NORTH DAKOTA

OIL AND GAS DIVISION

In re application of Summit	: Case No(s).	30869
Carbon Storage #1, LLC requesting	:	30870
consideration for the geologic	:	30871
storage of carbon dioxide in the	:	30872
Broom Creek Formation from the	:	30873
Midwest Carbon Express Pipeline in	:	30874
the storage facility located in	:	30875
Sections 31, 32, 33, and 34,	:	30876
Township 142 North, Range 87 West,	:	30877
Sections 1, 11, 12, 13, 14, 15,	:	30878
22, 23, 24, 25, 26, 35, and 36,	:	30879
Township 141 North, Range 88 West,	:	30880
Sections 2, 3, 4, 5, 6, 7, 8, 9,	:	
10, 11, 14, 15, 16, 17, 18, 19,	:	
20, 21, 22, 23, 25, 26, 27, 28,	:	
29, 30, 31, 32, 33, 34, and 35,	:	
Township 141 North, Range 87 West,	:	
Sections 1, 2, 3, and 12, Township	:	
140 North, Range 88 West and	:	
Sections 4, 5, 6, and 7, Township	:	
140 North, Range 87 West, Mercer,	:	
Morton, and Oliver Counties, ND.	:	
In re application of Summit	:	
Carbon Storage #1, LLC to	:	
consider the amalgamation of the	:	
storage reservoir pore space, in	:	
which the Commission may require	:	
that the pore space owned by	:	
nonconsenting owners be included	:	
in the geologic storage, as	:	
required to operate the Summit	:	
Carbon Storage #1, LLC storage	:	
facility located in Sections 31,	:	
32, 33, and 34, Township 142	:	
North, Range 87 West, Sections 1,	:	
11, 12, 13, 14, 15, 22, 23, 24,	:	
25, 26, 35, and 36, Township 141	:	
North, Range 88 West, Sections 2,	:	
3, 4, 5, 6, 7, 8, 9, 10, 11, 14,	:	
15, 16, 17, 18, 19, 20, 21, 22,	:	
23, 25, 26, 27, 28, 29, 30, 31,	:	

32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, in the Broom Creek Formation.

In re application of Summit Carbon Storage #1, LLC for an order of the Commission determining the amount of financial responsibility for the geologic storage of carbon dioxide from the Midwest Carbon Express Pipeline in the storage facility located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, in the Broom Creek Formation.

In re motion to consider establishing the field and pool limits for lands located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35,

Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, subject to the application of Summit Carbon Storage #1, LLC for the geologic storage of carbon dioxide in the Broom Creek Formation, and enact such special field rules as may be necessary.

In re application of Summit Carbon Storage #2, LLC requesting consideration for the geologic storage of carbon dioxide in the Broom Creek Formation from the Midwest Carbon Express Pipeline in the storage facility located in Sections 27, 28, 29, 32, 33, 34, and 35, Township 143 North, Range 88 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, 35, and 36, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, and 31, Township 142 North, Range 87 West, and Sections 1, 2, and 3, Township 141 North, Range 88 West, Mercer and Oliver Counties, ND.

In re application of Summit Carbon Storage #2, LLC to consider the amalgamation of the storage reservoir pore space, in which the Commission may require that the pore space owned by nonconsenting owners be included in the geologic storage, as required to operate the Summit Carbon Storage #2, LLC storage facility located in Sections 27, 28, 29, 32, 33, 34, and 35,

Township 143 North, Range 88 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, 35, and 36, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, 31, Township 142 North, Range 87 West, and Sections 1, 2, and 3, Township 141 North, Range 88 West, Mercer and Oliver Counties, ND in the Broom Creek Formation.

In re application of Summit Carbon Storage #2, LLC to consider the application of Summit Carbon Storage #2, LLC for an order of the Commission determining the amount of financial responsibility for the geologic storage of carbon dioxide from the Midwest Carbon Express Pipeline in the storage facility located in Sections 27, 28, 29, 32, 33, 34, and 35, Township 143 North, Range 88 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, 35, and 36, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, and 31, Township 142 North, Range 87 West, and Sections 1, 2, and 3, Township 141 North, Range 88 West, Mercer and Oliver Counties, ND, in the Broom Creek Formation.

In re motion of the Commission to consider establishing the field and pool limits for lands located in Sections 27, 28, 29, 32, 33, 34, and 35, Township 143 North, Range 88 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13,

14, 15, 16, 17, 18, 19, 20, 21, :
22, 23, 24, 25, 26, 27, 28, 29, :
30, 32, 33, 34, 35, and 36, :
Township 142 North, Range 88 West,:
Sections 5, 6, 7, 8, 17, 18, 19, :
20, 29, 30, and 31, Township 142 :
North, Range 87 West, and Sections:
1, 2, and 3, Township 141 North, :
Range 88 West, Mercer and Oliver :
Counties, ND, subject to the :
application of Summit Carbon :
Storage #2, LLC for the geologic :
storage of carbon dioxide in the :
Broom Creek Formation, and enact :
such special field rules as may :
be necessary. :

In re application of Summit :
Carbon Storage #3, LLC requesting :
consideration for the geologic :
storage of carbon dioxide in the :
Broom Creek Formation from the :
Midwest Carbon Express Pipeline in:
the storage facility located in :
Section 36, Township 143 North, :
Range 87 West, Sections 19, 20, :
21, 28, 29, 30, 31, 32, 33, 34, :
35, and 36, Township 143 North, :
Range 86 West, Sections 1, 2, 11, :
12, 13, 14, and 24, Township 142 :
North, Range 87 West, Sections 1, :
2, 3, 4, 5, 6, 7, 8, 9, 10, 11, :
12, 13, 14, 15, 16, 17, 18, 19, :
20, 21, 22, 23, 24, 25, 26, 27, :
28, 29, 30, 32, 33, 34, and 35, :
Township 142 North, Range 86 :
West, and Sections 6, 7, 17, 18, :
19, and 20, Township 142 North, :
Range 85 West, Oliver County, ND. :

In re application of Summit :
Carbon Storage #3, LLC to consider:
the amalgamation of the storage :
reservoir space, in which the :
Commission may require that the :
pore space owned by nonconsenting :
owners be included in the geologic:

storage, as required to operate the Summit Carbon Storage #3, LLC storage facility located in Section 36, Township 143 North, Range 87 West, Sections 19, 20, 21, 28, 29, 30, 31, 32, 33, 34, 35, and 36, Township 143 North, Range 86 West, Sections 1, 2, 11, 12, 13, 14, and 24, Township 142 North, Range 87 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, and 35, Township 142 North, Range 86 West, and Sections 6, 7, 17, 18, 19, and 20, Township 142 North, Range 85 West, Oliver County, ND, in the Broom Creek Formation.

In re application of Summit Carbon Storage #3, LLC for an order of the Commission determining the amount of financial responsibility for the geologic storage of carbon dioxide from the Midwest Carbon Express Pipeline in the storage facility located in Section 36, Township 143 North, Range 87 West, Sections 19, 20, 21, 28, 29, 30, 31, 32, 33, 34, 35, and 36, Township 143 North, Range 86 West, Sections 1, 2, 11, 12, 13, 14, and 24, Township 142 North, Range 87 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, and 35, Township 142 North, Range 86 West, and Sections 6, 7, 17, 18, 19, and 20, Township 142 North, Range 85 West, Oliver County, ND, in the Broom Creek Formation.

In re motion of the Commission to consider establishing the field and pool limits for lands located in Section 36, Township 143 North, Range 87 West, Sections 19, 20, 21, 28, 29, 30, 31, 32, 33, 34, 35, and 36, Township 143 North, Range 86 West, Sections 1, 2, 11, 12, 13, 14, and 24, Township 142 North, Range 87 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, and 35, Township 142 North, Range 86 West, and Sections 6, 7, 17, 18, 19, and 20, Township 142 North, Range 85 West, Oliver County, ND, subject to the application of Summit Carbon Storage #3, LLC for the geologic storage of carbon dioxide in the Broom Creek Formation, and enact such special field rules as may be necessary.

TRANSCRIPT OF HEARING

VOLUME II - (Pages 277 - 552)

Taken At
1000 East Calgary Avenue
Bismarck, North Dakota
June 12, 2024

(The following proceedings were had and made of record herein, commencing at 9:06 a.m., Wednesday, the 12th day of June, 2024:)

HEARING EXAMINER GARNER: We are on the record for hearings in the matters listed in the North Dakota Industrial Commission Hearing Docket for June 12. I'm David Garner, hearing examiner for these hearings. We're at the hearing room for the Department of Mineral Resources, Oil & Gas Division, and it is 9:08 a.m.

We will resume our hearings for Case Numbers 30869 through 30880. I notice new counsel appeared at the table, so I'll give everyone an opportunity for all interested parties to please come forward again.

MR. BENDER: Thank you, Mr. Examiner. I'll introduce Tom. He doesn't need any introduction, but with us today is Tom Throne. He's going to be assisting with Summit in this application.

HEARING EXAMINER GARNER: Okay.

MR. BRAATEN: Derrick Braaten, Braaten Law Firm, on behalf of the landowner intervenors. With me is my paralegal, Desirae Zaste, and client Kirk Swenson.

MR. BENDER: I apologize. I thought you were just looking for an introduction of the new counsel.

HEARING EXAMINER GARNER: No, that's --

MR. BENDER: Did you want me to make another appearance or --

HEARING EXAMINER GARNER: No. That's fine.

MR. BENDER: Okay.

HEARING EXAMINER GARNER: That's fine. Just a quick note. We're going to resume with the cross-examination of the two witnesses that were being crossed by Mr. Braaten yesterday. Change, though. We're going to then at that point in time allow Summit to call its remaining witnesses, give the Commission a chance to respond to them -- or question them. And then you'll have the remainder of the time to cross-examine those witnesses.

MR. BRAATEN: Okay. And, Your Honor, I don't want to be difficult or take up time. I just want to put on the record that I do object to that process.

HEARING EXAMINER GARNER: Okay.

MR. HELMS: 6:30.

HEARING EXAMINER GARNER: Oh, I'm sorry.

And we're going to have a deadline today again of 6:30 p.m., and if we are not done, we will be back here tomorrow morning at 9 a.m.

Okay. With that, I think we can proceed.

MR. HELMS: They're still under oath.

HEARING EXAMINER GARNER: They're still under oath.

CONTINUED CROSS-EXAMINATION

BY MR. BRAATEN:

Q. I wasn't going to ask this, but since it came up, do you understand that you're still under oath?

A. (BY MS. DOUGLAS) I do.

Q. Okay. We were discussing the CO_2 plume model yesterday, and I want to start by just asking if you have an understanding within the regulatory framework for Class 6 wells why a plume model is constructed?

A. I do.

Q. And what is that understanding?

A. So under the North Dakota UIC Class VI regulations, a geologic model is constructed to help define the horizontal and vertical boundaries of a storage reservoir.

Q. For what purpose or reason?

A. The purpose of this is to define the boundaries of the storage reservoir, in this case which would be the storage facility, which the regulations require pore space owners within that storage facility to be equitably compensated. Also, the modeling and simulation, it's constructed to help delineate the area of review, which is also a requirement of the statutes to delineate the area of review.

Q. And the delineation of the area of review is also the primary requirement or reason for creating that model under the Safe Drinking Water Act?

A. So we're talking about two sets of regulations here. So in -- in North Dakota UIC Class VI regulations, as I mentioned, the modeling is a tool to determine the AOR in the storage facility area. The Safe Water Drinking Act, under that, I believe, the EOA has its own set of UIC Class VI rules, which the North Dakota UIC Class VI rules are based on and are more stringent than. In the EPA rules, it is my understanding that modeling and simulation is used to define an area of review as well.

Q. Is North Dakota's underground injection

control program regulation for Class VI wells adopted pursuant to the Safe Drinking Water Act?

A. It is, and it is more stringent in terms that it goes above and beyond and also has stipulations for a storage facility area, pore space leasing, which the EPA UIC Class VI rules do not.

Q. And when the EPA promulgated its Class VI rules, the methodologies it used for delineating -- delineating an area of review were focused on the purpose and function of protecting USDWs; right?

A. That's correct, and North Dakota Administrative Code is as well. So they define the area of review as the region surrounding the geologic sequestration project where underground sources of drinking water may be endangered by the CO_2 injection activities.

Q. And so you're modeling the areal extent of the CO_2 plume because the regulations require you to do that in order to protect drinking water sources?

A. Modeling the simulation is required to evaluate potential impact and endangerment on any underground sources of drinking water in which you're required to define an area of review where you're required to monitor and ensure that you're

not endangering any underground sources of drinking water.

Q. You've noticed -- you've noted a couple of times that North Dakota's regulations are more stringent than the EPA regulations. That's because the EPA regulations require that any state being granted primacy have a set of regulations that are more stringent than EPA's?

A. I'm not familiar with the specific requirements. I know that they can't be any lesser.

Q. Okay. I've handed you what has been marked as Exhibit LO-83. Can you tell me if you've seen that document before?

A. I personally have not.

Q. And when you say "I personally have not," are you aware of others who have that you're thinking of?

A. Not specifically, no.

Q. If you look at the bullet points in the middle, you'll notice a number of descriptions of various data and input files. Is there anything in those bullet points that you can identify that was not provided to the Industrial Commission by EERC?

A. Upon request from the Commission, the EERC

had provided the DMR with the .DAT file, which is our simulation model input file for CMG, as well as our results file in the form of a .SR3, as well as shapefiles for the maps that were generated. Outside of those data sets, we did not provide any additional data to the DMR.

Q. You said for the maps that were provided outside of the data. What maps are you referring to?

A. The maps in the storage facility area. So we provided shapefiles for the storage facility boundary, the area of review boundary and such.

Q. Okay. And you're saying you provided the shapefiles but not necessarily the particular maps you generated from them?

A. Correct.

Q. Okay.

A. Let me correct for that. The maps are provided in the permit itself, so we didn't provide maps separately. They're within the permit itself.

Q. Okay. That's fair.

So this first one, all of the input files for the PHREEQC model were provided to the Commission?

A. No. As I stated, just the .DAT file for

the numerical simulations which were used to define the horizontal and the vertical boundaries of the reservoir.

Q. You didn't give them an input file for the PHREEQC model?

A. We did not, no. It was not requested.

Q. It's in your possession, though?

A. The EERC has the data.

Q. Sorry. Yes. EERC.

And EERC is Summit's agent and representative with respect to that data?

A. The ownership of the data is governed under our specific contracts with Summit including our NDA with them that govern data ownership.

Q. EERC has a nondisclosure agreement with Summit?

A. Yes.

Q. Who proposed that?

A. I was not involved in those discussions. It's a standard -- standard practice we have with most of our clients, though.

Q. Is that because your licenses for the computer modeling programs are academic licenses?

A. No. Commercial licenses were procured for this project as this was a commercially contracted

project.

Q. Did Summit compensate for the cost of the subscriptions for the programs on a commercial basis?

A. The EERC procured commercial licenses and the costs of those commercial licenses were billed to Summit. Yes.

Q. Okay. Were they temporary subscriptions?

A. Yes. So the licenses have a time period associated with them. Commonly, we procure licenses on the order of a month, two-month, three-month licenses, depending on the duration of the time period in the project we need the license to perform the scope.

Q. So I want to go back to my prior question. Other than the input model for the PHREEQC model -- sorry. Let me start over.

Other than the input file for the PHREEQC model, is there anything listed in these bullet points that was not provided by EERC to the Industrial Commission?

A. Yes. As I mentioned, the only input data that was provided can be found in your last bullet point in terms of what I would call the simulation -- or the numerical reservoir simulation

model data decks and the output files. Those were the two pieces of data which I am saying is the .DAT file and the .SR3 file. Those are the only two data sets from this list that were provided.

