding the construction, operation, or closure, as applicable, of the Facility; except for such liabilities that (A) are the result of acts or omissions of Lessee that are actually known to and expressly accepted by Lessor, (B) could have been known by Lessor in the exercise of reasonable due diligence, or (C) are the result of acts or omissions occurring after the later of the date of receipt of such closure certificate or the date that the SLB acquires title to the stored CO<sub>2</sub>.

(b) **Subsequent Carbon Offsets.** Notwithstanding anything herein to the contrary, the Parties acknowledge and agree as follows: (i) the CO<sub>2</sub> injected hereunder is to be permanently stored in the Storage Unit, (ii) all Carbon Credits associated with the capturing and permanent storage of CO<sub>2</sub> under this Lease are solely for the benefit of Lessee (or its designee), (iii) **LESSOR SHALL NOT TAKE ANY ACTION THAT WOULD INTENTIONALLY OR REASONABLY FORESEEABLY (A) MATERIALLY ADVERSELY IMPACT ANY OF THE LESSEE'S, EMITTERS', DIRECT OR INDIRECT MEMBERS OF AN EMITTER, THE LESSOR OR THE LESSEE, TAX EQUITY INVESTORS OR OTHERS ABILITY TO CLAIM, MAINTAIN, MONETIZE OR OTHERWISE RECEIVE THE BENEFIT OF, ANY CARBON CREDIT EARNED BY LESSEE, (B) RESULT IN ANY CARBON CREDIT TO BE SUBSEQUENTLY RECAPTURED OR OTHERWISE DISALLOWED, OR (C) RESULT IN ANY ACTIVITY THAT COULD RESULT IN A REVERSAL OR RELEASE OF CO<sub>2</sub> FROM THE STORAGE UNIT (PROVIDED THAT SUCH RESULTING "ACTIVITY" IN (C) DOES NOT INCLUDE ACTS OR OMISSIONS OF ANOTHER LESSEE OF LESSOR THAT CONSTITUTE NON-COMPLIANCE BY THAT LESSEE OF ITS LEASE OBLIGATIONS).** Subject to the foregoing and following the transfer of title of the permanently sequestered CO<sub>2</sub> from Lessee to Lessor, Lessor, at no expense to Lessee, shall have the sole and exclusive right to seek, market, receive, and retain in full any payment or other value that can be attributed to the permanently stored CO<sub>2</sub>, including, without limitation, in connection with a monetization of carbon offset credits, or any and all other monetization of such permanently stored CO<sub>2</sub> (collectively herein, a "Subsequent Carbon Offset"), whether in connection with a recognized compliance system or otherwise; provided, that, such Subsequent Carbon Offsets do not adversely impact Lessee's ability to claim, maintain, monetize or otherwise receive the benefit of, any Carbon Credit. If Lessor does pursue a Subsequent Carbon Offset and such Subsequent Carbon Offset (x) adversely impacts any of Lessee's, emitters', direct or indirect members of an emitter, Lessor or Lessee, tax equity investors or others ability to claim, maintain, monetize or otherwise receive the benefit of, any Carbon Credit, (y) results in any Carbon Credit to be subsequently recaptured or otherwise disallowed, or (z) results in any activity that could result in a reversal or release of CO<sub>2</sub> from the Storage Unit, Lessor and Lessee may choose to resolve such matter pursuant to the dispute resolutions procedures in Section 10.11 hereof. Following a determination of the then-current dollar amount of such adverse impact (if any) pursuant to Section 10.11, such amount will either be paid by Lessor to Lessee, applied as a credit toward subsequent Royalty due hereunder, or some combination of both, at Lessor's discretion.

## ARTICLE V. METERING

**5.01 Mass Determination.** The mass of CO<sub>2</sub> injected into the Storage Unit shall be determined in accordance with Class VI monitoring and verification requirements and in accordance with the MRV and best industry practices.

### **5.02 Measuring Stations.**

(a) **Costs.** The costs and expenses of installing, operating, and maintaining measuring stations (including all equipment, whether a single instrument or multiple instruments, necessary to determine the mass of stored CO<sub>2</sub>) required by this Lease shall be borne solely by Lessee.

(b) **Location; Adequacy.** The type, size, and location of Lessee's proposed metering for the Project are subject to the prior written approval of Lessor, such approval not to be unreasonably delayed or withheld. Lessee shall maintain one or more measuring stations, at least one of which must be located at the wellhead where the CO<sub>2</sub> is injected, in part for purposes of Lessor's audit of Royalty paid hereunder. Lessee shall provide Lessor with summaries of plans and drawings for Lessee's proposed transportation and storage system, including information regarding meter locations and specifications, so that Lessor has sufficient information to assess the adequacy of Lessee's proposed metering for purposes of this Lease; provided, however, Lessor shall maintain such summaries of plans, drawings and information strictly confidential, and shall not disclose all or any portion of such summaries to any third party without the prior written consent of Lessee, which consent may be withheld in Lessee's discretion, which discretion is subject to Lessor's obligations under Section 10.16, below, the Texas Open Records Act, and any relevant order of a court of competent jurisdiction. Lessee's measurement and monitoring program and equipment must be (i) adequate to measure or monitor the mass of CO<sub>2</sub> being injected into the Storage Unit, and (ii) in compliance with the testing and monitoring plan required by the Class VI Permit, the MRV, and as set forth in 40 CFR Section 146.90. Notwithstanding the foregoing provision regarding the qualified confidentiality of the summaries of Lessee's plans, drawings, and information, Lessor may analyze those materials, draw conclusions from them, and develop General Land Office best practices standards and requirements that may be shared by Lessor with the general public, including future CO<sub>2</sub> storage space lessees, even if those General Land Office-developed "best practices" standards and requirements are, ultimately, identical or substantially similar to the plans for Lessee's transportation and storage system for the Facility.

(c) **Standards.** Each measuring station for CO<sub>2</sub> mass delivered pursuant to this Lease shall be equipped in accordance with at least the standards (i) set forth in all applicable chapters of the American Petroleum Institute Manual of Petroleum Measurement Standards and (ii) of the American Gas Association. Subject to the prior approval of Lessor, measurement equipment will be subject to change to allow the use of improved technology under such standards.

**5.03 Meter Calibration and Meter Tests.** Lessee shall ensure that the measurement equipment for the Project is accurate and in good repair, and that such periodic tests of that equipment as Lessee may deem necessary are made as often as needed, and in accordance with standard industry measurement practices, provided that no more often than once every twelve (12) months Lessor may require such an equipment test by written notice thereof delivered to Lessee.

## ARTICLE VI. MONITORING

**6.01 Monitoring and Verification.** Lessee shall adhere to all provisions of the approved MRV in addition to, and consistent with, all other applicable regulatory requirements and all other

requirements of this Lease, including, but not limited to, the requirements of its Class VI Permit or other applicable UIC permit. The MRV plan shall be used to determine whether any CO<sub>2</sub> is escaping from the Storage Unit and the amount of any such leakage. Lessee shall make all plans, models and reports required by the approved MRV, along with any associated supporting data, available to Lessor upon request. All reservoir models, well logs, well tests and other monitoring and verification studies performed on or for the Storage Unit shall be interpreted by a licensed professional engineer (or other qualified professional engineer or geoscientist who is approved by Lessor, such approval not to be unreasonably withheld), which may include Lessee personnel, and such interpretations shall be made available to Lessor upon written request; provided, however, Lessor shall maintain such models, well logs, well tests and other monitoring and verification studies and any interpretations with respect thereto strictly confidential, and shall not disclose all or any portion of such studies or interpretations to any third party, other than technical advisors or other consultants working with Lessor who have signed a reasonable non-disclosure agreement, without the prior written consent of Lessee, which consent may be withheld in Lessee's sole discretion (provided that all of Lessor's foregoing obligations are subject to (A) the provisions of Section 10.16, and (B) the Texas Open Records Act and to any relevant order of a court of competent jurisdiction). Lessee shall permanently archive copies of all the aforementioned documents no later than the earliest of the closure date of the repository or the lease termination date. Notwithstanding the foregoing provision regarding the qualified confidentiality of the summaries of Lessee's studies and interpretations, Lessor may analyze those materials, draw conclusions from them, and develop General Land Office best practices standards and requirements, and such best practices and requirements may be shared by Lessor with the general public, including future CO<sub>2</sub> storage space lessees provided that no such shared information contains any Lessee information or data.

**6.02 Seismicity.** Without limiting the foregoing, Lessee shall conduct an annual review of the seismicity relating to the Property and immediately adjacent land and report its findings to Lessor. If such findings indicate that seismicity is increasing in any particular location, Lessee will make commercially reasonable efforts to adjust its CO<sub>2</sub> injection operations, using generally accepted engineering principles and industry practices, in order to reduce the possibility of the occurrence of damaging seismic activity.

## **ARTICLE VII REPORTING**

**7.01 Reports with Payments.** During the Operations Term, Lessee shall submit to Lessor, at the same time that Royalty is paid, a report identifying the source(s) and mass of CO<sub>2</sub> that has been gathered and injected into the Storage Unit during the period for which Royalty is being paid. Lessee shall submit to Lessor a copy of all filings and reports, when filed, that Lessee must file with the relevant governmental authority in connection with maintaining its Class VI Permit(s) or other applicable UIC permit(s).

**7.02 Statutory Reporting.** Pursuant to requirements of Texas Health and Safety Code, Ch. 382, at least annually, Lessee must submit a report to Lessor regarding the Project, including information regarding the measurement, monitoring, and verification of the permanent storage status of the CO<sub>2</sub> stored in the carbon dioxide repository. Such information must include (i) the total mass of CO<sub>2</sub> stored; (ii) the total mass of CO<sub>2</sub> received for storage during the year; and (iii) the mass of CO<sub>2</sub> received from each producer of CO<sub>2</sub>.

**7.03 Leaks.** Lessee acknowledges that its operation of the Project could damage the quality and quantity of storage pore space in the Property and/or in submerged lands outside of the Property which is owned by Lessor ("**Outside Lands**"). In order that Lessor can be informed regarding the condition of the Property and such Outside Lands, Lessee shall provide copies of reports no less often than every twelve (12) months during the entire Term of this Lease pertaining to (i) leak rates, (ii) leak detection

(whether by pressure transient well tests or otherwise), or (iii) whether any such leaks have resulted in a migration of CO2 outside of the Property. Damage to the pore space in the Property and/or the Outside Lands caused by Lessee's operations hereunder, which damage is material and could have been foreseen and avoided by a reasonably prudent operator, shall be a Default hereunder and shall be subject to the procedures and remedies in Section 9.01(b)(iv) and Section 9.02.

**7.04 Other Agency Reporting Requirements.** If, at any time during the Term of this Lease, the Texas Commission on Environmental Quality, the Texas Railroad Commission, the GLO, or any other relevant State agency promulgates rules for the reporting of CO2 storage, then Lessee must (i) comply with those rules to the extent applicable, and (ii) send to Lessor a true and complete copy of any report or information provided to such State agency in compliance with such rules.

## **VIII LESSEE'S REPRESENTATIONS**

**8.01 Lessee's Representations.** Lessee hereby represents and warrants to Lessor that (i) Lessee is authorized to do business in the State of Texas, (ii) entering into this Lease is an action duly authorized on behalf of Lessee by its management and in accordance with its organizational documents, and (iii) the person executing and delivering this Lease has the requisite authority to bind Lessee to Lessee's obligations hereunder.

## **IX DEFAULT AND REMEDIES**

### **9.01 Default by Lessee; Notice and Cure; Removal and Restoration.**

(a) **Default.** Subject to the notice and cure provisions below, if Lessee is not in material compliance with the terms of this Lease, including, without limitation, the terms of this Lease that require payment of any Bonus Payment or Royalty, that require the maintenance of necessary permits, that require compliance with applicable laws and regulations, and that limit the use that may be made of the Property by or on behalf of Lessee, Lessee shall be in "Default" hereunder.

#### **(b) Notice and Cure.**

(i) If, based on the corresponding Monthly Statement, the Royalty paid in any given month (A) has been underpaid, then Lessee shall pay the underpayment to Lessor within thirty (30) days of Lessor's notice to Lessee of such underpayment, or (B) has been overpaid, then Lessee may credit such overpayment against its next Royalty payment, and shall also provide Lessor with an explanation of such overpayment and credit. If (1) Lessee does not timely pay such underpayment, and (2) there exists no good faith dispute between the Parties regarding such underpayment, Lessee shall be in Default hereunder. The Parties may agree to resolve any good faith dispute arising under this Section 9.01 pursuant to the dispute resolution procedures in Section 10.11 hereof.

(ii) If, following an audit pursuant to Section 10.05, below, Lessor determines that Royalty for any given period of time that was audited for the sixty (60) month period prior to the audit has been underpaid, Lessor will send to Lessee a final audit billing notice setting out the amount of Royalty, penalty (pursuant to Section 3.04, above), and interest due. The Parties will then proceed in accordance with the terms of Tex. Nat. Res. Code, Sec. 52.135(b) – (d) (pertaining to audits regarding payment of royalty for oil and gas production). If Lessee does not pay, within thirty (30) days of a final decision, the amounts, if any, that are determined to be due following that statutory process, then Lessee shall be in Default hereunder.

(iii) If Lessee receives notice from any governmental entity that Lessee is in non-compliance with the terms of any permit that it has received from that governmental entity for the construction and/or operation of the Facility (a "Notice of Non-Compliance"), then Lessee will promptly provide to Lessor a copy of such Notice of Non-Compliance. If Lessee does not remedy the non-compliance in the manner and within the time set out in the Notice of Non-Compliance, then the provisions of Section 9.01(b)(iv) shall control.

(iv) If Lessor determines in its reasonable judgment that Lessee is operating the Facility in an unsafe manner and such operations could have been foreseen or avoided by a reasonably prudent operator (such as, e.g., but without limitation, by exceeding pressure limitations or damaging capacity potential), then Lessor shall notify Lessee in writing of the unsafe operation and Lessor may immediately seek a temporary injunction to prevent damage to Lessor's Property. Subject to the outcome of Lessor's temporary injunction request (if any), Lessee shall have thirty (30) days after receipt of such notice within which to (A) correct or cease such operations to the extent that Lessor has identified the operations to be unsafe (including damaging), or (B) explain to Lessor's reasonable satisfaction that Lessee's operation of the Facility is not unsafe. If Lessee has not corrected in all material respects or ceased its unsafe operations within thirty (30) days of Lessor's notice, as described in (A), or, if Lessor is not satisfied with Lessee's explanation within thirty (30) days after Lessor's receipt of Lessee's explanation, as described in subpart (B) above, then the Parties may seek to resolve such matters pursuant to Section 10.11 hereof.

(v) If Lessor determines in its reasonable judgment that Lessee is in Default of this Lease for any reason other than as described in the foregoing (i) – (iv), Lessor shall notify Lessee in writing of the alleged Default of this Lease and Lessee shall have thirty (30) days after receipt of such notice within which to correct, commence actions to correct or dispute all or any part of the alleged Default as to which Lessee has been notified and shall pursue the remedy of such alleged Default, if any, in good faith and with reasonable diligence until completion. If such Default is not corrected in all material respects within the 30-day period (or, in the case of a Default that is not susceptible to cure within 30 days, correction is not commenced within 30 days and then pursued diligently to completion), Lessee shall be in Default hereunder, provided, however, that if Lessee has disputed the Default within thirty (30) days after receipt of Lessor's notice, then the Parties will proceed to mediation with a mutually agreed-upon impartial third party as provided in Section 9.01(b)(iv) above.

**9.02 Lessor's Remedies.** Subject to the terms of Section 9.01(b), Lessor shall have, as a remedy for Lessee's Default hereunder, all remedies available to it in law or in equity except as any such remedy may be limited by the express terms of this Lease, including, at Lessor's sole discretion, the right to terminate this Lease and all rights inuring to Lessee hereunder by sending written notice of such termination to Lessee in accordance with this Lease. Upon sending of such written notice of termination, this Lease shall automatically terminate and all rights granted herein to Lessee shall revert to Lessor. Such termination shall not prejudice the rights of Lessor to collect any money due or to seek recovery on any claim arising hereunder, and nor shall any such termination relieve Lessee of its obligations hereunder that survive expiration or earlier termination of this Lease.

**9.03 Removal of Property; Restoration.** Upon expiration or earlier termination of this Lease, at Lessor's sole option, Lessee shall (1) convey all personal property and improvements of Lessee on the Property to Lessor, or (2) (A) restore the Property to its original topographical condition that existed as of the Effective Date, and (B) remove all personal property and any improvements placed or constructed on the Property by or on behalf of Lessee from the Property, except in each case to the extent such personal property or improvements are reasonably necessary for the closure of the Facility. The terms of this section shall survive expiration or earlier termination of this Lease. Lessor and Lessee agree that, in the event

Lessee fails to restore the Property or remove its personal property or improvements within the time specified in a notice provided pursuant to this Section 9.03, then Lessor may, at its sole option, remove and dispose of such property (with no obligation to sell or otherwise maintain such property in accordance with the Uniform Commercial Code), at Lessee's sole cost and expense, or Lessor may elect to own such property by written notice of such election provided. If Lessor makes an election under subpart (1) or (2) above and Lessee fails to comply with its obligations under this Section 9.03, then in such an event Lessor may restore the Property to its original topographical condition that existed as of the Effective Date, and remove all personal property and any improvements placed or constructed on the Property by or on behalf of Lessee from the Property, and Lessee shall be obligated to reimburse Lessor for the reasonable costs of such restoration, removal and disposal within ten (10) days of Lessor's demand for reimbursement. The terms of this section shall survive expiration or earlier termination of this Lease.

**9.04 Default by Lessor.** Notwithstanding any other provision of this Lease, if Lessor fails to perform any material obligation or breaches any covenant made to Lessee hereunder which, if capable of being cured, is not cured within thirty (30) days from the date that Lessee provides notice that corrective action is needed, Lessee may, in addition to all other remedies available to it, withhold or suspend payment of any amount due hereunder without prior notice to Lessor.

## **X MISCELLANEOUS**

### **10.01 Taxes and Fees.**

(a) **Responsibility.** Lessor represents that it is exempt from taxation. Lessee shall timely pay all taxes imposed on Lessee that, if unpaid, would result in a lien or other encumbrance on the Property and that would adversely impact Lessor's interest in the Property, provided, however, that Lessee may, in good faith, and at its sole cost, contest any such taxes or assessments, and shall be obligated to pay the contested amount only if and when finally determined to be owed by the applicable governmental authority.

(b) **Proceedings.** Lessee may (but is not required to) prosecute any administrative or judicial proceedings relating to the Project and the rights conveyed herein including, but not limited to, contesting any taxes or fees assessed or levied upon the Project as a result of Lessee's equipment, leasehold or easement interest, or operations hereunder. With the express prior written consent of Lessor, Lessee may undertake any administrative or judicial proceeding in the name of Lessor.

**10.02 Force Majeure.** If, and while, operation of the Project is delayed or interrupted as a result of events beyond the reasonable control of Lessee, such as (but not limited to) hurricanes, floods, other acts of God, fire, war, pandemic, or action or inaction by any governmental authority other than Lessor, Lessee shall be excused from non-performance (including the payment of any True-Up Payment, if applicable) during the pendency of the direct interruptive effect of such events on operations at the Facility.

**10.03 As Is, Where Is.** LESSEE HAS HAD THE OPPORTUNITY TO INSPECT THE PHYSICAL AND TOPOGRAPHIC CONDITION OF THE PROPERTY AND ACCEPTS SAME "AS IS" IN ITS EXISTING PHYSICAL AND TOPOGRAPHIC CONDITION. LESSEE IS NOT RELYING ON ANY REPRESENTATION OR WARRANTY OF THE LESSOR REGARDING ANY ASPECT OF THE PROPERTY, BUT IS RELYING ON LESSEE'S OWN INSPECTION OF THE PREMISES AND PROPERTY. LESSOR DISCLAIMS ANY AND ALL WARRANTIES OF HABITABILITY, MERCHANTABILITY, SUITABILITY, FITNESS FOR ANY PURPOSE, AND ANY OTHER WARRANTY WHATSOEVER NOT EXPRESSLY SET

FORTH IN THIS LEASE. LESSEE WILL MAKE ITS OWN DETERMINATION OF THE USABILITY OF THE PROPERTY FOR THE PROJECT. LESSEE IS HEREBY PUT ON NOTICE THAT ANY PRIOR GRANTS OF RIGHTS AND/OR ENCUMBRANCES MAY BE OF RECORD AND LESSEE IS ADVISED TO EXAMINE ALL RECORDS OF THE STATE AND COUNTY IN WHICH THE PROPERTY IS LOCATED. THE USE OF THE TERMS "GRANT" AND/OR "CONVEY" EXPRESSLY DO NOT IMPLY OR CREATE ANY WARRANTIES OF TITLE. THE TERMS OF THIS SECTION SHALL SURVIVE EXPIRATION OR EARLIER TERMINATION OF THIS LEASE.

**10.04 Notices.** All notices given pursuant to this Lease shall be in writing, and may be sent by (a) first class U.S. mail postage prepaid, certified, return receipt requested or (b) overnight mail, in each case addressed to the Party to be notified at the address listed for such Party above. The date that the certified letter is signed for or refused by the recipient, or, as applicable, the overnight mail is delivered to or refused by the recipient is the date that the notice is "received" under this Lease, including for purposes of Section 9.01(b), above. A copy of such notice shall also be provided by email, if to Lessor, to the Deputy Director of Energy Resources for the Texas General Land Office, or other express designee of Lessor, and if to Lessee, to the attention of the Executive Vice President and General Counsel. A Party may change its address for notice by giving notice to the other Party.

**10.05 Audits.** Lessor shall have the right, no more than once per Lease Year, personally or by representative, to inspect the proprietary books, accounts, contracts, records and data of Lessee solely as they pertain to the operation of the Project (including permit status), storage of CO<sub>2</sub> in the Storage Unit, calculation of the Royalty (including all documents and information related to Facility Proceeds and Recaptured Amounts), and any other matter reasonably deemed subject to the terms of this Lease so long as such audit process is conducted during regular business hours at Lessee's principal place of business; provided however, Lessee shall not be required to provide any copies of Lessee's proprietary books, accounts, contracts, records and data for review by Lessor outside of Lessee's principal place of business.

**10.06 Memorandum of Lease.** Lessee shall, at its sole cost and expense, record a Memorandum of Lease in the form of Exhibit B attached hereto (the "Memorandum") in the Official Public Records of the county or counties in which the Property is located and provide a file marked copy of same to Lessor within sixty (60) days after this Lease is executed by all Parties.

**10.07 Counterparts.** This Lease may be executed in counterparts, each of which shall be considered an original for all purposes.

**10.08 Assignments.** The interests of Lessor under this Lease may be freely assigned. The interests of Lessee under this Lease may be assigned on the prior written consent of Lessor (not to be unreasonably withheld, conditioned, delayed, or denied), but not otherwise; provided, however, the interests of Lessee may, upon written notice thereof provided to Lessor, be freely assigned without the prior consent of Lessor to any affiliate of Lessee that agrees in writing to assume and be bound by the obligations of "Lessee" hereunder (with a copy of such assumption provided to Lessor). For purposes of the foregoing, an "affiliate" of Lessee is an entity that (i) owns more than 50% of, or otherwise has a controlling managerial interest in, Lessee, (ii) is more than 50% owned by, or is controlled by, Lessee, or (iii) is under common ownership and control with Lessee in a single "family" of entities ultimately owned and controlled by the same entity.

**10.09 Protection of Natural and Historical Resources.** LESSEE IS EXPRESSLY PLACED ON NOTICE OF THE NATIONAL HISTORICAL PRESERVATION ACT OF 1966 (16 USC § 470, ET SEQ.) AND THE TEXAS ANTIQUITIES CODE (TEX. NAT. RES. CODE CH. 191), AS THE SAME MAY BE AMENDED FROM TIME TO TIME. IN THE EVENT THAT ANY SITE,

**OBJECT, LOCATION, ARTIFACT OR OTHER FEATURE OF ARCHEOLOGICAL, SCIENTIFIC, EDUCATIONAL, CULTURAL OR HISTORIC INTEREST IS ENCOUNTERED DURING ANY ACTIVITY ON ANY PORTION OF THE PROPERTY OWNED IN FEE BY LESSOR, LESSEE SHALL IMMEDIATELY CEASE SUCH ACTIVITIES AND SHALL IMMEDIATELY NOTIFY LESSOR AND THE TEXAS HISTORICAL COMMISSION, P.O. BOX 12276, AUSTIN, TEXAS 78711, SO THAT ADEQUATE MEASURES MAY BE UNDERTAKEN TO PROTECT OR RECOVER SUCH DISCOVERIES OR FINDINGS, AS APPROPRIATE. IN THE EVENT LESSEE IS REQUIRED TO CEASE ACTIVITIES UNDER THE LEASE AS TO ANY PORTION OF THE PROPERTY, THE TRUE-UP PAYMENT SET FORTH IN SECTION 3.01(E) SHALL NOT APPLY FOR ANY PERIOD FOR WHICH LESSEE IS REQUIRED TO CEASE ACTIVITIES.**

**10.10 Governing Law and Venue; Compliance with Laws.** This Lease shall be governed by the laws of the State of Texas. Exclusive venue for any dispute arising under or relating to this Lease shall be in any court of competent jurisdiction in Travis County, Texas. Lessor and Lessee agree that each of them will comply with all applicable federal, state and local laws and all applicable ordinances, rules, orders, and regulations of any authority having jurisdiction over the activities of Lessor or Lessee under this Lease.

**10.11 Non-Binding Mediation.** The Parties may agree at any time to mediate any dispute arising under Section 3.03, 4.01 or 9.01 of this Lease through an impartial third party. If both Parties agree to mediation, (i) the Parties will convene within a reasonable time with a professional mediator mutually agreed upon by the Parties, and (ii) representatives of each Party will make reasonable efforts to attend meetings and participate in telephone conferences or video conferences as reasonably requested by either Party. If (A) the dispute is not resolved within thirty (30) business days after the first convening with a mediator as described above, or (B) the Parties cannot agree to mediate, either Party may declare an impasse, which will conclude the mediation process. Thereafter, the Parties shall be entitled to seek all remedies available at law or in equity. Nothing in this Lease, including in this Section 10.11, shall be construed as a waiver by Lessor of its sovereign immunity from suit or from damages.

**10.12 Further Assurances.** The Parties shall take all further actions and shall execute and deliver to the other any document or instrument which is necessary to fully carry out the transactions contemplated by this Lease. The Parties shall cooperate with each other and act in good faith to accomplish the purposes of this Lease.

**10.13 Lessee Liability. LESSEE SHALL BE FULLY LIABLE AND RESPONSIBLE FOR ANY DAMAGE, OF ANY NATURE, ARISING OR RESULTING FROM ITS OWN ACTS OR OMISSIONS RELATED TO ITS EXERCISE OF THE RIGHTS GRANTED HEREIN. LESSEE AGREES TO AND SHALL INDEMNIFY AND HOLD LESSOR, LESSOR'S OFFICERS, AGENTS, AND EMPLOYEES, HARMLESS FROM AND AGAINST CLAIMS, SUIT, COSTS, LIABILITY OR DAMAGES OF ANY KIND, INCLUDING STRICT LIABILITY CLAIMS, WITHOUT LIMIT AND WITHOUT REGARD TO CAUSE OF THE DAMAGES OR THE NEGLIGENCE OF ANY PARTY, AND WHETHER FOR DAMAGES TO PROPERTY OR THE ENVIRONMENT OR INJURY OR DEATH OF ANY PERSON, OR ANY COMBINATION THEREOF, EXCEPT FOR THE CONSEQUENCES OF THE GROSSLY NEGLIGENT ACTS OR WILLFUL MISCONDUCT OF LESSOR, LESSOR'S OFFICERS, AGENTS, OR EMPLOYEES, ARISING DIRECTLY OR INDIRECTLY FROM LESSEE'S OPERATION OF THE PROJECT, INCLUDING ITS SOLE USE OF THE PROPERTY AND THE FACILITY (OR ANY ADJACENT OR CONTIGUOUS PSF LAND) OR FROM ANY BREACH BY LESSEE OF THE TERMS CONTAINED HEREIN. THE PROVISIONS OF THIS SECTION SHALL SURVIVE EXPIRATION OR EARLIER TERMINATION OF THIS LEASE.**

**10.14 Lessee Insurance.** Lessee shall obtain and maintain at all times during the Term of this Lease all of the insurances, and in the amounts, as were required pursuant to the RFP.

**10.15 Oil, Gas, and Other Assets Disclaimer.** The only rights pertaining to any asset of Lessor granted to Lessee under this Lease are those expressly set out herein with regard to construction, operation, and closure of the Facility on the Leased Property. Without limitation, and notwithstanding anything in this Lease to the contrary, the Parties acknowledge and agree Lessee shall in no way be entitled to any oil and/or gas rights owned or otherwise held by Lessor, and that this Lease shall in no way be construed as an agreement between Lessor and Lessee with respect to such oil and gas rights or interests or the production, sale, transfer or treatment of oil, gas or other hydrocarbons. Further, as between Lessor and Lessee, and subject to Section 10.16, Lessor (or its lessees, pursuant to agreements between them) shall retain all responsibility and obligation related to existing, or future, oil, gas or other mineral development on the Property including producing, shut-in or non-producing wells, platforms, pipelines and related infrastructure and equipment of any kind.

**10.16 Lessee's Information.** The Parties acknowledge that this Lease and Lessee's documents provided in compliance with this Lease, including information that may be provided in compliance with provisions in Section 2.03, Section 5.02, and Section 6.01 ("Lessee's Information") may be subject to the Texas Public Information Act as set forth in Chapter 552 of the Texas Government Code. Lessee shall have the right, as a third party, to seek to withhold all or part of Lessee's Information, including as set forth in Section 7.1.6 of the RFP, and to seek a determination from the Texas Attorney General in accordance with the Texas Public Information Act prior to the release of any Lessee Information. Lessor agrees to timely notify, and to reasonably cooperate with, including as set forth in Section 7.1.6 of the RFP, Lessee of any request for the release of Lessor's Information. Such reasonable cooperation shall include withholding information provided by Lessee to Lessor in compliance with this Lease pending any such determination by the Attorney General. Additionally, if the Parties agree that a request for Lessee's Information may be the subject of a shared exception to the Public Information Act, including homeland security, geological, or other exception, Lessor agrees to separately pursue a determination of the confidentiality from the Attorney General of the requested information.

**10.17 Miscellaneous.** This Lease may not be amended except in a writing signed by Lessor and Lessee. Nothing in this Lease shall be construed as creating any form of partnership or joint venture relationship between the Parties. No third party shall be deemed a third party beneficiary of this Lease. This Lease (which specifically incorporates the non-conflicting terms of the RFP, as described above) constitutes the entire agreement between Lessor and Lessee and supersedes all oral statements and prior understandings relating to the subject matter contained in this Lease. Except as set forth in this Lease, no representations, warranties, or agreements have been made by either Party to the other Party with respect to this Lease. If any part of this Lease is illegal, invalid or unenforceable under present or future laws, then the remainder of this Lease shall not be affected and in lieu of such part there shall be added a clause or provision as similar in terms to such illegal, invalid, or unenforceable part as may be legal, valid, and enforceable, and any affected part shall be severed from this Lease if necessary to enforce the remainder of this Lease.

**10.18 Change-in-Law.** Notwithstanding anything to the contrary herein, the Parties agree to negotiate in good faith for the purposes of amending this Lease in the future in order to (a) ensure compliance with existing, amended, and/or future rules, regulations, and/or administrative guidance promulgated by the EPA, RRC, TCEQ, IRS, Lessor, or any other regulatory or administrative body having jurisdiction and/or authority over tax credits, economic incentives, or other revenue generating structures applicable to Lessee's business and operations, consistent with Lessee's desire to execute a successful carbon capture and sequestration project; (b) ensure compliance with the all applicable law(s) or Applicable Procedure(s); or (c) address operational, market or commercial matters related to carbon capture and

sequestration projects. Further, the Parties agree to cooperate in good faith in connection with Lessee obtaining regulatory approvals and additional amendments to this Lease to expand the Property covered by this Lease if the Plume migrates through a pathway unpredicted by the storage reservoirs modeling into adjacent state-owned land or water bottoms (to the extent such additional acreage is available).

**10.19 Lender Protections.** Notwithstanding anything to the contrary contained in this Lease, Lessee shall have the right to grant one or more liens against, or security interests in, (i) any improvements and/or equipment of Lessee, and/or (ii) Lessee's leasehold interest in the Property, in each case, as security for any indebtedness of Lessee or its affiliates. In this regard, Lessor hereby agrees to use commercially reasonable efforts (without the obligation to incur any out-of-pocket expenses) to cooperate with Lessee's efforts in obtaining and maintaining financing for (x) the construction of the Storage Unit and any related improvements and/or equipment, (y) Lessee's leasehold interest under this Lease, and/or (z) Lessee's operations to be conducted on the Property. Furthermore, Lessor shall execute and deliver to Lessee any documents reasonably required by a title insurance company, a financing party or a third party, including estoppel certificates, in form and substance reasonably acceptable to Lessee, within ten (10) business days after presentation of said documents by Lessee; provided, however, that in no event shall such documents materially increase any obligation or materially decrease any right of Lessor hereunder.

**MEMORANDUM OF LEASE**

State: Texas  
County: Jefferson  
Lessor: State of Texas  
General Land Office  
1700 North Congress Avenue  
Austin, TX 78701  
Lessee: Bayou Bend CCS LLC  
Effective Date: April 1, 2022

1. This Memorandum of Lease (this "Memorandum") is entered into effective as of April 1, 2022 (the "Effective Date") by and between the State of Texas, acting by and through the Commissioner of the Texas General Land Office ("Lessor") and Bayou Bend CCS LLC ("Lessee"). Lessor and Lessee are hereinafter sometimes referred to singularly as a "Party" and collectively as the "Parties". Capitalized terms used in this Memorandum but not defined herein have the meaning ascribed to such terms in the Lease (defined below).

2. The Parties hereby acknowledge and give notice that Lessor and Lessee have entered into a Carbon Dioxide Transportation and Storage Lease dated April, 1 (the "Lease"), related to carbon dioxide sequestration operations by Lessee in, on, and under certain the Permanent School Fund lands in Jefferson County, Texas, which lands are more fully described in Exhibit A attached hereto (the "Leased Property"). In addition to the lease of the Leased Property to Lessee, Lessor hereby agrees that it will grant to Lessee the necessary easements, ingress and egress rights, rights-of-way, and surface locations over, across, and under certain tracts of land owned by the Permanent School Fund (the "Easement Tracts"), for the construction, installation, maintenance, and operation of pipelines, meters, and related equipment which are necessary for the transportation of CO2 from its source to the Leased Property and the measurement thereof. The Parties hereby agree to amend Exhibit A to this Memorandum to reflect any Easement Tracts conveyed by Lessor to Lessee. The Leased Property and the Easement Tracts are, collectively referred to herein and therein as, the "Property".

3. The Lease has been duly executed by Lessor and Lessee, but it has not been filed of record in the County Clerk's office of Jefferson County, Texas. Duplicate originals of the Lease are in possession of the Lessor and Lessee.

4. In the Lease, Lessor grants, leases and lets unto Lessee the exclusive right to geologically store anthropogenic carbon dioxide ("CO2") in a reservoir(s) and pore space in the

Miocene Formation (as such term is defined under the most expansive definition required to ensure certification or classification of the CO2 sequestration as permanent under any protocols, standards, regulations or laws relevant to Lessee and its storage activities conducted pursuant to the Lease, the "Storage Unit"), together with the exclusive right to drill and to construct, maintain, and operate pipelines, flowlines, wells, fixtures, machinery, and any other equipment Lessee deems necessary for the purposes herein and in connection with such geologic storage (such Storage Unit, together with associated pipelines, wells, fixtures, machinery, and equipment, called the "Facility" herein, and the permitting, construction, and operation of the Facility, sometimes called the "Project" herein). It is the intent of Lessor and Lessee that all equipment, pipe, supports, facilities, meters, systems and ancillary items placed or maintained by Lessee on the Property shall be considered part of the Facility and shall be owned and controlled by Lessee except as provided for in the Lease.

5. The Term (as used herein) of the Lease begins on April 1, 2022, and shall consist, collectively, of each of the Development Term, Construction Term, and Operations Term, as well as the accompanying Development Term Extension Period and Construction Term Extension Period (as those terms are defined in the Lease), as well as the closure and monitoring period following the Operations Term.

6. The Lease contains certain payment terms and obligations, as well as specific termination rights exercisable by one or more of the Parties.

7. Section 1.05(a) of the Lease provides, in part, that during the Term, under no circumstance shall any well bore be drilled through the Storage Unit, nor shall the Storage Unit be exposed to communication with any well bore (each of which, a "Drill-Through Restriction"). PRIOR TO CONDUCTING ANY HYDROCARBON DRILLING OR EXTRACTION ACTIVITIES ON OR NEAR THE PROPERTY, A LESSEE OR OPERATOR OF A STATE LEASE OR OPERATING AGREEMENT MUST FORBEAR FROM ANY ACTIVITIES THAT VIOLATE OR POTENTIALLY VIOLATE THE DRILL-THROUGH RESTRICTIONS.

8. Section 1.05(b) of the Lease provides, in part, that as a condition of any future state lease on any part of the Property or the grant of any lease, easement or access rights to the Property, Lessor shall require the lessee or holder of such lease, easement or access rights to expressly indemnify and defend Lessee for all claims for damages or losses (including losses attributable to Carbon Credits previously realized by Lessee which are recaptured or otherwise disallowed) that Lessee may suffer or incur as a result of such party's activities, including such losses or damages, including legal fees, that result from any Leak Event. Such indemnity shall be (A) set forth in a separate written agreement between Lessee and the lessee or holder of such lease, easement or access right, and (B) be backed by adequate financial security (i.e. posting of bonds, letters-of-credit, or other financial assurance) in favor of Lessee and its designees, in each case of (A) and (B), in a form reasonably acceptable to Lessee. PRIOR TO CONDUCTING ANY HYDROCARBON DRILLING OR EXTRACTION ACTIVITIES ON OR NEAR THE PROPERTY, A LESSEE OR OPERATOR OF A STATE LEASE OR OPERATING AGREEMENT SHALL (1) DELIVER A SEPARATE WRITTEN INDEMNITY AGREEMENT TO LESSEE, AND (2) OBTAIN ADEQUATE FINANCIAL SECURITY IN FAVOR OF

LESSEE AND ITS DESIGNEES, IN EACH CASE OF (1) AND (2), IN SUBSTANCE AND FORM REASONABLY ACCEPTABLE TO LESSEE.

9. The interests of Lessor under the Lease may be freely assigned. The interests of Lessee under the Lease may be assigned on the prior written consent of Lessor (not to be unreasonably withheld, conditioned, delayed, or denied), but not otherwise; provided, however, the interests of Lessee may, upon written notice thereof provided to Lessor, be freely assigned without the prior consent of Lessor to any affiliate (as such term is defined in the Lease) of Lessee that agrees in writing to assume and be bound by the obligations of "Lessee" hereunder (with a copy of such assumption provided to Lessor). Nothing contained in the Lease will be construed as creating a partnership, joint venture, association, trust, mining partnership, or other entity, whether for state law or federal income tax purposes.

10. The Lease contains other terms and provisions not herein set forth but incorporated by reference herein for all purposes. This Memorandum is executed for the purposes of placing all parties dealing with the Property, or with the improvements constructed on said Property, on notice of the existence of the referenced Lease and, where appropriate, its contents. This Memorandum does not modify the Lease. In the event of any conflict between the terms of this Memorandum and the Lease, the Lease shall control.

## CARBON-DIOXIDE STORAGE AGREEMENT

La. R.S. 30:209(4)(e) Operating Agreement

STATE OF LOUISIANA

PARISH OF EAST BATON ROUGE

THIS Operating Agreement (this "Agreement"), is entered into on the 13<sup>th</sup> day of October, 2021, to be effective on the Effective Date, by and between:

- (1) The State of Louisiana, and as to only "Specific Area of Interest A" described herein, the Louisiana Department of Wildlife & Fisheries and the Louisiana Wildlife & Fisheries Commission ("DWF") (collectively referred to herein as "State") acting through its authorized agent, the Louisiana State Mineral and Energy Board ("Board"), represented and undersigned by Samie S. Manuel duly authorized and whose mailing address is Post Office Box 2827, Baton Rouge, Louisiana 70821-2827; and
- (2) Air Products Blue Energy LLC, a Delaware limited liability company ("AP" or "Operator"), represented herein by Seifollah Ghossein duly authorized by a resolution of AP's Sole Member, a copy of which resolution is attached hereto and made a part hereof as Exhibit "A" and whose address is 1940 Air Products Blvd., Allentown, PA 18106-5500

In this Agreement, the State and AP may be referred to collectively as the "Parties" and individually as a "Party."

**WHEREAS**, the State is the owner of the Property located in the Parishes of Livingston, St. James, St. John the Baptist, Cameron, and Tangipahoa, State of Louisiana; and

**WHEREAS**, the properties that are the subject of this Agreement are approximately 122,455 acres in the parishes stated herein and are more particularly described below and depicted on Exhibits "B, C, and D", attached hereto and made a part hereof; and

**WHEREAS**, La. R.S. 56:1 delegates the Louisiana Wildlife & Fisheries Commission with the responsibility for protecting, conserving, and replenishing the natural resources of the State, subject to its supervision and control; and

INDUSTRIAL COMMISSION  
STATE OF NORTH DAKOTA

DATE 6/13/24 CASE NO 30869-880

Introduced By Bhaaten

Exhibit LO-45

BLF-000001

**WHEREAS**, La. R.S. 56:6(19) requires that the Louisiana Wildlife & Fisheries Commission, through its Secretary, shall in every possible way develop to their fullest proportions the natural resources of the State that are under its jurisdiction; and

**WHEREAS**, La. R.S. 56:8(117) defines Secretary as the secretary of the Department of Wildlife and Fisheries; and

**WHEREAS**, the Louisiana Department of Wildlife & Fisheries is an agency of the State as defined by La. R.S. 30:151; and

**WHEREAS**, DWF and the Board have entered into an Inter-Agency Agreement (“IAA”) which authorizes the Board to administer the properties owned by or under the jurisdiction of DWF for purposes of subsurface storage and pore space rights; and

**WHEREAS**, the IAA authorizes the Board to negotiate, award, administer and manage the existing and future oil and gas leases, operating agreements, subsurface storage agreements, and related activities/operations on DWF agency lands, and the Board, through the Office of Mineral Resources (“OMR”), has agreed to perform such services; and

**WHEREAS**, pursuant to La. R.S. 30:209, the State has the authority, upon a two-thirds vote of the members of the Board and after a public hearing conducted in the affected parish pursuant to La. R.S. 30:6, to enter into operating agreements whereby the State receives a share of revenues from the storage of Carbon Dioxide in whole or in part, as may be agreed upon by the Parties, in those situations where the Board determines it is in the best interest of the State either in equity or in the promotion of conservation to do so. The Board’s authority expressly extends to, but is not limited to, establishing a contractual agreement on unleased acreage to promote utilization of the State’s resources for Carbon Dioxide Storage. Further, pursuant to La. R.S. 30:209, the Board may do all other things that may appear to be necessary or desirable; and

**WHEREAS**, pursuant to La. R.S. 30:135, the Department of Natural Resources (“DNR”), through OMR, shall provide the necessary staff functions to assist the Board in its leasing, supervisory, and other activities; and

**WHEREAS**, this Agreement is entered into for the purpose of injecting Carbon Dioxide into certain geological strata or formations for permanent storage, in the general vicinity of the Properties more fully described below ("**Storage Reservoirs**"); and

**WHEREAS**, the Parties now enter into this Agreement to effect its terms and intent for the Injection, Storage, transportation, shipment, and Withdrawal of Carbon Dioxide Stream(s) and for all other purposes necessary or incidental thereto.

**NOW, THEREFORE**, the Parties, in consideration of the premises and the mutual benefits to be derived respectively by the State and AP, and the covenants and conditions set forth below, together with good and valuable consideration, the adequacy and sufficiency of which is hereby acknowledged and confessed by both Parties hereto, the State and AP do hereby agree and stipulate as follows:

The properties subject to this Agreement constitute approximately 122,455 acres and are situated in the Parishes of Livingston, St. James, St. John the Baptist, Cameron, and Tangipahoa, State of Louisiana, and are more particularly described as follows:

"**Specific Area of Interest A**" includes a tract comprised of 33,146 acres located in the Canal Bank area of the Maurepas Swamp Wildlife Management Area as more particularly described in Exhibit "B" to this Agreement;

"**Specific Area of Interest B**" includes the tract comprised of 57,100 acres consisting of Lake Maurepas as more particularly described in Exhibit "C" to this Agreement; and

"**Specific Area of Interest C**" includes the tract comprised of 32,209 acres consisting of Sabine Lake as more particularly described in Exhibit "D" to this Agreement.

Hereinafter, Specific Areas of Interest A, B, and C may be referred to collectively as "**Property**" or individually as a "**Specific Area of Interest**".

**FURTHERMORE**, the Parties agree and acknowledge that this Agreement allows AP to inject and store Carbon Dioxide Stream(s) beneath the Property only in the Storage Reservoirs thereof and for all other purposes necessary or incidental thereto and to create a limited relationship between the Parties whereby the State (i) will receive a share of revenues from the Storage of Carbon Dioxide Stream(s), as reflected in this Agreement, and (ii) will assume a portion of the risk

of the cost of such activities and the operation of Facilities as reflected in this Agreement, as the Board has determined that it is in the best interest of the State in equity and in the promotion of conservation to do so.

#### **Article 1 - Definitions**

- 1.1 **“Applicable Law(s)”** means any applicable, valid, final, and non-appealable federal or state statute, law, rule, regulation, or order, or any judicial decision, as may now be in effect or which may be enacted, adopted, or made effective at a future date. Applicable Laws include, without limitation, all statutes, laws, rules, regulations, orders, and judicial decisions that pertain to geologic or geophysical assessment of the Property, or construction, operation, monitoring, reporting, verification or closure of the Facilities, and any future amendments thereof, including, without limiting the generality of the foregoing, all such matters that pertain to protection of the environment, environmental matters, pollutants, minimum water quality standards, dredging, filling, local navigation, and/or health and safety matters.
- 1.2 **“Applicable Procedure(s)”** means the valid, final, and non-appealable standards, public processes, procedures, and rules applicable to the regulation of the Facilities, to the extent applicable, by the U.S. Environmental Protection Agency (“EPA”), Louisiana Office of Conservation (“OC”), DNR, and the Louisiana Department of Environmental Quality (“DEQ”), as well as any other State or federal regulatory bodies having jurisdiction over all or a part of any one or all of the Facilities.
- 1.3 **“Associated Substances”** means substances associated with, contained in, or incidental to the capture and/or Storage of Carbon Dioxide.
- 1.4 **“Carbon Dioxide”** means carbon dioxide including its derivatives and all mixtures, combinations, and phases, whether liquid or gaseous, stripped, segregated, or divided from any other stream, or produced from a chemical reaction.
- 1.5 **“Carbon Dioxide Stream(s)”** means a stream of Carbon Dioxide, plus Associated Substances and any substances added to the stream to enable or improve the Injection process. This subpart does not apply to any carbon dioxide stream, the Injection of which would be prohibited under Applicable Law(s).

- 1.6 **“Contract Year”** means the calendar year beginning on the Effective Date of this Agreement and ending on the first anniversary of the Effective Date and for every year thereafter from anniversary date to anniversary date.
- 1.7 **“Drill” or “Drilling”** means the act of boring a hole to reach a proposed location under the Property.
- 1.8 The term **“AP Group”** as used throughout this Agreement, means and includes AP and its directors, members, partners (general and limited), officers, agents, employees, contractors, subcontractors (of any tier), other representatives, and insurers, and each of its subsidiaries and affiliates, successors and assigns and their directors, members, partners (general and limited), officers, agents, employees, contractors, subcontractors, other representatives, and insurers, and each of them.
- 1.9 **“Facility/Facilities”** means the underground storage facility or facilities, including but not limited to, the Storage Reservoirs, and all related surface and subsurface Improvements and Equipment associated with underground Carbon Dioxide Storage in the Storage Reservoirs on or under the Property. When used in the singular it shall refer to one of the facilities located on or under the Property, and when used in the plural it shall refer to all of the facilities located on and under the Property.
- 1.10 **“Improvements and Equipment”** means all wells, pads, fixtures, equipment, machinery, and tools, including all pipelines, pipe, pipe casing, separators, condensers, evaporators, holding tanks, generators, compression equipment, measurement equipment, monitoring or testing devices or equipment, utility lines and facilities and any other surface or subsurface structures or equipment, and all alterations, additions, replacements, materials, parts, and components thereof, made, placed, installed or used, on, in or under the Property by AP.
- 1.11 **“Injection” or “Injected”** means the deposit of a Carbon Dioxide Stream into any of the Facilities.
- 1.12 **“Sequestration Protocols”** means any other protocols, standards, regulations or laws in addition to the obligations imposed by this Agreement, Applicable Law(s) and Applicable Procedure(s) relevant to AP and its Storage activities conducted pursuant to this

Agreement. To remove any doubt, the Sequestration Protocols shall not result in AP performing its obligations under this Agreement to a lesser standard than required under any Applicable Law(s), any Applicable Procedure(s) or this Agreement.

- 1.13 “**Storage**” means the activity of Injection or subsurface containment and/or Withdrawal of a Carbon Dioxide Stream into or from any of the Facilities, together with related Drilling, well completion, transportation, and all other operations conducted on or within any of the Facilities, and any other activities necessary or incidental thereto.
- 1.14 “**Storage Reservoir(s)**” means the geologic formation(s), reservoirs, saline aquifers, and pore space beneath the Property or Properties that have been or will be approved for Storage prior to Injection by the Louisiana Commissioner of Conservation in accordance with Applicable Law(s) and Applicable Procedure(s).
- 1.15 “**Withdrawal**” means the removal of any portion of a Carbon Dioxide Stream from any of the Facilities for the purpose of pressure or other maintenance or protection of the environment and public safety, all in accordance with and subject to Applicable Law(s), Applicable Procedure(s) and Sequestration Protocols. Withdrawal shall not include the withdrawal of any portion of a Carbon Dioxide Stream for the purpose of selling Carbon Dioxide, using Carbon Dioxide for other commercial purposes, or intentionally releasing the Carbon Dioxide Stream into the atmosphere, except as contemplated in this definition.

## Article 2 - Approval Process

2.1 Advertisement and Public Hearing. The Board, through OMR, shall cause this Agreement to be advertised in compliance with Applicable Law(s), and shall conduct a public hearing or hearings pursuant to and in accordance with La. R.S. 30:6, as required by La. R.S. 30:209 (the “**Public Hearing(s)**”).

2.2 Approval or Disapproval. Following the Public Hearing(s), the Board shall render its determination regarding approval or disapproval of this Agreement at a Board meeting. If the Board approves this Agreement by a two-thirds vote of its members, as required by La. R.S. 30:209, this Agreement shall be effective as stated in Section 2.3.

2.3 Effective Date. The “**Effective Date**” of this Agreement shall be the first date on which both of the following have occurred:

a) This Agreement has been signed by the duly authorized representative of AP;

AND

b) This Agreement has been approved by the Board in accordance with Section 2.2.

### Article 3 - Term

3.1 With respect to the termination and maintenance provisions set forth in the remainder of Article 3, each Specific Area of Interest shall be treated as completely separate areas. Pursuant to the provisions below, an action taken with respect to one Specific Area of Interest shall not apply to or affect another Specific Area of Interest. Thus, pursuant to the remaining provisions of Article 3, this Agreement may be maintained with respect to one Specific Area of Interest, and this Agreement may terminate with respect to another Specific Area of Interest.

3.2 Subject to earlier expiration because of the commencement of the Permit/Construction Term, the first three (3) years following the Effective Date of this Agreement shall be the “**Initial Term**”. This Agreement shall terminate at the end of the Initial Term with respect to a Specific Area of Interest on which AP has failed to apply for a permit to construct a Class VI injection well. However, upon a showing of good cause by AP (with such cause to be confirmed by the State), this Agreement may be extended for up to an additional two (2) years at the end of the Initial Term (“**Initial Discretionary Term**”) with respect to any Specific Area of Interest on which AP has failed to apply for a permit to construct a Class VI injection well. In order for AP to exercise this option, AP shall notify the State at least ninety (90) days prior to the expiration of the Initial Term that it wishes to exercise this option. If extended by an Initial Discretionary Term, then this Agreement shall terminate at the end of the Initial Discretionary Term with respect to any Specific Area of Interest on which AP has failed to apply for a permit to construct a Class VI injection well.

3.3 If prior to the end of the Initial Term or the Initial Discretionary Term (if applicable), AP has applied for a permit to construct a Class VI injection well on any Specific Area of Interest, then this Agreement shall be maintained only with respect to that individual Specific Area of Interest for an additional four (4) years from the end of the Contract Year in which the permit application is made (“**Permit/Construction Term**”). This Agreement shall terminate at the end of the Permit/Construction Term with respect to a Specific Area of Interest on which AP

has failed to begin Injection. However, at the end of the Permit/Construction Term, this Agreement may be extended, upon a showing of good cause by AP (with such cause to be confirmed by the State), for up to four (4) additional one-year periods ("**Permit/Construction Discretionary Term(s)**") with respect to any Specific Area of Interest on which AP has failed to begin Injection. In order for AP to exercise this option, AP shall notify the State at least ninety (90) days prior to the expiration of the Permit/Construction Term or the Permit/Construction Discretionary Term(s) (if applicable) that it wishes to exercise this option. This Agreement shall terminate at the end of the Permit/Construction Discretionary Term(s) with respect to any Specific Area of Interest on which AP has failed to begin Injection.

3.4 If prior to the end of the Permit/Construction Term or the Permit/Construction Discretionary Term(s) (if applicable), AP begins Injection at a Specific Area of Interest, then this Agreement shall be maintained with respect to that individual Specific Area of Interest for so long as Injection is occurring without a gap of more than one (1) year ("**Operational Term**"). Except for the rights described in the following subsection 3.5 and all other rights and provisions in this Agreement that expressly remain in effect and survive (or are intended to remain in effect and survive) following Injection, this Agreement shall terminate during the Operational Term with respect to a Specific Area of Interest on which there has been a gap of more than one (1) year without Injection. However, at the end of the Operational Term, this Agreement may be extended, one (1) or more times, by the State in the State's sole discretion ("**Operational Discretionary Term(s)**") with respect to any Specific Area of Interest on which there has been a gap of more than one (1) year without Injection. In order for AP to exercise this option, AP shall notify the State at least ninety (90) days prior to the expiration of the Operational Term or the Operational Discretionary Term(s) (if applicable) that it wishes to exercise this option. This Agreement, for purposes of Injection, shall terminate at the end of any Operational Discretionary Term with respect to a Specific Area of Interest on which there has been no Injection during the Operational Discretionary Term.