Q. So if you look at the third bullet point, is there anything there that was provided to the Industrial Commission?

A. Yes. Thank you for correcting me. So all core analysis data was provided to the Industrial Commission as well as the North Dakota Geological Survey through submission to the North Dakota core library staff. And as required, all well log data, formation testing, fluid analysis was provided as -- as part of completions reports for the three stratigraphic test wells that were drilled. So those were technically provided.

Q. When you look through these bullet points on this letter, do you have an understanding of what is being referenced in all of these? Is there anything you don't understand what is being referenced?

A. No. I understand.

Q. If I asked you to go back to EERC today and sit down and pull together an external hard drive and put this data on that external hard drive

and give it to me, approximately how long would it take you to do that?

A. That would involve the procurement of commercial licenses to access.

Q. No. Assuming that you have a commercial license, which you do for all of this, if you needed to go to your office, take all of this data and put it on an external hard drive, how long would that take you?

A. Days to weeks.

Q. It would take you weeks to put this data on a hard drive? You're telling me that?

A. To ensure that we have the proper data, QC it, and we ran multiple iterations.

Q. No. I'm asking you to take this data that you understand what all of it is, export it, transfer those files onto an external hard drive, how long?

A. One to two weeks.

Q. It would take you one to two weeks to transfer those files to a hard drive, but you can start from scratch with publicly available data and replicate and recreate that entire model in four weeks?

A. So the publicly available data would be

coming from single data bases. The way the EERC's file structure and the iterations of our models, the amount of data we have, it's my opinion knowing our data storage, the amount of data we have, the different iterations of modeling simulations done for this project, I would estimate it would take our staff that amount of time to ensure that we had the proper data to be transferred.

Q. But you keep saying -- you're saying ensure we have the proper data to be transferred. I'm saying physically how long does it take to click the buttons on the computer to tell the files in the computer to transfer them to an external hard drive and how long does it take the computer to process that file transfer and get it onto the external hard drive? I'm not talking about quality control or review.

A. Okay. I can't speculate. I don't know the size of the data in terms of megabytes, gigabytes or the speed to upload it.

Q. So you have no idea how long it would take to put this on an external hard drive and send it to us?

A. I gave you an estimated range of what I believe it would take.

Q. Three weeks?
A. I believe I said one to two.
Q. One to two weeks.
And you're still saying that you could also replicate the entire model yourself from public data in just four weeks? Can you explain that?
A. I believe I did already answer that.
Q. Why does it only take two weeks to transfer the files onto a hard drive but you can take and recreate everything in four weeks?
A. I believe I already answered that.
Q. And you think that sounds plausible?
A. I gave a range and in my opinion of what it would take.
Q. Okay. Were you asked to do that at any point?
A. No.
Q. Were you at any point advised that you might need to make data available to an opposing party in any kind of legal proceeding for Summit?
A. I was made aware that data may be requested. Not specifically that it would need to be provided.
Q. Were you told that it would not need to be

provided?

MR. BENDER: I'm going to object insofar as it might get into issues on attorney/client privilege. So if any of this was discussed with you while I was present on the phone or whatever or Ty, I'd instruct you not to answer it.

MR. BRAATEN: Are you asserting the privilege on behalf of Summit or EERC?

MR. BENDER: Summit.

Q. (MR. BRAATEN CONTINUING) At any time when there was no representative of Summit, other than Mr. Bender, were you told that -- or there was no representative of Summit present for the conversation, at any point were you told that you would not need to provide data?

A. No. I was involved in discussions to determine what it would take for us to provide that data. I was not told we would not have to provide it. I was told as a potential we may have to.

Q. Who were you told that by?

A. Mr. Lonny Jacobson who is our direct point of communication with the Summit team.

Q. Is he with EERC or Summit?

MR. BENDER: Your Honor, I'm going to object. We're getting into issues having to do

with discovery. These issues are before the Commission in a motion to compel. I don't think it's appropriate to try to litigate that here. We haven't had an opportunity to respond to that motion to compel, so I'm going to object to this whole line of questioning.

HEARING EXAMINER GARNER: I'm going to overrule.

MR. BENDER: Okay. Thank you.

Q. (MR. BRAATEN CONTINUING) Who does Lonny -- did you say Lonny Jacobson?

A. Yeah.

Q. Who does he work for?

A. The Energy & Environmental Research Center.

Q. Okay. When did you talk to him about the potential of having to provide data?

A. Can you clarify "provide data"? To whom?

Q. We just talked about a conversation you had had with Lonny in which you indicated that you had not been told that you would not need to provide data. Do you recall that conversation?

A. I do. It was after discovery was submitted.

Q. And when you say "after discovery was

submitted," are you referring to the request for data and information that were sent by me on behalf of the intervenors?

A. Correct.

Q. Okay. What did he ask you about that data?

A. What effort and software licenses would be needed to compile that data.

Q. And just tell me fully what your response to that was when you talked to him at that time?

A. We provided him with a specific list of the software licenses needed, the data as well as things, like I discussed yesterday, about some of the data sets being acquired from data brokers that the specific digitized logs in question are governed by a license agreement.

Q. Did you make a determination that because of those license agreements you were unwilling to provide those data sets?

A. EERC did not make that determination. We provided information to Summit on what it would take for us to produce those data sets.

Q. With respect to everything that's listed in Exhibit 83 in those bullet points, first, EERC has itself all of that data related to Summit's

project; right?

A. Yes.

Q. And has EERC provided all of that data to Summit itself?

A. I'm unsure. I don't believe we have provided every piece of data yet.

Q. So Summit doesn't even have all of the data that EERC has?

A. I can't comment on that with certainty.

Q. Well, did you just say that EERC has not provided all of this data to Summit?

MS. DOUGLAS: Could you read back what I stated?

(Record read as requested.)

MS. DOUGLAS: So I believe I said I'm unsure, I'm uncertain about that. I don't have a definitive answer.

Q. (MR. BRAATEN CONTINUING) Okay. What did Lonny tell you about his conversations with Summit about it?

A. That we would just not have to provide it at this time. A determination was not made on whether we would be providing it or not.

Q. At any point were you asked to start compiling the data in the potential event that you

did have to provide it?

A. No, because as I mentioned, we'd be required to procure software licenses.

Q. For what?

A. To open the model, take out any data. For example, to open the Petrel model, we'd need a Petrel license in order to take out the digitized well logs that are governed by that license agreement.

Q. So the temporary subscriptions you had for the models, have those lapsed at this point?

A. They have.

Q. Okay. So you didn't want to export the data because in order to do that, you would have had to buy another subscription just to export the data out of the models?

A. Again, the EERC's contracted to perform this scope by Summit Carbon Storage, and so they would have had to approve and authorize us to procure the software.

Q. And they didn't want to pay for the software?

MR. BENDER: If you know.

MS. DOUGLAS: I -- I don't know. I was not involved in those discussions.

Q. (MR. BRAATEN CONTINUING) Well, you're the one that just told me that the need to procure new licenses was part of the reason for not exporting or starting on the export of the data; right?

A. We would need to be authorized by Summit to start those activities.

Q. And they never did that?

A. No.

Q. Did Lonny ask them if they would like to authorize that?

A. I'm not privy to those discussions.

Q. The PHREEQC model is a free model, though, that anyone can use and there would be no barrier with subscriptions to putting all that data together; right?

A. Correct. As I testified, though, yesterday, I believe that all of the input data used for that is described in the permit itself.

Q. Have you personally had any direct communications with the employees or members of the North Dakota Industrial Commission about this matter in the last two weeks?

A. I have not, no.

Q. Do you know if Lonny has?

A. I'm not aware if he has or not, but I do

not believe he has.

Q. As part of your work on the -- the Summit project, did you do any work related to the surface facilities?

A. No, I did not.

Q. There was a comment yesterday that I believe -- and you can correct me if I'm wrong, but I believe you said that these injection wells will not endanger human health. Would you agree with that?

A. I believe Caitlin testified to human health.

Q. Okay. And did I hear it right or do you agree that the testimony was that these injection wells, the Class VI wells, will not endanger human health?

A. (BY MS. OLSEN) I believe I testified to the injection wells have engineering protocol in place that would not endanger human health or the environment in relation to CO_2 injection activities.

Q. Thank you. In making that statement, did you consider the potential of CO_2 releases from those surface facilities such as valves, blowouts, things of that nature?

A. That was discussed later on in the permit.

So my references to that are in relation to the injection well and the review that was done on the injection well specifically.

Q. Would it also be accurate to say specifically with respect to the things that happen downhole at the injection well?

A. The engineering safeguards in place downhole are such that they would prevent migration of CO_2 into USDWs or the atmosphere.

Q. What about the engineering safeguards between the terminus point of the Midwest Carbon Express Pipeline and the wellhead?

A. (BY MS. DOUGLAS) We believe we have witnesses coming up who are better suited to testify to that.

Q. Okay. We had a discussion yesterday about the permeability adjustment with the 2.5 multiplier. Do you recall that?

A. I do.

Q. Did you or Lonny have conversations with Summit at any point regarding that issue?

A. We did.

Q. And what were those conversations?

A. So as I testified yesterday, the results showed a slightly higher permeability that could

have been used to justify a higher multiplier. In discussions with EERC and Summit, EERC providing technical advisement to use a lower value, those discussions included discussions with Summit from a business case. They wanted to permit the site to take a certain amount of CO_2 and store CO_2 within a certain area.

And so through sensitivity modeling and business considerations, it was a joint determination to use 2.5. Additionally, the Commission has approved a permit for the Broom Creek Formation that has used 2.5 as well.

Q. What were the business considerations Summit expressed regarding the use of the 2.5 factor?

A. Again, I just discussed the amount of CO_2 they were targeting and the area -- the area to be permitted for CO_2. I discussed a little bit yesterday I didn't want to overestimate the storage facility area and then not inject that amount of CO_2 to where we would be over-leasing the area and not using it.

Q. So Summit was -- Summit's preference would be that that perm adjustment be a lower number based on that business consideration?

A. Through discussions with EERC and Summit, the 2.5 multiplier was selected.

Q. But specifically because in part of Summit's business considerations of wanting to keep the storage facility as small as possible for the amount of CO_2 they want to inject; right?

A. I wouldn't say it's as small as possible. There's just some consideration to not overestimate the area needed.

Q. Because if they reduce the size or the boundary of that storage facility, then if there are people just on the other side of that, they don't need to pay for any property rights for that; is that accurate?

A. Can you repeat that?

Q. If they reduce the geographic areal extent of the storage facility boundary, it reduces the number of landowners for whom they need to compensate for the use of the property rights and that's the business consideration; right?

A. It's a fact a smaller storage facility area would result in less landowners having to be permitted. The -- the business consideration wasn't related to number of landowners as it was area.

Q. What business interest does Summit have in reducing the size or boundary of that storage facility if it's not related to not having to compensate landowners?

A. I --

MR. BENDER: If you know the answer.

MS. DOUGLAS: I don't know that. I'd have to defer to Summit.

Q. (MR. BRAATEN CONTINUING) And so the compensation of landowners is the only thing you know of as a business consideration that they would have been thinking about in --

MR. BENDER: I think that's a mischaracterization of her testimony. Can you ask the question again?

Q. (MR. BRAATEN CONTINUING) Sure. You've testified to the business consideration of the need to lease landowners; right?

A. Yes.

Q. And that's the only business consideration that you've testified to related to Summit's consideration of which permeability adjustment factor to use?

A. Yes, but it's not the only business consideration. There's also operational costs

associated with monitoring. If they -- they use a permeability multiplier in a larger permeability multiplier as we discussed, it may result in a larger plume, likely a larger associated pressure front, larger AOR that would require additional acreage to monitor, meaning additional monitoring costs.

Q. And every five years or so Summit is going to rerun the models based on the data acquired thus far from that monitoring; right?

A. Yeah. So the regulations require a reevaluation of the AOR determination, no less than every five years, meaning that Summit will be using operational and monitoring data to history match, calibrate their models and confirm their permitted AOR and storage facility area are still sufficient.

Q. What if they found out it wasn't?

A. So the North Dakota Century Code 43-05-01-12 --

MR. BENDER: Let me -- let me correct you. That's the Administrative Code.

MS. DOUGLAS: Thank you for that correction.

Q. (MR. BRAATEN CONTINUING) 43-05-01, and what was the next one?

A. 12. Dash 12.

Q. Okay.

A. Okay. This contains the -- the regulation language regarding any changes to the storage facility area on that reevaluation. If it was deemed that the CO_2 would potentially go outside the boundaries and Summit determined they needed to expand the area, they would need to go through the modification process.

Q. And the result being potentially an adjustment to the boundaries of the storage facility?

A. That would require a major modification which I believe requires an additional hearing at that point if they needed to modify the permitted boundaries.

Q. But if the data indicated that the storage facility boundary had not been modeled in a way that was accurately reflecting the conditions in the last five years, that is a potential result of the five-year review, that you redraw the storage facility boundary; right?

A. Potentially.

Q. And if you did that, what do you do about all the payments you've made to the landowners so

far?

A. I can't speak to that.

Q. Is there any process you're aware of that would address that?

A. Again, I believe it would be addressed in that major modification proceedance, which would be a hearing just like the one we're in today.

Q. Were there any communications about using the 2.5 multiplier between EERC and the Industrial Commission?

A. I can't recall specifically. Potentially in their review of initial permit drafts submitted, it could have been discussed.

Q. If you had used 2.7 for the factor instead of 2.5, how many more acres of property would have been included in the storage facility?

A. I can't speak to that. We did not run that case.

Q. Okay. Do you have any sense of what that might be?

A. I do not because simulations are a complex, multi-physics approach, and so adjusting the permeability is not a straight ratio to plume size.

Q. Would you agree that it would result in

some additional acreage?

A. Yes, I believe I stated that.

Q. Just a couple minutes ago you made a reference to sensitivity analysis. Do you recall that?

A. Yes.

Q. What do you mean by "sensitivity analysis"?

A. So the EERC performs sensitivity analysis. Some of that is discussed in -- in the permit as well. We looked at parameters that affectively -- or could affect simulation results. In addition to that, to the sensitivity analysis, we also did uncertainty analysis to look at how various properties and distribution of properties, such as permeability, could potentially impact the -- the model and the simulation results.

Q. And that's essentially doing quality control to test the predictive utility of your model?

A. I wouldn't classify it as testing the utility of our model. We did those things to determine what parameters we thought were appropriate and justifiable for use in the model.

Q. Could you do that assessment of the

parameters chosen without running sensitivity analysis on the model?

A. Could you repeat that?

Q. Could you assess the propriety of the parameters used in the model without running any sensitivity analysis on it? Let me ask a different question.

What properties did you run sensitivity analysis on?

A. Sensitivity analysis, you said?

Q. Yep.

A. So we ran sensitivity analysis on injection rates, bottomhole pressure conditions, wellhead temperatures, wellhead pressures.

Q. For what purpose?

A. So on page 3-15, we have a paragraph talking about sensitivity analysis.

Q. And you indicate that because of the availability of data in the form of well logs, core sample data and rock fluid properties, the need for typical sensitivity studies of influential reservoir parameters has been reduced. Has it been eliminated?

A. No, which is why we ran a sensitivity analysis.

Q. What's the difference between the sensitivity analysis you ran and what you would refer to here as typical sensitivity studies?

A. Typical sensitivity studies would vary more parameters potentially. So we felt confident in site-specific data to define limits of certain variables so we didn't need to test those.

Q. Up until you ran the injection test?

A. I -- I don't understand the question.

Q. Well, what were the parameters you were comfortable with that you didn't need to run sensitivity analysis on?

A. Things like model size, grid cell size, boundary conditions. We ran certainty cases on property distribution. We didn't necessarily run sensitivity cases on property distribution.

Q. Would you have been confident using your model to develop this application for Summit with running zero sensitivity analysis?