3.5 Following the expiration, termination or release (whichever occurs first) of this Agreement at any point in time on a Specific Area of Interest, AP shall remain responsible for, and this Agreement shall remain in effect as to, any and all restoration, closure, monitoring or other obligations and requirements imposed by this Agreement, Applicable Law(s) and Applicable Procedure(s), and AP shall have all necessary and incidental rights to access the Property and

utilize the Facilities to undertake such obligations and requirements. AP shall also retain all rights necessary or incidental to comply with any Sequestration Protocols related to restoration, closure, monitoring or other requirements established under such Sequestration Protocols. AP shall further retain all rights necessary or incidental to obtaining a Certificate of Completion of Injection Operations [as defined in the Sequestration Act (as hereinafter defined)] or other rights, credits, liability limitations, or releases afforded it under Applicable Law(s) or Applicable Procedure(s). For the avoidance of doubt, the right to permanently sequester the Carbon Dioxide Stream(s) shall survive the expiration, termination or release of this Agreement as to any point in time on a Specific Area of Interest.

#### **Article 4 - Payments**

As adequate and total consideration for the rights granted to AP pursuant to this Agreement, AP shall make the following payments to the State:

4.1 AP agrees to pay OMR on the Effective Date of this Agreement, a lump sum payment of fifty dollars (\$50) per each acre within each Specific Area of Interest which acreage is set forth on Exhibits "B," "C," and "D" attached hereto.

4.2 With respect to each Specific Area of Interest, for the period commencing on the Effective Date until its applicable Operational Term commences, AP shall pay OMR in arrears at the rate of fifty dollars (\$50) per year per acre contained in each Specific Area of Interest, as calculated in this Article 4. Payments under this Section 4.2 may be adjusted if acreage of an applicable Specific Area of Interest is released by AP in accordance with this Agreement. Payments under this Section 4.2 shall cease with respect to an applicable Specific Area of Interest if that entire Specific Area of Interest is released by AP or this Agreement otherwise expires or terminates with respect to a Specific Area of Interest and payments under this Section 4.2 shall further cease if this Agreement is terminated in its entirety. Payments due under this Section 4.2 shall be payable within fifteen (15) business days after the end of each Contract Year. For the avoidance of doubt, payments under this Section 4.2 shall be pro-rated for the number of applicable days within the given Contract Year if the Operational Term commencement, or expiration, termination or release of this Agreement associated with such payment, occurs during the given Contract Year rather than co-incident with the end of the Contract Year.

4.3 With respect to each Specific Area of Interest, upon the commencement of its applicable Operational Term, (i) the payment obligation set forth in Section 4.2 above shall cease for the given Specific Area of Interest, and (ii) thereafter for the given Specific Area of Interest, AP shall pay OMR in arrears, due and payable fifteen (15) business days after the end of each Contract Year during its applicable Operational Term (and during any Operational Discretionary Term, if applicable), an amount equal to the greater of (a) the product of the “**Annual Injection Fee Per Ton**”, as adjusted pursuant to Section 4.5, times the number of metric tons (“ton” or “tons”) of any Carbon Dioxide Stream Injected into a Facility in the given Specific Area of Interest under this Agreement during the given Contract Year of the Operational Term and/or Operational Discretionary Term, as applicable (such product being the “**Annual Injection Fee**”) in accordance and consistent with the annual Class VI permit monitoring and verification requirements, or (b) a minimum guaranteed annual payment (“**MGAP**”) calculated by multiplying the then current Annual Injection Fee Per Ton times the given applicable minimums stated below, determined as follows:

(a) For Specific Area of Interest A, the MGAP shall equal the product of the then current Annual Injection Fee Per Ton multiplied by one-half (0.5) million tons per year for each year of its Operational Term and/or Operational Discretionary Term, as applicable;

(b) For Specific Area of Interest B, the MGAP shall equal the product of the then current Annual Injection Fee Per Ton multiplied by (i) one (1) million tons per year for the first three (3) year period after commencement of its Operational Term, and (ii) two (2) million tons per year for each year of its Operational Term and/or Operational Discretionary Term, as applicable, thereafter; and

(c) For Specific Area of Interest C, the MGAP shall equal the product of the then current Annual Injection Fee Per Ton multiplied by one (1) million tons per year for each year of its Operational Term and/or Operational Discretionary Term, as applicable.

The “Annual Injection Fee Per Ton” shall initially be set at one dollar fifty cents (\$1.50) per ton, and thereafter shall be subject to adjustment pursuant to Section 4.5.

Each MGAP for a Specified Area of Interest shall be in lieu of, and not in addition to, a Specified Area of Interest’s Annual Injection Fee, and in no event shall both an Annual Injection Fee and MGAP be due by AP under this Section 4.3. No MGAP payment shall be due with respect

to a Specific Area of Interest that is released, expired or terminated from this Agreement. The payments under this Section 4.3 shall cease if and when an Operational Term (or Operational Discretionary Term, if applicable) terminates for an applicable Specific Area of Interest. For the avoidance of doubt, the MGAP payments under this Section 4.3 shall be pro-rated for the number of applicable days within the given Contract Year if the Operational Term (or Operational Discretionary Term, if applicable) commencement or termination, or the expiration, termination or release of this Agreement associated with such payment, occurs during the given Contract Year rather than co-incident with the end of the Contract Year.

4.4 If AP shall fail to perform any monetary payment obligation under this Agreement, then in such event the State shall cause a written notice to be served on AP, which notice shall declare it to be the intention of the State to terminate this Agreement if the default is not cured. AP shall have thirty (30) days after receipt of the aforesaid notice in which to remedy the nonpayment, and, if within such thirty (30) day period, AP does so remedy by paying the State the applicable monetary payment obligation required herein, then such termination notice shall be withdrawn and this Agreement shall continue in full force and effect. In the event that AP fails to remedy the nonpayment within such thirty (30) day period, this Agreement shall be terminated and of no further force or effect from and after the expiration of such thirty (30) day period with respect to the applicable Specific Area of Interest that is subject to the payment default. The State shall be entitled to any penalties and interest authorized by Applicable Laws.

4.5 AP agrees that the Annual Injection Fee Per Ton shall be adjusted in the event the 45Q tax credit received by AP increases above the base rate of fifty dollars per ton (\$50/ton), as follows: at the close of each Contract Year during the Operational Term (or Operational Discretionary Term, if applicable), the Annual Injection Fee Per Ton shall be increased by an amount equal to nine percent (9 %) of any such increase above such base rate of fifty dollars per ton (\$50/ton) during such Contract Year. For the avoidance of doubt, such adjustment shall mean that the applicable MGAP calculated for each Specific Area of Interest shall also be increased by a proportionate equivalent amount. In no event shall the adjusted Annual Injection Fee Per Ton decrease. When AP is no longer in receipt of 45Q tax credits, the Annual Injection Fee Per Ton for a given Specific Area of Interest shall be fixed for the balance of the term of this Agreement with respect to such a Specific Area of Interest at its then current value.

4.6 AP agrees and acknowledges that by reason of a Withdrawal pursuant to Section 5.4, AP shall not be entitled to a refund of the Annual Injection Fee paid to the State for the Carbon Dioxide Stream previously Injected and Withdrawn. However, the State agrees that AP shall not be required to pay an Annual Injection Fee for the Withdrawn Carbon Dioxide Stream reinjected into any Storage Reservoirs on the Property. Furthermore, AP agrees and acknowledges that it shall not be entitled, by reason of expiration or termination of this Agreement, or voluntary release of acreage by AP, to any refund of any bonus, rental or other payments previously paid, nor be released from the obligation required by Section 4.3 to pay the MGAP for each applicable Specified Area of Interest.

4.7 Except as otherwise approved by OMR in writing, AP shall make each payment owed to the State under this Agreement by electronic fund transfer using the Automated Clearing House (ACH) Network service pursuant to the institution transfer instructions. The electronic-fund transfer shall be from a banking institution in the United States in U.S. Dollars payable to the "Office of Mineral Resources" into the account identified by OMR, or to any other account as OMR may from time to time designate to AP. In the event AP is not able to transfer the fund via ACH, it may obtain approval from OMR to use a different method of payment.

4.8 Together with every Annual Injection Fee or MGAP made to the State, AP shall include information reasonably required by OMR and readily available to AP, detailing the amount of any Carbon Dioxide Stream Injected into each Facility that was used to calculate the Annual Injection Fee or MGAP. The information required herein shall be submitted to OMR in accordance with OMR's format specifications and consistent with the Class VI permit monitoring and verification requirements.

4.9 AP shall also pay to the State an amount consistent with the appropriate schedule (either the DWF or State Land Office schedule in effect as of the Effective Date) for pipeline right-of-ways for any pipelines installed on State or DWF owned land or water-bottoms, located inside the Property. Pipelines as that term is used in this Section shall not include flow-lines which are located on the Property and necessary for Storage under the Property ("**Storage Lines**"). Furthermore, AP agrees to consult DWF and/or the State Land Office for approval of the placement location of said pipelines (excluding Storage Lines) and AP agrees to install the pipelines (excluding Storage Lines) in accordance with the requirements of DWF and/or the State Land

Office. This Agreement does not provide for nor address pipeline right-of-ways located outside the Property.

#### Article 5 - Rights

The State, pursuant to the authority of La. RS. 30:209 and other Applicable Law(s), does herein grant and retain certain rights, subject to the conditions herein set forth and immediately as of the Effective Date the following exclusive rights:

##### State's Rights

5.1 Exploration of Oil and Gas. The Parties acknowledge and agree that the State shall have the right to carry on, in and upon the Property, such operations necessary for and in connection with the discovery, extraction, preparation, utilization, removal and sale of any and all minerals above and below the Storage Reservoirs subject to any requirements or restrictions imposed by Applicable Law(s) and Applicable Procedure(s). However, the State's rights are to be exercised so as not to unreasonably interfere with, and with due regard for, the operations to be carried on by AP in accordance with this Agreement.

5.2 Drill-Through Rights. AP agrees and acknowledges that this Agreement does not prohibit a lessee or operator of a state lease or operating agreement granted for the development and production of minerals, oil, or gas on the Property from the right to drill and extract above the Storage Reservoirs or to drill and extract below the Storage Reservoirs, provided that the Storage Reservoirs are not penetrated by such drilling or extraction activities. The lessee or operator of a State lease or operating agreement must exercise its rights in accordance with the rules for a Class VI well or other rules and orders issued by the Commissioner of Conservation and this Section 5.2 in order to protect the applicable Facilities and/or the surrounding properties against pollution and/or against the escape or migration of any Carbon Dioxide Stream from the applicable Storage Reservoirs, and in accordance with the requirement of Section 5.5 below, and all Applicable Law(s) and Applicable Procedure(s). The State agrees and acknowledges that AP shall have the right to drill through any geologic formations, reservoirs, saline aquifers and/or pore spaces beneath the Property, subject to the rules for a Class VI well or other rules and orders issued by the Commissioner of Conservation, and all Applicable Law(s) and Applicable Procedure(s). Notwithstanding the foregoing, and for the avoidance of doubt and to provide additional clarity, the Parties agree that drilling or extraction that penetrates the Storage Reservoirs or its Carbon

Dioxide “storage complex” (as such term is defined under the most expansive definition required to ensure certification or classification of the Carbon Dioxide sequestration as permanent under any protocols, standards, regulations or laws relevant to AP and its Storage activities conducted pursuant to this Agreement) is prohibited (the “**Drill-Through and Extraction Restrictions**”). Further, notwithstanding any provision in this Agreement to the contrary, the Drill-Through and Extraction Restrictions set forth in this Section 5.2 of this Agreement shall ensure the “permanence” (as such term is defined under the most expansive definition required to ensure certification or classification of the Carbon Dioxide sequestration as permanent under any protocols, standards, regulations or laws relevant to AP and its Storage activities conducted pursuant to this Agreement) of the Sequestered Carbon Dioxide Stream which is currently for at least 100 years.

5.3 Property Access. (a) Pursuant to La. R.S. 30:127(G), AP shall maintain and preserve the public’s access to public waterways throughout the Property covered by this Agreement; (b) Subject to the provisions of La. R.S. 30:127(G), AP is permitted to enclose (including by way of fencing) and protect the Injection well site portions of the Facilities or other portions of the surface Facilities as may be required by applicable Sequestration Protocols; (c) AP shall grant the State, or any other person or entity acting on behalf of the State, access at all reasonable times via any road or waterway to inspect the Property to ensure compliance with all requirements of this Agreement or to exercise any right reserved explicitly or impliedly in this Agreement; and (d) The State retains the right to sell, exchange, transfer, or otherwise dispose of all or any portion of the Property and all rights in the Property not expressly granted to AP or necessarily implied by this Agreement. Further, the State shall have the right to use any and all portions of the Property for any purpose or to issue rights-of-ways and servitudes upon the Property, provided doing so does not unreasonably interfere with the rights of AP. For the avoidance of doubt, DWF retains the right to access the Properties to carry out its statutory duties, authorities, and programs, subject to AP’s rights under this Agreement.

#### AP's Rights

5.4 Permitted Purposes. AP is hereby granted, for itself and its affiliates, the right to use the Property for all purposes and rights granted in this Agreement, including, without limitation, the sole and exclusive right to use and occupy the Property for the purposes and rights

set forth in this Agreement, and the full control of all operations in connection with the construction, preparation, installation, maintenance, operation, expansion, enlargement, modification, replacement, repair, and disposition of the Facilities, Injecting any Carbon Dioxide Stream into the Storage Reservoirs, the installation, maintenance, repair, replacement and removal of Improvements and Equipment, the Injection, Storage, transportation, shipment, handling, transmission, Withdrawal, or other disposition of Carbon Dioxide Stream(s) Stored, or to be Stored from time to time, in each Facility, and monitoring each Facility and/or Storage Reservoirs (collectively, without limitation, the “**Permitted Purposes**”), subject to Applicable Law(s) and Applicable Procedure(s). As to Specific Area of Interest A, AP shall exercise its rights in accordance with the attached Schedule 1.

AP agrees that the Carbon Dioxide Stream(s) Injected for Storage in the Storage Reservoirs as contemplated by this Agreement is intended to be permanent. As such, any Withdrawal of Carbon Dioxide from any Storage Reservoirs shall, to the extent reasonably practicable, be reinjected into any of the Storage Reservoirs listed in this Agreement or any other Class VI injection well permitted by the State. For the avoidance of doubt, the de minimis incidental release of any portion of a Carbon Dioxide Stream from any of the Facilities (a) shall not constitute a Withdrawal requiring re-injection or (b) otherwise be prohibited by this Agreement.

5.5 Incidental Rights. Without limiting the foregoing, and for the avoidance of doubt, AP also shall have the sole and exclusive right to control, conduct, or perform all activities on the Property as may be necessary or incidental to the Permitted Purposes, including, but not limited to: (a) installing (including Drilling), maintaining, replacing, removing, monitoring, inspecting, testing, and/or operating the Improvements and Equipment necessary or incidental to constructing, maintaining, operating, monitoring or testing the Facilities or Storage Reservoirs; (b) performing mechanical integrity tests or other tests as may be desirable to determine Storage Reservoirs’ capacity, limits, safety and/or integrity, or to comply with Applicable Law(s); (c) Injecting Carbon Dioxide Stream(s) for pressure maintenance in operations, mechanical integrity activities, or other lawful purposes; (d) transporting of Carbon Dioxide Stream(s); (e) performing any corrective action required pursuant to Applicable Law(s), Applicable Procedure(s) and Sequestration Protocols; (f) dredging in connection with constructing, maintaining, operating or monitoring the Facilities; (g) constructing, operating, and maintaining utility lines, fuel lines and pipelines and facilities related thereto to construct, operate maintain, or monitor the Facilities; (h) constructing,

operating, and maintaining pipelines for the transport of Carbon Dioxide Stream(s); (i) storing and using such quantities of fuel oil and other materials or substances as may be reasonable in connection with the Facilities; (j) accessing the entire Property as necessary to conduct any activities contemplated by this Agreement; and (k) viewing and performing testing, such as geological and geophysical surveys, seismic tests, and other testing and data relating to the Property and Storage Reservoirs to determine the capacity and suitability of the Storage Reservoirs and the Property for the Permitted Purposes. AP agrees it shall comply with the standard seismic regulations and requirements administered by DWF, for any geophysical or geological surveys and operations conducted within a wildlife-management area or wildlife refuge. These rights do not include the right to withdraw water from State owned water bottoms on the Property, except as may be necessary to support the activities of AP contemplated by this Agreement, and only to the extent allowed by, and in conformity with, Applicable Law(s) and Applicable Procedure(s).

5.6 In exercising its sole operational control and discretion, AP shall conduct all operations on or under the Property as a reasonably prudent operator, in a good and workmanlike manner, and in compliance with all Applicable Law(s) and Applicable Procedure(s).

5.7 Without limiting the foregoing, AP shall be responsible for obtaining all necessary permits and satisfying the insurance, bonding, fee and other obligations mandated by Applicable Law(s) and/or Applicable Procedure(s) regarding each Facility. Once obtained, such permits shall be deemed to be Applicable Law(s) with which AP will be responsible to comply.

5.8 Except subsequent to a transfer of ownership pursuant to La. R.S. 30:1109(A) or such successor statute thereto, wells, compressors pipelines, tank batteries, and Improvements and Equipment placed in or on the Property after the date hereof and used in connection with operations hereunder, shall be owned and controlled by the Operator and the State shall have no interest (ownership, controlling or otherwise) therein whatsoever. However, nothing herein stated shall deprive the State of the right to file a lien for unpaid cost or damages nor any other agency from levying any other costs or damages or enforcing any other rights commensurate with the authority granted by the State.

5.9 Except for any costs and expenses paid from the Carbon Dioxide Geologic Storage Trust Fund (established by La. R.S. 30:1110) in accordance with Applicable Law(s) and Applicable Procedure(s), all costs and expenses incurred in connection with Storage operations in,

on or under the Property or associated with the Facilities, including carrying out any Permitted Purposes or exercising any Incidental Rights, shall be borne solely by the Operator. The State shall be held free and harmless from liability or responsibility for any and all costs and expenses so incurred under the terms of this Agreement.

5.10 Nothing in this Section shall prohibit the State, acting in its capacity as a regulatory authority (through the OC, DEQ, or other regulatory authority), from enforcing all Applicable Law(s) and Applicable Procedure(s), specifically including any applicable environmental or underground injection/storage laws and regulations. For the avoidance of doubt, DWF retains the right to access the Properties to carry out its statutory duties, authorities, and programs, subject to AP's rights under this Agreement.

5.11 Correlative Rights. The Parties, their successors and assigns, agree to exercise their respective rights granted herein with reasonable regard for the rights of the other and shall use only so much of the Property, including its surface, as is reasonably necessary to conduct their operations. The exercise of the rights granted herein shall be subject to the provisions of Applicable Law(s) and Applicable Procedure(s), including, without limitation, Articles 11 and 22 of the Louisiana Mineral Code (La R.S. 31.1, *et seq.*).

#### Article 6 - Insurance

6.1 Coverage Required. Within thirty (30) days of the Effective Date, AP shall pay all costs and/or premiums, for policies of insurance, providing coverage against third party claims relating to the Facilities, including the Property, with a carrier approved in the State of Louisiana and rated by AM Best or a similar agency not lower than "A-" with a surplus size of "VII or higher." The policies of insurance shall be maintained in full force until the termination or expiration of this Agreement and continuing until all obligations are fulfilled. Such commercial general liability policies shall name the State as an additional insured. Such policies of insurance shall be subject to the terms and conditions of the policies and shall have the following limits:

A. For bodily injury, One Million (\$1,000,000) Dollars per occurrence, with a Two Million (\$2,000,000) Dollars aggregate.

B. For property damage which is not considered to be environmental damage, One Million (\$1,000,000) Dollars per occurrence, with a Two Million (\$2,000,000) Dollars aggregate.

C. For environmental damage, Ten Million Dollars (\$10,000,000) for each occurrence.

6.2 Proof of Insurance. AP shall provide the State with current certificates of insurance demonstrating compliance with the requirements of Sections 6.1 above (a) within forty five (45) days of the Effective Date; (b) within fifteen (15) days following annual policy renewals during the term of this Agreement; and (c) within fifteen (15) days of each reasonable request therefor by the State. Such certificates of insurance shall contain the requirements that (i) those insurance companies provide thirty (30) days' prior written notice of any cancellation or termination of those insurance policies as stated on a standard accord cancellation form or such similar form, and (ii) the insurance companies providing commercial general liability insurance waive any right of subrogation in favor of the State limited to the extent of obligations and liabilities assumed by AP under this Agreement.

6.3 Insurance Default Remedies, Notice and Cure Rights. In the event notice of cancellation of the insurance required by Section 6.2 is given and another certificate of insurance evidencing the issuance of another policy meeting all the terms and conditions of Section 6.2 is not furnished prior to cancellation [and except where such failure to furnish same is excused due to an Incident or any other provision of this Agreement or Applicable Law(s)], the Injection rights of AP under this Agreement shall automatically and without further notice to AP, be suspended (but not terminated), and AP shall immediately suspend Injection under this Agreement. For avoidance of doubt, rights necessary to maintain the viability of the Storage Reservoirs and the Facility or Facilities for the purposes hereof and as necessary for health, safety, and/or environmental concerns shall be permitted at all times. The reinstatement of the requisite insurance coverage as evidenced by the certificate showing same to the State shall immediately thereon lift the suspension and allow AP to resume Injection. Should AP fail to obtain coverage within one hundred twenty (120) days after receiving a written notice and request to obtain insurance from the State, this Agreement may terminate at the option of the State.

#### Article 7 - Bankruptcy and Security

7.1 The Operator agrees to acknowledge and verify in any appropriate manner to any bankruptcy court or to any other authority, and hereby also acknowledges and verifies, that the Annual Injection Payments required in Article 4 are not a part of AP's estate, and that the estate

has no claim or interest therein. AP further acknowledges that all legal and equitable title to any portion of the payments owed to the State is vested in the State and that AP relinquishes all dominion, control, and title to the same. AP and the State agree that so long as this Agreement remains in effect, this Agreement is an executory contract and unexpired within the meaning of Section 365 of the United States Bankruptcy Code.

7.2 The Operator shall furnish any bond or other security, required by Applicable Law(s), to cover the Operator's obligations for closure and post-closure activity.

#### **Article 8 – Indemnification**

8.1 The Operator unconditionally agrees that it will respond to, investigate, provide defense for, protect against, save, indemnify, and hold free and harmless the State, the Board, DNR, OMR, DWF, the Board members, DNR's, OMR's and DWF's employees and other representatives of, from, and against any and all demands, claims, causes of action, damages, judgments, costs, fees, expenses and attorney's fees arising from any harm, loss, injury or death to any person, or any harm, loss, damage or destruction of any property, THAT MAY ARISE OUT OF, OR BY REASON OF, THE PERFORMANCE OF ALL SERVICES, ACTIVITIES, OBLIGATIONS, DUTIES AND OPERATIONS UNDER THIS AGREEMENT BY AP, THE OPERATOR, OR ANY OF ITS EMPLOYEES, AGENTS, CONTRACTORS, SUBCONTRACTORS, OR OTHER REPRESENTATIVES, OR ANY OTHER MEMBER OF THE AP GROUP, due to their negligence, commission or omission, and of and from any and all costs and expenses relating to the defense of any such claims, including reasonable attorney's fees incident thereto.

#### **Article 9 – Inspection, Records and Audit Rights**

9.1 Subject to compliance with AP site rules and requirements, and provided that the State treats such information as strictly confidential to the extent allowed by Applicable Law(s) and Applicable Procedure(s), the State, or any person or entity acting as agent, representative or under the authority of the State shall have the right, at all reasonable times and upon reasonable notice, to examine, audit or inspect all books, records, accounts, statements, maps, plans, seismic or geologic data, diagrams and other such documents pertaining to Operator's Storage, Injection and calculation of payments required under Article 4 from the Effective Date of this Agreement. Except as provided in Section 9.2, AP shall only be required to maintain the foregoing items for

ten (10) years, but AP reserves the right to retain any and all such items for such longer period as AP deems necessary or desirable to ensure compliance with any Sequestration Protocols.

9.2 AP shall preserve all books and records used to calculate the payments required under Article 4 for as long as required by Applicable Law(s). AP shall reasonably cooperate with the State in any such audit and the State shall conduct said audit as not to unreasonably interfere with AP's operations.

9.3 AP shall provide access to accurate records concerning AP's payment obligations due under this Agreement with respect to each Facility required by Article 4, including but not limited to all accounts hereunder showing the amounts of Carbon Dioxide that have been Injected, are in Storage or have been Withdrawn from each Facility; provided that the State treats such records as strictly confidential, to the extent allowed by Applicable Law(s) and Applicable Procedure(s). The State may seek penalties in the event such accurate records are not timely provided in accordance with this Agreement and Applicable Law(s). The State and its agents shall, subject to all AP site safety rules and requirements, have the right, upon reasonable prior notice to AP and during normal business hours, to review such records created and maintained by AP concerning the design, construction, maintenance, modification, and physical operation of each Facility only in so far as such records are directly related to the calculation of payments required under Article 4 of this Agreement. Subject to all AP site safety rules and requirements, the State and any of its duly authorized representatives shall have access at all times to each Facility, the Property, and to any wells or Improvements and Equipment associated with the Facilities and to all records and reports directly related to Operator's Injection and to the calculation of payments required under Article 4 of this Agreement. AP shall reasonably cooperate with the State in any such review, and any such review shall be at the sole cost of the State and shall be done so as not to unreasonably interfere with AP's operations. To the extent that such information is received or acquired by the Operator from or in connection with operations hereunder subsequent to the date hereof, the Operator agrees, upon written request by the State, to furnish timely to the State any and all well data associated with the Facilities, provided that, to the extent allowed by Applicable Law(s) or Applicable Procedure(s), the State treats such records as strictly confidential.

9.4 For avoidance of doubt, all information obtained by the State pursuant to this Article 9 shall be treated as strictly confidential by the State to the fullest extent allowed by Applicable Law(s) and Applicable Procedure(s).

#### **Article 10 - Release of Acreage**

Upon its own initiative, AP may release acreage by notifying the State in writing, at least thirty (30) days prior to the release, of its intent to do so and identifying the specific acreage to be released in the manner and format required by the State. Upon release of the acreage, AP shall lose any rights for Storage of Carbon Dioxide Stream(s), incidental rights, or undertaking any activities to carry out Permitted Purposes on the portion of the Property released, except for the rights described in Section 3.5 of this Agreement and this Article 10. Additionally, AP shall be required to undertake restoration, closure and post-closure activities in accordance with this Agreement for that acreage that has been released. Upon completion of any required restoration, closure, post-closure, and monitoring obligations in this Agreement for the portion of the Property being released, the amount required to be paid to the State by AP under its obligation to make payments for acreage included under this Agreement pursuant to Section 4.2 shall be reduced by the amount of acreage released from the date of such release going forward.

#### **Article 11 – Closure, Post-Closure and Monitoring Activities**

11.1 Except for any activities undertaken by the State following issuance of a Certificate of Completion of injection operations (if sought by AP) pursuant to the Sequestration Act [or other Applicable Law(s)] at each Facility, upon the termination of this Agreement (for purposes of Injection) or upon release of specific acreage (and then only as to that released acreage), at its sole cost and expense, AP shall close the Facilities in conformity with any and all Applicable Law(s), Applicable Procedure(s) and this Agreement (including, without limitation, the Restoration Obligations) regarding closure and post-closure. AP has the continuing right to use the Property under this Agreement to perform its closure and post-closure activities (including any monitoring of the Storage Reservoirs) following termination of this Agreement for Injection Purposes or a release of acreage.

11.2 AP shall cause to remain in full force and effect the insurance coverage required by Article 6 and any bond required pursuant to Section 7.2 until such time as the action contemplated by Section 11.1 shall be completed.

11.3 Notwithstanding anything in this Article 11 to the contrary, AP retains the right to conduct its closure and post-closure obligations in conformance with Sequestration Protocols. As such, even if AP does seek and obtain a Certificate of Completion in conformance with the Sequestration Act [or other Applicable Law(s)], AP shall retain all rights necessary or incidental to enable it to conform to any Sequestration Protocols.