A. I think it points back to your questions earlier where you asked about what is the intent of running these models to define the storage facility area in an area of review taking into consideration the required five-year reevaluation, the amount of CO_2 that would be injected in -- in that time. I

believe running a model without sensitivity analysis would -- would still provide enough insight to be able to safely inject for those -- at least those five years until the reevaluation time period.

Q. So you're comfortable with a larger margin of error in the first five years?

A. Given the amount of CO_2 that will be injected, the proposed CO_2 plume size, other variables such as the area of review evaluation that looked at proximity of legacy wellbores and things like that, given the testing and monitoring plan, yes.

Q. Because ultimately what we're talking about here are pressures and the extent of the plume, and given what's going to be injected in the first five years, you don't have those same safety concerns in those first five years; would that be fair?

A. Could you restate that?

Q. You're comfortable with a greater margin of error in the first five years; right?

A. Given the amount of CO_2 that would be injected, that's -- that's correct, because we're -- the model as a whole was used to define a

boundary which is for 20 years of injection plus a period of postinjection plus a buffer. So within that five years, we're talking about a much smaller area.

Q. And if it's not exact, it's not going to be problematic because you're not going to have injected enough to get out to that boundary by that time anyway?

A. That's my belief. Correct.

Q. Except that you're treating all of the landowners inside that boundary exactly the same with the first ton that goes down that well and everyone on the outside of that line exactly the same, meaning they get nothing; right?

MR. BENDER: If -- if you understand how the allocation formula works for paying royalties, you can answer the question, but if you don't, I would not -- I would not answer it if I were you.

MS. DOUGLAS: Could you restate your question?

MR. BRAATEN: I can't even remember. May I have you read it back, please?

(Record read as requested.)

Q. (MR. BRAATEN CONTINUING) With respect to compensation.

A. I guess I don't understand your question. If the CO_2's still in the boundaries, you're in compliance with your permit and you're compensating those within the boundary.

Q. Regardless of where that CO_2 is actually?

A. I guess to Mr. Bender's point, I'm not comfortable talking on the compensation rates for landowners or how that's going to be distributed across owners within the area.

Q. And so to the extent you ran sensitivity analysis on the model and to the extent you're comfortable with the predictive utility of the model in the ways that you used it for this application, it was never a consideration to you how that would affect how landowners get compensated?

A. This modeling and simulation was done to define the boundaries. Summit made decisions related to compensation of pore space owners.

HEARING EXAMINER GARNER: Why don't we take a ten-minute break.

(Recessed at 10:00 a.m. and reconvened at 10:12 a.m.)

HEARING EXAMINER GARNER: We are back on the record. Mr. Braaten, you can resume your

questioning.

Q. (MR. BRAATEN CONTINUING) You had mentioned that the Industrial Commission had previously accepted the use of a 2.5 factor. Was that for the Project Tundra project?

A. For those permits, correct.

Q. And was the EERC similarly involved with developing those applications?

A. We were involved, but they had -- we were involved.

Q. Did someone from EERC make that determination in the prior case? That was a bad question. Let me ask it again.

Did someone from EERC make the determination to use the 2.5 permeability adjustment factor in the prior proceedings related to Project Tundra in which EERC was involved?

A. I can say we participated in those discussions. I can't provide more details on who made the determination and the parties involved as that project is -- is still actively being conducted and is governed by an NDA with Minnkota.

Q. If you were going to assess someone else's work developing the same models that EERC developed for Summit's application, how would you go about

assessing those models that were developed by others?

MR. BENDER: Do you understand what he's talking about when he says "assess"?

MS. DOUGLAS: I was just going to ask, assessing for what purposes?

Q. (MR. BRAATEN CONTINUING) If you were asked to determine if the inputs and parameters and ways in which the models were set up and run would be acceptable to you in your professional experience such that they would support an application for Class VI wells.

A. The EERC's been contracted in this capacity before, so I'm speaking from direct experience here. Typically, that review process would come in the form of presentations about inputs and assumptions used in the model by those that created the model. We would evaluate their inputs and assumptions for reasonability and if they're justifiable based on the data sets that they had available to them, and we'd take into considerations Class VI requirements related to compliance. But EERC has not in these roles -- where we've been contracted to perform this work before, we have not reviewed people's models or

rerun their simulations to -- to double-check things in that manner. We've reviewed their inputs and assumptions through presentations, reviews of reports, that type of thing.

Q. Presentations by whom?

A. As I mentioned, those that generated the models presented to us their inputs and assumptions. A lot of the information that would have been in those presentations is captured -- for our models that information is similarly captured in the storage facility permits.

Q. Did you run the model at a 2.7 adjustment factor for permeability?

A. I just previously mentioned earlier today that we did not.

Q. Why not?

A. We didn't feel it was necessary. We made a decision to run it with 2.5 and so we ran it with 2.5.

Q. Would it have cost you anything to run it at 2.7?

A. Yes, it would have cost us time, so --

Q. How much time?

A. -- hours, and it would have cost us time running it with the model license. So we only

have -- we pay for a model license for a month. Running the model would tie up that license for a week or so.

Q. Because that's how long it takes to run the model?

A. A model this size typically could be anywhere from two days to a week of run time, depending on if any errors are encountered and you have to restart the model.

Q. Meaning that if you had to restart the model, it could take up to a week?

A. Potentially.

Q. Could it take longer than a week?

A. Potentially, if there are model errors which can't be necessarily predicted when the simulator is going to experience a numerical error and give an error file.

Q. But you think an engineer could replicate it in four weeks?

A. You asked me how much time it would take to -- to build a model and I said four weeks to build the model. That's different than running the simulations.

Q. Okay. So several weeks to replicate the model and then at least another week to run it?

A. Correct.

Q. So it's your testimony that another engineer could both replicate and run that model in five weeks?

A. If the model they built ran and didn't experience any numerical errors that they would have to troubleshoot.

Q. Have you ever set up and run a model that didn't have any numerical errors that had to be troubleshooted?

A. Myself personally, no.

Q. There's a binder directly in front of you there with a number of tabbed exhibits. If you don't mind, can I have you open it to landowner -- or LO-63.

A. I'm there.

Q. Are there features on this map that you recognize from the shapefiles submitted by Summit to the DMR?

A. These appear to be the storage facility boundaries and the AOR for the three permits.

Q. Are you also familiar with the maps that were produced to indicate the 5-, 10- and 20-year pressure increases in the area of the injectors?

A. Yes, I'm familiar with those.

Q. And does it appear that one of those is also overlaid on this exhibit?

A. It does appear that way, but it's difficult to see given the color scale for that layer.

Q. You are familiar with the maps that were generated to indicate the areal extent of the pressure increases in the reservoir that were in the application; right?

A. I am.

Q. And so you'd agree that there will be increases in the pressure in the formation well outside the boundaries of the storage facility?

A. Yes. If we may, I'd like to speak off page 4-2 of the permit.

Q. Okay.

A. Figure 4-1.

Q. And just for the record, the permit being referenced is Exhibit 1A?

A. Correct. So this map is showing the predicted maximum subsurface pressure due to injection from the three sites. So this is at 20 years is where -- of injection is where we see the maximum. And as you can see, the pressure increase extends beyond the proposed facility

boundaries in the area of review.

Q. What variable of Darcy's law limits the amount and rate at which you can inject CO_2?

A. I don't think I could speak to that without the equation in front of me.

Q. What limits your ability to inject CO_2 into these Class VI wells? Let me ask that again.

What limits the rate and amount of CO_2 that you can inject into that reservoir through these Class VI wells?

A. So the bottomhole pressure constraint is the -- the regulatory constraint that dictates the amount of CO_2 that can be injected into these wells. So that bottomhole pressure constraint is derived as 90 percent of the fracture pressure gradient. So bottomhole pressure is the regulatory constraint for the Class VI.

Q. And the bottomhole pressure is obviously directly impacted by existing pressures in the formation; right?

A. That's correct.

Q. Are you familiar with the intervention by Minnkota in this proceeding?

A. Generally.

Q. Are you familiar with where the well is

that they had concerns about?

A. Yes.

Q. Is Summit's project going to affect the ultimate bottomhole pressure that limits Minnkota's project?

A. There will be pressure interference.

Q. Can I have you go back to Exhibit LO-63?

A. I'm there.

Q. Do you see in the legend there there's a number of different colors, and I'll agree with you the color scale's a bit off, but down near the bottom next to Swenson there's a white color. Do you see that?

A. Yep.

Q. Do you see the land that sits right in between the areas of review of the three different storage facilities?

A. Yes.

Q. Is there going to be pressure interference with Mr. Swenson's lands and pore space?

A. Define "pressure interference with."

Q. From the Class VI injectors that Summit is going to inject CO_2 into.

A. There will be a pressure increase in the reservoir due to injection. The map does show the

pressure increase will be in the pore space below that land.

Q. Which would similarly limit the ability to inject into the pore space in that part of the reservoir based on limits to bottomhole pressure that are being affected by that pressure interference by Summit's Class VI wells?

A. Yes, potentially.

Q. How much is Summit compensating for that?

A. They're not required to compensate based on North Dakota Class VI laws. They're required to compensate for use of pore space for CO_2 storage. Injection will cause pressure increase.

Q. Which reduces the availability of pore space for storage of substances?

A. No. The pore space is still there. It's not taking the pore space away.

Q. It reduces the availability of the pore space for the storage of substances?

A. I don't agree with that characterization.

Q. Why not?

A. An operator could come in and still develop that and store CO_2 in that pore space.

Q. Subject to a bottomhole pressure limitation that has been significantly impacted by

the three Class VI wells surrounding him; right?

A. For the amount. Bottomhole pressure might impact potential injection rates, not necessarily the volumes that could be stored there. So one thing to note that while injection operations will increase pressure, when injection stops or if injection rates are limited, after injection stops pressure will die off in the reservoir, and we have a map that demonstrates that.

During operations, you know, if Summit's injecting at a lower rate, there will be a lower pressure increase. It could also, you know, shut in wells which would result -- or decrease -- which would result in additional pressure decreasing there. The pressure increase is temporary, but a developer could come in and still inject CO_2 there.

Q. And you show equilibrium of pressures ten years after operations; right?

A. The permit has a map that demonstrates this pressure decrease. It doesn't represent pressure equilibrium.

Q. What would you project that to be in time from the end of operations?

A. We did not simulate that.

Q. Would you expect it to be more than

20 years?

A. We'd have to simulate that.

Q. Significant pressure interference for at least 30 years of Mr. Swenson's pore space caused by the Summit project?

A. Again, it would limit injection rates. It wouldn't limit the total volumes that could be stored on his land. So to answer your question, there would be a pressure increase of approximately 500 psi up to a thousand psi increase over the current pressure of the Broom Creek today for up to 30 years.

Q. What's the economic incentive for injecting CO_2 into the pore space?

A. Can you clarify that question?

Q. Is Summit being paid in the form of tax credits by the federal government to inject CO_2 in the pore space?

A. I believe Wade testified yesterday as to the -- the economic drivers behind their project. I can't answer questions on that.

Q. Will the 45Q credits be in place in the same form and amount 30 years from now?

MR. BENDER: Objection. Calls for speculation.

HEARING EXAMINER GARNER: Overruled.

MS. DOUGLAS: As written today?

Q. (MR. BRAATEN CONTINUING) Correct.

A. No. But as I mentioned, while Summit's operating, there's nothing that would preclude an operator from coming in and injecting to store CO_2. The same amount of pore space would still exist. They would just have to inject at lower injection rates, but they could still get the same amount of CO_2 in that pore space over time.

Q. How much longer amount of time?

A. We have not run that model.

MR. BRAATEN: Real quick, I apologize, on the prior exhibit, LO-83, I did not move to admit, and I would move to admit LO-83.

MR. BENDER: Did you say 83 or 63?

MR. BRAATEN: 83.

MR. BENDER: Oh, that one. I'm sorry.

MR. BRAATEN: I'm skipping back.

HEARING EXAMINER GARNER: Any objections?

MR. BENDER: No objection.

HEARING EXAMINER GARNER: The exhibit is admitted.

Q. (MR. BRAATEN CONTINUING) You talked yesterday briefly about the area of review and

corrective action. Did you look at the old wells that have been P and A'd around the area of the storage facilities?

A. (BY MS. OLSEN) We did.

Q. What did you look at in those wells?

A. Particular to this permit, there are no legacy wells in this area.

Q. Within the area of review?

A. Within the area of review for the TB Leingang, that's correct.

Q. Did you look at the legacy wells that are closest but not within your area of review?

A. We did not evaluate wells outside of the area of review.

Q. Okay. Are you aware of the Fritz-Lutz 1 well?

A. I don't believe that was in the area of review.

Q. Are you aware of where it is in relation to the area of review?

A. Which area of review?

Q. Any of them.

A. Not at this moment.

Q. And are you familiar with the Richter 1 well?

A. I recall the Richter 1 well.

Q. Did you assess that well in any way as part of your work on the Summit project?

A. No. Class VI rules only require evaluation of wells within the area of review.

Q. Can I have you turn to Figure 4-1, the pressure map we were taking a look at a moment ago.

A. (BY MS. DOUGLAS) We're there.

Q. Are the dots on this pressure map indicative of wells?

A. Yes.

Q. Are you generally familiar with the two wells I mentioned being to the southwest of the storage facility represented on this map? Sorry. I don't know who I'm talking to. Either of you who knows.

A. Not based on the current map. They're not labeled or have well names, so I can't identify them based on this map.

Q. And just based on your familiarity with your location, does it appear that the -- let me ask a different question.

Based on your familiarity with the Richter 1 well, is it your understanding that that well is generally to the south or southwest of the storage

facilities?

A. (BY MS. OLSEN) I don't recall that information, but if you say it is.

Q. So if we look directly south from the SCS1 injection wells that is indicated on the map with the green triangle, if you go south of that until you're outside of the area of review and storage facility boundaries, almost directly south in blue there is a dot and it is a dot directly south of the green triangle and within the area that I believe is indicated as a 400 psi pressure differential. Do you see where I'm pointing at that?

A. I do.

Q. Does that well have surface casing below the depth of the uppermost freshwater aquifer or U.S. drinking water aquifer?

A. I don't have that information in front of me.

Q. Have you assessed the integrity of the plugs on that well?

A. For this permit, only wells within the area of review are required to be assessed.

Q. I understand. But as a factual matter regardless of a requirement, did you assess the

integrity of the plugs on that well?

A. I did not.

Q. And did EERC assess that?

A. I don't recall.

Q. Do you know if Summit assessed that?

A. I don't know.

Q. You'd agree that the reservoir pressures in the area of that well are going to increase by 400 psi based on your modeling as indicated on this map at Figure 4-1?

A. That's correct.

Q. Did you run an MIT on the well?

A. We did not. I assume the well is plugged.

Q. When was it plugged?

A. I don't know. Most of the wells in this area are vintage and drilled in the '70s. That's my assumption.

Q. Or even earlier?

A. Sure.

Q. Some of them plugged before the 1950s even?

A. Perhaps.

Q. So plug job that's 70 years old now?

A. Seven years?

Q. 70.

A. Perhaps.

Q. And it was plugged before we had the oil and gas conservation laws on the books in North Dakota we have now?

A. Plugging rules were different, yep.

Q. How much time and expense would be required to pressure up an MIT and run it at 400 psi on that well?

A. (BY MS. DOUGLAS) That -- that well's abandoned and so it's -- it's not accessible at the surface. You'd have to redrill out the plugs and recomplete it to get any information out of it.

Q. Was there an assessment of whether that might need to be replugged?

A. No. Again, Caitlin's testified and stated here a couple times we're only required to evaluate the wells in our AOR.

I would like to say -- point out, we did look at potential leakage or ribbing of leakage in that well. So if I could direct you to page 3-41 to map -- to the map in Figure 3-2. So we modeled a case here assuming hypothetical leakage pathways, again, hypothetical leakage pathways, meaning that there's a leakage pathway through plugs for this model. If there was a leakage pathway due to the

pressure increase -- maximum pressure increase from injection, we're estimating over the life of the project only .005 meters cubed of formation fluid could leak up through that well, again assuming it's leaking, into overlying formations.

So, again, we have not evaluated that particular well. It's outside of our AOR. We don't believe that there is endangerment of USDWs due to leakage.

Q. But if the plugs were bad, your modeling indicates that fluids from the formation would travel up that well in some amount to the freshwater drinking aquifer that is not protected by a surface casing?

A. The Broom Creek as it sits today is overpressurized. If those plugs were bad because the Broom Creek is overpressurized, fluids would already be flowing.

Q. How much psi would it take to bust those plugs?

A. I don't have that calculation.

Q. So you don't know if the pressure formation would cause those plugs to burst right now?

A. (BY MS. OLSEN) Class G cement is

typically rated to 5,000 psi.

Q. Is that what they used in 1945?

A. I'd have to look at the plugging records to look at that specific well.

Q. Do they have plugging records?

A. I don't know.

Q. Do you have any familiarity with how wells were plugged in North Dakota in the 1940s?

A. Generally, yes.

Q. Based on what?

A. My experience working for the Department of Mineral Resources.

Q. If you put a Class VI injector on the Swenson land and ran it at the same rates and volumes that Summit is going to run its wells, would that have any impact on Summit's project?

A. (BY MS. DOUGLAS) Yes, potentially.

Q. Do you think Mr. Swenson could get a Class II disposal well into the Broom Creek Formation permitted on his land in between the three Class VI injectors?

A. So my understanding is that the -- the Commission -- and I might not be using the proper terms -- but if they grant this permit, they will define this as a field, and so my understanding is

Mr. Swenson could permit the Class II or a Class VI well on his land. He would have to work with the Commission and make sure that he abides by any Commission orders related to those field rights.

Q. Given your knowledge of the technical feasibility of that, do you think the Commission's going to grant that permit?

A. I think development of any subsurface resources in the state require the cooperation of many entities, including landowners and project developers.

Q. How is Summit cooperating with Mr. Swenson to allow him to develop his pore space subject to the pressure increases caused by Summit's Class VI wells?

A. Is Mr. Swenson actively trying to develop those?

Q. Do you have the answer to my question?

A. I don't have any knowledge of Mr. Swenson actively trying to develop those.

Q. And so if Summit is preventing him from developing those, what does it matter if he's actively trying to develop them right now or not?

A. Could you clarify how Summit's --

Q. Why are you saying it's significant or

relevant whether or not Mr. Swenson is actively trying to develop a Class II well?

A. Your question you asked me, I believe -- and it can be repeated back here, but I believe you asked why is Summit preventing Mr. Swenson from developing his pore space.

Q. Okay. Well, if I asked that, I apologize. My intended question is has Summit worked with Mr. Swenson or reached out or talked to him about how their operations are going to affect his ability to use his pore space?

A. I was not privy to the discussions between Summit and Mr. Swenson.

Q. Would you agree there's going to be about a 900 psi pressure increase in the pore space in the reservoir under Mr. Swenson's land?

A. Approximately, yes.

Q. Is the max bottomhole pressure about 3,000, 3,500? What's the max bottomhole pressure on the BK Fischer?

A. It's on the range of, yeah, 3,600 psi to 3,800 psi, depending on what site-specific data --

Q. So you're going to increase the pressure in his pore space by approximately 25 percent of the max bottomhole pressure?

A. I've not done the specific calculations, but if you're saying that's what it is --

Q. Is 900 approximately one-fourth of 3600?

A. Yep.

Q. There was testimony yesterday about the delineation of the CO_2 plume boundary, and I believe the testimony was that it was determined to be at a 5 percent concentration of CO_2 in the aquifer as the edge of the CO_2 plume; is that right?

A. That's correct.

Q. And can you tell me again why 5 percent?

A. Yes. So there's several studies out there that suggest that 5 percent is the detection limit for monitoring techniques, particularly 3D seismic.

Q. Would it be fair and accurate to say that at the bottom of the injector, bottomhole, you've got about a hundred percent CO_2 in the formation, would that be fair, during injections?

A. Right -- right at the injection well?

Q. Right. I'm just saying if you start aground like right at -- where you're injecting, we can make an assumption that the CO_2 is a hundred percent of the fluid right there; right? Within one inch of the bottom of the well -- actually, let me ask you something. Are they perforating the

well?

A. They will be perforating the well.

Q. Okay.

A. Or -- yes, they will be perforating the well.

Q. Is there going to be a lateral?

A. No.

Q. Okay. So within the wellbore we're at a hundred percent CO_2?

A. Correct.

Q. And you're indicating the edge of the plume is 5 percent CO_2?

A. Correct.

Q. Does the concentration of CO_2 become more diluted in a linear manner as you move away from the wellbore?

A. No, not necessarily. I'd like to point you to page 3-25 and 3-26.

Q. Okay.

A. So these are showing cross-sections through the simulated plume. These are representing the gas saturation in the model cells. So saturation of CO_2 is also dictated by the porosity and permeability of the rock, so you'll note -- so, again, this has the 5 percent

saturation cutoff. You'll note along the wellbore you see an area of white, so this is on Figure 3-15a. Even at the wellbore saturation is below 5 percent due to the porosity and permeability in that model layer.

So it's -- it's dependent on porosity and permeability and how the CO_2 would flow in the formation.

And just a point of clarification, saturation will never be a hundred percent. CO_2 injection can never move all of the formation fluid out of -- out of the rock.

Q. Okay. Thank you. If we held constant permeability and porosity, would the CO_2 become more diluted in a linear or logarithmic function as you move away from the wellbore?

A. Not directly linear or logarithmic, but generally it would. At the edges of the plume is where you see more mixing of CO_2 with -- with brine.

Q. So, generally speaking, if we were to plot the reduction in CO_2 concentration on a linear scale out to 1 percent, and let's pretend we can measure, would the area of that line representing 6 percent to 1 percent be much longer than the rest of the line?

A. Based on the volumes being simulated here, no, it would be much, much smaller because you'd have a larger area with higher saturation.

Q. Would the area over which the saturation changes from 10 percent to 0 percent be significantly longer than the area over which it changes from 20 percent to 10 percent?

A. I can't really make an educated guess on that --

Q. What would you expect?

A. -- at this time.

Q. Would you expect that area from 10 to 0 percent to take longer or be longer than the area from 10 to -- or 20 to 10 percent based on what you know about how it dilutes as it moves away from the wellbore as an engineer?

A. Again, I don't think I could -- could speak on that.

Q. Okay. And the 5 percent, again, though, was chosen because that's essentially the detection limit and that's the lowest limit you can detect with running the models? Sorry. Let me start over.

The 5 percent is used because that is the detection limit from the seismic?

A. Correct. Based on published studies --

Q. Okay.

A. -- from other carbon capture and storage sites that are in operation.

Q. But you agree that's not actually the border or the edge of where the actual CO_2 being injected is traveling to?

A. As discussed, it's the boundary we can detect.

Q. How?

A. With seismic.

Q. But only to a 5 percent concentration of CO_2; right?

A. Yep.

Q. So we know that there is CO_2 outside of that boundary if that boundary is set at 5 percent. It sure doesn't go from 5 percent to 0 within a millimeter; right?

A. There's the potential for CO_2 to be --

Q. It's not just potential. Just as a matter of physics, there's obviously CO_2 outside of that boundary; right?

A. Yeah.

Q. Is there a plan to put two different wellbores in at each injector site?

A. That's my understanding.
Q. Is the intent to do any kind of directional drilling with the wellbores?
A. I believe so, but I can defer questions of that to a witness who can answer in more detail.
Q. Okay. Did someone generate a PHI-H map for the reservoir in the area -- areas of review?
A. I don't believe one was provided in the permit and I'm not sure if one was produced.
Q. Would the -- would EERC have produced the PHI-H map if one was produced?
A. Yes.
Q. Can I have you look at Figure 3-1?
A. I'm there.
Q. It says the distributed PHIE property along a roughly west-east cross-section. It seems obvious, but I want to make sure I understand. The little callout in the upper left with the red line, does that indicate the cross-section?
A. That does. The red line's the path of the cross-section.
Q. Okay. Do you see the vertical line for the Archie Erickson 2?
A. I do.
Q. And do you see just to the left of that

there's a couple areas with some fairly significant pockets of red, I'll call them?

A. Yep.

Q. And then if we look over at the Milton Flemmer, just to the right of that there's an area that is mostly blue and green with just a little yellow. Do you see where that is?

A. I do.

Q. If we took a hundred-foot diameter core in that area with the red splotches just to the left of the Archie Erickson and then we took a hundred-foot diameter core in that area with the blue and green just to the right of the Milton Flemmer, would one of those cores contain more available pore space for the storage of substances than the other?

A. Yes. If we're -- we're -- in a hypothetical case if we're assuming that this model is a hundred percent accurate and represents the rocks there, where you have higher porosity, you're going to have more pore space just mathematically.

Q. And there's also a difference -- if we did that same exercise, there's also a difference in the amount of pore space available for storage based on the vertical extent of the formation;

right?

A. You're saying based on the thickness?

Q. Correct.

A. Yes. That would be a factor in that calculation -- sorry. That would be a factor of the calculation, would be height, if you're calculating volume.

Q. And would a PHI-H map show us geographically what the various values were, taking into account the porosity as well as the thickness?

A. It would for the realization of the model in the permit. One thing to understand, while we use site-specific data as controls, we used variograms and other means to distribute properties to the best of our ability. It doesn't mean that the model will be a hundred percent accurate, which is why we have that five-year reevaluation period in case our model -- or the actual subsurface geology is slightly different than our model, so that we can account for those differences in how bottomhole pressure is responding to injection as well as how the CO_2 plume is migrating in the reservoir.

Q. But if we look at Figure 3-1 in that area of red just to the left of the Archie Erickson,

you're not saying that the model just randomly allocated an area of higher porosity to that specific location based on, you know, a factor of variability. It's doing that because it is predicting that that actually has more porosity there in that specific location; right?

A. It's being informed by control points, but we did uncertainty analysis looking at a hundred different cases for property distribution -- sorry, not a hundred -- a thousand different cases for property distribution. We chose the one P50 case which we feel is the most likely.

Q. And you couldn't have done that unless you were able to do sensitivity analysis?

A. Uncertainty analysis.

Q. Sorry.

A. But, yes, that's correct. Those are the steps we performed to determine which model we had the highest confidency in being the most probable case.

Q. And it's important to do that; right?

A. When you're the operator looking to define the boundaries of your storage facility area, it's important as you will be obligated to operate and CO_2 must stay within those bounds.

Q. What if you're the landowner with pore space on the outside of that boundary, is it important for them?

A. I don't understand what context it would be important for them. The operator's required to keep CO_2 within their boundaries. If CO_2 is going to go outside their boundaries, they're in noncompliance with their permit. If they have to adjust their boundaries, they are going to have to amalgamate or acquire that additional pore space outside, go through this major modification and hearing process to get that approved.

Q. With respect to the compensation being paid to the landowners whose property is being used by Summit, is there any consideration given to the actual porosity or actual thickness of their pore space?

A. I believe Summit chose to treat all landowners within the storage facility area equally, meaning that the compensation is based by a total amount of CO_2 injected and they're given the proportional payment for the amount of land they have within the storage facility area. They did not use a volumetric approach. So in a volumetric approach landowners would be paid for the actual

amount of CO_2. Why that's not done is it -- it would -- it would benefit the landowners directly around the injection well, so Summit chose to treat all landowners within the storage facility area equally instead of --

Q. Accurately?

A. I don't agree with that classification.

Q. Well, they're not paying the landowners based on the amount of CO_2 being stored in their pore space; right?

A. Summit's paying for the use of the pore space, so they are leasing the pore space.

Q. Are they leasing the pore space from my clients?

A. My understanding is that your clients are outside of the storage facility area boundary, so their pore space is not being leased for storage of CO_2.

Q. Can I have you flip back to Landowner 63.

A. I'm there.

Q. If you see the different colors next to the names and you look at the map, there are blocks of colors both within and without the storage areas, areas of review and outside of those boundaries?

A. Yep.

Q. I apologize. Bear with me one moment. I think I may be done.

Is there a place in the permit application where thickness or porosity is broken down by landowner or tract?

A. No.

Q. Okay. Whether it's in the application or not, was that ever done or attempted by EERC, to your knowledge?

A. No.

Q. How does it affect the accuracy of your 3D seismic if you are not doing it on certain tracts?

A. It has the potential to reduce the resolution and quality of the seismic data.

Q. And does it reduce the resolution and quality just for that area specifically or does that lack of seismic in that area impact the quality of the other data?

A. So the quality of the seismic data is dependent on the fold as well as the source receiver offsets, so it's dependent -- the quality of the image is dependent on the fold within each area. Fold is lower when you aren't allowed to have source and receivers in a specific tract.

However, if you have sufficient source receiver offset, the quality of data will be lesser for shallower formations, but you would -- depending on the side of the land where you don't have source and receivers, you may still have source -- sufficient source and receiver offset to produce high-quality images with a seismic of the deeper formations.

Again, that's going to be dependent on the depth of the reservoir, the source receiver offset and the area where receivers and source weren't allowed to be placed or operated.

MR. BRAATEN: I don't have any further questions.

HEARING EXAMINER GARNER: Any questions from the staff?

EXAMINATION

BY MS. MADCHE:

Q. I have some questions. I would like to start out with some of the questions that were deferred to this group from earlier. Let's see here.

So you had given testimony on the location of coal reserves and coal leases within the three storage facility permits. Would you be able to

answer approximately how close mining activity currently is from proposed equipment, aboveground infrastructure for the three facilities? So to repeat, for each three storage facility permits, what's the proximity to current mining activity to date from the aboveground surface infrastructure? And if you need to defer that, that's fine. Just let me know.

A. (BY MS. DOUGLAS) All right. I'm going to point you to the Exhibit 2.

MR. BENDER: It's 1B.

MS. DOUGLAS: 1B. Exhibit 1B, page 280. This is the Archie Erickson/BK Fischer permit.

Q. (MS. MADCHE CONTINUING) Yep.

A. Figure 2-50. So these reflect the closest mining operations from the Coyote Creek and Beulah Mine which are the closest mining operations to any of the three storage facility areas. And you can see on this map green shows future mining activities and brown shows mined out -- or areas where mining has already taken place. And you can see the approximate distance from those to the proposed injection sites as well as the flowlines. So here the scale we're looking at, I believe those are townships. So it's approximately three to

four miles, the surface facilities are, from the future mining activities.

Q. And just to confirm, yesterday in your testimony you had stated that there were no active coal leases where surface infrastructure was planned for the three facilities; correct?

A. Correct.

Q. So earlier I had asked a question on why the Milton Flemmer 1 was used as the type log in Article 1.15 for all three storage agreements. Could you elaborate as to why?

A. I can. So the Milton Flemmer well penetrates the entire thickness of the Amsden, so it was used as the type log so that we could accurately represent the depth to the top and the bottom of the Amsden and the thickness. The other two stratigraphic test wells drilled for the other storage facility areas do not penetrate the entire Amsden. That is why the Milton Flemmer 1 well was used as the type log for all three storage facilities.

Q. When it comes to the royalty payments, would you agree that due to the lack of history matching data that we have that there would be more uncertainties to allocating via volumetric versus

the tract participation as Summit has chosen to go forward with?

A. I would agree with that. I'd also add that there are limitations for using monitoring methods to quantify the amount of CO_2 in a given area in the subsurface. Monitoring methods such as 3D seismic and time lapse changes that can be captured in 3D seismic are susceptible to both changes in pressure and changes in fluid saturation, so you would not be able to accurately separate out effects of pressure from CO_2 saturation in order to assure you're compensating landowners using a volumetric approach.