#### **Article 12 - Surface Use and Restoration**

##### **12.1 Surface Use.**

(a) AP shall comply with and be subject to all Applicable Law(s) which govern: waste disposal, storage, treatment, transportation, or management; environmental quality (regardless of the environmental media involved); geologic Storage of Carbon Dioxide; navigation; archeological resources; cemeteries; coastal resource management; and wetlands protection and restoration.

(b) AP shall conduct operations as a prudent operator using standard industry practices and procedures and proper safeguards, including taking necessary preparations and precautions to prevent and remedy pollution, fire, explosion, and environmental damage to the Property. AP shall be responsible, unless otherwise limited by La. R.S. 30:1109 and La. R.S. 30:1111(as amended or any successor statutes thereto), for all damage to the Property caused by AP's or AP Group's operations including, but not limited to loss or damage to timber, crops, roads, buildings, fences, bridges, soil, surface and subsurface water, aquifers and vegetation and all environmental damage. Unless otherwise provided by La. R.S. 30:1109 and La. R.S. 30:1111, (as amended or any successor statutes thereto), this responsibility shall be irrespective of whether such damage is due to AP's or AP Group's negligence or to the inherent nature of AP's or AP Group's activities or operations. For the avoidance of doubt, this provision applies as to the Parties only and it is not intended to apply to or be for the benefit of any third persons.

(c) AP shall report all unpermitted and reportable discharges on the Property as required by Applicable Law(s).

(d) AP shall, at its sole cost and expense, keep and maintain all Improvements and Equipment on the Property utilized, owned, placed and/or caused to be placed by AP and all Facilities appurtenant to such Improvements and Equipment in good order and repair and in the appropriate condition for the safe conduct of any activities or enterprises conducted on the Property

pursuant to the rights granted hereunder, in each case as a prudent operator using standard industry practices and procedures and proper safeguards and in accordance with Applicable Law(s).

#### 12.2 Restoration.

(a) Except as otherwise set forth in this Agreement [including this Section 12.2(a)], AP shall be obligated to plug and abandon all wells owned, utilized, placed or caused to be placed by AP on the Property no longer necessary for the Permitted Purposes; to remove from the Property all Improvements and Equipment owned, utilized, placed or caused to be placed by AP which are no longer utilized for the Permitted Purposes; and to the extent caused by AP's activities on the Property, restore the surface of the Property, as near as practicable, to the condition existing on the Effective Date of this Agreement ("**Restoration Obligations**"), all at AP's sole risk, cost and expense and subject to compliance with Applicable Law(s) and Applicable Procedure(s). Unless doing so would be in violation of Applicable Law(s), AP shall complete the Restoration Obligations within a reasonable time (but no later than eighteen (18) months, subject to extension for Force Majeure or any Suspending Events) following: (a) the date said wells, structures or facilities are no longer necessary for Permitted Purposes; or (b) the date this Agreement has expired, terminated or been released (whichever occurs first) as to all or a portion of the Property. Notwithstanding anything contained in this Agreement to the contrary, to the extent permitted by Applicable Law(s) and Applicable Procedure(s), AP shall be allowed to abandon in place Improvements and Equipment below the surface of the Property; however, to the extent any Improvements and Equipment (other than well bores) sought to be abandoned in place are located on a portion of the Property managed by DWF, then abandonment in place for such Improvements and Equipment shall be determined after consultation with DWF in accordance with the applicable provisions of Schedule 1. The failure of AP to timely complete the Restoration Obligations shall subject AP to and make AP liable for any and all costs or expenses of any kind incurred by the State for plugging said wells or removing said structures or facilities, but in no instance shall title to or ownership of said facilities automatically vest in or transfer to the State nor shall said wells, structures or facilities be deemed "improvements" to the Property for purposes of vesting title in same to the State. Notwithstanding anything in the foregoing to the contrary, AP retains the right to perform its Restoration Obligations and such related obligations in accordance with any other Sequestration Protocols.

(b) The State recognizes AP's right to draw and remove casing from wells and, further, to remove any structures and facilities no longer utilized for Permitted Purposes on the Property.

### **Article 13 - Warranty of Title and Use**

13.1 **Warranty of Title.** Notwithstanding any provision herein to the contrary, this Agreement is granted and accepted without any warranty of title and without any recourse against the State whatsoever, either express or implied. As such, the Parties acknowledge and agree that the State shall not be required to return any payments received pursuant to this Agreement, even notwithstanding any subsequent litigation or judicial decrees, orders, or rulings regarding title to all or any part of the Property or otherwise be responsible to AP therefor. AP represents that it has investigated the title or is satisfied with such title as the State may have. The State hereby disclaims any covenant of quiet enjoyment or peaceful possession of the Property.

13.2 **Warranty of Use.** The State makes no warranties as to the condition of the Storage Reservoirs and AP accepts the Storage Reservoirs "AS IS". The State has no obligation to make any repairs, additions or improvements to the Storage Reservoirs, and the State does not warrant the suitability of the Storage Reservoirs for any purposes intended by AP or contemplated by this Agreement.

13.3 **Termination for Lack of Title.** Notwithstanding anything stated in this Agreement to the contrary, this Agreement shall terminate, as to the portion of the Property implicated, if it is determined by a court of competent jurisdiction (and any applicable appeal delays have run or have been exhausted) that the State does not have title to the Property.

### **Article 14 - Force Majeure and Suspending Events**

(A)(1) If, at any time this Agreement is being maintained by Injection occurring on a Specific Area of Interest, and Operator is prevented from continuing Injection by the occurrence of a Force Majeure or Suspending Event as defined in this Article, ("**Incident**"), and Operator cannot maintain this Agreement under any other operative provision of this Agreement, then and only then shall the date for Operator to re-commence Injection in order to maintain this Agreement be postponed on a day-for-day basis for so long as the adverse effects of the Incident continue, providing that Operator provides OMR with notice in accordance with section (B) of this Article and that Operator is diligently, reasonably, and in good faith attempting to mitigate and eliminate the effects of the Incident to the extent such mitigation is within Operator's control. The occurrence

of an Incident shall not maintain this Agreement for more than twelve (12) months from the date of the Incident onset unless extended by the State.

(2) A determination as to whether Operator can utilize this Article and whether Operator has complied with the requirements thereof is at the sole, reasonable discretion of the State. If an Incident has occurred, the Operator is still required to make the MGAP and Annual Injection Fee payments required by Article 4 of this Agreement.

(B) Within ninety (90) days of the Incident onset, Operator shall submit a written notice containing the following: (1) the onset date, description and nature of the Incident; (2) the effects preventing continuation of Injection; (3) a description and evidence of Operator's diligent, reasonable and good faith efforts to mitigate and eliminate the effects of the Incident and to resume Injection; (4) an estimated time for resumption of Injection; and (5) any other information or documentation evidencing the existence of the Incident reasonably requested by the State. Notice given beyond ninety (90) days shall not be considered reasonable notice and the application may be denied by the State barring consequential extenuating circumstances.

(C) Every thirty (30) days following the notice required in section (B) of this Article, Operator shall be required to submit written, detailed reports on a monthly basis to OMR giving therein a description and evidence of Operator's diligent, reasonable, and good-faith efforts to mitigate and eliminate the effects of the Incident and to resume Injection. If the reports are not timely submitted or if Operator did not attempt in good faith to mitigate the effects of the Incident, the State, after notice and opportunity to be heard, may declare the Incident recognition to be ended and that Operator may not after such failure utilize this provision to excuse any failure to comply with any obligations of this Agreement relating to the particular Incident involved.

(D) A "**Force Majeure**" event is a fortuitous event that is beyond the Operator's control and is not ultimately determined to be caused by the Operator or due to the Operator's negligent or intentional commission or omission, or failure to take reasonable and timely foreseeable preventative measures that would have mitigated or negated the effects of the event. An example of a Force Majeure event may include, depending on the specific circumstances involved: (1) a major storm, major flood, or other similar natural disaster; or (2) a major accident such as a blowout, fire, or explosion, which prevents the occurrence of an act or event that would otherwise extend the effectiveness of this Agreement or prevent its termination.

(E) “Suspending Event” includes: (1) the lack of availability, after the Operator has diligently, timely and in good faith attempted to secure same, of any required equipment, materials and/or personnel, such as the specific type of rig or specific type of casing or drill pipe necessary for the occurrence of an act or event that would otherwise extend the effectiveness of this Agreement or prevent its termination; or (2) the unreasonable or unexpected delay by any government agency or political subdivision in granting, modifying, or reinstating permits necessary for the occurrence of an act or event that would otherwise extend the effectiveness of this Agreement or prevent its termination (e.g., delays relating to permits for the expected Carbon Dioxide source plant or facility); or (3) an order of any federal or state court of competent jurisdiction preventing or suspending the occurrence of an act or event that would otherwise extend the effectiveness of this Agreement or prevent its termination; or (4) the act of a third party, not under the control or at the instigation of the Operator, in shutting down and unreasonably refusing to reopen any pipeline, plant, or facility through which a Carbon Dioxide Stream for a Facility are necessarily emitted or passed through as part of the capture, transport or Injection of a Carbon Dioxide Stream (and provided there is no other reasonably economical method or alternative of carrying on Injection of a Carbon Dioxide Stream) so as to prevent the occurrence of an act or event that would otherwise extend the effectiveness of this Agreement or prevent its termination; or (5) any delays lasting one-hundred eighty (180) days or more due to shut downs, closures, repairs, maintenance or damage events to any pipeline, plant or facility through which a Carbon Dioxide Stream for a Facility is emitted or passed through as part of the capture, transport or Injection of a Carbon Dioxide Stream; or (6) other events not described herein that may be recognized by the State.

#### **Article 15 - Miscellaneous Provisions**

15.1 It is understood and agreed that this Agreement shall not create the relationship of a partnership between the Parties hereto, and that no act done by any Party pursuant to the provisions hereof shall operate to create such relationship, nor shall the provisions of this Agreement be construed as creating such relationship.

15.2 It is expressly provided herein that neither this Agreement, nor anything herein contained, nor any of the data, maps, or exhibits considered in connection herewith, whether attached hereto or not, nor any course of conduct followed by any Party hereto pursuant to this Agreement, shall ever be considered to be or permitted to serve as a basis of estoppel against any

Party hereto in question of title, where title to Property or a portion of the Property is in dispute, anything herein contained to the contrary notwithstanding.

15.3 This Agreement shall extend to and be binding upon the successors, assigns, and successive assigns of the Parties; however, it is understood and agreed that no future assignments of the rights granted hereunder shall be effective unless and until such assignment or assignments are first approved by the State, through either DWF or the Board (depending on the Specified Area of Interest subject to the assignment), and same shall be subject to any reasonable conditions imposed by DWF or the Board (depending on the Specified Area of Interest subject to the assignment) in giving its approval, which approval shall not be unreasonably withheld, conditioned, delayed, or denied.

15.4 Payments, notices, reports, statements, and any and all written documents herein required to be given or furnished by any of the Parties hereto shall be in writing and mailed or delivered (via nationally recognized overnight courier or hand delivery), to the following addresses of the Parties hereto, to-wit:

If to the State:                      Department of Natural Resources  
Attn.: State Mineral and Energy Board  
Post Office Box 2827  
Baton Rouge, Louisiana 70821-2827

If to the Operator:                Air Products Blue Energy, LLC  
Attention: Corporate Secretary  
1940 Air Products Boulevard  
Allentown, Pennsylvania 18106-5500  
Telephone No.: 1-610-481-4880  
Fax No.: 1-610 481-5765  
Email: CorpSec@airproducts.com

15.5 This Agreement shall be recorded in the conveyance records of all Parishes where the Property is located in order to notify all interested third parties (including, without limitation, any lessees or other users or occupants of the Property) of the exclusive use of the Storage Reservoirs below the surface of the Property for permanent Carbon Dioxide sequestration and the restrictions pertaining thereto (including, without limitation, the Drill-Through and Extraction

Restrictions set forth in Section 5.2 of this Agreement). The Operator agrees that it shall execute and record, within ninety (90) days after the expiration or termination of this Agreement covering all or any portion of the Property, an appropriate and legally sufficient release evidencing such expiration or termination, and shall also supply the State with a copy or copies thereof with recordation information properly certified by the recorder of each Parish in which a Property is located. In the event the Operator fails to comply therewith after thirty (30) days of written notice from the State, it shall be liable for reasonable attorney's fees and court costs incurred in bringing suit for such cancellation and for all damages resulting therefrom. Notwithstanding the foregoing, a disclosure filing in mutually agreeable form shall also be recorded in the conveyance records of all Parishes where the Property is located to notify all interested third parties (including, without limitation, any lessees or other users or occupants of the Property) of the exclusive use of the Storage Reservoirs below the surface of the Property for permanent Carbon Dioxide sequestration and the restrictions pertaining thereto (including, without limitation, the Drill-through and Extraction Restrictions set forth in Section 5.2 of this Agreement).

15.6. This Agreement shall be interpreted and construed under the laws of the State of Louisiana. Should any provision, in whole or in part, of this Agreement be declared, found, or held invalid, illegal, or otherwise unenforceable, such declaration, finding, or holding shall not invalidate or render unenforceable the remaining provisions, which shall be construed and enforced as though the invalidated or unenforceable provision, or portion thereof, was not contained herein, provided that such remaining provisions fulfill the primary purpose of this Agreement.

15.7 The Parties hereby agree that this Agreement, and all terms, provisions, and conditions set forth herein are intended to be compatible with, and not limit or contradict any obligations or protections afforded under, the Louisiana Geologic Sequestration of Carbon Dioxide Act, La. R.S. 30:1101, *et seq.* (as amended from time to time in the future, the "Sequestration Act").

15.8 The venue for any suit, action, or proceeding instituted, arising out of, or relating to this Agreement, shall only be in the Nineteenth (19<sup>th</sup>) Judicial District Court, East Baton Rouge Parish, State of Louisiana. Each Party irrevocably submits to the exclusive jurisdiction of said courts, waives any objection which it may have now or hereafter to such venue, and waives any other venue to which it may be entitled by virtue of domicile or otherwise.

15.9 This Agreement has been read and understood by each Party. The Parties to this Agreement have freely and voluntarily executed this Agreement for the consideration recited herein. They have not relied on any representation or statement by any Party other than those statements contained herein. They have relied solely and completely upon their own respective judgment and the advice of their own attorneys.

15.10 This Agreement is the result of arms-length negotiations between the Parties and each has had the opportunity to review and revise it prior to execution. As a result, both Parties agree that the rule of construing the terms and provisions of an instrument against the drafting Party is not and shall not be applicable to this Agreement. This Agreement constitutes the entire agreement as between the Parties, and it shall not be modified or amended, nor shall any of its requirements be waived, except in a subsequent writing executed by all Parties.

15.11 Each Party represents and warrants to each and every other Party that the individuals executing this Agreement, and the agreements contemplated by this Agreement, have been duly authorized by their respective corporate principals and that this Agreement and the other documents contemplated by this Agreement, shall be binding on the Parties hereto in accordance with the provisions of such documents.

15.12 This Agreement may be executed in counterparts and each executed counterpart shall have the same force and effect as the original instrument. If counterparts are executed, the signatures of the Parties to each counterpart may be combined into and used as a single document.

15.13 The article and section headings in this Agreement are for convenience of reference only and shall not be deemed to alter or affect the meaning or interpretation of any provisions hereof.

15.14 The Parties agree to negotiate in good faith for the purposes of amending this Agreement in the future (subject to the State's approval and sole discretion) in order to (a) ensure compliance with existing, amended, and/or future rules, regulations, and/or administrative guidance promulgated by the EPA, OC, the Internal Revenue Service, or any other regulatory or

administrative body having jurisdiction and/or authority over tax credits, economic incentives, or other revenue generating structures applicable to Operator's business and operations, consistent with Operator's desire to execute a successful carbon capture and sequestration project; (b) ensure compliance with the Sequestration Act or other Applicable Law(s) or Applicable Procedure(s); or (c) address operational, market or commercial matters related to carbon capture and sequestration projects. Further, the Parties agree to cooperate in good faith in connection with Operator obtaining regulatory approvals and additional amendments to this Agreement to expand the Property covered by this Agreement if the Carbon Dioxide plume migrates through a pathway unpredicted by the Storage Reservoirs modeling into adjacent State-owned land or water bottoms (to the extent such additional acreage is available).

15.15 Safety Precautions and Other Protocols. Both Parties, and their respective contractors, subcontractors, invitees, and agents shall comply with Occupational Safety and Health Administration rules and regulations applicable to industrial sites when entering any area of the Property on which AP's surface facilities are located. The State understands and acknowledges that AP may, from time to time, be subject to Sequestration Protocols. Accordingly, and notwithstanding anything contained in this Agreement to the contrary, the State acknowledges and agrees that AP retains all rights necessary or incidental for AP to ensure conformance with any such Sequestration Protocols.

**This Part Left Intentionally Blank**

THUS DONE AND SIGNED on the date or dates herein below written, in the presence of the undersigned competent witnesses.

**EXHIBIT B**  
**SPECIFIC AREA OF INTEREST A – PROPERTY**  
**DESCRIPTION**

“Specific Area of Interest A” includes a tract, title to which is in the State, through the Louisiana Department of Wildlife & Fisheries, and includes all of the lands of the Maurepas Swamp Wildlife Management Area situated in St. James Parish, Louisiana, within the following boundaries:

Beginning at a point being the Northeasternmost point of St. James Parish, Louisiana, said point also being within the boundary of the Maurepas Swamp Wildlife Management Area; thence Southwesterly approximately 25,800 feet along the boundary of St. James Parish to the southern boundary of said Maurepas Swamp Wildlife Management Area; thence along said Maurepas Swamp Wildlife Management Area the following: Southwesterly, Southeasterly, Southwesterly, Northerly, and Southwesterly along irregular Section 43, Township 11 South, Range 5 East to a point of intersection with the Easternmost corner of Section 76, Township 11 South, Range 5 East; thence Southwesterly and Westerly along the Southern boundary of said Section 76 to its Southwest corner, said point also being the Northeast corner of Section 80, Township 11 South, Range 5 East; thence Southwesterly and Westerly along the boundary of said Section 80 to its Southwest corner, said point also being the Southeast corner of Section 79, Township 11 South, Range 5 East; thence continue along the South and West boundary of the Southeast Quarter and West along the Northwest Quarter of said Section 79 to a point being the Southeast corner of the Northeast Quarter of Section 76 Township 11 South, Range 4 East; thence Westerly along the Northeast Quarter, Southerly along the East Half of the Southwest Quarter, Northerly along the Southeast Quarter of the East Half of the Southwest Quarter, and Westerly along the Northwest Quarter of the Southwest Quarter of said Section 76, said point also being on the East boundary of Section 75, Township 11 South, Range 4 East; thence Southerly and Westerly along the boundary of said Section 75 to its Southwest corner, said point also being the Southeast corner of Section 74, Township 11 South, Range 4 East; thence continue along the South and West boundary of the Southeast Quarter of said Section 74 and West along the South boundary of the Northwest Quarter of said Section 74 to a point of intersection with the North boundary of Section 28, Township 11 South, Range 4 East; thence Southeasterly and Northwesterly along the North Half of said Section 28 to a point on the North Half of Section 29, Township 11 South, Range 4 East; thence Northwesterly along the North Half of said Section 29 to a point on the North Half of Section 30, Township 11 South, Range 4 East; thence Northwesterly and Northeasterly along the North Half of said Section 30 to a point of intersection with the East Half of Section 73, Township 11 South, Range 4 East; thence Northwesterly and Northerly along the Southern and Western boundary of the East Half of said Section 73 to a point of intersection with

the South line of Section 49, Township 11 South, Range 4 East; thence along the Southern and Western boundary of said Section 49 to a point being its Northwest corner, said point also being the Southeast corner of Section 45, Township 11 South, Range 4 East; thence along the Southern and Western boundary of said Section 45 to a point being the Northeast corner of Section 46 Township 11 South, Range 4 East; thence along the North boundary of the East half of said Section 46 to a point being the Northeast corner of the West half of said Section 46; thence Southerly, Westerly, and Northerly along the boundary of said Section 46 to a point being its Northwest corner, said point also being on the North line of St. James Parish; thence along the said boundary of St. James Parish to a point having a Coordinate of  $Y = 535,547.23$ ; thence Easterly along the North boundary of said Maurepas Swamp Wildlife Management Area to the point being the Southwest corner of Section 30, Township 10 South, Range 5 East; thence Northerly along the West boundary of said Section 30 to a point of intersection with the said boundary of St. James Parish; thence along the said boundary of St. James Parish to the point of beginning, containing approximately 33,146 acres.

All as depicted on the map attached hereto.

Exact dimensions and final acreage of the area to be determined by survey.

**EXHIBIT C**  
**SPECIFIC AREA OF INTEREST B – PROPERTY**  
**DESCRIPTION**

“Specific Area of Interest B” includes a tract, title to which is in the State in its public trust domain and includes all of the lands now or formerly constituting the beds and bottoms of all water bodies of every nature and description and all islands and other lands formed by accretion or reliction, except tax lands, and includes all lakebeds and waterbottoms of Lake Maurepas, owned by the State of Louisiana, situated in Tangipahoa, Livingston, and St. John the Baptist Parishes, Louisiana, within the following boundaries:

Beginning at a point having Coordinates of X = 2,294,150.00 and Y = 589,950.00, said point being the approximate location of the common boundary of Tangipahoa Parish, Livingston Parish, and St. John the Baptist Parish, Louisiana; thence Southwesterly approximately 17,500 feet along the meanders of Lake Maurepas, to a point being the Northernmost point of the Maurepas Swamp Wildlife Management Area, said point also being the Northeast corner of Section 17, Township 9 South, Range 8 East; thence continue Southwesterly, Westerly, and Northwesterly along the meanders of Lake Maurepas approximately 150,000 feet to a point having Coordinates of X = 2,233,600.00 and Y = 561,900.00, said point being the common boundary of St. John the Baptist Parish, Louisiana and Livingston Parish, Louisiana; thence continue Northeasterly, Southeasterly, Northeasterly, Northwesterly, and Northeasterly approximately 137,500 feet along the said boundary of Lake Maurepas to a point having Coordinates of X = 2,270,900.00 and Y = 610,250.00, said point being the common boundary of Livingston Parish, Louisiana and Tangipahoa Parish, Louisiana; thence continue Southeasterly, Southwesterly, and Southeasterly approximately 72,000 feet along the said boundary of Lake Maurepas to the point of beginning.

Lake Maurepas contains approximately 24,000 acres in Livingston Parish, Louisiana, 8,900 acres in Tangipahoa Parish, Louisiana, and 24,200 acres in St. John the Baptist Parish, Louisiana for an aggregate of approximately 57,100 acres.

All as depicted on the map attached hereto.

Exact dimensions and final acreage of the area to be determined by survey.

**EXHIBIT D**  
**SPECIFIC AREA OF INTEREST C – PROPERTY**  
**DESCRIPTION**

“Specific Area of Interest C” includes a tract, title to which is in the State in its public trust domain and includes all of the lands now or formerly constituting the beds and bottoms of all water bodies of every nature and description and all islands and other lands formed by accretion or reliction, except tax lands, and includes all lakebeds and waterbottoms of Sabine Lake, owned by the State of Louisiana, situated in Cameron Parish, Louisiana, within the following boundaries:

Beginning at a point being the Northernmost boundary of Sabine Lake situated at the Easternmost point of irregular Section 1, Township 13 South, Range 14 West and the Texas-Louisiana border; thence continue along the meanders of Sabine lake the following: Southeasterly approximately 8,200 feet, Easterly approximately 6,000 feet, Southeasterly approximately 13,500 feet, Southerly approximately 16,800 feet, Southwesterly approximately 94,600 feet, Continue Southwesterly approximately 65,000 feet, and Southeasterly approximately 20,700 feet to a point in irregular Section 12, Township 15 South, Range 16 West, also being the beginning of Sabine Pass; thence Southwesterly approximately 4,000 feet to said Texas-Louisiana border; thence along said Texas-Louisiana border the following: Northwesterly approximately 29,000 feet, Northerly approximately 14,000 feet, Northeasterly approximately 92,000 feet, Northerly approximately 52,500 feet, And Northeasterly approximately 11,300 feet to the point of beginning, containing approximately 32,209 acres.

All as depicted on the map attached hereto.

Exact dimensions and final acreage of the area to be determined by survey.

## **SCHEDULE 1**

This Schedule 1 is meant to supplement that certain Carbon-Dioxide Storage Agreement, dated as of \_\_\_\_\_, 2021 (the "Agreement"), by and between the State of Louisiana and Air Products Blue Energy LLC, a Delaware limited liability company ("AP"). Capitalized terms not defined herein shall have the same meaning as set forth in the Agreement.

This Schedule 1 supplements the Agreement with respect to AP's activities and Improvements and Equipment located within the Maurepas Swamp Wildlife Management Area ("WMA") as referenced herein which relates to Specific Area of Interest A under the Agreement. The WMA is under the jurisdiction of DWF, which has promulgated rules and regulations for the protection of wildlife resources, including aquatic life, and their supporting habitat within the WMA. In addition to any specific applicable rules and regulations of DWF related to the WMA, the following provisions shall apply with respect to AP's activities and Improvements and Equipment located within the WMA:

### **1. Cooperation and Consultation regarding Timing, Siting and Modifications**

AP agrees to consult with DWF in advance regarding timing of activities and locations of well sites, pipelines, roads, and utilities within the WMA to help minimize impacts to wildlife resources, including aquatic life, and their supporting habitat.

To the extent AP needs to conduct activities within the WMA during deer firearm (inclusive of primitive and modern) hunting season, AP shall notify DWF and seek authorization prior to commencing such activities. AP and DWF will work together cooperatively to facilitate AP's activities during deer firearm hunting season in a manner acceptable to DWF.

Modifications to plans for proposed project Improvements and Equipment, including, but not limited to, access routes, pipeline routes, well sites, flowlines and appurtenant structures may be required by DWF if less damaging project alternatives exist.

### **2. Commencement of Activities**

AP shall notify DWF prior to commencement of activities within the WMA and seek written authorization from DWF to commence activities. DWF will work cooperatively with AP to facilitate timely authorization of such commencement of activities.

### **3. Compensatory Mitigation; Property Exchange**

To the extent permanent impacts occur due to AP's activities (i.e. property within the WMA is cleared, or altered such that it is no longer in conservation use), AP shall purchase and donate to DWF property of equal or greater ecological value in exchange for such permanently impacted property in order to satisfy any applicable acts of sale or donation.

Compensatory mitigation will be required as part of AP's regulatory permitting process to offset unavoidable wetland or coastal resource impacts, as determined by the U.S. Army Corps of Engineers and/or the Louisiana Office of Coastal Management.

#### **4. Timber Damage**

Standard DWF compensation rates apply for any timber resource damages and are reproduced and incorporated here:

- DWF shall be paid at triple the stumpage rates posted for the region by Timber Mart-South as of date of damage or removal.

#### **5. Seismic Fees**

Standard DWF compensation rates apply for any seismic activity in accordance with Applicable Law(s).

#### **6. Road Servitudes and Utility Rights of Way**

As needed, AP will enter into or facilitate appropriate road servitudes and utility rights of way for AP's activities and Improvements and Equipment within the WMA at the standard DWF compensation rate as listed and incorporated below:

##### **Road Servitude:**

- \$1 per foot, per year. Not to exceed 30 ft. (width)

##### **Utility Right-of-Way (ROW):**

- Small public utility ROW (telephone, waterline, gas, fiber optic communication system, etc.). \$75 per rod. Not to exceed 15 ft. (width). 20-year minimum term.
- Greater than 15 ft. (width), same as pipeline compensation schedule.