Q. So now I'm going to move forward to questions that I have from Section 2 on the geologic exhibits. For the storage facility permit for the TB Leingang, what was the maximum pressure applied during the microfracture testing in the Milton Flemmer 1 well within the Spearfish/Opeche Formation?

A. I'll defer that question to a later witness who was involved in those tests.

Q. Would you be able to state who it's being deferred to specifically?

A. Ms. Jean Oddy.

Q. Okay. As it pertains to all three of the storage facility permits and to their stratigraphic test wells, can you explain how you determined which sand package within the Broom Creek you target for your microfracture in situ stress test to determine the fracture propagation pressure gradient?

A. I'll also have to defer that to Ms. Oddy.

Q. Okay. For all three of the applications and the three stratigraphic test wells, was the next dissipation zone above the injection zone, so your Inyan Kara, sampled at all three facilities?

A. I believe so, yes.

Q. And did those samples show evidence that the formations are currently hydraulically separated?

A. That's our interpretation of the data, yes.

Q. And in all three storage facility permits, has any Fox Hills wells been sampled?

A. (BY MS. OLSEN) There's historical groundwater sampling data in Appendix B throughout each of the three permits. Plans to test those wells in the baseline sampling plan are described in Section 5 and will be testified to later.

Q. So just to confirm, you reviewed any data that already existed which would be in Appendix B, but no baseline sampling has started in the Fox Hills?

A. That's correct.

Q. Core plugs taken from the base of the upper confining zone in the Milton Flemmer 1 well had a fairly high anhydrite weight percentage, around 86 to 98 percent. Similar in the Archie Erickson, there was around 95 and a half percent shown. Did geochemical modeling indicate that it was likely that the boundary between the two formations would dissolve due to that percentage of anhydrite?

A. (BY MS. DOUGLAS) Geochemical modeling done for the upper confining zone showed little to no dissolution of anhydrite due to geochemical reactions with the modeled CO_2.

Q. And would that apply for both the TB Leingang and the BK Fischer?

A. That's correct.

Q. So I'm going to ask some questions related to the formation imaging logs. Would you be the correct witness to answer for all three storage facility permit applications? I only ask because

it was discussed that you were going to have another witness at the end that would talk about differences between the three facilities, or are you good with answering them?

A. We're good with answering the questions to all three.

Q. Okay. So in the Milton Flemmer 1 well, both in the formation imaging logs and within the thin sections specifically where high anhydrite content existed, there were a handful of fractures that were shown. Can you please explain why these fractures don't pose a risk to the storage facility?

A. You said for the upper confining zone?

Q. Yes.

A. Could you point to specifically what depth interval?

Q. So in figure 2-33 and into 2-34 in the TB Leingang application, it shows that there are a handful of resistive litho-bound fractures present in the Opeche/Spearfish interval. Why are these fractures not a concern as far as containment?

A. They're not a concern for containment because they're commonly filled. In the case of the resistive bound fractures, they're commonly

filled with anhydrite.

Q. So they wouldn't have transmissibility to have CO_2 move through them?

A. Correct. They wouldn't have transmissibility in the sense of they wouldn't have sufficient permeability.

Q. So now in the BK Fischer application, similarly in the Archie Erickson 2 well, the investigation also found fractures, including one minor fault. I would have the same questions for that one. I'll let you get to the -- the figure here. So Figure 2-30 (c) specifically would show some of the fractures and the minor fault that was found within the Opeche/Spearfish interval.

A. For this well the fractures were also commonly filled either with anhydrite or clay. In the case of the minor fault, it -- it appears to be isolated. It doesn't appear to transect a sufficient vertical extent to -- to serve as a fluid migration pathway or to be transmissible. Meaning it's a minor fault and it doesn't cut through the entirety of the upper confining zone.

Q. And similarly in the last application, in the Slash Lazy H 5 well there were fractures found and a minor fault in the Amsden Formation.

A. Again, the minor fault -- or the fractures are commonly filled, in this case commonly with anhydrite. Similarly, given the geometry of this minor fault, it appears to be isolated and does not have properties to -- for it to serve as a fluid migration pathway.

Q. So I want to go back to the BK Fischer application. In the 3D seismic survey that was done across these three storage facilities, was the Stanton fault that was suspected to run through the northwest corner of the BK Fischer storage facility area found in the 3D seismic?

A. No. The proposed location of the Stanton fault is on the edge of the 3D seismic survey. We saw no indication of the fault or any deformation associated with the fault.

Q. So now I'm going to move to questions related to Section 3 for the model and simulation. Do you know what the geographical projection was used in Petrel for the geologic model?

A. I don't have that information on hand, but perhaps I could provide it after a break.

Q. Okay. And what is the cell size in the model both within and outside of the refinement grid?

A. Outside the refinement grid, it's a thousand by a thousand feet. Within the refinement grid, I believe it's 250 feet by 250 feet.

Q. So on Figure 2-3 on page 2-5 that shows a boundary for the simulation model, could you explain why the boundary was centered as shown in that figure within the geologic model?

A. Are you asking why the simulation model extent was centered within the geologic model extent?

Q. Yes. Or how it was determined as far as placement for the centering with it?

A. So the -- the simulation model extent was selected to cover Summit's sites and have enough of a boundary -- or have enough cells as to model the pressure plume and not have artifacts due to boundary conditions. Additionally, we wanted to incorporate the nearest site, the DCC West site, to evaluate potential pressure interference.

Q. In the numerical simulation, are all three facilities injecting across the same 20-year injection period?

A. Yes. That's what was modeled.

Q. In this section it's stated that the TDS value of the Broom Creek measured from the Milton

Flemmer 1 was used as the input for the numerical simulation. Can you explain why the Milton Flemmer 1 sample was chosen out of the three?

A. Yes. So the Milton 1 sample was the -- the meeting of the three values. We selected that as it was a site-specific value close to what could be considered an average between the three.

Q. And could you explain what effect the TDS input would have on the CO_2 plume?

A. Yeah. A higher TDS could potentially result in a smaller plume.

Q. Similarly, it's stated that the temperature and pressure gradients derived from the Milton Flemmer 1 were used in the simulation. Similarly the reasoning behind why the Milton Flemmer 1 was chosen?

A. One of the reasons being wanting to apply the same reservoir conditions associated with the salinity value.

Q. And could you explain what effect temperature has on the CO_2 plume? Movement, to clarify.

A. A difference in temperature could result in either a larger or smaller plume.

Q. So let's say like an increase in

temperature.

A. I can't recall at the moment. I could provide that answer potentially after a break.

Q. You had noted earlier that the CO_2 stream used in the geochemical modeling was done at 95 percent CO_2 and 2 percent oxygen to be more conservative because oxygen is likely what's going to be most reactive. Could you explain additionally -- so in earlier testimony with group one, they had stated that the minimum requirement for the CO_2 purity would be 95 percent to be able to take CO_2 from sources to send to these storage facilities. Can you explain why in the numerical simulation 98.25 percent was used instead of 95 percent? 95 percent being the minimum cutoff for Summit to take CO_2 from third-party sources.

A. Just to clarify, that's what Wade testified to, 95 not 98.

Q. Correct. But the model uses 98.25 percent. I'm just asking why 98.25 percent was used in the numerical simulation.

A. Sure. So 98 percent is the expected operational composition.

Q. And could you just explain what effect CO_2 purity also has on the CO_2 plume movement? So like

a higher CO_2 purity would have what influence on CO_2 plume movement?

A. In this case because of the compositions where we're talking about, the potential would be changes in plume size, but they -- it would be very minimal.

Q. As proposed well injectors are drilled, so for the three applications the six injectors haven't been drilled yet. As they are drilled and logging and coring and testing data is gathered, that planned to be incorporated into the geologic model and an updated simulation ran prior to starting injection?

A. I don't know specific plans to update the model, but I believe regulations require validation of the proposed model inputs with the injection well data, including the injection test that's required for each injection well.

Q. So to confirm, if -- if the results indicated a substantial change and the regulatory group requested that it be done, at that time it would likely be done?

A. By the regulatory group you mean the DMR?

Q. DMR.

A. Yes, we would.

Q. At what frequency will plume predictions be updated once operations are underway?

A. No less than every five years.

Q. So I'd like to go to Figure 3-6 on page 3-10 in the TB Leingang application.

A. I'm there.

Q. For all of the applications when showing the permeability curves used for siltstone and anhydrite, they were used equivalently. Could you explain why you're using the same? So to clarify, can you explain why the same permeability curve is used for siltstone and anhydrite?

A. Sure. That's related in part to the core analysis sampling and the data points available. Because siltstone and anhydrite are expected to be low permeability and porosity lithologies, we felt it was sufficient to apply this data set to both lithologies in the model.

Q. So I'd like to move to Table 3-5 on page 3-35.

A. I'm there.

Q. So for all of the applications when having this table shown for the EPA Method 1, you are using the proposed locations of one of the injection wells, being the TB Leingang 1, the BK

Fischer 1 and the KJ Hintz 1. Considering these wells haven't been drilled yet, can you explain how these values are derived?

A. Sure. So these values are taken from the geologic model and the simulation model.

Q. And can you explain why it was chosen to use these rather than the three stratigraphic test wells?

A. Given that we modeled to populate these, you'll note that, for example -- so I'd -- just trying to find a map I'd like to point you to. So I'd like to point you to page 3-22. So here is a map of the -- the average pressure change after 20 years of injection. Again, the AOR was defined using pressure data from the simulations. If you look at -- here in this case the green triangle represents the injection well and just to the southwest of that, that gray triangle represents the Milton Flemmer well, and you can see that there is a large difference in pressure between those two locations. So in that sense it was more appropriate to use data from the injection well location to be able to evaluate pressure change.

MS. MADCHE: That is all the questions I have. Thank you.

EXAMINATION

BY MR. STOLLDORF:

Q. Moving on to Section 4, I have some questions about locations. If you guys can't answer these, just let me know who can. Start on page 4-4, Figure 4-2. Just an AOR map showing occupied structures, among other things. How far exactly -- or approximately how far away from the facility are -- are occupied structures?

MR. BENDER: We have another witness who can provide that unless you know.

MR. STOLLDORF: Do you know who just so I know who to ask?

MR. BENDER: It will be Jimmy Powell.

MR. STOLLDORF: Jimmy.

Q. (MR. STOLLDORF CONTINUING) For the TB Leingang, BK Fischer and KJ Hintz wells, have any baseline samples been taken from these wells to date?

A. (BY MS. OLSEN) Not in this part of the Summit project.

Q. Okay.

A. Water -- Fox Hill -- you mean groundwater monitoring wells; correct?

Q. Correct.

A. Yep.

Q. This one is just related to the KJ Hintz facility area of review. The Raymond Jensen 1-34 well, File No. 4942, is a plugged and abandoned well within that facility. Can you briefly explain the protective measures that are being made to monitor the CO_2 plume movement near that well?

A. 3D seismic surveys will be taken at least every five years as part of the testing and monitoring plan to track the plume. And at or around year 19, Summit proposes putting in an additional groundwater monitoring well in the Fox Hills Formation nearby that legacy wellbore.

Q. Do you know how -- approximately how close?

A. I don't think the final location has been determined yet.

MR. STOLLDORF: Okay. That's all I have.

EXAMINATION

BY MR. SUGGS:

Q. Okay. Bear with me. A lot of my questions have been asked at different levels, so I'm going to have to pan through this as I go.

But I'm also going to start with a couple of questions that were deferred. One being the --

looking at Figure 1-1 on 1-2 -- on page 1-2 of the Leingang application. Okay. I'll start with the odd shape of the CO_2 plume as it exists in the modeled stabilized CO_2 extent. Is there any explanation for why we don't see CO_2 in that central area, the southwest central area?

A. (BY MS. DOUGLAS) Yeah. In this region of the model, we had low porosity and permeability layers. That's why you don't see predicted migration of CO_2 plume there.

Q. The low PHIE and perm, I guess, layers that exist in that area, were they arbitrarily -- and when I say "arbitrarily," just purely due to the variograms were they assessed or was there additional seismic evaluation that supported that low porosity/perm area?

A. There is additional seismic data that was used as control points and to -- to support the distribution of properties, but it should be noted that seismic data has resolution images for resolving thicknesses of different porosity and permeability layers, so there's potentially some uncertainty.

Q. Okay. So I guess in that explanation, did it just -- I'm going to tie this back to some of

the discussion on the depositional environment. Would the seismic in that area indicate it was partially interdunal or do you see the dune structures there or not?

A. Correct. That would suggest the low porosity and permeabilities typically associated with those interdunal dolomites as well as anhydrite deposits.

Q. Okay. And then I asked this as well earlier, but in Township 141 North, Range 88 West, Section 35, you'll note that on this exhibit, at least, the stabilized CO_2 plume extent does appear to contact the storage facility area border. Do you know what the distance is between there? What kind of buffer is applied at approximately around that area?

A. Yes. So regarding the stabilized CO_2 plume extent, it's a short distance, you know, on the order of 10 feet, but I would like to point out the red line is the CO_2 extent at the end of injection. So we feel that that buffer is reasonable, and we will, you know, reevaluate the predicted plume movement and our storage facility area boundaries no less than every five years to confirm that.

Q. So just to clarify, the red line is the

extent of the CO_2 migration at the end of the 20-year injection cycle?

A. Correct.

Q. And the gray that goes outside of that would be where the model is predicting that CO_2 to migrate during a ten-year postinjection phase?

A. Correct.

Q. Okay. Moving on to Sections 2 and 3, on page 2-17 -- I've got to get there myself. The narrative right above the figure indicates that the net sandstone thickness in the simulation model area ranges from 6 feet to 397 feet with an average of 140 feet. Can you point me at -- somewhere on the figure below, Figure 2-10a where it would approach 6, or is that a typo in any way?

A. I believe the typo should say -- I believe those values are from the geologic model extent, not the simulation model extent, so that is an error.

Q. Okay. So that wouldn't be -- so what should that read, then?

A. Because it's sandstone thickness, I'd have to calculate that from the model. I can't derive that from the thickness map.

Q. I guess looking at the isopach of the

Broom Creek, then, do you see anywhere on that map that you're presenting where the thickness would approach 6 feet? I mean in glancing at it, I thought the -- the thinnest that was represented was on the order of a hundred feet.

A. Yes. That's why I believe that that's an error. It should say those values are from the geologic model extent where the Broom Creek actually --

Q. Oh.

A. -- does pinch out, not the simulation model.

Q. Got you. So not the simulation, but the whole --

A. Correct.

Q. -- geologic?

A. So that -- I believe that sentence is in error.

Q. And that'd be where it would punch out to the northeast and the Broom Creek wouldn't exist --

A. Correct.

Q. -- far northeast of the whole model area?

A. Correct.

Q. Okay. Page 2-22. At the bottom of that page you indicate that there's, I guess, a sample

bias towards the sandstones that were sampled. Does that sample bias affect the overall model in any way?

A. No. So the core samples were used to calibrate petrophysical logs of porosity -- calculated porosity and permeability, and those logs were what were used to help derive model properties. So I -- I don't believe that that bias impacted the model in a significant fashion.

Q. Figure 2-16 on page 2-25.

A. I'm there.

Q. At the very top of the Broom Creek here, you have an anhydrite facies identified in column 7 on that figure. And then in column 8 when you upscale those for the modeling purposes, it's being applied the siltstone facies. Is there any effect on the modeling due to that or is there a reason that was applied instead of the anhydrite facies?

A. There is not an effect of that. Both the anhydrite and siltstone are populated as low porosity and permeability.

Q. So functionally they both act as confining layers in the modeling?

A. That's correct.

Q. That drives me to the geochemical side of

this so I'm going to jump probably largely over into Appendix C, but bear with me. The -- the narrative -- so I'm looking at C-15 and 16 here -- or sorry -- Figures C-15 and 16. I think I'm on C-12.

A. Figure C-15 and 16 or page --

Q. So the narrative that I'm asking about is on page C-12 where you reference Figures C-9 and 10, which those figures are on pages C-15 and C-16.

A. Okay.

Q. This narrative indicates that dolomite is the primary entity in dissolution and that anhydrite is precipitating it. I just want to confirm that.

A. That's correct.

Q. Okay. So in previous applications, the anhydrite has been identified as a primary dissolving element in those models, in those geochemical analyses. So I guess my questions here are what is different about the modeling that was done here or the chemistry of the water or the chemistry of the rock that is causing anhydrite to be a precipitant instead of a dissolving --

A. I don't have that answer readily available.

Q. Is that something that may be provideable in short term or is that something I might need a supplemental response on?

A. I could potentially provide it after a break.

Q. Okay. I guess I'll -- I guess I'll ask that if it's not something that can be answered in testimony after a break, that it would be submitted as explanation in supplemental.

A. Okay.

Q. Still on C-12 here -- bear with me. So actually on page C-14, Figure C-8. In this figure, the bottom figure, shows that mineral trapping is still on the negative side of the equation so more dissolution has taken place than precipitation at this point through the extent of what's presented on this figure; correct?

A. Yes. So what this figure is showing is why there's negative amount for mineral trapping. It's because of that dolomite being dissolved and that those dissolved carbonates are being attributed to as carbon that was added into the system.

Q. Okay. In previous testimony you indicated that it would be on the order of hundreds of years

before true mineralization started happening for CO_2 in the storage reservoir. Have you projected that out? Do you know a rough time frame when that negative trend starts moving the other way?

A. We have not modeled that.

Q. Okay. C-18.

A. Maybe just one point very quickly. Sorry, we're going back to Figure C-8. You can see by the slope of the curve, after CO_2 injection ends, we have less of that mineral trapping and that slows down over time.

Q. But you still haven't taken it to the point of when that actually reverses? It's just --

A. That's correct.

Q. -- expected or anticipated that it does reverse?

A. Correct.

Q. Okay. Going on to page C-18, the -- the narrative here for your PHREEQC model, and you've testified to this earlier, that you used the diffusion process for the mechanism by which the CO_2 would enter. And, conversely, if you look at later in the -- in the appendix when you're talking about the lower confining zone and the simulation that was done there, you're talking about advection and

dispersion. Can you elaborate a little bit on why the two different mechanisms are used for the two different confining zones?

A. Yes. So diffusion was used for the upper confining zone as CO_2 is a buoyant fluid which is -- so CO_2 is a buoyant fluid which is why we needed to use advection and dispersion which allowed the CO_2 to dissolve in -- in -- in brine and the density to allow it to enter the model cells for the lower confining zone.

Q. So for the lower confining zone -- sorry, I'm going to have to ask you to clarify that. Focus on why diffusion was used for the upper confining zone modeling.

A. I don't think I can elaborate and provide that specific answer at this time, but I could potentially provide it after a break.

Q. Okay. Probably the same situation, if I don't get that answer as part of testimony, I might want it as a supplemental.

A. Correct. We would be able to provide that.

Q. Page C-18 still. The formation brine for the simulation that was done on the Opeche and as well as the -- or the Opeche/Spearfish as well as

what was done on the Amsden for the lower confining zone, in both cases you used the brine composition as it was determined from Broom Creek samples?

A. That's correct.

Q. Can you elaborate on why?

A. Just let me confirm something real quickly.

So it's my understanding given the porosity and permeability of at least the Opeche/Spearfish, we weren't able to collect a fluid sample due to the immobility of the water due to low permeability. Therefore, we used the Broom Creek as a representative sample as we don't believe the composition will vary greatly.

Q. Okay. Still on page C-18, Table C-4 the average mineral composition of the Opeche/Spearfish that was used here, can you confirm which facies within the Spearfish that would represent -- or the Opeche/Spearfish?

A. This sample -- the average sample here is approximately 60 percent mineral weight anhydrite, so I'd interpret that as anhydrite.

Q. On page C-19, middle paragraph there when you're discussing Figure C-13, you indicate that the net change due to precipitation or dissolution,

in this case you're referencing C2, which is a cell within the model that was done, has less than 5 kilograms per cubic meter net change. That net change, is that positive or negative?

A. I'd have to clarify how that was calculated and provide that as a supplement.

Q. I don't think I could confirm or guesstimate with the figure in front of me which way that would be going, so if we could confirm that as well.

A. Yep. We could provide that as a supplement.

Q. Page C-25, similar question. This happens to be the -- Table C-6 on page C-25 -- averaged mineral composition for the Amsden formation that's being presented in this table. Could you elaborate and confirm which facies that were represented in your modeling?

A. I'd characterize that as a -- well, it would be represented as a dolostone in our model.

Q. Okay. I guess a similar question on page C-28. The narrative at the -- in the bottom paragraph, again you're referencing an overall net porosity change as less than 2 percent. And can you tell me whether that's a positive change or a

negative?

A. I would like to provide that as a supplement.

Q. Okay. Then back up to Section 3, page 3-7, I believe. The bottom paragraph on page 3-7 you discuss the distances from the edge of the model and the volume modifiers that were applied as boundary conditions. Can you spend just a few moments confirming what those distances are measured from and to within the model? And then -- well, I'll let you do that first.

A. So those distances are measured from the Broom Creek extent interpreted by the EERC which is shown on page 2-16 in Figure 2-9.

Q. So the distance you're referencing there is the distance from the edge of the Broom Creek to the edge of the modeled area?

A. To the edge of the simulation modeled --

Q. The whole simulation.

A. -- area. That is correct.

Q. Okay. And then when applying your volume modifiers as boundary conditions, can you elaborate on what the effect of those are within the model?

A. Yes. So we applied the volume modifiers to represent the fact that we don't have an

infinitely acting aquifer where the Broom Creek pinches out. Because we don't have an infinitely acting aquifer, there will be differences in how pressure responds in the reservoir due to that pinch-out. And so these modifiers were applied to take into account that difference in boundary condition between an infinitely acting aquifer and the closed boundary.

And so the volume modifier is used in the CMG calculations with the boundary condition to account for the specific distance beyond the model where that pinch-out occurs, and so that is accounted for with the boundary conditions as it relates to the simulated pressure.

Q. So the -- the cell -- the modifier being applied to a boundary cell allows -- allows that cell to act as if it has a larger volume than its individual cell size?

A. That's correct. To allow the computational simulator to account for how that pressure would respond outside of the model.

Q. So the smaller values have less distance or less volume in the reservoir in that direction --

A. Correct.

Q. -- towards a pinch-out or towards a boundary of the -- the -- I guess the Broom Creek as a whole as opposed to what's actually simulated within the model?

A. That's correct.

Q. So this was asked a little bit, so I'm on page 3-8, the description your capillary pressure curves, and you indicate that they were derived from mercury capture -- mercury injection capillary pressure testing on the cores; right?

A. Correct.

Q. But then that they were modified. Can you elaborate on the need why they were -- why it was necessary to modify those core-derived values and what that process looked like?

A. So those values were calculated using data for -- from a single sample, so we looked at the porosity and permeability from that sample to upscale it to the ranges of the porosity and permeability reflected in our model.

Q. Okay. When you say that, was that -- when you say the single sample, you're referring to the single sample that was used to derive the two confining zones, being anhydrite facies values and siltstone facies values, or am I -- yeah, siltstone

and anhydrite.

A. We took capillary entry pressure data from a single sample from those units to derive these curves.

Q. Okay. And so, I guess, the modification of that mercury -- mercury-injection-derived data to be representative for CO_2 injection, what was done to, I guess, adjust the mercury fluid properties to the CO_2 fluid properties?

A. I could provide that answer after a break.

Q. Okay. Same, I guess, question or same response, then, if it's something that doesn't come as part of direct testimony, we'll want supplemental explanation for it.

Down in the AOR page 4-14, it was actually referenced in a number of locations, including on page 4-12 in Table 4-6, but there's a reference that's being used to the Tongue River Formation for a freshwater aquifer. I just -- I guess I'm just going to point out and confirm that Tongue River isn't a formation recognized on the North Dakota stratigraphic column at this time. There's an RI 59 -- Report of Investigation 59 that was published in 1977 that proposed renaming the Tongue River and the Ludlow as they correlate from Montana and

Wyoming to the Slope and -- drawing a blank on the other one and I don't have it written here -- but rename those two formations. The Tongue River as you're referencing here would be equivalent to those two formations that are represented on the geologic strat column in North Dakota; correct? Or can we confirm that?

A. (BY MS. OLSEN) We can confirm that.

Q. Okay. On page 4-16, there's a line here in your narrative that reads, "The Pierre Formation is the thickest shale formation in the AOR and primary geologic barrier between the USDWs and the injection zone."

The primary barrier would be the upper confining zone; correct?

A. (BY MS. DOUGLAS) That's correct. So that's a misstatement.

Q. It would just be an additional barrier --

A. Correct.

Q. -- of significant thickness as what's indicated?

A. Yeah. We -- we consider it as a tertiary confining zone because there's the primary confining zone, a secondary confining zone, and then we consider the -- everything between the

Inyan Kara Formation and the Fox Hills as a tertiary confining zone.

Q. One last item I'm going to jump -- it kind of mixes between the AOR and the -- and Section 3. It's actually on 3-42 I think where the -- page 3-42 where the narrative is. Right at the bottom of this page there's a statement, "Therefore, the AOR is delineated as the storage facility area plus a 1-mile buffer."

This immediately follows a discussion of the risk-based AOR approach that was taken, but the one-mile buffer that's applied for that AOR, is that -- is there any importance to the one mile that's being used or is that just a value that is chosen?

A. I can confirm during break, but to my understanding, that the AOR at a minimum has to be the storage facility area plus a one-mile buffer, but I will confirm that my understanding is correct during the break.

MR. SUGGS: Okay. That'll be all I've got on these sections.

HEARING EXAMINER GARNER: Okay. At this time why don't we take a break for lunch for an hour.

(Recessed at 12:29 p.m. and reconvened at 1:30 p.m.)

HEARING EXAMINER GARNER: Okay. We are back on the record.

Attorney Bender, how would you like to proceed? Are we going to answer some questions that were pending?

MR. BENDER: Yes. I don't know if I should say we'll recall -- we'll bring back Amanda Douglas who -- and there were some questions posed for her and she said she needed a little time during the break to research those answers. What we were proposing, perhaps to save some time, is she can read what she believes to be the question and then she can give the answer. And then there was a question or two also that Caitlin Olsen got that needed a little time to respond to. So I can just ask Amanda a few questions and proceed that way, if that's okay with you, Mr. Examiner.

HEARING EXAMINER GARNER: Is that okay? That's fine.

REDIRECT EXAMINATION

BY MR. BENDER:

Q. All right. Amanda, before we took the break, when you were answering some questions that

were posed to you by the Commission staff, I believe it was your testimony that if you had a little time during the break, you could take a look at some of your notes and some of the documents you have and respond to those questions; is that correct?

A. (BY MS. DOUGLAS) That's correct.

Q. Do you want to just walk through the questions as you understood them and then provide us with the responses?

A. Yes.

Q. Okay.

A. With respect to the projection system used, it was NAD27 North Dakota State Plane South U.S. feet.

The Commission had a question about generally how would having a higher reservoir temperature impact plume size. So it should be noted that temperature isn't the main driver in dictating plume size. There's other parameters that are more sensitive or the -- the -- the CO_2 plume size is more sensitive to other parameters. But generally a higher temperature could result in a bigger plume.

I had a question on why we saw

precipitation of anhydrite and dissolution of dolomite and what constituents in the water chemistry or the mineralogy used for those models was different than previous permit submitted that would cause this. We would like to provide that answer as a supplement.

I had questions about the transport mechanisms for the PHREEQC modeling. For the upper confining zone, diffusion is expected to be the dominant transport mechanism due to the buoyancy of the CO_2. At the boundary between the reservoir and the confining zone, the reservoir will have a higher CO_2 concentration, so diffusion will allow the movement of gas from an area of high concentration to an area of low concentration.

So with respect to advection and dispersion, these are the expected dominant transport mechanisms for the lower confining zone. So dispersion in the sense of the CO_2 mixing and forming saturated brine and that saturated brine mixing with unsaturated CO -- brine that's unsaturated with CO_2 and the different densities between the two and that mixing by dispersion, so between that and advection, those are the expected dominant transport mechanisms, and that's why those

were used for the lower confining zone.

And there was a question on the use of MICP data and calculated relative permeability data, and we'd like to provide that as a supplement.

Q. That's all you have? Those were the questions you received; is that correct? Those are the questions?

A. Those are the questions I received. There is one more question that I received that Ms. Olsen will be providing the answer to.

MR. BENDER: Mr. Examiner, unless there's other questions from the staff of Ms. Douglas, I would move to Ms. Olsen.

HEARING EXAMINER GARNER: Okay. That's fine.

Q. (MR. BENDER CONTINUING) Caitlin, can you recite for us what the question was that you're going to address for us now?

A. (BY MS. OLSEN) Yeah. The first question, Rich, I believe you asked -- I don't remember the order in the questions, but you had asked about the nomenclature for some of those aquifers and namely the Tongue River. The new name that is more recently used is Bullion Creek, and so that is the

same formation. We're talking about the same thing there, just to clarify.

And then the second question you had asked about the AOR and the minimum one-mile buffer outside of the storage facility area. That language comes from 43-05-01-05 and it's -- that language is outside throughout that rule, and it references it -- the area several times. And just to give an example, it will say something like the evaluation must do X, Y, Z in the facility area and within one mile of its outside boundaries.

So the AOR, when we talk about reviewing wells and items inside of the AOR, is the storage facility area and one-mile boundary pursuant to 43-05-01-05.

MR. BENDER: Okay. If there's no questions from the staff, Mr. Examiner, we're ready to move forward with our next witness as we talked. Oh, I'm sorry.

MR. SUGGS: I did have a couple questions that weren't addressed.

FURTHER EXAMINATION

BY MR. SUGGS:

Q. The net positive or net negative?

A. (BY MS. DOUGLAS) I had stated earlier

that we'd like to provide those, too, as supplements.

Q. Okay. As a supplement still. Okay. And then I apologize, but I did have one set of questions that I forgot to hit and I have to find it again in my notes. Page 2-66.

MR. BRAATEN: Of Exhibit 1A?

MR. SUGGS: Yes.

MR. BRAATEN: Thank you.

Q. (MR. SUGGS CONTINUING) And I guess the narrative actually starts on page 2-65 regarding your Mohr-Coulomb Critical Stress Analysis of Faults. The faults that you have depicted in Figure 2-42, can you identify what depths those were identified at or what range of -- there's been testimony that there's no faults in the injection reservoir or the confining zones. So where are these faults coming from? How were they identified?

A. Yes. So the 3D seismic survey acquired over the project area led to the identification of several deep faults within the storage -- all three storage facility areas. These faults originate within the Precambrian basement and all of them terminate below the top of the Interlake Formation,

which is approximately 3,000 feet below the Broom Creek Formation.

Q. So they're all deep --

A. Correct.

Q. -- features?

Okay. And those are some of the items that are identified or at least visibly identifiable on Figure 2-41 on page 2-64?

A. That's correct.

MR. SUGGS: Okay. Thank you.

MR. BENDER: Okay. Mr. Examiner, if there aren't any further questions, our plan now is to call four new witnesses, and then we will recall Caitlin Olsen to do the comparison between what we've discussed in great detail, which is the Leingang with the Fischer and the Hintz. And then we're going to recall Wade Boeshans to talk about the amendment that the Commission received a letter on from Minnkota.

HEARING EXAMINER GARNER: Okay.

MR. BENDER: So our first witness will be James Powell.