##### **Water Pipeline Right-of-Way (ROW):**

- Not to exceed 10ft. (width), not less than \$100 per rod, per year. (Note: Term of ROW could be greater than 1 year)

#### **7. Pipeline Schedule and Right-of-Way Agreements**

As stated in Section 4.9 of the Agreement, the DWF pipeline right-of-way schedule in effect as of the Effective Date shall control the price for DWF pipeline rights-of-way for any pipelines installed within the WMA by or for AP and is incorporated herein as follows:

- 1 to 50 ft. (width)
  - ≤4" diameter (single line or combined lines in 1 trench). \$75 per rod.
  - >4" diameter (single line or combined lines in 1 trench). Not less than \$100 per rod.
- 51 to 100 ft. (width). Not less than \$200 per rod.
- Over 100 ft. (width). Special rate based on each individual request.

- 20-year minimum term. Renewable for an additional 20 years.
- A right-of-way agreement shall be for a single pipeline installation only.
- AP shall obtain pipeline right-of-way agreements from DWF prior to installation of pipelines.

## **8. Abandonment of Flow-lines and Pipelines**

AP agrees to remove its flow-lines and all equipment, structures or appurtenances associated therewith in accordance with Section 12.2 of the Agreement. With respect to proposed pipeline(s), DWF desires to minimize immediate and long-term impacts to wildlife resources, including aquatic life, and their supporting habitat. DWF understands that AP's preference is to abandon in place proposed pipeline(s) or segments of proposed pipeline(s) and agrees to work cooperatively with AP in this regard consistent with Applicable Laws to determine whether such abandonment in place may be accomplished in a way that is protective of the wildlife resources, including aquatic life, and their supporting habitat. For all portions of the pipeline(s) abandoned in place, AP will enter into Pipeline Abandonment and ROW Release Agreement(s) with DWF. AP will also provide DWF with depth-of-cover surveys on all portions of the pipeline(s) that have been abandoned in place prior to execution of the Pipeline Abandonment and ROW Release Agreement(s). Allowance of Abandonment in place shall not alter other restoration obligations contained in Section 12.2 of the Agreement. AP will remove pipeline segments that become exposed or uncovered, or return them to their previous depth of cover and provide DWF a depth-of-cover survey. For any portions of the pipeline(s) as to which abandonment in place is prohibited by Applicable Law (at the time of abandonment), or as to which AP and DWF have consulted and DWF has determined that removal is required to protect the wildlife resources, including aquatic life, and their supporting habitat, AP agrees to remove such portions of the pipeline(s).

## **9. Public Improvements Necessitating Pipeline Relocation**

AP and DWF recognize that it might hereafter become necessary or desirable to widen, deepen or make some other work of public improvement on land or on the streams or water bottoms over and through which a pipeline of AP is located within the WMA, and this grant is accepted under the express condition and with the distinct understanding that, if any such work by the United States, the State of Louisiana, or any agency, board, commission, department or political subdivision of either, makes it necessary to alter or relocate any such pipeline, the entire cost of such alteration or relocation shall be borne, at least initially, by AP, this responsibility on the part of AP being part of the consideration for which this grant is made. This provision, however, shall not prejudice AP's right to receive just compensation, indemnification and/or relocation costs from the United States, the State of Louisiana or any agency, board, commission, department or political subdivision of either to the extent allowed under Applicable Law.

Re: Clay Basin Storage Facility  
Daggett County, Utah

Dear Mr. Ingleby:

We are writing to respond to your October 13, 2015, letter requesting a meeting with the appropriate parties to renegotiate the fees associated with the Clay Basin Gas Storage Agreement, and respond to your concerns addressed to Mr. Edwin Roberson, Utah State Director, on April 7, 2017.

Based on your concerns stated at the April 7, 2017, meeting, internal staff discussions, and coordination with our Washington Office, we are prepared to offer the following fee schedule for your consideration.

June 1, 2016 to May 31, 2021

Annual Storage Fee - \$2.0280 per net Federal mineral acre or fraction thereof  
Injection Fee - \$0.0050 per MCF  
Withdrawal Fee - \$0.0203 per MCF

If you have any questions please contact Mickey Coulthard of this office at (801) 539-4042.

Sincerely,

Roger L. Bankert

**EXHIBIT B. SAMPLE LEASE ..... B-1**

## **ARTICLE I. EXECUTIVE SUMMARY, DEFINITIONS, AND AUTHORITY**

### **1.1 EXECUTIVE SUMMARY**

Pursuant to Texas Health and Safety Code, Sec. 382.501 et seq., the Texas General Land Office ("GLO"), on behalf of the School Land Board ("SLB"), is requesting proposals for the lease of Permanent School Fund ("PSF") land in Jefferson County, Texas for the establishment and operation of a geologic carbon dioxide storage repository under submerged land in a Miocene formation, including construction of necessary transportation and storage infrastructure (the "Project"). The Texas Land Commissioner sits as ex officio Chairman of the SLB, and the staff of the GLO acts as the staff of the SLB. The SLB seeks an experienced and adequately funded entity to undertake the Project in order to maximize the value of PSF land. Respondents must execute **Exhibit A**, *Affirmations and Solicitation Acceptance*, and complete other items listed on the submission checklist to be considered. Additional information on the GLO/SLB and its programs can be found at <http://www.glo.texas.gov>.

The GLO will review Solicitation Responses to this Solicitation and make recommendations to the SLB. The SLB may then award one or more leases to one or more Respondents for one or more Project facilities. The GLO anticipates that a period of negotiation with the successful Respondent(s), including with regard to rent proposals, storage proposals, metering, reporting, and other relevant matters, will be necessary to reach a lease agreement that is in the best interests of the PSF.

### **1.2 DEFINITIONS**

"**Addendum**" means a written clarification or revision to the Request for Proposals issued by the GLO. Respondents must acknowledge receipt of any addenda in the submission of the Solicitation Response.

"**Affiliate**" means any individual or entity that, directly or indirectly, controls, is controlled by, or is under common control with, Respondent. "Control" means the ability to directly or indirectly direct the management and policies of an entity, whether through the ownership of voting securities or membership interests, by contract, or otherwise.

"**BAFO**" means Best and Final Offer.

"**BEG**" means the Bureau of Economic Geology at the University of Texas at Austin.

"**CO<sub>2</sub>**" means carbon dioxide, both anthropogenic and non-anthropogenic.

"**ESBD**" means the Electronic State Business Daily, <http://www.txsmartbuy.com/esbd>.

“GLO” means the Texas General Land Office individually and on behalf of the School Land Board.

“Lessee” means, collectively, one or more Respondents that are chosen by the SLB after review of Solicitation Responses to undertake the Project, including by signing the lease with the State, the form of which is attached to this Solicitation as Exhibit B.

“PIA” means the Public Information Act, Chapter 552 of the Texas Government Code.

“PSF” means Permanent School Fund.

“Respondent” means the entity responding to this Solicitation.

“RFP” means Request for Proposals.

“SLB” means School Land Board.

“Solicitation” means this RFP.

“Solicitation Response” means the Respondent’s entire response to this Solicitation, including all documents requested in Articles III and V.

“State” means, collectively, the State of Texas, the SLB, the GLO, or state agency identified in this Solicitation, including its officers, employees, or authorized agents.

“TAC” means the Texas Administrative Code.

### **1.3 AUTHORITY**

The GLO/SLB is soliciting the proposals described herein under Texas Health and Safety Code, Ch. 382, Subchapter K.

**REMAINDER OF PAGE INTENTIONALLY LEFT BLANK**

## ARTICLE II. NATURE OF WORK

### 2.1 PROJECT BACKGROUND

The lease that a Lessee obtains through this Solicitation process will authorize Lessee to use the leased PSF tracts as necessary for transportation and safe, long-term geologic storage of CO<sub>2</sub> as described in this Solicitation. Lessee will be responsible for providing and maintaining, as necessary, all labor, materials, tools, equipment, technology, permits, supplies, superintendence, insurance, incidentals, and services necessary for the construction and operation of the contemplated CO<sub>2</sub> storage repository. The GLO anticipates that the work for the Project will include, and in some instances the lease that the Lessee signs will require, at least the following tasks:

- 1) Characterize the geologic and geophysical features of BEG-identified\* and SLB-authorized storage formations.
- 2) Select a site based on geological suitability, long-term well integrity risk, and repository economic viability.
- 3) Transport CO<sub>2</sub> from its source(s) to the storage location(s).
- 4) Obtain and comply with necessary permitting requirements, including but not limited to successful acquisition of Class VI UIC permit(s) and compliance with all other applicable federal, state, and local laws and regulations (including but not limited to relevant rules of the GLO, the Texas Railroad Commission, the Texas Commission on Environmental Quality, the U.S. Occupational Safety and Health Administration, and the U.S. Environmental Protection Agency regarding Class VI wells, and carbon dioxide handling, transport, storage, and monitoring).
- 5) Construct and operate the contemplated CO<sub>2</sub> sequestration facility.
- 6) Develop an operational plan, including financial assurance, decommissioning of all topside structures and adequate well plugging and abandonment and contingency plans to address potential CO<sub>2</sub> leakage events and well integrity failures.
- 7) Compensate the PSF for use of the offshore repository and any associated easements, and storage of CO<sub>2</sub>.
- 8) Identify environmental concerns and develop a plan to address those concerns.
- 9) Monitor CO<sub>2</sub> sequestration and report repository technical and economic performance to GLO.
- 10) Develop and adopt a repository closure contingency plan, including verification of necessary bond payment for well abandonment.

\*(see BEG report entitled "Gulf of Mexico Miocene CO<sub>2</sub> Site Characterization Mega Transect")

The selected Respondent(s), after selection, shall be bound to specific terms and conditions to be negotiated with the GLO within the framework of the lease form attached to this Solicitation as Exhibit B.

## **2.2 LEASE AND TERM**

Any lease resulting from this Solicitation shall be effective as of the earlier of the date that it is signed by both parties or August 16, 2021 (the “Effective Date”), and shall initially remain in effect for, at most, a 3-year due diligence and permitting period, followed by construction and operation periods, with an overall maximum term of 30 years, subject to possible extension as agreed to by the parties, and subject to the conditions set forth herein and in the lease. The lease will have progress milestones for the development of the Project, which milestones are to be met by the selected Respondent. Failure to meet milestones may lead to termination of the lease, as set out in the lease. The parties may, upon mutual written agreement, renew the lease unless terminated early under the terms and conditions of the lease.

**REMAINDER OF PAGE INTENTIONALLY LEFT BLANK**

### **ARTICLE III. ADMINISTRATIVE INFORMATION**

#### **3.1 SCHEDULE OF EVENTS**

<b>EVENT</b>	<b>DATE/TIME</b>
Issue Solicitation	April 7, 2021
Deadline for Submitting Questions	April 21, 2021 at 5:00 p.m. CDT
Anticipated Release Date of Answers to Questions	April 28, 2021
<b>Deadline for Submission of Solicitation Responses</b>	<b>May 10, 2021 at 2:00 p.m. CDT</b>
Evaluation Period	May 11, 2021 to June 10, 2021
Short List Notification (if applicable)	June 14, 2021
Demonstrations/Presentations (if needed)	June 21, 2021 to June 22, 2021
SLB Meeting for Selection and Notice of Award	June 28, 2021
Lease Formation, Negotiation, and Execution	June 29, 2021 to August 30, 2021
Deadline for Bonds and Insurance	Upon Execution of Lease

**NOTE:** These dates represent a tentative schedule of events. The SLB reserves the right to modify these dates at any time prior to the deadline for submission of Solicitation Responses upon notice posted on the Electronic State Business Daily (ESBD) website at: <http://www.txsmartbuy.com/esbd>. Please search under Agency Code 305 (General Land Office and Veterans Land Board). Any modification of dates after the deadline for submission of Solicitation Responses will not be posted.

## 3.2 INQUIRIES

### 3.2.1 Contact

All requests, questions, or other communications about this Solicitation must be made **in writing** to the GLO's Purchasing Department, addressed to the person listed below.

Name	Susan Tipton-Hines, CTCM, CTCD
Address	1700 N. Congress Ave., Austin, Texas 78701
Phone	800.998.4456 or 512.475.0226
Email	<u>Susan.Tipton-Hines@GLO.Texas.Gov</u>

### 3.2.2 Clarifications

The GLO will allow written requests for clarification of this Solicitation. Questions may be e-mailed to the point-of-contact listed in Section 3.2.1 above. Respondents' names shall be removed from questions in the responses released. Questions shall be submitted in the following format. Submissions that deviate from this format may not be accepted:

- a) Identifying Solicitation number
- b) Section number
- c) Text of passage being questioned
- d) Question

**NOTE:** The deadline for submitting questions is noted in Section 3.1 above. Please provide company name, address, phone number, e-mail address, and name of contact person when submitting questions.

### 3.2.3 Responses

All accepted questions will result in written responses with copies posted to the ESD at: <http://www.txsmartbuy.com/esbd>. Responses shall be posted as an Addendum to the Solicitation. It is Respondent's responsibility to check the ESD for updated responses.

### 3.2.4 Prohibited Communications

On issuance of this Solicitation, except for the written inquiries described in Section 3.2.1 above, the SLB and the GLO will not answer questions or otherwise discuss the contents of this Solicitation with any potential Respondent or their representative(s). Attempts to ask questions by phone or in person will not be allowed or recognized as valid. Failure to observe this restriction may disqualify the Respondent. Respondent shall rely only on written statements issued through or by the GLO's purchasing staff. This restriction does not preclude discussions

between affected parties for the purposes of conducting business unrelated to this Solicitation.

### 3.3 SOLICITATION RESPONSE COMPOSITION

#### 3.3.1 General Requirements

Respondent shall complete and upload the documents listed below to the Box™ URL in Section 3.4.3:

- a) One Proposal, including all documents requested in Part 1 of the *Submission Checklist*, submitted as one Portable Document Format (.pdf) file;
- b) One Annual Report (see Section 5.6), submitted as one .pdf file; and
- c) One Financial Statement Components Worksheet, submitted as a Microsoft Excel (.xlsx) file.

Respondent shall prepare a clear and concise Solicitation Response that focuses on the instructions and requirements of the Solicitation. Respondent is responsible for all costs related to the preparation of its Solicitation Response.

Any terms and conditions attached to a Solicitation Response that are intended to change the terms of the lease will not be considered and may result in disqualification.

#### 3.3.2 Solicitation Response Format

For ease of evaluation, the Solicitation Response shall be presented in a format that corresponds to the order requested in Article VIII, *Submission Checklist*. Responses to each section and subsection shall be labeled clearly to indicate the item being addressed. Exceptions to this will be considered during the evaluation process.

#### 3.3.3 Page Limit and Supporting Documentation

Proposals shall not exceed 40 pages in length. Exhibit A, signed acknowledgments of addenda, references, résumés, Annual Report (if relevant), and the Financial Statement Components Worksheet are considered supporting documentation and are not included in the page limit. The Solicitation Response should be formatted using 12-point or larger font, except for charts, graphs, or other graphical representations of data.

### **3.4 SOLICITATION RESPONSE SUBMISSION AND DELIVERY**

#### **3.4.1 Deadline**

**Solicitation Responses must be received at the Box™ URL in Section 3.4.3 no later than as specified in Section 3.1.** Respondents may submit their Solicitation Responses any time prior to that deadline. Box™ shall time stamp all uploaded Solicitation Responses; any other documentation of timely submission in lieu of the Box™ time stamp WILL NOT be accepted.

#### **3.4.2 Labeling**

Each file uploaded to Box™ shall include Respondent's company name and the title of the document; for example: "Company X: Proposal."

#### **3.4.3 Delivery**

Respondents must upload Solicitation Responses to the following the Box™ URL:

<https://txglo.app.box.com/f/835f08da04394c54924e2468851500f0>

The GLO/SLB shall not accept Solicitation Responses submitted by any other means. Please contact the point-of-contact listed in section 3.2.1 above for assistance with the Box™.

#### **3.4.4 Alterations, Modifications, and Withdrawals**

Solicitation Responses may be modified, altered, or withdrawn by notifying the point-of-contact listed in Section 3.2.1 above, provided such notice is received prior to the deadline for submission of Solicitation Responses.

**REMAINDER OF PAGE INTENTIONALLY LEFT BLANK**

## **ARTICLE IV. SOLICITATION RESPONSE EVALUATION & AWARD PROCESS**

### **4.1 EVALUATION CRITERIA**

#### **4.1.1 Conformance with State Law**

Solicitation Responses shall be evaluated in accordance with applicable State law. The GLO/SLB shall not be obligated to accept the highest royalty or rent proposal, but shall make an award to the Respondent that provides the “Best Value” to the State of Texas.

#### **4.1.2 Minimum Qualifications**

Respondents must meet the minimum qualifications listed below. Furthermore, Solicitation Responses that appear unrealistic in terms of technical commitment, that show a lack of technical competence, or that indicate a failure to comprehend the risk and complexity of the Project may be rejected.

Respondent shall submit a summary (not to exceed two pages) that provides specific support for meeting the minimum qualifications outlined in this Section. This support can specifically state how the Respondent meets each minimum qualification or can direct the evaluators to the appropriate section of the Solicitation Response that provides support for the Respondent satisfying each minimum qualification.

4.1.2.1 Respondent must have demonstrated experience undertaking and completing large-scale projects involving infrastructure construction and/or industrial-scale facility operation, preferably involving CO<sub>2</sub>, gas storage, and/or hydrocarbon pipelines;

4.1.2.2 Respondent must have demonstrated experience obtaining and complying with Federal or State permits, preferably involving either or both of oil and gas regulations or environmental regulations; and

4.1.2.3 Respondent must be financially solvent and adequately capitalized.

#### **4.1.3 Selection Criteria**

Solicitation Responses shall be consistently evaluated and scored in accordance with the following best value criteria:

4.1.3.1 Demonstrated relevant experience, qualifications and past performance of Respondent and proposed staff (30%)

- 4.1.3.2 Proposed methodology for storage, and proposed schedule for completion of the Project (25%)
- 4.1.3.3 Proposed source(s) and quantities of CO<sub>2</sub> to be stored, and proposed schedule and rate of payments to be made to the GLO, for the benefit of the PSF, for lease of land and storage of CO<sub>2</sub> (25%)
- 4.1.3.4 Proposed plan for permitting and for compliance with all applicable Federal and State regulation (10%)
- 4.1.3.5 Overall responsiveness, clarity, and organization of Solicitation Response (10%)

**NOTE:** To clarify any response, the Solicitation evaluation committee may contact references provided in response to this Solicitation, contact Respondent's clients, or solicit information from any available source concerning any aspect of the Solicitation deemed pertinent to the evaluation process.

## **4.2 SHORT LIST**

The GLO expects to make an initial evaluation of the Solicitation Responses to develop a short list of finalists. However, the GLO is not obligated to develop this list. If a list is developed, all Respondents will be notified in writing whether or not they are finalists.

## **4.3 DEMONSTRATIONS / PRESENTATIONS**

The GLO may invite short listed finalists to provide demo presentations. All presentations will be conducted online via a virtual platform mutually agreed upon by the GLO and Respondent upon Respondent's acceptance of the invitation.

Respondents will be provided with notice of any such presentations and are responsible for their own presentation equipment and internet connection. Failure to participate in the requested presentation may eliminate a Respondent from further consideration. The GLO is not responsible for any costs incurred by the Respondent associated with the presentation.

## **4.4 BEST AND FINAL OFFER (BAFO)**

Clarification discussions, at the GLO's sole option, may be conducted with Respondents who submit Solicitation Responses determined to be acceptable and competitive. Respondents shall be accorded fair and equal treatment with respect to any opportunity for discussion and/or written revisions of the Solicitation Responses. Such revisions may be permitted after submissions and prior to award solely for the purpose of obtaining BAFOs.

In conducting discussions, the GLO shall not disclose any information derived from the Solicitation Responses submitted by competing Respondents.

The GLO evaluation committee shall score BAFO responses in a manner consistent with the scoring of original solicitation responses. The criteria to be re-evaluated following a BAFO shall depend on the type of clarification requested by the GLO from Respondent. Scores for any of the applicable selection criteria included in the GLO's request for BAFO shall be replaced by the BAFO scores.

#### **4.5 LEASE AWARD**

The SLB may award a lease to one or more Respondents under this Solicitation. An award notice will be sent to the selected Respondent(s). Any award is contingent upon the successful negotiation of final lease terms with the GLO and upon approval of the SLB. Negotiations shall be confidential and not subject to disclosure to competing Respondents unless and until an agreement is reached. If lease negotiations cannot be concluded successfully, the GLO may negotiate a lease with fewer than all of the initially chosen Respondents, may negotiate a lease with the next highest scoring Respondent(s), or may withdraw this Solicitation.

**NOTE:** Solicitation Responses are subject to the Texas Public Information Act, Chapter 552 of the Texas Government Code, and will be withheld from or released to the public only in accordance therewith.

**REMAINDER OF PAGE INTENTIONALLY LEFT BLANK**

## **ARTICLE V. REQUIRED RESPONDENT INFORMATION**

### **5.1 RESPONDENT INFORMATION**

Each Respondent must provide satisfactory evidence of its experience and operational and financial ability to undertake and complete the types of activities described in this Solicitation, including to complete and operate the Project.

#### **5.1.1 Company Narrative**

Provide a detailed narrative explaining why Respondent is qualified to undertake the Project, focusing on its key strengths and competitive advantages.

#### **5.1.2 Company Profile**

Provide a company profile to include:

- a) The company ownership structure (e.g., corporation, partnership, LLC, sole proprietorship, etc.), including any wholly-owned subsidiaries, affiliated companies, or joint ventures. (*Please provide this information in a narrative or as a graphical representation*). If Respondent is an Affiliate of, or has a joint venture or strategic alliance with, another company, please identify the percentage of ownership and the percentage of the company's ownership. Finally, please provide your proposed operating structure for the Project and which entities (i.e. parent company, Affiliate, Joint Venture, subcontractor) will be performing Project tasks;
- b) The year the company was founded and/or legally organized. If organized as a business entity other than a sole proprietorship (e.g., corporation, LLC, LP, etc.), please indicate the type of entity, the state under whose laws the company is organized, and the date of organization;
- c) The location of Respondent's headquarters and any field office(s) that may provide services in connection with the Project;
- d) The name, title, mailing address, e-mail address, and telephone number of Respondent's point of contact for any resulting lease under this Solicitation; and
- e) Whether Respondent has ever been a party to a contract with any Texas state agency. If "Yes," specify when, for what duties, and with which agency.

**NOTE: A Respondent that is not organized under the laws of the state of Texas must register with the Texas Secretary of State before it may transact business**

**in Texas. Respondent must provide proof of registration before the SLB may award a lease under this Solicitation.**

## **5.2 TECHNICAL PROPOSAL**

Respondent must describe clearly, specifically, and as completely as practicable, its proposed methodology and schedule for achieving the objectives of the Project, including with regard to transportation of CO<sub>2</sub> to and its long-term storage in the repository, as well as post-closure monitoring and security of stored CO<sub>2</sub>. Respondent should describe tasks to be performed to be responsive to Article II, Nature of Work.

## **5.3 REFERENCES**

Respondent shall provide a minimum of three **non-GLO** references for projects of similar general scope performed within the last three years. The GLO/SLB reserves the right to check references prior to award. Any negative responses received may be grounds for disqualification of the Solicitation Response.

Respondent must verify current contacts for its references. Information provided shall include:

- a) Client name;
- b) Project description;
- c) Total dollar amount of project; and
- d) Client project manager name, telephone number, and e-mail address.

**The GLO checks references by e-mail. Respondents who do not provide accurate e-mail addresses waive the right to have those references considered in the evaluation of their Solicitation Responses.**

## **5.4 LITIGATION HISTORY**

Respondent must disclose any civil or criminal litigation or investigation pending at any time during the last three years that involves Respondent's work on or involvement with a construction, pipeline, industrial, or other type of project generally similar to the Project, as well as any in which Respondent has already been judged guilty or liable. For each instance of litigation or investigation, Respondent shall list: basic case information (e.g., cause number/case number, venue information, names of parties, name of investigating entity [if relevant]); a description of claims alleged by or against Respondent or its parent, subsidiary, or other Affiliate; for each resolved case, a description of the disposition of Respondent's involvement (e.g., settled, dismissed, judgment entered, etc.).

Failure to comply with the terms of this provision may disqualify any Respondent. Solicitation Responses may be rejected based upon Respondent's prior history with the

state of Texas or with any other party that demonstrates, without limitation, unsatisfactory performance, adversarial or contentious demeanor, or significant failure(s) to meet contractual obligations.

If Respondent has no litigation history, as described above, so indicate in the appropriate section of the Solicitation Response.

## 5.5 CONFLICTS

Respondent must disclose any potential conflict of interest it may have with the GLO or the SLB in undertaking the Project, including all existing or prior arrangements. Please include any activities of affiliated or parent organizations and individuals who may be assigned to manage this account. If Respondent has no conflicts, as described above, so indicate in the appropriate section of the Solicitation Response.

## 5.6 ANNUAL REPORT

If Respondent is an entity that is required to prepare audited financial statements, Respondent shall submit an annual report that includes:

- a) Last two years of audited accrual-basis financial statements, including an income statement, cash flow statement, and balance sheet;
- b) If applicable, last two years of consolidated statements for any holding companies or affiliates;
- c) An audited or un-audited accrual-basis financial statement of the most recent quarter of operation; and
- d) A full disclosure of any events, liabilities, or contingent liabilities that could materially affect Respondent's financial ability to undertake the Project.

If Respondent is a privately-owned entity or sole proprietorship for which audited financial statements are not required, Respondent shall submit a report that includes:

- a) Last two years of un-audited accrual-basis financial statements, including an income statement, cash flow statement, and balance sheet;
- b) An audited or un-audited accrual-basis financial statement of the most recent quarter of operation; and
- c) A full disclosure of any events, liabilities, or contingent liabilities that could materially affect Respondent's financial ability to undertake the Project;

OR

- a) Other financial information sufficient for the GLO, in its sole judgement, to determine if Respondent is financially solvent and adequately capitalized.

Respondent shall also complete and submit the Financial Statement Components Worksheet, posted to the ESBD as an Excel workbook (.xlsx format). Any respondent that fails to comply with this Section 5.6 or that is not financially solvent or adequately capitalized, as affirmed by the GLO Chief Financial Officer, shall be deemed not to have met the minimum qualification stated in Section 4.1.2.3 of this Solicitation.

**REMAINDER OF PAGE INTENTIONALLY LEFT BLANK**

## **ARTICLE VI. RENT AND ROYALTY PROPOSAL**

### **6.1 RENT AND ROYALTY PROPOSAL**

Respondent must provide a proposal for paying to the GLO, for the benefit of the PSF, all or some of the following, as well as any other payments Respondent proposes to pay to the GLO, for the benefit of the PSF, in connection with the Project: (i) rent for the use of PSF land, whether surface or submerged, for transportation facilities associated with the Project; (ii) payment for the right to use PSF-owned submerged strata for CO<sub>2</sub> storage; (iii) rent or royalty payment for the mass of CO<sub>2</sub> initially placed into storage, without regard to loss or leakage; (iv) a portion of the value, however monetized, of CO<sub>2</sub> capture and/or storage tax credits earned by, or paid to, Respondent in connection with the Project; and (v) minimum rent during feasibility and construction periods for the submerged areas that may be used for storage pursuant to the Project as proposed by Respondent.

Per Section 4.1.3.3 of this Solicitation, Respondent's proposed source(s) and quantities of CO<sub>2</sub> to be stored, and the rent resulting from the proposed quantities, are a material element in the selection of the Respondent(s) who will enter into leases with the GLO/SLB. For that reason, the lease will include a baseline revenue target in the operations phase, based on a reasonable forecast of expected revenues based on rent structure and proposed stored quantities as set out in Respondent's Response. The lease will allow the GLO to terminate the lease if the baseline revenue target is not met over the course of an agreed period of time as stated in the lease.