HEARING EXAMINER GARNER: Mr. Powell, please raise your right hand.

JAMES POWELL,

being first duly sworn, was examined and testified as follows:

DIRECT EXAMINATION

BY MR. BENDER:

Q. You go by Jimmy; is that correct?

A. Yes, sir.

Q. Will you state your full name for the record?

A. James Earnest Powell.

Q. And, Jimmy, by whom are you employed?

A. Summit Carbon Solutions.

Q. And in what capacity?

A. Chief operating officer.

Q. What I'd like you to do is briefly highlight for the examiner, Commission staff and opposing counsel your educational background and work experience.

A. Okay. I have a bachelor of science in engineering, and I have about 35 years of experience in the energy industry, predominantly upstream/midstream, with the last 25 leading large projects such as this, both internationally and in the U.S.

Q. Okay. So I'm just going to have a

question or two for you having to do with engineering and operational design. To what standard will the flowlines be constructed?

A. The flowlines, like the remainder of the pipeline system, will be constructed -- designed, constructed and operated in accordance with DOT regulations, CFR 49, 195.

Q. Okay. And can you explain how the three entities that have made application for the storage permits are going to work together and monitor this system and utilize the data that's provided throughout the SCADA system?

A. Yeah. So from receipt of the CO_2 molecules at the capture facilities through transportation of the pipeline system and through -- to the sequestration system to the injection site and subsurface, it will all be operated as one integrated system under one supervisory control and data acquisition system, and it will be controlled from a single control center.

MR. BENDER: And, Mr. Examiner, after I finish with a few questions of these other witnesses, Mr. Powell will be available for questions from the staff. So if I can move to the next witness, I'll do so.

HEARING EXAMINER GARNER: Sure.

MR. BENDER: Next witness is John Hunt.

HEARING EXAMINER GARNER: Mr. Hunt. Please raise your right hand.

JOHN HUNT,

being first duly sworn, was examined and testified as follows:

DIRECT EXAMINATION

BY MR. BENDER:

Q. John, would you state your name for the record, please?

A. (BY MR. HUNT) John Hunt.

Q. And, John, by whom are you employed?

A. By EERC.

Q. And in what capacity?

A. I'm a senior geoscientist and measurement reporting verification, or MRV, specialist.

Q. And can you briefly provide for the Commission staff your educational background and work experience?

A. Sure. So I hold bachelor of science and master of science degrees in geology. I'm a licensed professional geologist. And prior to the EERC, I worked at Chesapeake Energy as a petroleum geologist.

Q. Okay. And you're going to talk just a little bit about -- at least from questions from me, about Section 5 of the application which is -- has to do with testing and monitoring; is that correct?

A. That's correct.

Q. Okay. And my first question is can you provide a brief summary of Table 5-2 in the application?

A. Yes. So Table 5-2 begins on page 5-4 of the TB Leingang application or Exhibit 1A. And let me back up here just a little bit. So the testing and monitoring plan, the full plan is laid out between Tables 5-1, 5-2 and 6-1. So 5-1 being the preinjection plan, 5-2 is the operational plan and 6-1 is the postinjection plan. We're hitting the highlights of Table 5-2 simply because this makes up the bulk of testing and monitoring and includes all of the different various activities that Summit will -- will perform.

And so let's -- yeah, again, let's go to Table 5-2. This is an overview of the operational testing and monitoring plan. And just to start us off, a brief description of the -- of really what's contained in this table. So if we're looking at

the columns and we're stepping left to right, we see the first thing is the Monitoring Type. I'll touch on that a little bit more in a minute, but essentially, you know, whether it's a CO_2 stream or surface facilities, the wellbores or the environment, those generally make up the monitoring types.

Then we step over and we have the Parameter, so what parameters are we interested in measuring. And then the next column describes the activity that will collect those data. Then we have the primary purpose of the activity listed, the equipment and any tests associated with gathering that data. The location where that data will be gathered and a sampling frequency described.

Finally, in the last three columns, we have how that data -- what data will make its way into the reporting to DMR. So we have the Report Content, the Reporting Method and then the Reporting Schedule specified.

So how I like to think about this plan overall is you're really following the CO_2 stream as it enters the sequestration facility, and you're first and foremost analyzing the CO_2 stream in terms

of composition and end-to-end metering. So those are some of the things highlighted in the rows within the CO_2 Stream Analysis section. There's also the Surface Facilities Leakage Detected -- Detection Plan as well as the Corrosion Prevention and Detection Plan. Those generally at a high level have already been touched on a little bit so I won't go into great detail there.

And then we move to the wellbore sections. Now the CO_2 stream has traveled through the surface facilities and it's entered the wellbore, so here we're primarily focused on activities that look at monitoring wellbore integrity. So, for example, pressure, temperature gauges, fiberoptic cable, all of which provide continuous readings to monitor the -- the operations of those wells, of the injection wells.

And, finally, we have -- I guess continuing on the wellbore monitoring part, we also include a Downhole Corrosion Detection Plan, and the key activity there is the pulse neutron log which is also feeding into the wellbore mechanical and integrity piece where we have periodic pulse neutron logs planned to be acquired throughout the life of the project.

And then, finally, the -- so now we've injected the CO_2 into the storage reservoir and what we're interested in is monitoring the volume in a targeted way as that CO_2 expands within the storage reservoir and ultimately that volume contained within the area of review boundary. So we have a Near Surface monitoring plan, which is primarily made up of soil, gas and groundwater -- I guess wholly made up of soil, gas and groundwater sampling, and then an Above-Zone Monitoring Interval, which is defined as the Opeche/Spearfish to the Skull Creek. Again, pulse neutron logging for logging saturations, and then the fiberoptic cable to look at temperature.

And -- and then, finally, we end with the monitoring of the storage reservoir itself which, again, will be conducted with the fiberoptic cable to monitor the temperature profile of the storage reservoir as well as casing-conveyed pressure temperature gauges on the injection wells and -- and also a downhole pressure temperature gauge installed in the reservoir monitoring well. And then we have planned 3D seismic surveys as has been testified to a little bit prior to this point, as well as a plan for monitoring seismicity with a

surface array of seismometers.

MR. BENDER: No further questions of this witness. And the next witness will be -- yeah, next witness is going to be Jay Volk.

HEARING EXAMINER GARNER: Jay Volk. Mr. Volk, please raise your right hand.

JAY VOLK,

being first duly sworn, was examined and testified as follows:

DIRECT EXAMINATION

BY MR. BENDER:

Q. Jay, can you state your full name for the record, please?

A. (BY MR. VOLK) Yes. Thank you, Lawrence. Jay Volk.

Q. And, Jay, by whom are you employed?

A. Summit Carbon Storage.

Q. In what capacity?

A. I am the sequestration director of health, safety, environmental.

Q. Okay. And can you provide for us briefly your educational background and work experience?

A. Yes. Lawrence, I have a bachelor's degree, master's degree and PhD -- PhD from North Dakota State University. My PhD is in the

department of natural resources with range sciences. My work history has largely been through BNI Coal. Spent approximately 17 years there working on permitting, compliance, testing and monitoring, financial assurance plans and site closures. The last two years I've been employed with Summit Carbon Solutions working within the Class VI regulations.

Q. You're going to have to slow down a little bit.

A. I apologize. Thank you for the reminder.

Q. And, Jay, you're here today to discuss Section 7, which is emergency and remedial response plans; is that correct?

A. That is correct.

Q. As well as financial assurance which appears in Section 12; is that correct?

A. That is correct.

Q. Okay. So you'll be able to handle questions from the Commission staff on those two subject areas; is that correct?

A. That is correct.

Q. Okay. Let me just ask you a question or two, first with respect to emergency and remedial response. Can you tell us generally what is the

purpose of emergency and remedial response plans?

A. Yes. Lawrence, the purpose of the ERRP in Section 7 is really to provide guidance for a quick, safe and effective response plan to keep the community and -- community, workers and the environment safe. Items that we look at included in there are definitions and reviews of local resources --

Q. Slow down a little bit.

A. I am sorry for a second time.

Looking at areas such as what are the local resources in the areas, identification of potential events, as well as the response to the events.

Q. And can you explain for us, slowly, the interactions that you've had with local first responders in Oliver, Mercer and Morton Counties?

A. Yes. Our interactions between the three counties have really included a multilayered approach to outreach. We've engaged all three counties with LEPC meetings. We've worked within dispersion methodology of meetings. We've worked individually with LEC portfolio holders, as well as with local responders on an individual basis through safety tours or landowner meetings.

Q. Okay. Jay, let's shift gears a bit and talk a little bit about Section 12, which is Financial Assurance Demonstration Plan. Can you provide for us a brief overview of the methodologies used to determine the financial assurance? And if you have to direct the Commission's attention to any part of the application, that'd be great.

A. Thank you, Lawrence. And I would direct you to Table 12 -- or excuse me -- 12-1 on page 12-2. The methodology that we used in developing the financial assurance plan really consisted of known cost, which included areas such as plugging in injection wells, the PISC -- the PISC plans, testing and monitoring, as well as site closures and the flowline abandonment sections.

Other areas we looked at were estimated costs, and that was used to determine the ERRP as well as endangerment to USDWs. We also looked at previous literature as well as previous Class VI permits in developing the financial assurance plan.

Q. Okay. And can you provide for us an overview of the cost estimates associated with the financial assurances?

A. Yes. So, again, referring to Table 12-1,

for the TB Leingang, the plugging and injection well cost was 1,166,000. Likewise, the PISC storage and facility monitoring was 4,225,000, as well as the flowline plugged and abandoned at 243,000.

And, I apologize, I'd have to ask -- the PISC and storage facility is 4,225,000 if I misspoke on that. The ERRP is 11,100,000. And the endangerment of USDW is 2,695,000. And that gives a total of 20,316,000 between the three -- or excuse me -- between the TB Leingang.

I do want to make a quick reference before I move on to the other two sites is what is covered by the surety bond versus pollution liability policies is also outlaid in Table 12-1 in which the plugging of injection wells, PISC storage facility and monitoring, flowline plugged and abandonment cost, as well a site closure and remediation will be covered under a surety. Whereas, an ERRP as well as the endangerment of USDWs, a pollution liability policy will be used.

Again, there is minor differences between SCS2 and SCS3 in which the total bond for SCS2 proposed is $20,868,800 as well as the KJ Hintz at $20,817,800.

Cumulatively, the three are bonded at just over $62 million.

MR. BENDER: Mr. Examiner, that's all the questions I have for this witness. We do have another witness that we'd like to call at this time, Jean Oddy.

HEARING EXAMINER GARNER: Ms. Oddy, please raise your right hand.

JEAN ODDY,

being first duly sworn, was examined and testified as follows:

DIRECT EXAMINATION

BY MR. BENDER:

Q. Jean, would you state your full name for the record, please?

A. (BY MS. ODDY) Jean Oddy.

Q. And by whom are you employed?

A. Summit Carbon Solutions.

Q. In what capacity?

A. Sequestration project engineer.

Q. And could you briefly highlight for the Commission staff your educational background and work experience?

A. Yes. I have a bachelor of science in petroleum engineering from Montana Technological

University. Before Summit I worked for Neset, which is an engineering and geological consulting firm, in which most of my responsibilities was around drilling engineering, design and operations, as well as plugging and abandonment projects in the Williston Basin, including wells such as Class II saltwater disposal wells. And I joined Summit last year in January.

Q. Okay. And you're here to discuss any questions the Commission staff might have about well design, casing, cementing, plugging and completion; is that correct?

A. That's correct.

Q. Okay. A question or two having to do with well design and casing. Can you -- excuse me. With respect to Section 9, can you describe the well construction plan design? And if you have to refer to a particular figure or exhibit, please do so.

A. Yes. I'd like to direct your attention to Figure 9-1 on page 9-2. So in this well construction program, starting with the surface section, the surface hole will be drilled with freshwater-based drilling fluid down to a depth within the Pierre Formation. Surface casing will

then be set and placed at least 50 feet below the base of the lowest underground source of drinking water. Surface casing will then be set and cemented in place from the surface casing shoe all the way to the surface of the ground to provide isolation to and from the underground source of drinking water.

Moving on to the next section, we've got the long string casing, so that section will be drilled and cored at specific intervals. And then in accordance to Class VI regulations and administrative code, corrosion resistant alloy casing will be set in place to a depth below the Broom Creek Formation which is in the Amsden. The long string casing will then be cemented in place with CO_2 resistant cement from the shoe all the way through the Mowry Formation, then cemented to surface.

MR. BENDER: Mr. Examiner, that's all the questions I have for this witness.

I would point out that at this point in time, given the space that we have here for witnesses to sit, I would like to give the Commission an opportunity to ask these witnesses questions, and then also point out that we do have

two other individuals who are in the audience. And in the event these witnesses have some questions that they feel can be better answered by someone else, I would bring those people up. One is Jamey Backus, B-a-k-k-e-s [sic], and the other is Luis -- how do I pronounce that?

MR. POWELL: Piasco.

MR. BENDER: Piasco, P-i-a-s-o [sic].

HEARING EXAMINER GARNER: Okay. Any questions from the staff?

EXAMINATION

BY MS. MADCHE:

Q. I will go ahead and start. As before I'm going to start with what I think are deferred questions for this group. Early on Richard Suggs had asked on whether or not you would be able to provide industrial codes that best reflect the capture sources, such as the ethanol facilities. Is that something that you can provide at this time?

A. (BY MR. VOLK) Yes. The ethanol NAICS is 325193 reflecting as asked for the capture NAICS code, and that is for ethanol.

Q. Earlier an answer was provided for approximately how many miles of the MCE pipeline

transmission pipeline system is within the North Dakota PSC jurisdiction. 352 miles was provided, but I believe, Jimmy, you would be able to confirm that number?

A. (BY MR. POWELL) Yes. It's 3 -- approximately 332 miles are in the jurisdiction of the Public Service Commission. In the delta roughly 19 miles is within the NDIC jurisdiction. So Wade had it accurate and correct. But the PSC is 332.

Q. Okay. I had asked earlier on with the first group yesterday on whether or not royalties were being paid on the full CO_2 stream or just the CO_2 mass of the stream. Is there anyone in this group that can confirm that or is that something that would need to be a supplemental?

MR. BENDER: No one can answer that. We'll have to supply you with supplemental information on that one.

MS. MADCHE: Okay.

Q. (MS. MADCHE CONTINUING) In Section 2 earlier I had asked what the maximum pressure was applied during the microfracture testing in the Milton Flemmer 1 that was done across the Spearfish/Opeche Formation.

A. (BY MS. ODDY) Yes. I would like to direct your attention to Figure 2-7 on the TB Leingang 1 permit.

Q. I'm ready.

A. So relative to Milton Flemmer 1, the maximum injection pressure is highlighted with the black square box on the image on the upper section there, and from that graph it looks like around 5580 psi was -- was pumped as a maximum. However, after evaluation, there was no breakdown pressure observed at that maximum pressure injected.

And then referring to Table 2-4, we do have a summary on the Opeche/Spearfish microfracture stress test breaking down your breakdown pressure as well as your propagation pressure.

Q. So some additional questions as it pertains to the microfracture testing that was done. A question that I had posed earlier was how do you determine which sand package within the Broom Creek to target for these tests?

A. So prior to the micro in situ stress tests, we ran logs such as your magnetic resonance log as well as an FMI log and sonic log, and in combination of that along with the core photos that

we observed, along with some field description, were able to pick the representative sand package within the Broom Creek Formation and pick the test steps.

Q. Could you elaborate a little bit more on what makes a representative sample?

A. Yes. So I'm going to go back here to another figure. Figure 2-5. We looked at the sonic log, and on column 7 we've got the facies there, so we looked at, you know, a good, thick sandstone package. And then looking at the magnetic resonance log, that showed us good porosity in that test point. Then looking at making sure there are no visible bedding or fractures within the core photos that was -- that was collected and any field description that was noted by the geologists on site.