**Respondents are hereby expressly put on notice that because of the open-ended nature of rent and royalty proposals that can be made, the ultimate rent and/or royalty provisions in the lease will be subject to further negotiation and documentation following the award(s) under this Solicitation.**

**REMAINDER OF PAGE INTENTIONALLY LEFT BLANK**

## **ARTICLE VII. TERMS AND CONDITIONS**

### **7.1 GENERAL CONDITIONS**

#### **7.1.1 Amendment**

The GLO, on behalf of the SLB, reserves the right to alter, amend, or modify any provision of this Solicitation, or to withdraw this Solicitation, at any time prior to the award, if it is in the best interest of the SLB and/or the PSF.

#### **7.1.2 Informalities**

The GLO reserves the right to waive minor informalities and irregularities in any Solicitation Response received.

#### **7.1.3 Rejection**

The GLO reserves the right to reject any or all Solicitation Responses received prior to lease award.

#### **7.1.4 Irregularities**

Any irregularities or lack of clarity in this Solicitation should be brought to the attention of the point-of-contact listed in Section 3.2.1 as soon as possible, so that corrective addenda may be furnished to prospective Respondents via the ESD.

#### **7.1.5 Negotiation Period**

Solicitation Responses shall be binding for a period of 120 days after they are opened. Respondents may extend the time for which their Solicitation Response will be honored.

#### **7.1.6 Open Records**

The GLO and SLB are government agencies subject to the Texas Public Information Act (PIA), Chapter 552, Texas Government Code. The Solicitation Response and other information submitted to the GLO by the Respondent and any lease(s) awarded pursuant to this Solicitation are subject to release as public information. The Solicitation Response and other submitted information shall be presumed to be subject to disclosure unless a specific exception to disclosure under the PIA applies. If it is necessary for the Respondent to include proprietary or otherwise confidential information in its Solicitation Response or other submitted information, the Respondent must clearly label that proprietary or confidential information and identify the specific exception to disclosure of that information in the PIA. Merely making a blanket claim that the entire Solicitation Response is

protected from disclosure because it contains some proprietary information is not acceptable, and shall make the entire Solicitation Response subject to release under the PIA. In order to trigger the process of seeking an Attorney General opinion on the release of proprietary or confidential information, the specific provisions of the Solicitation Response the Respondent considers proprietary or confidential must be clearly labeled as described above. Any information which is not clearly identified as proprietary or confidential shall be deemed to be subject to disclosure pursuant to the PIA, except as provided by law.

Respondents are required to make any information created or exchanged with the GLO or SLB pursuant to this Solicitation and any lease that may result from this Solicitation, and not otherwise excepted from disclosure under the Texas Public Information Act, available in a format that is accessible by the public at no additional charge to the GLO.

Information related to the performance of any resulting lease may be subject to the PIA and will be withheld from public disclosure or released only in accordance therewith. Respondent shall make any information created or exchanged with the GLO or the SLB, and not otherwise excepted from disclosure under the PIA, available in a format that is accessible by the public at no additional charge to the GLO. Respondent shall make any information required under the PIA available to the GLO in Portable Document Format (PDF) or any other format agreed between the parties. The original copy of each Solicitation Response shall be retained in the official files of the GLO as a public record.

Solicitation Responses and all other documents associated with this Solicitation will be withheld or released upon written request only in accordance with the PIA. To the extent that a Respondent wishes to prevent the disclosure of portions of its Solicitation Response to the public, Respondent shall demonstrate the applicability of any exception to disclosure provided under the PIA in accordance with the procedures prescribed by the PIA. Respondent may clearly label individual documents "confidential" or "trade secret" to demonstrate that it believes certain information is excepted from disclosure and may legally be withheld from the public. Respondent thereby agrees to indemnify and defend the GLO for honoring such a designation. The failure of Respondent to clearly label such documents shall constitute a complete waiver of any and all claims for damages caused by the GLO's release of these records.

Pursuant to Texas Government Code Chapter 2261, any lease or contract that results from this Solicitation, including selected Respondent's Solicitation Response, shall be posted to the GLO's website.

#### 7.1.7 Lease Responsibility

Respondent shall be solely responsible for the performance of all contractual obligations that may result from an award based on this Solicitation. Respondent

shall not be relieved of its obligations for any nonperformance by its subcontractors.

#### 7.1.8 Public Disclosure

Respondent will not advertise that it is doing business with the GLO or SLB or use a lease resulting from this Solicitation as a marketing or sales tool without prior written consent of the GLO or SLB as applicable.

#### 7.1.9 Remedies

All remedies available to the GLO for breach or anticipatory breach of any lease that results from this Solicitation are cumulative and may be exercised concurrently or separately, and the exercise of any one remedy shall not be deemed an election of such remedy to the exclusion of other remedies. Liquidated damages, actual damages, cost projections, and/or injunctive relief may also be invoked either separately or combined with any other remedy in accordance with applicable law.

### 7.2 INSURANCE AND BONDS

#### 7.2.1 Required Insurance Coverages

For the duration of any lease resulting from this Solicitation, Lessee shall acquire insurance with financially sound and reputable independent insurers, in the type and at least the amount as follows:

##### 7.2.1.1 Workers Compensation & Employers Liability

Lessee must maintain Workers' Compensation insurance coverage in accordance with statutory limits.

Workers Compensation: Statutory Limits  
Employers Liability: Each Accident \$1,000,000  
Disease - Each Employee \$1,000,000  
Disease - Policy Limit \$1,000,000

This website (coverage starts with 406 of the Labor code) addresses what Texas requires of Workers Compensation:

<http://www.tdi.texas.gov/wc/act/index.html>

##### 7.2.1.2 Commercial General Liability (Occurrence based)

- a) Bodily Injury and Property Damage:  
\$1,000,000 each occurrence  
\$2,000,000 aggregate limit
- b) Medical Expense each person: \$5,000
- c) Personal Injury and Advertising Liability: \$1,000,000

- d) Products / Completed Operations Aggregate: \$2,000,000
- e) Damage to Premises Rented to You: \$50,000

The required coverage is to be written with companies licensed in the State of Texas, with an “A-” rating from A.M. Best, and authorized to provide the corresponding coverage. Work on the Project shall not begin until after Lessee has submitted acceptable evidence of insurance. Failure to maintain insurance coverage or acceptable alternative methods of insurance shall be deemed a breach of contract.

#### 7.2.2 Alternative Insurability

Notwithstanding the preceding, the GLO reserves the right to consider reasonable alternative methods of insuring the lease in lieu of the insurance policies customarily required. It will be Respondent’s responsibility to recommend to the GLO alternative methods of insuring the contract. Any alternatives proposed by Respondent should be accompanied by a detailed explanation regarding Respondent’s inability to obtain the required insurance and/or bonds. The GLO shall be the sole and final judge as to the adequacy of any substitute form of insurance coverage.

#### 7.2.3 Bonds

Respondent’s bond or other fiscal surety obligations will be as set out in the lease.

### 7.3 LEASE TERMS AND SOLICITATION ACCEPTANCE

Exhibit B, *Sample Lease*, is the framework of the lease form that will be used by the SLB for the Project; please review the terms and conditions of the form. The SLB reserves the right to negotiate final lease terms with any selected Respondent. The terms and conditions in Exhibit B are subject to change prior to the execution of any lease that may result from this Solicitation.

Execution of Exhibit A of this Solicitation, *Affirmations and Solicitation Acceptance*, shall constitute an agreement to all terms and conditions specified in this Solicitation, including, but not limited to, Exhibit B, *Sample Lease*, and all terms and conditions therein.

**REMAINDER OF PAGE INTENTIONALLY LEFT BLANK**

## **ARTICLE VIII. SUBMISSION CHECKLIST**

This checklist is provided for Respondent's convenience only and identifies documents that must be submitted with this Solicitation to be considered responsive. Any Solicitation Responses received without these requisite documents may be deemed nonresponsive and not considered for lease award.

### **A COMPLETE SOLICITATION PACKAGE SHALL INCLUDE:**

1. Part 1 – Proposal (one .pdf file)
2. Part 2 – Annual Report (or substitute permitted by this Solicitation) (one .pdf file)
3. Part 3 – Financial Statement Components Worksheet (one .xlsx file)

### **PART 1 – PROPOSAL**

**Please present documents in the following order:**

- |   |                 |     |
|---|-----------------|-----|
| 1. <b><u>Exhibit A</u></b> , Affirmations and Solicitation Acceptance |                 | ___ |
| 2. Signed Acknowledgments of Addenda (if applicable)                  |                 | ___ |
| 3. Summary of Minimum Qualifications                                  | (Section 4.1.2) | ___ |
| 4. Respondent Information   | (Section 5.1)   | ___ |
| 5. Technical Proposal   | (Section 5.2)   | ___ |
| 6. References   | (Section 5.3)   | ___ |
| 7. Major Subcontractor Information (if applicable)                    | (Section 5.4)   | ___ |
| 8. Litigation History (if applicable)                                 | (Section 5.4)   | ___ |
| 9. Conflicts (if applicable)  | (Section 5.5)   | ___ |
| 10. Rent and Royalty Proposal   | (Section 6.1)   | ___ |

### **PART 2 – ANNUAL REPORT**

- |                  |               |     |
|------------------|---------------|-----|
| 1. Annual Report | (Section 5.6) | ___ |
|------------------|---------------|-----|

### **PART 3 – FINANCIAL STATEMENT COMPONENTS WORKSHEET**

- |   |               |     |
|---|---------------|-----|
| 1. Financial Statement Components Worksheet | (Section 5.6) | ___ |
|---|---------------|-----|

**EXHIBIT A. AFFIRMATIONS AND SOLICITATION ACCEPTANCE**

### **GENERAL AFFIRMATIONS AND SOLICITATION ACCEPTANCE**

Execution of this Exhibit A, constitutes an agreement to all terms and conditions in the Solicitation, including, without limitation, this Exhibit A. If Respondent fails to sign this Exhibit A or signs it with a false statement, Respondent's Solicitation Response and any resulting contract(s) shall be void. Respondent agrees without exception to the following general affirmations and acknowledges that any contract resulting from this Solicitation may be terminated and payment withheld if any of the following affirmations or certifications are inaccurate:

1. Respondent represents and warrants that all statements and information prepared and submitted in its Solicitation Response are current, complete, true, and accurate. Submitting a Solicitation Response with a false statement or making a material misrepresentation during the performance of a contract is a material breach of contract and may void the Solicitation Response and any resulting contract.
2. Pursuant to Section 2155.003 of the Texas Government Code, Respondent represents and warrants that it has not given, offered to give, nor intends to give at any time hereafter any economic opportunity, future employment, gift, loan, gratuity, special discount, trip, favor, or service to a public servant in connection with the submitted Solicitation Response.
3. Pursuant to Section 2155.004(a) of the Texas Government Code, Respondent certifies that neither Respondent nor any person or entity represented by Respondent has received compensation from the GLO to participate in the preparation of the specifications or solicitation on which its Solicitation Response is based. Under Section 2155.004(b) of the Texas Government Code, Respondent certifies that the individual or business entity named in its Solicitation Response is not ineligible to receive the specified contract and acknowledges that the contract may be terminated and payment withheld if this certification is inaccurate. This Section does not prohibit a Respondent from providing free technical assistance.
4. Under the Texas Family Code, Section 231.006, a child support obligor who is more than 30 days delinquent in paying child support and a business entity in which the obligor is a sole proprietor, partner, shareholder, or owner with an ownership interest of at least 25 percent is not eligible to receive payments from state funds under a contract to provide property, materials, or services. Under Section 231.006, Texas Family Code, the vendor or applicant [Respondent] certifies that the individual or business entity named in this contract, bid, or application [Solicitation Response] is not ineligible to receive the specified grant, loan, or payment. The Solicitation Response must include the name and social security number of any individual or sole proprietor and each partner, shareholder, or owner with an ownership interest of at least 25 percent of the business entity submitting the bid or application. This information must be provided prior to execution of any contract resulting from this Solicitation.
5. The GLO is federally mandated to adhere to the directions provided in the President's Executive Order (EO) 13224, blocking property and prohibiting transactions with persons who commit, threaten to commit, or support terrorism and any subsequent changes made to it. The GLO will cross-reference Respondents/vendors with the federal System for Award Management (<https://www.sam.gov/>), which includes the United States Treasury's Office of Foreign Assets Control (OFAC) Specially Designated National (SDN) list. Respondent certifies: 1) that Respondent and its principals are eligible to participate in this transaction and have not been subjected to suspension, debarment, proposed debarment, or similar ineligibility or exclusion by any federal, state, or local governmental entity; 2) that Respondent is in compliance with the State of Texas statutes and rules relating to procurement; and 3) that Respondent is not listed on the federal government's terrorism watch list as described in Executive Order 13224. Entities ineligible for federal procurement are listed at <https://www.sam.gov/>. This provision shall be included in its entirety in all subcontracts to contracts resulting from this Solicitation.
6. Respondent agrees that any payments due under any contract resulting from this Solicitation will be applied towards any debt or delinquency Respondent owes to the State of Texas including, but not limited to, delinquent taxes, delinquent student loan payments, and delinquent child support.
7. In accordance with Section 669.003 of the Texas Government Code, relating to contracting with the executive head of a state agency, Respondent certifies that it is not (1) the executive head of the GLO, (2) a person who at any time during the four years before the date of the contract was the executive head of the GLO, or (3) a person who employs a current or former executive head of a state agency.

8. If any contract resulting from this Solicitation is for services, Respondent shall comply with Section 2155.4441 of the Texas Government Code, requiring the purchase of products and materials produced in the State of Texas in performing service contracts.
9. Respondent shall retain in its records the Solicitation and its Solicitation Response and all documents related to this Solicitation or any contract resulting from this Solicitation. Unless a longer retention period is specified by applicable federal law or regulation, Respondent may destroy such records only after the seventh anniversary of the date: the contract is completed or expires; or all issues that arise from any litigation, claim, negotiation, audit, open records request, administrative review, or other action involving the Solicitation, Solicitation Response, contract, or related documents are resolved. Respondent acknowledges that the State has a right of access to information in Respondent's possession relating to State property and agrees to make such information reasonably available upon request of the GLO.
10. The state auditor may conduct an audit or investigation of any entity receiving funds from the state directly under a contract resulting from this Solicitation or indirectly through a subcontract under such contract. The acceptance of funds directly under such contract or indirectly through a subcontract under such contract acts as acceptance of the authority of the state auditor, under the direction of the legislative audit committee, to conduct an audit or investigation in connection with those funds. Under the direction of the legislative audit committee, an entity that is the subject of an audit or investigation by the state auditor must provide the state auditor with access to any information the state auditor considers relevant to the investigation or audit. Respondent shall ensure that this paragraph concerning the authority to audit funds received indirectly by subcontractors through a contract and the requirement to cooperate is included in any subcontract it awards. Any contract resulting from this Solicitation may be amended unilaterally by the GLO to comply with any rules and procedures of the state auditor in the implementation and enforcement of Section 2262.154 of the Texas Government Code.
11. In accordance with Section 2252.901 of the Texas Government Code, for the categories of contracts listed in that section, Respondent represents and warrants that none of its employees including, but not limited to, those authorized to provide services under the contract, were employees of the GLO during the twelve (12) month period immediately prior to the date of execution of the contract. Solely for professional services contracts as described by Chapter 2254 of the Texas Government Code, Respondent further represents and warrants that if a former employee of the GLO was employed by Respondent within one year of the employee's leaving the GLO, then such employee will not perform services on projects with Respondent that the employee worked on while employed by the GLO.
12. The Respondent shall not discriminate against any employee or applicant for employment because of race, disability, color, religion, sex, age, or national origin. The Respondent shall take affirmative action to ensure that applicants are employed and that employees are treated without regard to their race, disability, color, sex, religion, age, or national origin. Such action includes, but is not limited to: employment, promotion, demotion, or transfer; recruitment or recruitment advertising; layoff or termination; rates of pay or other forms of compensation; and selection for training, including apprenticeship. Respondent shall post notices, setting forth the provisions of this non-discrimination article, in conspicuous places available to employees or applicants for employment. Respondent shall include the above provisions in all subcontracts to any contract resulting from this Solicitation.
13. Respondent represents and warrants that, in accordance with Section 2155.005 of the Texas Government Code, neither Respondent nor the firm, corporation, partnership, or institution represented by Respondent, or anyone acting for such a firm, corporation, partnership, or institution has (1) violated any provision of the Texas Free Enterprise and Antitrust Act of 1983, Chapter 15 of the Texas Business and Commerce Code, or the federal antitrust laws, or (2) communicated directly or indirectly the contents of its Solicitation Response to any competitor or any other person engaged in the same line of business as Respondent.
14. By signing this Solicitation Response, Respondent certifies that if a Texas address is shown as the address of the Respondent, Respondent qualifies as a "Texas Bidder" as defined in Section 2155.444(c) of the Texas Government Code.
15. Respondent understands that the GLO does not tolerate any type of fraud. The GLO's policy is to promote consistent, legal, and ethical organizational behavior by assigning responsibilities and providing guidelines to enforce controls. Any violations of law, GLO policies, or standards of ethical conduct will be investigated, and appropriate actions will be taken. Respondents are expected to report any possible fraudulent or dishonest acts, waste, or abuse to the GLO's Internal Audit Director at 512.463.6078 or [Tracey.Hall@glo.texas.gov](mailto:Tracey.Hall@glo.texas.gov).

16. Respondent certifies that it will comply with the federal Immigration Reform and Control Act of 1986, the Immigration Act of 1990, and the Immigration Act of 1996 regarding employment, employment verification, and retention of verification forms of individuals who will prospectively perform work described in this proposal.
17. Sections 2155.006 and 2261.053 of the Texas Government Code, prohibit state agencies from accepting a Solicitation Response or awarding a contract that includes proposed financial participation by a person who, in the past five years, has been convicted of violating a federal law or assessed a penalty in connection with a contract involving relief for Hurricane Rita, Hurricane Katrina, or any other disaster, as defined by Section 418.004 of the Texas Government Code, occurring after September 24, 2005. Under Sections 2155.006 and 2261.053 of the Texas Government Code, Respondent certifies that the individual or business entity named in this Response is not ineligible to receive the specified contract and acknowledges that such contract may be terminated, and payment withheld if this certification is inaccurate.
18. Respondent represents and warrants that it shall comply with the applicable provisions of and rules and regulations related to the Drug-Free Workplace Act of 1988 (41 U.S.C. §§ 8101-8106).
19. The Respondent represents that payment to the Respondent and the Respondent's receipt of appropriated or other funds under any contract resulting from this Solicitation are not prohibited by Section 556.005 or Section 556.008 of the Texas Government Code.
20. If the Solicitation is for completion of a "project" (as defined by Texas Government Code §2252.201) in which iron or steel products will be used, Respondent agrees any iron or steel product produced through a "manufacturing process" (as defined by Texas Government Code §2252.201) and used in the project shall be produced in the United States.
21. If Texas Government Code Chapter 2270 prohibiting state contracts with companies boycotting Israel applies to Respondent and any contract awarded to Respondent pursuant to this Solicitation, then Respondent verifies it does not boycott Israel and will not boycott Israel during the term of any contract awarded to Respondent pursuant to this Solicitation.
22. If Respondent is submitting a Solicitation Response for the purchase or lease of computer equipment, then Respondent certifies it is in compliance with Subchapter Y, Chapter 361 of the Texas Health and Safety Code related to the Computer Equipment Recycling Program and the Texas Commission on Environmental Quality rules in Title 30 Texas Administrative Code, Chapter 328.
23. Upon the GLO's request, Respondent shall provide copies of its most recent business continuity and disaster recovery plans.
24. If the Solicitation is for consulting services, as defined in Texas Government Code Chapter 2254, in accordance with Section 2254.033 of the Texas Government Code, Respondent certifies it does not employ an individual who has been employed by the GLO or another agency at any time during the two years preceding the submission of the Solicitation Response or, in the alternative, Respondent has disclosed in its Solicitation Response the following: (i) the nature of the previous employment with the GLO or the other agency; (ii) the date the employment was terminated; and (iii) the annual rate of compensation for the employment at the time of its termination.
25. Respondent must use the dispute resolution process provided for in Chapter 2260 of the Texas Government Code to attempt to resolve any dispute arising under any contract resulting from this Solicitation.
26. Any contract resulting from this Solicitation is contingent upon the continued availability of lawful appropriations by the Texas Legislature. Respondent understands that all obligations of the GLO under a contract resulting from this Solicitation are subject to the availability of state funds. If such funds are not appropriated or become unavailable, the GLO may terminate such contract. Any contract resulting from this Solicitation shall not be construed as creating a debt on behalf of the GLO in violation of Article III, Section 49a of the Texas Constitution.
27. Respondent represents and warrants that it is not engaged in business with Iran, Sudan, or a foreign terrorist organization, as prohibited by Section 2252.152 of the Texas Government Code.
28. Any contract resulting from this Solicitation shall be governed by and construed in accordance with the laws of the State of Texas, without regard to the conflicts of law provisions. The venue of any suit arising under the contract is fixed in any court of competent jurisdiction of Travis County, Texas, unless the specific venue is otherwise identified in a statute which directly names or otherwise identifies its applicability to the GLO.

29. Respondent has disclosed in writing to the GLO all existing or potential conflicts of interest relative to the performance of any contract resulting from this Solicitation.
30. The GLO will comply with the Texas Public Information Act (Chapter 552 of the Texas Government Code) as interpreted by judicial rulings and opinions of the Attorney General of the State of Texas. Information, documentation, and other material associated with this Solicitation or any resulting contract may be subject to public disclosure pursuant to the Texas Public Information Act. In accordance with Section 2252.907 of the Texas Government Code, Respondent shall make any information created or exchanged with the State pursuant to the Solicitation and any resulting contract, and not otherwise excepted from disclosure under the Texas Public Information Act, available in a format that is accessible by the public at no additional charge to the State.
31. The person signing this Solicitation Response represents and warrants that he/she is duly authorized and legally empowered to submit this Solicitation Response, execute a contract on behalf of Respondent, and contractually bind the Respondent.
32. Respondent expressly acknowledges that state funds may not be expended in connection with the purchase of an automated information system unless that system meets certain statutory requirements relating to accessibility by persons with visual impairments. Accordingly, Respondent represents and warrants that any technology provided to the GLO for purchase under this Solicitation is capable, either by virtue of features included within the technology or because it is readily adaptable by use with other technology, of: providing equivalent access for effective use by both visual and non-visual means; presenting information, including prompts used for interactive communications, in formats intended for non-visual use; and being integrated into networks for obtaining, retrieving, and disseminating information used by individuals who are not blind or visually impaired. For purposes of this Section, the phrase "equivalent access" means a substantially similar ability to communicate with or make use of the technology, either directly by features incorporated within the technology or by other reasonable means such as assistive devices or services which would constitute reasonable accommodations under the Americans With Disabilities Act or similar state or federal laws. Examples of methods by which equivalent access may be provided include, but are not limited to, keyboard alternatives to mouse commands and other means of navigating graphical displays, and customizable display appearance.
33. If any contract resulting from this Solicitation is for the purchase or lease of covered television equipment as defined by Section 361.91(3) of the Texas Health and Safety Code, Respondent certifies its compliance with Subchapter Z, Chapter 361 of the Texas Health and Safety Code, related to the Television Equipment Recycling Program.
34. The requirements of Subchapter J, Chapter 552, Government Code, may apply to a contract awarded under this Solicitation and Respondent agrees that the contract can be terminated if Respondent knowingly or intentionally fails to comply with a requirement of that subchapter.
35. If Respondent, in its performance of a contract awarded under this Solicitation, has access to a state computer system or database, Respondent must complete a cybersecurity training program certified under Texas Government Code Section 2054.519, as selected by the GLO. Respondent must complete the cybersecurity training program during the initial term of the contract and during any renewal period. If awarded a contract, Respondent must verify in writing to the GLO its completion of the cybersecurity training program.
36. Under Section 2155.0061, Government Code, the Respondent certifies that the individual or business entity named in this bid (Solicitation Response) or contract is not ineligible to receive the specified contract and acknowledges that this contract may be terminated, and payment withheld if this certification is inaccurate.

Check below if preference claimed under Title 34 Texas Administrative Code § 20.306.

- ☐ Supplies, materials, equipment, or services produced in Texas/offered by Texas bidders or Texas bidder that is owned by a service-disabled veteran
- ☐ Agricultural products produced/grown in Texas
- ☐ Agricultural products and services offered by Texas bidders
- ☐ Texas vegetation native to the region for landscaping purposes
- ☐ USA produced supplies, materials, or equipment
- ☐ Products of persons with mental or physical disabilities
- ☐ Products made of recycled, remanufactured, or environmentally sensitive materials, including recycled steel
- ☐ Covered television equipment
- ☐ Energy efficient products

- ☐ Rubberized asphalt paving material
- ☐ Recycled motor oil and lubricants
- ☐ Products and services from economically depressed or blighted areas
- ☐ Products produced at facilities located on formerly contaminated property
- ☐ Vendors that meet or exceed air quality standards
- ☐ Paper containing recycled fibers
- ☐ Recycled Computer Equipment of other manufacturers
- ☐ Foods of Higher Nutritional Value
- ☐ Travel agents residing in Texas

I have read, understand, and agree to comply with the terms and conditions specified in this Solicitation Response.  
Checking "YES" indicates acceptance, while checking "NO" denotes non-acceptance.

**EXHIBIT B. SAMPLE LEASE**

## CARBON DIOXIDE TRANSPORTATION AND STORAGE LEASE

This Carbon Dioxide Transportation and Storage Lease (this “**Lease**” or “**Agreement**”) is granted by virtue of the authority granted in Chapters 33 and 51 Tex. Nat. Res. Code, 31 TAC Chapter 13 (Land Resources) et seq., Tex. Health and Safety Code Sec. 382.501 et seq., and all other applicable statutes and rules, as the same may be amended from time to time, is subject to all applicable State regulations promulgated from time to time, and is dated to be effective as of \_\_\_\_\_, 2021 (the “**Effective Date**”), by and between the State of Texas, acting by and through the Commissioner of the Texas General Land Office, on behalf of the Permanent School Fund of the State of Texas, with its primary address at 1700 North Congress Avenue, Austin, Texas 78701 (“**Lessor**”), and \_\_\_\_\_ with its primary address at \_\_\_\_\_ (“**Lessee**”). Lessor and Lessee are sometimes individually referred to in this Lease as a “**Party**” and collectively as the “**Parties**.”

### RECITALS

A. Pursuant to Texas Natural Resources Code, Ch. 33, the Texas School Land Board (the “**SLB**”) is authorized to lease submerged land for any purpose that is in the best interests of the State, subject to the applicable notice requirements of that chapter.

B. Texas Health & Safety Code, Sections 382.501 et seq. allow the SLB to lease Permanent School Fund (“**PSF**”) land for the construction of any necessary infrastructure for the transportation and offshore deep subsurface geologic storage of anthropogenic carbon dioxide.

C. On \_\_\_\_\_, 20\_\_, the SLB issued RFP No. \_\_\_\_\_ (the “**RFP**”) and provided the appropriate public notice of the opportunity to lease PSF land for offshore storage of anthropogenic carbon dioxide in compliance with applicable law and as set out in the RFP.

D. Lessee responded to the RFP and applied to become the “**Lessee**” hereunder, and the SLB, finding at its meeting held on \_\_\_\_\_, 20\_\_, that the award of this Lease to Lessee would be in the best interests of the State, approved this Lease.

### AGREEMENT

**Now, therefore**, in consideration of the premises, and for other good and valuable consideration, the receipt and sufficiency of which are hereby acknowledged, the Parties agree as follows:

#### ARTICLE I. GRANT

**1.01 Lease of Property.** In consideration of the mutual covenants contained herein and other good and valuable consideration, and subject to all of the terms and conditions of this Agreement and for the term of this Agreement, Lessor hereby grants, leases and lets unto Lessee the right to geologic storage of anthropogenic carbon dioxide (“**CO2**”) in a reservoir(s) in the Miocene section beneath the surface of the Permanent School Fund land described in Exhibit A

attached hereto (the “**Leased Property**”), together with the right to construct, maintain, and operate pipelines, wells, fixtures, machinery, and equipment on the Leased Property in connection with such geologic storage (such geologic storage area, together with associated pipelines, wells, fixtures, machinery, and equipment, called the “**Facility**” herein, and the permitting, construction, and operation of the Facility, sometimes called the “**Project**” herein). The intent of the Parties is that all equipment, pipe, supports, facilities, meters, systems and ancillary items placed or maintained by Lessee on the “**Property**” (defined below) shall be considered part of the Facility.

**1.02 Surface Access and Easements.** In addition to the lease of the Leased Property to Lessee, Lessor hereby grants to Lessee a non-exclusive easement over, across, and under tracts of land owned by the Permanent School Fund for the construction, installation, maintenance, and operation of pipelines, meters, and related equipment for the transportation of CO2 from its source to the Leased Property and the measurement thereof (the “**Easement Tracts**”), as such Easement Tracts are generally shown on Exhibit B attached hereto. The Leased Property and the Easement Tracts are, collectively, the “**Property**”.

**1.03 Permits.** As more fully set forth in Section 2.02 (Development Term) below, Lessee may seek and obtain such federal, state, or local permit rights as are necessary for the Project and the Facility. Upon expiration or earlier termination of this Agreement, at the sole discretion of Lessor, and to the extent permitted by law, Lessor and Lessee shall cooperate to transfer any such permit rights to Lessor. Lessee’s obligation to transfer permits to Lessor shall survive the termination of this Agreement.

**1.04 Reserved Rights.** Lessor expressly reserves the following from the rights in the Property and in the Easement Tracts otherwise granted to Lessee in this Lease:

(i) **Mineral Leases.** The right to retain existing leases or execute and enter into new leases for the exploration, development, production, treatment, marketing, sale and transportation of oil, gas, and other minerals to third persons, and to grant to such mineral lessees the right to use the surface and subsurface of the Property for ancillary purposes in a manner that does not materially and unreasonably interfere with the rights granted to Lessee in this Agreement.

(ii) **Other Uses of the Property.** The right to enter into, or to grant easements or other access rights to third parties to enter into, the Property and/or the Easement Tracts for any use, to conduct any activity, or to construct, maintain, and operate any facility or infrastructure that does not materially and unreasonably interfere with the rights granted to Lessee in this Agreement.

**1.05 Incorporation of the RFP.** All of the terms and conditions of the RFP are hereby expressly incorporated into this Agreement as if fully set forth herein; provided, however, that if there is a direct conflict between a provision of this Agreement and a provision of the RFP, the provision of this Agreement shall control.

## **ARTICLE II. TERM**

**2.01 Term.** Subject to all of the terms and conditions of this Agreement, including, without limitation, Lessee’s compliance with its obligation to pay Rent hereunder (as “**Rent**” is

defined below), the “**Term**” (herein so called) of this Agreement shall consist, collectively, of each of the Development Term, Construction Term, and Operations Term, as well as the closure and monitoring period following the Operations Term (as those terms are defined below), as and to the extent that each such portion of the Term is in effect pursuant to the terms of this Agreement.

## **2.02 Development Term.**

(a) **Due Diligence.** Subject to earlier expiration because of the commencement of the Construction Term, the first \_\_\_\_\_ ( ) months following the Effective Date of this Agreement shall be the “**Development Term**”. During the Development Term, and at no cost or expense to Lessor, Lessee may conduct its due diligence and take any action that Lessee believes is reasonably necessary to determine whether the Property is suitable for the Project, including, without limitation, conducting engineering studies, economic studies, applying for permits, and marketing; provided, however, that Lessee may not make any material physical changes to the Property during the Development Term without the prior written approval of Lessor, which approval may be given or not in Lessor’s sole discretion; and provided further that Lessee may not, without the prior written approval of Lessor, apply for a permit the issuance of which would preclude use of the Property by Lessor or its lessees for any purpose that is reserved to Lessor pursuant to Sec. 1.04 of this Agreement.

(b) **Permits.** Lessee shall be solely responsible for applying for and obtaining any and all necessary permits for construction and operation of the Facility, including, without limitation, a US Environmental Protection Agency Class VI UIC well permit (see 75 Federal Register 77229) (“**Class VI Permit**”). Likewise, Lessee shall be solely responsible for ongoing compliance with all federal, State, and local laws, ordinances, and regulations that are or become applicable to the Project and/or the Facility. Lessee must be able to demonstrate to Lessor, to Lessor’s reasonable satisfaction, that all such permits have been obtained and that Lessee is in compliance with all such applicable laws, ordinances, and regulations at the time that Lessee proposes to begin the Construction Term under this Lease. With regard to its obligations under this paragraph, “Lessee” includes the named Lessee as well as its agents and contractors.

(c) **Termination by Lessee.** Provided that Lessee has paid all Rent (as defined below) through and including the effective date of such termination, and is otherwise in compliance with its obligations under this Agreement, Lessee may terminate this Agreement at any time during the Development Term upon thirty (30) days’ prior written notice thereof delivered to Lessor. Lessor acknowledges and agrees that Lessee has provided to Lessor sufficient and independent consideration for such option to terminate. Upon such termination by Lessee, this Agreement and the obligations of the Parties under it, shall terminate, except for any obligation of Lessee that expressly survives termination hereof pursuant to the other terms and conditions of this Agreement, including, without limitation, any such surviving obligations pertaining to indemnification of Lessor, removal of equipment, and remediation.

(d) **No Warranties.** Lessee hereby acknowledges that applicable laws, including, without limitation, Sec. 45Q of the Internal Revenue Code, may require the commencement and/or completion of a CO2 storage facility or of CO2 capture facilities by a date certain in order for an entity to claim the benefit of any federal tax credits associated with the capture and/or storage of CO2. Lessor expressly makes no representations or warranties

whatsoever that Lessee or Lessee's proposed providers of CO2 for storage will be able to satisfy any such requirement. Regardless of the availability of any such tax credit, Lessee's obligation to pay Rent according to the terms of this Agreement shall continue hereunder until such time as Rent is no longer due and payable hereunder pursuant to the other terms and conditions of this Agreement.

(e) **Progress Report.** Beginning with the first such report due on the six-month anniversary of the Effective Date, and every six months thereafter during the Development Term, Lessee shall prepare and submit to Lessor a "**Development Term Progress Report**". Each Development Term Progress Report shall provide Lessee with an update of how development activities are progressing, including with regard to permitting activities, possible sources of CO2 for storage, and the results of studies regarding engineering for and upcoming construction of the Facility. Subject to the notice and cure provisions of this Lease, Lessee's failure to provide Lessor with a Development Term Progress Report shall be a default under this Lease.

(f) **Deadline to Apply for Class VI Permit.** Notwithstanding any other provision of this Agreement to the contrary, if Lessee has not applied for a Class VI Permit for the Facility within \_\_\_\_ ( ) months after the Effective Date, or if Lessee has not obtained a Class VI Permit for the Facility within \_\_\_\_ ( ) months after the Effective Date, Lessor may terminate this Agreement upon thirty (30) days written notice thereof delivered to Lessee.

## **2.03 Construction Term**

(a) **Duration.** Subject to the other provisions of this Agreement, the "**Construction Term**" shall (a) begin on the earlier of (i) the expiration of the Development Term (if Lessor or Lessee have not earlier terminated this Agreement as provided above), or (ii) the date on which Lessee gives written notice to Lessor of Lessee's intent to proceed with construction of the Facility on the Property, and shall (b) end on the earlier of (i) the date that the Facility is complete and fully permitted such that Lessee may begin receiving and storing CO2 at the Facility pursuant to its permits and this Agreement (the "**Complete Date**"), or (b) the expiration of \_\_\_\_ ( ) months after the commencement of the Construction Term.

(b) **Termination by Lessor.** If Lessee has not achieved the Complete Date by the expiration of the Construction Term, Lessor may terminate this Agreement upon thirty days written notice thereof delivered to Lessee no more than \_\_\_\_ days after the expiration of the Construction Term.

(c) **Lessee Solely Responsible.** Lessee shall be solely responsible for designing, manufacturing, procuring, permitting, fabricating, constructing, erecting, installing, operating, maintaining and paying for all equipment, pipelines, wells, supports, facilities, systems and ancillary equipment relating thereto, to be located on the Property, to:

- (1) receive the CO2 into the most upstream point of the Facility;
- (2) transfer, transport and pipe the CO2 to the inlet of the scrubber(s) or compressors (if any);

(3) compress, pump, and measure (and dehydrate or purify as necessary) the CO<sub>2</sub>; and

(4) deliver the CO<sub>2</sub> downstream into permanent storage in the Facility.

(d) **Diligent Pursuit**. During the Construction Term, at no cost or expense to Lessor, Lessee shall construct and complete the Facility. If Lessee has not achieved the Complete Date by the end of the Construction Term, and if Lessor has not exercised its right to terminate the lease, Lessee shall, nevertheless, continue diligently working during the Operations Term (defined below) to construct the Facility, achieve the Complete Date, and begin operating the Project.

(e) **Construction Plans**. Lessee acknowledges that, as the owner of the Property, Lessor has a reasonable and legitimate interest in remaining informed about the location, design, construction, and operation of the Facility. Lessee shall (i) maintain and retain, and provide Lessor with access to, an online repository for the documents prepared and submitted for the approval and maintenance of the Class VI Permit for the Facility, as well as all plans and documents prepared for the ISO standard, and, (ii) as requested by Lessor, provide Lessor with copies of all relevant permits, plans, schematics, as-builts, and all other materials reasonably requested by Lessor that pertain to the design, construction, location, and operation of the Facility (collectively, the “Plans”). Notwithstanding the foregoing, however, Lessee shall be solely responsible and liable for the permitting, design, and construction of the Facility, and the receipt by Lessor of the Plans and any commentary by Lessor to Lessee regarding the Plans shall not be construed in any way as the undertaking by Lessor of any professional or legal responsibility whatsoever for either the completeness or adequacy of the Plans or the Facility as it is actually constructed and operated by or on behalf of Lessee. Lessee shall be solely responsible for all performing and/or obtaining all testing, inspections, and approvals necessary for Lessee to achieve the Complete Date and to begin operating the Facility as intended by this Agreement.

(f) **Minimum Construction Requirements**. Lessee shall design and construct the Facility, and operate the Project, so that there is a reasonable expectation that at least 99 percent of the CO<sub>2</sub> sequestered in the Facility will remain sequestered for at least 1,000 years. All work done by or on behalf of Lessee with regard to the Project shall be (i) pursued diligently and timely, and performed in a good and workmanlike manner, and (ii) undertaken in full compliance with all applicable laws and regulations, as well as industry best practices, including as set out in ISO 27914 (and successor standards) (see definition of “ISO Standard”, below).

## **2.04 Operations Term**

(a) **Duration**. The “Operations Term” shall begin immediately upon the expiration of the Construction Term (the “Operations Commencement Date”), and shall end after the expiration of \_\_\_\_\_ years after the Operations Commencement Date or upon the earlier termination of this Agreement pursuant to the terms hereof.

(b) **Lessee’s General Obligations**. During the Operations Term, Lessee shall (i) maintain all permits necessary under applicable law for the initial and continued operation of the Facility, including, without limitation, a Class VI Permit, (ii) seek and accept anthropogenic CO<sub>2</sub> for transportation to and storage in the Facility, (iii) inject CO<sub>2</sub> into the Facility, subject to

limits set out in this Agreement or in applicable regulations, (iv) obtain, operate, maintain, repair, and replace all pipelines, meters, equipment, and machinery as necessary for the safe and effective operation of the Facility, (v) satisfy all requirements on Lessee under this Agreement, including, without limitation, with regard to metering and reporting, (vi) pay all amounts owing to Lessor pursuant to the terms of this Agreement, and (vii) when it becomes appropriate, and with sufficient time prior to the expiration or earlier termination of this Agreement, prepare for and, as applicable, perform all actions and install all equipment reasonably necessary for the post-injection period, including for closure of the Facility and post-closure monitoring.

(c) **Continuous Operations.** If, following the Operations Commencement Date, Lessee injects less than \_\_\_\_ tons of CO<sub>2</sub> (the “**Minimum Amount**”) per month into the Facility in any four of six continuous months, then Lessor may terminate this Lease upon thirty (30) days written notice thereof delivered to Lessee. The foregoing requirement for continuous operations will not apply for a month during which the Minimum Amount is not injected into the Facility because of repairs to or replacement of pipeline, compression, or injection well equipment diligently pursued and completed, or because of the occurrence of a force majeure event, as described in Section 10.02 (Force Majeure) below.

(d) **Planned Stoppage.** Lessee shall notify Lessor in writing not less than 30 days prior to any scheduled cessations to injection operations due to planned stoppage for maintenance, monitoring, or verification activities. Lessee shall take all reasonable precautions to minimize the amount of time that injection ceases during the term of the lease. Lessee shall prepare a report of all planned or unplanned activities which occur during each period of time where injection operations cease, and shall make such reports available to Lessor upon request. The reports shall be sealed by a professional engineer or geoscientist licensed in the State of Texas and shall describe the justification for the outage and its actual (or expected) duration. Failure to comply with this provision shall be grounds for termination of the lease.

(e) **Limit of Facility.** At such time as the Facility has reached the limit of its capacity to store injected CO<sub>2</sub>, Lessee shall cease transporting CO<sub>2</sub> to the Facility for injection, and shall otherwise cease injecting CO<sub>2</sub> into the Facility. With the cessation of injection of CO<sub>2</sub> into the Facility as the result of reaching the maximum technically accessible storage volume, the Operations Term shall terminate.

(f) **Removal of Property.** Subject to Lessor’s remedies in the event of a default hereunder by Lessee, Lessee shall have the right, at any time during the term of this Lease, to remove any personal property, improvements, equipment and fixtures placed by Lessee on the Property, provided, however, that no such removal may materially adversely affect the operation or safety of the Project.

**2.05 Closure and Monitoring.** Following the expiration or earlier termination of the Operations Term, the Term of this Agreement shall remain in effect, and Lessee shall remain responsible for closure of the Facility and the establishment of monitoring equipment and protocols, and for taking any other action, all in compliance with applicable regulations and industry best standards to ensure the continued, safe storage of CO<sub>2</sub> in the Facility as required by the terms of this Agreement. To the extent that Lessee’s compliance with its closure and monitoring obligations hereunder (including under applicable State and federal statutes and rules)

requires the posting of bonds, letters of credit, or other financial assurance, Lessee shall remain responsible for satisfying such fiscal assurance requirements. Lessee's monitoring and financial assurance obligations under this Section 2.05 expressly survive the expiration or earlier termination of this Agreement.

**2.06 No Warranty.** Lessee expressly accepts and assumes all risk and liability for penalty, civil or criminal fines or charges, or any other consequence, whether in connection with environmental damage, misreporting to governmental entities, Section 45Q obligations, or any other context, arising in connection with operation of the Project, including its ultimate closure. The obligations of Lessee under this section expressly survive expiration or earlier termination of this Agreement.

### **ARTICLE III. RENT**

**3.01 Rent and Royalty.** During the Term of this Agreement, Lessee shall pay consideration to Lessor as follows:

*[This section will be based on Respondent's proposal in its response to the RFP.]*

*Rent shall include a minimum rent paid during the Development Term and Construction Term, a rent paid during the Operations Term based on throughput, storage capacity, Sec. 45Q tax credit or other carbon credit values, Lessee's monetization of the value of the CO2 to be stored, and/or other factors, and consideration paid to support post-closure obligations, including monitoring, described in this Agreement.*

*A portion of rent may be required and designated to be passed along to a third party for purposes of independent measurement, monitoring, and verification activities with regard to the CO2 storage in the Facility.]*

#### **3.02 Definitions.**

(a) **Lease Year.** A "Lease Year" means each successive twelve (12) month period commencing on the Effective Date.

*[If and as necessary for the negotiated Rent terms, the following terms (b) and/or (c) will have these meanings:] -*

(b) **"Section 45Q Credits"** means any rights, credits, revenues, tax benefits or values, carbon-related tax credits or other quantifiable benefits generated by either Lessee or a customer of Less for CO2 stored in the Facility under this Agreement pursuant to 26 U.S.C. § 45Q (see IRS Notice 2009-83).

(c) **Carbon Credit** means any rights, credits, revenues, offsets, tax benefits or values, greenhouse gas rights or similar rights related to carbon credits (including, without limitation, IRS Sec. 45Q credits), rights to any greenhouse gas emission reductions, carbon-related tax credits or equivalent arising from emission reduction trading or any quantifiable benefits (including recognition, award or allocation of credits, allowances, permits or other tangible rights), whether created from or through a governmental authority, other person, or private contract, now

or in the future, associated with the production, capture and sequestration of CO<sub>2</sub>, operation of the Facility, or other operation of the Project, and including such rights to sell or trade any of the aforementioned domestically or internationally, and including the right to count or claim any applicable reductions pursuant to the Department of Energy's Climate Challenge Program, to register all such reductions pursuant to § 1605 of the Energy Policy Act of 1992, and any other program of a governmental authority designed to encourage or reward the reduction of greenhouse gas emissions.

*[if and as necessary, depending on Rent terms]* **3.03 Audit of Tax Information.**

The Parties anticipate that either Lessee or a customer of Lessee will realize quantifiable value from a Carbon Credit. In order for Lessor to be able to audit Rent due under this Lease, Lessee will provide, for itself, or will require copies of, for contracts with third party customers, the tax return for the year in which the credit was claimed and for which tax credit value was realized; provided, that the portions of a tax return that are not germane to any such tax credit may be withheld or redacted.

**3.04 Payments and Statements.** Lessee will make the first Operations Term Rent payment within sixty (60) days after the date of Lessee's initial storage of CO<sub>2</sub> in the Property. Thereafter, Lessee will pay Rent on a monthly basis with respect to the CO<sub>2</sub> stored in the Property by Lessor as calculated *[per the negotiated rental provisions above]*, with such payments being due no later than thirty (30) days after the last day of the relevant month. Each Rent payment shall include *[information from Lessor's metering/reporting sections below]*.

## **ARTICLE IV. OWNERSHIP OF CO<sub>2</sub>**

**4.01 Ownership of Stored CO<sub>2</sub>.** The CO<sub>2</sub> transported to and stored in the Facility remains the property of Lessee or the generator of the CO<sub>2</sub> according to the agreements between them, until such time as the SLB may elect to accept ownership of the CO<sub>2</sub> pursuant to this Section 4.01; provided, however, that Lessee and/or the generator, as the case may be, even while owning the CO<sub>2</sub> may not withdraw or make any other use of the CO<sub>2</sub> in storage, as the Parties agree that CO<sub>2</sub> storage in the Facility as contemplated by this Agreement is intended to be permanent. Once CO<sub>2</sub> has been delivered into storage into the Facility, and once the SLB has determined that permanent storage has been verified and that the storage has met all applicable State and federal requirements for closure of CO<sub>2</sub> storage sites, the SLB shall acquire title to the CO<sub>2</sub> stored in the Facility. However, delivery of CO<sub>2</sub> into the Facility or acceptance of ownership of the CO<sub>2</sub> by the SLB on behalf of the PSF does not relieve Lessee of liability for any act or omission regarding the construction, operation, or closure, as applicable, of the Project.

## **ARTICLE V. METERING**

**5.01 Mass Determination.** The mass of CO<sub>2</sub> delivered into the Facility shall be determined as follows: *[to be negotiated]*

**5.02 Measuring Stations.**

**(a) Costs.** The costs and expenses of installing, operating, and maintaining measuring stations (including all equipment, whether a single instrument or multiple instruments,

necessary to determine the mass of stored CO<sub>2</sub>) required by this Agreement shall be borne solely by Lessee.

(b) **Location; Adequacy.** The type, size, and location of Lessee's proposed metering for the Project are subject to the prior written approval of Lessor, such approval not to be unreasonably delayed or withheld. Lessee shall maintain one or more measuring stations, at least one of which must be located at the wellhead where CO<sub>2</sub> is injected, in part for purposes of Lessor's audit of Rent paid hereunder. Lessee shall provide Lessor with copies of plans and drawings for Lessee's proposed transportation and storage system, including information regarding meter locations and specifications, so that Lessor has sufficient information to assess the adequacy of Lessee's proposed metering for purposes of this Agreement. Lessee's metering should, among other things, be adequate to measure (i) the mass of CO<sub>2</sub> being injected into the Facility, and (ii) the mass of CO<sub>2</sub> retained within the Facility at any given time.

(c) **Standards.** Each measuring station for CO<sub>2</sub> mass delivered pursuant to this Agreement shall be equipped in accordance with at least the standards (i) set forth in all applicable chapters of the American Petroleum Institute Manual of Petroleum Measurement Standards and (ii) of the American Gas Association. Subject to the prior approval of Lessor, measurement equipment will be subject to change to allow the use of improved technology under such standards.

**5.03 Meter Calibration and Meter Tests.** Lessee shall ensure that the measurement equipment for the Project is accurate and in good repair, and that such periodic tests of that equipment as Lessee may deem necessary are made as often as needed, but in no event less frequently than at least once every \_\_\_\_\_ months per meter; provided, Lessee agrees to perform additional calibrations at the request of Lessor, and at Lessor's expense, unless such requested calibration results in an adjustment greater than +/- \_\_\_\_\_.0%, in which case, Lessee will pay for the cost of the calibration. Lessee shall promptly deliver to Lessor (or maintain in the online repository of plans and documents referenced in Section 2.03(e) above) copies of the results of all calibrations. If, upon any such calibration, the measuring equipment is found to be (a) within \_\_\_\_\_.0% accurate, such equipment shall be considered correct in computing deliveries, and (b) inaccurate by any amount exceeding \_\_\_\_\_.0% error, repairs shall be made immediately at Lessee's cost, and any previous reading of such equipment shall be corrected to zero error for any period which is known definitely or agreed upon, but in case the period is not known definitely or agreed upon, then for one-half (1/2) of the period of time elapsed since the date of the last calibration.

## **ARTICLE VI. MONITORING**

**6.01 Monitoring and Verification – ISO Standard.** Lessee shall adhere to all provisions of International Standard ISO 27914, First Edition 2017-10, "Carbon dioxide capture, transportation and geological storage — Geological storage" (the "**ISO Standard**") in addition to, and consistent with, all other applicable regulatory requirements, including, but not limited to, all Class VI Permit requirements. Future published versions of the ISO Standard may later be adopted with the written consent of Lessor. Lessee shall make all plans, models and reports required by the ISO Standard, along with any associated supporting data, available to Lessor upon request. All reservoir models, well logs, well tests and other monitoring and verification studies performed on or for the Facility shall be interpreted by a professional engineer or geoscientist licensed in the State of Texas, and such interpretations shall be made available to Lessor upon request. Lessee

shall permanently archive copies of all the aforementioned documents no later than the earliest of the closure date of the repository or the lease termination date.

**6.02 Seismicity.** Without limiting the foregoing, Lessee shall conduct an annual review of the seismicity relating to the Property and immediately adjacent land and report its findings to Lessor. If such findings indicate that seismicity is increasing in any particular location, Lessee will make commercially reasonable efforts to adjust its CO2 injection operations, using generally accepted engineering principles and industry best practices, in order to reduce the possibility of damaging seismic activity.

## **ARTICLE VII REPORTING**

**7.01 Reports with Payments.** During the Operations Term, Lessee shall submit to Lessor, at the same time that Rent is paid, a report identifying the source(s) and mass of CO2 that has been gathered and injected into the Facility during the period for which Rent is being paid. Lessee shall submit to Lessor a copy of all filings and reports, when filed, that Lessee must file with the relevant governmental authority in connection with maintaining its Class VI Permit(s).

**7.02 Statutory Reporting.** Pursuant to requirements of Texas Health and Safety Code, Ch. 382, at least annually, Lessee must submit a report to Lessor regarding the Project, including information regarding the measurement, monitoring, and verification of the permanent storage status of the CO2 stored in the carbon dioxide repository. Such information must include (i) the total mass of CO2 stored; (ii) the total mass of CO2 received for storage during the year; and (iii) the mass of CO2 received from each producer of CO2.

**7.03 Damage to the Property.** Lessee acknowledges that its operation of the Project could damage the quality and quantity of storage pore space in the Property and/or in adjoining submerged land owned by Lessor. In order that Lessee can be informed regarding the condition of the Property, Lessee shall provide copies of reports no less often than every \_\_\_\_ months during the entire Term of this Agreement pertaining to (i) leak rates, (ii) leak detection (whether by pressure transient well tests or otherwise), or (iii) whether damage to the Property is reasonably likely to have caused the affected pore space to have become unsuitable for future storage. Damage to the pore space in the Facility caused by Lessee's operations hereunder, which damage could have been foreseen and avoided by a reasonably prudent operator, shall be a default hereunder and shall be subject to injunction by Lessor, the assessment of monetary damages by Lessor (based on the reduction in future usefulness of the Property as an asset for CO2 storage), or any other remedy available to Lessor at law or in equity.

**7.04 Other Agency Reporting Requirements.** If, at any time during the Term of this Agreement, the Texas Commission on Environmental Quality, the Texas Railroad Commission, the GLO, or any other relevant State agency promulgates rules for the reporting of CO2 storage, then Lessee must (i) comply with those rules, and (ii) send to Lessor a true and complete copy of any report or information provided to such State agency in compliance with such rules.

## **VIII LESSEE'S REPRESENTATIONS**

8.01 **Lessee's Representations.** Lessee hereby represents and warrants to Lessor that (i) Lessee is authorized to do business in the State of Texas, (ii) entering into this Lease is an action duly authorized on behalf of Lessee by its management and in accordance with its organic documents, (iii) the person executing and delivering this Lease has the requisite authority to bind Lessee to Lessee's obligations hereunder, and (iv) during the Term of this Lease, Lessee will maintain all necessary permits for operation of the Project, and will make commercially reasonable good faith efforts to remain in compliance with all statutes and regulations applicable to the Project.

## **IX LESSEE'S DEFAULT AND LESSOR'S REMEDIES**

### **9.01 Default by Lessee; Notice and Cure; Removal and Restoration.**

(a) **Default.** Subject to the notice and cure provisions below, if Lessee is not in compliance with the terms of this Lease, including, without limitation, the terms of this Lease that require payment of Rent, that require the maintenance of necessary permits, that require compliance with applicable laws and regulations, and that limit the use that may be made of the Property by or on behalf of Lessee, Lessee shall be in default hereunder.

(b) **Notice and Cure.** Lessee's failure to comply with the terms of this Lease shall not constitute a default hereof unless, following thirty (30) days prior written notice from Lessor specifying a default or breach of this Lease, Lessee fails to pay any money due hereunder or continues in breach of any term or condition of this Lease, in each case as specified in such notice. Except in the event of a default in the obligation to pay Rent, which obligation the Parties hereby agree is susceptible to cure within the 30-day period, if an event of default or breach of this Lease is not reasonably susceptible to cure within the 30-day period, then, provided that Lessee is diligently working to cure such event of default or breach of this Lease within and beyond such 30-day period and diligently pursues such cure to completion, Lessor shall not have the right to terminate this Lease with respect to such event of default or breach, unless the default or breach is not cured within ninety (90) days of Lessor's initial notice of the default, or such other time as agreed to by Lessor.

9.02 **Lessor's Remedies.** Lessor shall have, as a remedy for Lessee's default hereunder, all remedies available to it in law or in equity except as any such remedy may be limited by the express terms of this Lease, including, at Lessor's sole discretion, the right to terminate this Lease and all rights inuring to Lessee hereunder by sending written notice of such termination to Lessee in accordance with this Lease. (Section 7.03 (Damage to the Property) above is not limited by the terms of this Article IX.) Upon sending of such written notice of termination, this Lease shall automatically terminate and all rights granted herein to Lessee shall revert to Lessor. Such termination shall not prejudice the rights of Lessor to collect any money due or to seek recovery on any claim arising hereunder, and nor shall any such termination relieve Lessee of its obligations hereunder that survive expiration or earlier termination of this Lease.

9.03 **Removal of Property; Restoration.** Upon expiration or earlier termination of this Lease, at Lessor's sole option, Lessee shall (1) convey all personal property and improvements of Lessee on the Property to Lessor, or (2) (A) restore the Property to its original topographical condition that existed as of the Effective Date, and (B) remove all personal property

and any improvements placed or constructed on the Premises by or on behalf of Lessee from the Premises. The terms of this section shall survive expiration or earlier termination of this Lease. Lessor and Lessee agree that, in the event Lessee fails to restore the Property or remove its personal property or improvements within the time specified in a notice provided pursuant to this Section 9.03, then Lessor may, at its sole option, remove and dispose of such property (with no obligation to sell or otherwise maintain such property in accordance with the Uniform Commercial Code), at Lessee's sole cost and expense, or Lessor may elect to own such property by written notice of such election provided. If Lessor elects to remove Lessee's property and dispose of it pursuant to this Section, then in such an event Lessee shall be obligated to reimburse Lessor for the reasonable costs of such removal and disposal within ten (10) days of Lessor's demand for reimbursement. The terms of this section shall survive expiration or earlier termination of this Lease.

## **X MISCELLANEOUS**

### **10.01 Taxes and Fees.**

(a) **Responsibility.** Lessor represents that it is exempt from taxation. If any taxes or liens are levied on Lessee's interest under this Lease, or if any other taxes or assessments are appropriately levied against the Property, Lessee shall pay such taxes and assessments prior to the due date, or pay any late fees or charges if not paid in a timely manner, directly to the taxing authority. Lessee may in good faith and at its sole cost contest any such taxes or assessments, and shall be obligated to pay the contested amount only if and when finally determined to be owed. **LESSEE AGREES TO AND SHALL PROTECT AND HOLD THE LESSOR HARMLESS FROM LIABILITY FOR ANY AND ALL TAXES, CHARGES, AND ASSESSMENTS, TOGETHER WITH ANY PENALTIES AND INTEREST THEREON, AND FROM ANY SALE OR OTHER PROCEEDING TO ENFORCE PAYMENT THEREOF.**

(b) **Proceedings.** With the express prior written consent of Lessor, Lessee may (but is not required to) prosecute any administrative or judicial proceedings relating to the Property and the rights conveyed herein including, but not limited to, contesting any taxes or fees assessed or levied upon the Property as a result of Lessee's equipment, leasehold or easement interest, or operations hereunder. With the express prior written consent of Lessor, Lessee may undertake any administrative or judicial proceeding in the name of Lessor.

**10.02 Force Majeure.** If operation of the Project is delayed or interrupted by events beyond the reasonable control of Lessee, such as hurricane, flood, other Acts of God, fire, war, or action or inaction by any governmental authority other than Lessor, Lessee shall be excused from non-performance during the pendency of such event. Notwithstanding the foregoing, in the event of force majeure, Lessee must pay at least the Minimum Rent.

**10.03 As Is, Where Is.** **LESSEE HAS HAD THE OPPORTUNITY TO INSPECT THE PHYSICAL AND TOPOGRAPHIC CONDITION OF THE PROPERTY AND ACCEPTS SAME "AS IS" IN ITS EXISTING PHYSICAL AND TOPOGRAPHIC CONDITION. LESSEE IS NOT RELYING ON ANY REPRESENTATION OR WARRANTY OF THE LESSOR REGARDING ANY ASPECT OF THE PROPERTY, BUT IS RELYING ON LESSEE'S OWN INSPECTION OF THE PREMESIS AND PROPERTY. LESSOR DISCLAIMS ANY AND ALL WARRANTIES OF HABITABILITY,**

**MERCHANTABILITY, SUITABILITY, FITNESS FOR ANY PURPOSE, AND ANY OTHER WARRANTY WHATSOEVER NOT EXPRESSLY SET FORTH IN THIS LEASE. LESSEE WILL MAKE ITS OWN DETERMINATION OF THE USABILITY OF THE PROPERTY FOR THE PROJECT. LESSOR AND LESSEE HEREBY AGREE AND ACKNOWLEDGE THAT THE USE OF THE TERMS "GRANT" AND/OR "CONVEY" IN NO WAY IMPLIES THAT THIS LEASE OR THE PROPERTY ARE FREE OF LIENS, ENCUMBRANCES AND/OR PRIOR RIGHTS. LESSEE IS HEREBY PUT ON NOTICE THAT ANY PRIOR GRANT AND/OR ENCUMBRANCES MAY BE OF RECORD AND LESSEE IS ADVISED TO EXAMINE ALL RECORDS OF THE STATE AND COUNTY IN WHICH THE PROPERTY IS LOCATED. THE TERMS OF THIS SECTION SHALL SURVIVE EXPIRATION OR EARLIER TERMINATION OF THIS LEASE.**

**10.04 Notices.** All notices given pursuant to this Lease shall be in writing, and may be sent by (a) first class U.S. mail postage prepaid, certified, return receipt requested or (b) overnight mail, in each case addressed to the Party to be notified at the address listed for such Party above. A copy of such notice shall also be provided by email, if to Lessor, to the Deputy Director of Energy Resources for the Texas General Land Office, or other express designee of Lessor, and if to Lessee, to \_\_\_\_\_. A Party may change its address for notice by giving notice to the other Party.

**10.05 Audits; Availability of Tax Returns.** Lessor shall have the right, no more than once per Lease Year, during regular business hours, personally or by representative, to inspect the books, accounts, contracts, records and data of Lessee solely as they pertain to the operation of the Project, storage of the CO<sub>2</sub>, receipt and/or use of Section 45Q or other Carbon Credits (if applicable to the Rent hereunder), and any other matter reasonably deemed subject to the terms of this Lease. To the extent that the relevant information regarding Lessee's tax credits, including their effect on the Rent due to Lessor under this Lease, is part of Lessee's state and/or federal tax return(s), Lessee shall make available to Lessor any and all information, including tax returns, as is necessary for Lessor's audit purposes hereunder. Lessee hereby waives any objection to making such information available to Lessor for audit purposes, provided, however, that Lessee may hold back or redact information from such tax return(s) that is not relevant to Rent as long as the available and non-redacted information is sufficient for Lessor's audit purposes hereunder, as determined by Lessor in its sole discretion.

**10.06 Memorandum of Lease.** Lessee shall, at its sole cost and expense, record a Memorandum of Lease in the Official Public Records of the county or counties in which the Property is located and provide a file marked copy of same to Lessor within sixty (60) days after this Lease is executed by all Parties.

**10.07 Counterparts.** This Lease may be executed in counterparts, each of which shall be considered an original for all purposes.

**10.08 Assignments.** The interests of Lessor under this Lease may be freely assigned. The interests of Lessee under this Lease may be assigned on the prior written consent of Lessor (not to be unreasonably withheld, conditioned, or delayed), but not otherwise.

**10.09 Protection of Natural and Historical Resources.** LESSEE IS EXPRESSLY PLACED ON NOTICE OF THE NATIONAL HISTORICAL PRESERVATION ACT OF 1966 (16 USC § 470, ET SEQ.) AND THE TEXAS ANTIQUITIES CODE (TEX. NAT. RES. CODE CH. 191), AS THE SAME MAY BE AMENDED FROM TIME TO TIME. IN THE EVENT THAT ANY SITE, OBJECT, LOCATION, ARTIFACT OR OTHER FEATURE OF ARCHEOLOGICAL, SCIENTIFIC, EDUCATIONAL, CULTURAL OR HISTORIC INTEREST IS ENCOUNTERED DURING ANY ACTIVITY ON ANY PORTION OF THE PROPERTY OWNED IN FEE BY LESSOR, LESSEE SHALL IMMEDIATELY CEASE SUCH ACTIVITIES AND SHALL IMMEDIATELY NOTIFY LESSOR AND THE TEXAS HISTORICAL COMMISSION, P.O. BOX 12276, AUSTIN, TEXAS 78711, SO THAT ADEQUATE MEASURES MAY BE UNDERTAKEN TO PROTECT OR RECOVER SUCH DISCOVERIES OR FINDINGS, AS APPROPRIATE. IN THE EVENT LESSEE IS REQUIRED TO CEASE ACTIVITIES UNDER THE LEASE AS TO ANY PORTION OF THE PROPERTY, THE MINIMUM ROYALTY SET FORTH IN SECTION 4(D) SHALL NOT APPLY FOR ANY PERIOD FOR WHICH LESSEE IS REQUIRED TO CEASE ACTIVITIES.

**10.10 Governing Law and Venue; Compliance with Laws.** This Lease shall be governed by the laws of the State of Texas. Exclusive venue for any dispute arising under or relating to this Lease shall be in any court of competent jurisdiction in Travis County, Texas. Lessor and Lessee agree that each of them will comply with all applicable federal, state and local laws and all applicable ordinances, rules, orders, and regulations of any authority having jurisdiction over the activities of Lessor or Lessee under this Lease.

**10.11 Further Assurances.** The Parties shall take all further actions and shall execute and deliver to the other any document or instrument which is necessary to fully carry out the transactions contemplated by this Lease. The Parties shall cooperate with each other and act in good faith to accomplish the purposes of this Lease.

**10.12 Lessee Liability.** LESSEE SHALL BE FULLY LIABLE AND RESPONSIBLE FOR ANY DAMAGE, OF ANY NATURE, ARISING OR RESULTING FROM ITS OWN ACTS OR OMISSIONS RELATED TO ITS EXERCISE OF THE RIGHTS GRANTED HEREIN. LESSEE AGREES TO AND SHALL INDEMNIFY AND HOLD LESSOR, LESSOR'S OFFICERS, AGENTS, AND EMPLOYEES, HARMLESS FROM AND AGAINST CLAIMS, SUIT, COSTS, LIABILITY OR DAMAGES OF ANY KIND, INCLUDING STRICT LIABILITY CLAIMS, WITHOUT LIMIT AND WITHOUT REGARD TO CAUSE OF THE DAMAGES OR THE NEGLIGENCE OF ANY PARTY, AND WHETHER FOR DAMAGES TO PROPERTY OR THE ENVIRONMENT OR INJURY OR DEATH OF ANY PERSON, OR ANY COMBINATION THEREOF, EXCEPT FOR THE CONSEQUENCES OF THE GROSSLY NEGLIGENT ACTS OR WILLFUL MISCONDUCT OF LESSOR, LESSOR'S OFFICERS, AGENTS, OR EMPLOYEES, ARISING DIRECTLY OR INDIRECTLY FROM LESSEE'S OPERATION OF THE PROJECT, INCLUDING ITS USE OF THE PROPERTY AND THE FACILITY (OR ANY ADJACENT OR CONTIGUOUS PSF LAND) OR FROM ANY BREACH BY LESSEE OF THE TERMS CONTAINED HEREIN. THE PROVISIONS OF THIS SECTION SHALL SURVIVE EXPIRATION OR EARLIER TERMINATION OF THIS LEASE.

**10.13 Lessee Insurance.** Lessee shall obtain and maintain at all times during the Term of this Lease all of the insurances, and in the amounts, as were required pursuant to the RFP.

**10.14 Miscellaneous.** This Lease may not be amended except in a writing signed by Lessor and Lessee. Nothing in this Lease shall be construed as creating any form of partnership of joint venture relationship between the Parties. No third party shall be deemed a third-party beneficiary of this Lease. This Lease (which specifically incorporates the non-conflicting terms of the RFP, as described above) constitutes the entire agreement between Lessor and Lessee and supersedes all oral statements and prior understandings relating to the subject matter contained in this Lease. Except as set forth in this Lease, no representations, warranties, or agreements have been made by either Party to the other Party with respect to this Lease. If any part of this Lease is illegal, invalid or unenforceable under present or future laws, then the remainder of this Lease shall not be affected and in lieu of such part there shall be added a clause or provision as similar in terms to such illegal, invalid, or unenforceable part as may be legal, valid, and enforceable, and any affected part shall be severed from this Lease if necessary to enforce the remainder of this Lease.

**[10.15 Lessor and Lessee may negotiate a standard, limited Lender Protection provision, if needed.]**

IL-CC-CS-\_\_\_\_\_; and

**LEASE AGREEMENT**

THIS LEASE AGREEMENT (hereinafter the "Lease") is dated and effective as of \_\_\_\_\_, 2022 (the "Effective Date") and is made by and between \_\_\_\_\_ (the "Landlord") and **HG CARBON STORAGE LLC**, a Delaware limited liability company (the "Tenant")

**Recitals:**

**WHEREAS**, Landlord is the fee owner of that real property located in Christian County, Illinois, and more particularly described in **Exhibit A** attached hereto and incorporated herein by reference (the "Property"). The premises leased to Tenant includes, without limitation, that portion of the subsurface lying between the top of the St Peter formation and the top of the Precambrian Basement underlying the approximately \_\_\_\_\_ acres of surface Property located in Christian County, Illinois, described in **Exhibit A** attached hereto (collectively, the "Premises"). The volume of subsurface Premises described above which is subject to the terms of this Lease is hereinafter sometimes referred to as the "Premises" or "Deep Subsurface" and the portion of the above described Property which is retained by Landlord is hereinafter sometimes referred to as the "Landlord's Property;" and

**WHEREAS**, Tenant desires to lease the Premises and hereby leases all rights for the development and operation of an underground carbon capture and storage facility, among other purposes.

**NOW, THEREFORE**, in consideration of the mutual covenants and obligations of the parties herein contained, and for other good and valuable consideration, the sufficiency of which is hereby acknowledged, the Landlord and Tenant (collectively, the "Parties") hereby agree as follows:

**ARTICLE 1: TERMS OF THE LEASE**

1.1 **Lease**. Landlord hereby leases the Premises to Tenant, and Tenant hereby leases the Premises from Landlord, on the terms and conditions contained in this Lease.

1.2 **Use of Premises**. Tenant shall have the exclusive right to use the Premises, including, without limitation, using the Premises for permanently storing, sequestering and monitoring carbon dioxide and incidental associated substances derived from the source materials and capture process and any substances added or used to enable or facilitate transport, injection, monitoring, and storage (such injected material being referred to herein as "Carbon Dioxide"). The operation of the carbon capture and storage facility described above is herein sometimes referred to, collectively, as the "CCS Facilities," or individually as a "CCS Facility." Nothing in this Lease shall be construed as requiring Tenant to install and/or operate any CCS Facilities or any other business or use on the Premises or the Property, and Tenant shall not be required to operate the Premises for the storage of Carbon Dioxide or for any other purpose.

1.3 **Part of a Larger Project**. Landlord acknowledges that Tenant may elect to install CCS Facilities on other property as part of a larger project (collectively, the "Project"), all of which are specifically designed to be interrelated and integrated in operation and use for the full life of such CCS Facilities. Tenant may designate, from time to time, the CCS Facilities with which the Premises is included in the Project. The properties designated by Tenant as included in the Project with the Premises shall herein sometimes be referred to as the "Project Properties."

1.4 **Commencement and Expiration Dates**. This Lease shall be effective and the term of this Lease (the "Term") shall commence on the Effective Date which is specified above in the introductory paragraph of this Lease. The

120453837V-4

BLF-000001

Term shall end on that date (the "Expiration Date") which is the date Ninety-Nine (99) years following the Effective Date, unless the Term is sooner terminated in accordance with the express terms of this Lease.

1.5 Tenant's Right to Terminate. Tenant shall have the right to terminate this Lease, and the Term of this Lease, as to all or any part of the Premises, at any time and from time to time during the Term, upon Tenant giving written notice of termination to Landlord. Upon any termination of this Lease by Tenant, Tenant shall surrender the Premises, or the portion thereof that has been terminated, to Landlord, and the parties shall be bound to comply with the terms of Section 9.1 below.

## **ARTICLE 2: ADDITIONAL USE OF PREMISES AND LANDLORD'S PROPERTY**

2.1 Inspections and Due Diligence. Landlord grants permission to Tenant to enter upon the surface of Landlord's Property, to conduct various surveys, and may use, without limitation, vibroseis trucks, thumper trucks, monitoring and vibration sensors and other equipment, appurtenances and facilities Tenant deems necessary and appropriate for use in conducting geophysical and other surveys. Prior to any entry upon the surface of Landlord's Property for the purpose of exercising of the right to conduct geophysical surveys, Tenant shall provide to Landlord at least ten (10) days written notice. Surface access shall be utilized by Tenant, to the extent practical, at times which minimize damage to crops or to the land.

2.2 Pooling. Tenant is granted the right and agrees to pool or unitize all or a portion of the Premises with adjoining and nearby subsurface area which Tenant owns or controls by filing of record a declaration of pooling designating the area covered by the unit ("Storage Unit"). The size, shape and location of the Storage Unit will be determined on the basis of the permit acquired for injection of Carbon Dioxide from the United States Environmental Protection Agency (or the Illinois Environmental Protection Agency, if applicable) in connection with the storage and sequestering of Carbon Dioxide, or if such permit is unnecessary or does not provide such guidance, by such reasonable means as Tenant determines. Tenant agrees to declare and record the location of the Storage Unit prior to injection of the initial metric ton of Carbon Dioxide. The portion of the Premises included in the Storage Unit, if any, shall be based on the aforesaid determination. Tenant may expand, contract or reshape the Storage Unit at any time or times based upon the best available science and information at the time of such change, including, without limitation, an increase or decrease in the planned amount of Carbon Dioxide to be injected, a change in the number or location of injection wells, receipt of additional information regarding the area impacted by injected Carbon Dioxide or improved analytic techniques regarding the appropriate size and shape of a Storage Unit.

## **ARTICLE 3: RENT**

3.1 Development Rent. (a) Tenant shall pay Landlord a one-time payment in an amount equal to the greater of (i) One Hundred and No/100 Dollars (\$100.00) per acre of surface Property described above, and (ii) Two Thousand Five Hundred and No/100 Dollars (2,500.00) (the "Development Rent"). The Development Rent payment will be made by Tenant to Landlord within forty-five (45) days after the Effective Date.

(b) Notwithstanding the initial payment of Development Rent described above in Section 3.1(a), Tenant shall pay Landlord, an additional bonus amount equal to Twenty-Five and no/100 Dollars (\$25.00) per acre of surface Property described above if (1) this Lease and the Memorandum described in Section 11.4 below are fully executed and delivered to Tenant on or before March 31, 2022 (the "Bonus Deadline"), and (2) the Memorandum is publicly recorded in the official real estate records of Christian County, Illinois, on or before the Bonus Deadline.

(c) In addition to the payments described above in this Section 3.1, if the Commercial Operation Date (as hereinafter defined) has not occurred as of the date four (4) years after the date of the Effective Date (the "Fourth Anniversary"), and this Lease has not be terminated by Tenant or Landlord, then Tenant shall pay Landlord an additional one-time payment in an amount equal to the greater of (i) One Hundred and No/100 Dollars (\$100.00) per acre of surface Property described above, and (ii) Two Thousand Five Hundred and No/100 Dollars (2,500.00) (the "Additional Development Rent"). The Additional Development Rent payment will be made by Tenant to Landlord within forty-five (45) days after the Third Anniversary.

3.2 Commercial Operation Rent. Tenant shall pay to Landlord the following amounts as the "Commercial Operation Rent":

(a) Initial One-Time Payment of Commercial Operation Rent. On or before the date forty-five (45) days following the Commercial Operation Date (as hereinafter defined) Tenant shall pay Landlord an amount equal to the greater of (i) Four Hundred and No/100 Dollars (\$400.00) per acre of surface Property above the Premises included in the Premises as of the Commercial Operation Date, and (ii) Two Thousand Five Hundred and No/100 Dollars (2,500.00) ("Initial Operating Rent Payment"); and

(b) Termination of Lease. If the Commercial Operation Date has not occurred on or before the seventh (7<sup>th</sup>) anniversary of the Effective Date, then this Lease shall automatically terminate without any further action being required by Landlord or Tenant.

(c) Commercial Operations Rent: From and after the first calendar day of the first calendar month following the Commercial Operation Date, Tenant shall pay to Landlord commercial operations rent ("Operations Rent") which shall be such portion of the Total Storage Unit Royalty (defined below) as the amount of Landlord's Deep Subsurface acreage leased hereby bears to the total acreage within the Storage Unit.

(d) Royalty Amount. The "Total Storage Unit Royalty" is Twenty-Five Cents (\$0.25) per metric ton of Carbon Dioxide injected into the Storage Unit.

(e) Payment Terms. Payment of the Operations Rent shall be made in two installments:

- (1) on or before August 31 for the volume of Carbon Dioxide injected into the Storage Unit during the immediately preceding January 1 through June 30, as estimated by Tenant; and
- (2) on or before February 28 for the volume of Carbon Dioxide injected into the Storage Unit during the immediately preceding July 1 through December 31, as estimated by Tenant.

Within thirty (30) days after the annual publication of Carbon Dioxide injection volumes into the Storage Unit with the United States Environmental Protection Agency ("EPA") the Operations Rent payments shall be true'd up to reflect the actual volume reported to the EPA, with a payment adjustment (plus or minus) made in the next Operations Rent payment made in accordance with this Section 3.2(e) to reflect the true-up to actual reported volumes; provided that the final true-up after injection ceases shall be made as a stand-alone payment following completion of injection and shall only be made if it results in a positive amount being paid to Landlord (i.e. Landlord shall not be required to refund any overpayment for the final true-up).

For all purposes under this Lease, the term "Commercial Operation Date" shall mean the date that, following the completion of all testing of the injection wells, and the receipt by Tenant of

the written approval of all governmental authorities required for the injection of Carbon Dioxide into the Storage Unit that includes the Premises, the first metric ton of Carbon Dioxide is injected into the Storage Unit that includes the Premises.

(f) Proration for Lesser Interests. If Landlord owns an interest in the Premises less than the entire fee simple estate, then the Operating Rent to be paid to Landlord shall be reduced proportionately. No change in ownership of the Operating Rent shall bind Tenant until sixty (60) days after Tenant receives documentation of such change. If the right to Operating Rent is disputed or unknown as a result of such change in ownership or the amount of Operating Rent due is disputed, Tenant may suspend the portion of payments which are in dispute until the dispute is resolved by agreement or final court order. Failure to pay Operating Rent shall not affect this Lease, but shall only create a cause of action for amounts due; however, if Landlord initiates an action in court after sixty (60) days' notice to Tenant of failure to pay an amount due under a documented and undisputed claim, and Landlord is thereafter successful in obtaining judgment for Landlord's full claim, then Tenant shall pay Landlord's reasonable attorneys' fees and costs.

(g) CPI Adjustment. The Operating Rent due shall be adjusted over time in accordance with this provision. Effective as of the first July 1 date that occurs following the date 24 months after initial injection of Carbon Dioxide in the Storage Unit that includes the Premises (the "Initial Adjustment Date"), and on each July 1 thereafter (each July 1 date thereafter being herein sometimes referred to as an "Adjustment Date"), the amount of the Operating Rent owed shall be adjusted by multiplying the then currently applicable Operating Rent by the lesser of:

i) the greater of (a) 1.0100 and (b) the Consumer Price Index for All Urban Consumers (reference base 1982-84=100), unadjusted index, all items, as first published by the United States Department of Labor, Bureau of Labor Statistics ("CPI-U") CPI-U for July of the year in which the adjustment is being made, divided by the CPI-U for July of the immediately prior calendar year; and

ii) 1.0300,

and the adjusted Operations Rent due shall be effective on all Carbon Dioxide injected in the Storage Unit during the period of time from the July 1 Adjustment Date for that calendar year through June 30 of the following year.

In the event of any dispute regarding the calculation of the adjustment to the Operating Rent as provided above, Tenant shall continue to pay the Operating Rent at the previous rate, and after the dispute is finally resolved, refunds to Tenant, or additional Operating Rent to Landlord, as the case may be, shall be promptly paid, with interest at the rate of six percent (6%), compounded monthly. In the event the reference base of the CPI-U is rebased, the CPI-U shall continue to be used by the parties as rebased. If during any January when the Operating Rent is being adjusted the CPI-U is no longer published or issued by a governmental authority, then Landlord and Tenant shall use such other index as is then generally recognized and utilized for similar determinations of purchasing power. If there is a failure to agree on the replacement index, then a court sitting in equity will select the replacement index, and the provisions of this paragraph regarding payment pending resolution of a dispute shall apply.

(h) If the amount of Carbon Dioxide stored or sequestered into the Storage Unit is not made publicly available by the EPA or other similar reporting agency prior to the annual true-up described in Section 3.2(e) above being made by Tenant, then Landlord shall on or before the date one hundred and twenty (120) days following the date of such annual true-up, upon written notice and request given by Landlord to Tenant, have the right to access the books and records of Tenant, during normal business hours, as reasonably necessary to verify the amount of Operating Rent payable to Landlord for the one (1) year period prior to such annual true-up. If any investigation determines an underpayment of more than five percent (5%) during such one (1) year period, then Tenant shall also pay Landlord for all reasonable costs incurred by Landlord in conducting the investigation.

(i) The rights granted to Tenant under this Lease may be exercised for the benefit of the Premises and other subsurface now or hereafter controlled by Tenant for Carbon Dioxide storage and sequestration.

**ARTICLE 4: Damages.**

4.1 Tenant shall be liable to Landlord for any and all damages incurred by Landlord, including, but not limited to, those relating to the land, crops, groundwater, subsidence, improvements, livestock, timber, buildings, fences, drainage systems, equipment or personal injury occasioned by any present and future use of the Premises or the Landlord's Property, including, but not limited to, the injection, presence, maintenance, operation, inspection, migration or release of the sequestered and stored Carbon Dioxide in the Premises.

4.2 To the extent practical, Tenant shall use existing roadways or paths and minimize disturbance of the surface of Landlord's Property when exercising the rights granted herein, but in any event Tenant shall compensate Landlord for all damages to Landlord's Property caused by exercise of Tenant's rights, including, without limitation, damages to growing crops, pasture, timber, fences, soil (ruts, compaction and otherwise), waterways, drainage tile and ditches, ponds, well, water quality, soil subsidence, and other farm facilities.

4.3 In the event of crop or certain land damages, the following calculations shall apply:

(1) In the event of damaged or destroyed crops or areas which Landlord was unable to plant, the crop damages shall be computed as follows:

(A) the size of the damaged area is determined;

(B) the determined area is multiplied by the average yield that year on Landlord's adjoining land; and

(C) the calculated yield loss is multiplied by the average cash price at ADM in Decatur, IL, during the following January.

(2) In the event there is any soil disturbance (such as ruts or compaction), the amount owed for this disturbance shall be computed as follows:

(A) the area of disturbed land is computed by measuring all that area located within the outermost boundaries where the disturbance occurred;

(B) a calculation is made to determine the amount which would be paid (under the above formula) for this amount of area as if there was 100% crop loss; and

(C) the calculated crop loss amount is multiplied by two (2).

(3) Tenant shall pay Landlord for such crop damages and land damages on or before February 28th following the calendar year of damage.

4.4 Tenant shall indemnify and hold Landlord harmless from any and all liability, liens, demands, judgments, suits, attorneys' fees, costs and claims of any kind or character arising out of, or in connection with the presence, migration, or release of Carbon Dioxide stored or sequestered in the Premises, or relating in any other way to Tenant's operations in the Premises or to Tenant's use of the rights granted herein, including, but not limited to, claims for damage, loss or destruction of any property, real or personal, and claims for injury, under any theory of