Q. So just to confirm, you're looking for a sand package that would represent good porosity and permeability but without fractures that could possibly affect the results of the MBT test?

A. That's right.

Q. So as a follow-up to that, on average to date across the Broom Creek on previous applications, the frac grading has between 0.69 psi

per foot to 0.712 psi per foot. Could you explain why we're seeing a larger variation across these three facilities, specifically as it relates to the Slash Lazy H 5 which was at 0.784 psi per foot which would be above that range, or what you anticipate might have caused it to be higher than what we've seen to date on past applications?

A. So with that for the KJH -- or sorry -- the Slash Lazy H 5, cause of that could potentially be activities during the drilling operation that may impact. Also could be some bedding within the FMI logs that was observed.

However, we are willing to, you know, work with the DMR on solutions on confirming that -- that value at the KJH sites. It is also part of our plan to perform an in situ stress test in the KJH, at least on one of the wells. In addition, we are planning on performing an injectivity test in the injection wells again to confirm these values, and that also applies in all six injection wells.

Q. Would you be able to explain what effect the frac gradient has on the CO_2 plume size?

MR. BENDER: That's probably a question that we'll have to recall Amanda to answer.

MS. MADCHE: Okay. And am I correct that

we'll want to do that at the end as far as recalling?

MR. BENDER: Yeah. What I thought we'd do is after we finish with this group, once again, because of the size of the group, we're going --

MS. MADCHE: Sure.

MR. BENDER: -- to have to recall Wade Boeshans and also Caitlin, and perhaps we could bring Amanda up at the same time and get that done if the examiner's okay with that.

HEARING EXAMINER GARNER: I am okay with that. I was going to allow cross of these four before they go to sit down and bring them back up and sit down and bring them back up. Does that work? Is that fine?

MR. BENDER: I mean, there's a lot of people. I think it's a lot of cross. We can finish our -- the remaining witnesses, I think, very quickly. That's kind of what I had in mind this morning, but it's certainly your call, Mr. Examiner.

HEARING EXAMINER GARNER: Mr. Braaten, any input? Are you okay waiting with the other witnesses to be called and then we can -- then you'll have an opportunity to cross any one of the

witnesses and recall them up here.

MR. BRAATEN: Yeah. I think with respect to that, I just want to be clear on record that specifically because what I'm running into now is difficulty with scheduling with experts and when they're going to be here, but thinking about what Mr. Bender is saying whether I cross these folks now or cross all of these folks right after, I don't think that's going to help me on anything else, so --

HEARING EXAMINER GARNER: Okay.

MR. BRAATEN: -- I'm okay with that --

HEARING EXAMINER GARNER: Okay.

MR. BRAATEN: -- but reserving my prior objections --

HEARING EXAMINER GARNER: Sure.

MR. BRAATEN: -- on the scheduling.

HEARING EXAMINER GARNER: Your objection's noted, so we'll go then with your witnesses.

MR. BENDER: Thank you.

Q. (MS. MADCHE CONTINUING) Okay. Just to continue on the microfracture testing which you've already given some testimony on, just confirming that we would want to see a microfracture test done on either the KJ Hintz 1 or 2 just to confirm that

value which was proposed in the testing and monitoring plan.

Let's see here. So as it pertains to the -- how the microfracture test data is used in the simulation to calculate the bottomhole pressure constraints that are used in the model, if the results do come out substantially different on the KJ Hintz 1 or 2, whichever you decide to do to confirm that result, it is likely DMR would want the model reran because of the bottomhole pressure constraint being affected by that frac gradient.

A. Understood.

Q. Okay. I'm now moving into Section 5, so I would like to go to Table 5-3. So on this table you have the CO_2 stream composition specification that must be met for you to, I believe, accept a third-party source. My question related to this is whether or not all the sources you currently have contracts with have had samples taken or FEED studies completed to confirm they meet or exceed that stream composition?

A. (BY MR. POWELL) So the individual quality spec for each course is greater than 95 percent --

Q. Okay.

A. -- carbon dioxide, and we did -- we had

done a stack test at each facility, and that will be done -- the plants typically do them annually. Unless we have a reason to do them intermittently, we'll follow their schedule, but the individual spec is not greater than 95 percent CO_2.

Q. Yeah. I think the confusion was the narrative right above Table 5-3 since it states, "Any new CO_2 streams from third-party entities not accounted for at the time of permitting must also meet or exceed the specification once commingled."

And you're saying at a minimum at the source side they would be greater than 95 percent with the anticipation that the commingled stream would be greater than 98.25 percent; correct?

A. Correct. And it's my recollection I think all but one of the 57 sources were 98 percent or higher. There was one facility that was about 96. So commingled, yes, it would be greater than the 98 percent.

Q. And for any new sources that might come down the line, I'm guessing additionally you would want a stack test done before to confirm that they're going to meet the specifications to take that source?

A. You're correct.

Q. Could you -- yeah, we would require that that data be submitted to us before we would approve new sources too.

A. Okay.

Q. Could you elaborate on how the baseline isotopic signature of the CO_2 stream will be resampled if new sources are added later on?

MR. HUNT: So I think I can respond.

MR. POWELL: Okay. Go ahead because I was just going to read a paragraph, but go ahead, John.

A. (BY MR. HUNT) Okay. So in the event that a new source is added and approved by DMR, Summit would sample that new commingled CO_2 stream within one year after adding that additional CO_2 source to get its composition and isotopic signature.

Q. (MS. MADCHE CONTINUING) Let's see. Will the meters that exist -- or sorry. Let me rephrase that.

Will meters exist at all the outlets at the CO_2 source facilities, both in state and out of state, to be able to account for how much CO_2 mass and total injection stream volumes each individual source is contributing?

A. (BY MR. POWELL) Yes. So Coriolis meters will be installed consistently throughout the

system.

Q. And how do you plan to ratio those mass and volumes back to the individual three storage facility permits for reporting?

A. So I'm not the measurement expert, but it would be reconciled. We'll have custody transfer from the -- on the outlet or discharge side of the capture facilities, and then we'll have -- we'll have a measurement station at the terminus of the main line. And then we'll have Coriolis meters or measurement facilities at each of the injection sites. And so it'll be a mass balance from volume in from each of the 57 source plants all the way through what's injected at each of the well sites and that'll be reconciled.

Q. So I want to move us to Figure 5-3 on page 5-12 of the TB Leingang application. So this figure shows a generalized flow diagram. Could you walk us through this figure specifically as it relates to the capabilities to isolate individual flowlines from each other and how pigging of the flowline system will take place?

A. Yes, and I'd -- this is a difficult diagram to do that from. If you start from right to left -- so each line segment on the discharge

side of a capture facility will have a launcher. And so -- and then each pipe diameter change within the pipeline system will also have a launcher and receiver. And then when you get to the sequestration site, there will be a receiver at each of the well sites.

So if you're looking right to left, so in a common pipeline diameter size, you know, the launcher will be the initiation of that pipe segment, and then it'll go through right to left and then you will be -- for instance, at the sequestration site before it reaches the injection facility, then it will go through a receiver, and then downstream will be a meter or measurement station which will include a gas chromatograph, Coriolis meter and pump. And then the -- the -- the line of demarcation will be on the inlet valve upstream of the shutdown valve at the injection facility.

Q. So just to confirm, with the three -- with the three individual flowlines, are you able to pig those separately?

A. Yes. Each pipe diameter will be able to be pigged independently. So in the sequestration where we have 16, 20 and 24, each of those diameter

changes, the entire segment will be able to be pigged independently.

Q. And as a follow-up, are there any plans for an isolation valve at the junction of where the BK Fischer flowline, called NDL-325, splits off from the TB Leingang flowline known as NDL-327?

A. I may -- may need help from Jamey if that's a diameter change.

MR. BENDER: Okay. We'll bring him up later.

Q. (MS. MADCHE CONTINUING) Can you confirm the land description of where that junction occurs at those two flowlines? Looking at the prior figure, Figure 5-2 it looks like it's Section 5, Township 141 North, Range 87, but it's pretty small scale on the map.

A. It looks correct to me as well, but it is small scale.

MR. POWELL: And, again, perhaps Jamey can confirm, Lawrence.

Q. (MS. MADCHE CONTINUING) So now I'd like to go to Table 5-4 on page 5-14. In this table the flowline has a maximum rate of 936 million standard cubic feet per day, approximately equivalent to 18 million metric tons a year. Earlier on in the

project summary, the modeling had shown that this facility, the TB Leingang specifically, would be able to take 124.4 million metric tons over a 20-year period which would average around 6.22 million metric tons annually. Can you please confirm there's no intent to send -- even though the line has the capacity to send the full 18 million metric tons, there's no intent to send it all to this one facility?

A. That is correct. There is no intent.

Q. And on average, what do you anticipate the flow rate to be on this flowline?

MR. POWELL: Again, I'm going to have to defer to Jamey for that, Lawrence. Sorry.

Q. (MS. MADCHE CONTINUING) Similarly, on the BK Fischer application instead, and on its Table 5-4 on page 5-14, it has a maximum rate of 314.5 million standard cubic feet per day, equivalent to around 6 million metric tons a year, and its modeling had more of an annual amount of 4.92 million metric tons.

So, again, just confirming again that you would not be exceeding what the modeling had showed in those bottomhole pressure constraints even if the flowline capacity would allow you to?

A. That's correct.

Q. And I'm interested in what the average flow rates will be for all three flowlines for when that gets deferred.

MR. BENDER: That's another Jamey question?

MR. POWELL: Yes.

Q. (MS. MADCHE CONTINUING) So, additionally, on that table, for all three of the applications a typical operating pressure has a 900 psi range, roughly, going from 1250 to 2150 psi. And this might be a question that you need to defer again. I'm wanting to know why such a big range was given and whether or not you have -- kind of more within that range where you actually typically plan to be for all three facilities.

A. The range is just -- it's to keep the CO_2 in super critical state, and so that's the range from 1250 to 2150, and it's really applicable over the -- predominantly over the pipeline system because over the 2500 miles we have about -- including -- excluding the pumps at the discharge site of the capture facilities, we have 17, I believe -- if I recollect properly, 17 intermediate pump stations, so you have that pressure gradient

from the discharge down to the suction side of the -- of the next intermediate pump station, so that's the range of pressures.

As it says, the maximum operating pressure is 28 -- 2183, but the discharge set points will be 2160, and then we'd run the surge analysis and, of course, you know that's 110 percent so that's, according to the math off the top of my head, about 2400.

Q. So a couple follow-ups to that. In the modeling, the model was done as being pressure constrained both on bottomhole pressure and wellhead pressure and not weight constrained. I'm curious as to why you have a maximum discharge pressure of 2160 psi when the wellhead pressure constraint in the model was only 2100 psi.

A. Yeah, I might have to defer that one.

MR. BENDER: Jamey again.

Q. (MS. MADCHE CONTINUING) And just a statement, because this isn't a weight-constrained model, typically DMR would be going forward with setting a wellhead pressure constraint based on the model and not on operating conditions.

When it comes to kind of the fluctuation that you had mentioned that you have on the

pressure to keep it in a super critical state, will the metering that you're planning to use be able to handle those fluctuations knowing that the density of CO_2 is affected greatly by both temperature and pressure and both the temperature and pressure on this Table 5-4 is a fairly substantial range?

A. Yes, it is. It will. The Coriolis meters can handle that variation.

Q. And are those mass flow meters or volumetric meters?

A. Again, I'm not the measurement expert, but I believe that they're mass flow meters.

MR. BENDER: Do you have the answer?

MR. HUNT: No.

MR. BENDER: Okay.

Q. (MS. MADCHE CONTINUING) So some questions related to the corrosion prevention and monitoring detection that's being implemented for all three storage facilities. Can you elaborate a little bit more on the ER -- the ER probes that are proposed and the impressed current cathodic protection system that's going to be used along the flowline system?

A. (BY MR. HUNT) Yes. So for the ER probe, DMR can think of those as -- you know, you guys are

familiar with a corrosion coupon. So imagine this as a miniaturized corrosion coupon that is then attached to a probe that's then attached to the -- to the flowline where it's subjugated to the -- the stream continuously, and in real time there will be continuous measurements of the electrical resistance of that -- of that miniaturized coupon or -- or that probe, said another way. Those -- those resistivity measurements are sensitive to changes in mass and thickness in particular.

Q. What material is the composition of the ER probes?

A. So they will be of the flowline material as well as the wellbore material.

Q. So there will be two probes at at least each injection site?

A. That is my understanding.

Q. And with the impressed current cathodic protection system, is that combined as far as the same system that's going to be across the flowline and the transmission pipeline operated as a continuous protection?

A. (BY MR. POWELL) It is.

Q. Referencing back to that Figure 5-2, I'm just looking for confirmation on what the land

description would be for the terminus point. Again, on this one it looks like it's Section 5, Township 141 North, Range 86 West.

MR. BENDER: Is that something we can supply you in a supplement?

MS. MADCHE: Yeah. Both of those locations could be confirmed in a supplement. That would be fine.

Q. (MS. MADCHE CONTINUING) So a question on the seal pot system that is planned to be used to maintain the tubing/casing annulus pressure to approximately 300 psi. Are you anticipating any on-site tank storage such as vessels needing to be on site for that system that would be holding, like, packer fluid or brine, not necessarily a nitrogen vessel?

A. (BY MS. ODDY) At this time I don't believe we plan on having storage tanks for corrosion-inhibited fluid, but we will have the nitrogen seal pot like you said adjacent to the wellhead.

Q. I guess just a note. If at any point those plans do change, secondary containment such as a dike would be required around any brine storage or the packer fluid.

And also a note that a Sundry variance would be required to have the 300 psi annulus pressure just because currently as rule requires, it's to be greater than the injection pressure.

A. Understood.

Q. I believe this has already been answered earlier in part, but just to confirm, no baseline soil, gas sampling or groundwater sampling has taken place yet; correct?

A. (BY MR. HUNT) That is correct.

Q. And that would be anticipated to begin approximately a year in advance of injection operations beginning?

A. That is also correct.

Q. So this question is specific to the KJ Hintz and it may need to be deferred. I'm just looking for how that year 19 was determined for the year to install the Fox Hills monitoring well next to the Raymond Jensen 1-34 P&A well.

A. Yeah. So in general the idea there was, as has been testified to, you know, previously, seismic surveys will be acquired at least every five years, so, you know, year 2, year 4, year 9, year 14, year 19. And so the idea there was that as Summit is monitoring the CO_2 plume expanding in

the storage reservoir, we don't anticipate at this time that that legacy wellbore will see CO_2 and certainly within that time frame.

But, you know, taking a proactive approach and after taking the seismic data and then reviewing that data to see how is the CO_2 plume progressing, is it conforming to expectations, so that year 19 really just allows some of the opportunity, the -- the optionality to wait to install that well until, you know, it is needed. And, of course, if it's determined that it may be needed prior to then, then they have that option as well.

Q. So I want to reference Section 5.7.2. Let me get a page number. So that would be page 5-26 in the TB Leingang application. And it's paragraph 4, and this language is in all three applications. There's a statement that Summit reserves the right to evaluate and modify, if necessary, appropriate groundwater sampling locations and frequency. Just a note that any changes to the frequency or locations should go through DMR for approval and review.

A. Yes. Acknowledged.

Q. And that would apply as well as far as any

changes made to the near surface monitoring during the PISC period.

A. Understood.

Q. Could you give a little more testimony on the local passive seismicity array that's planned to monitor for potential induced seismicity?

A. Sure. So at this time Summit has plans to install multiple seismometers at the site. At this time -- well, a specific layout or design or number of stations is unknown, but prior to injection Summit would request bids from vendors to put together a site-specific strategy.

We understand today that by multiple -- in order to properly triangulate and locate any seismicity events, you would need at least three seismometer stations as a minimum.

Q. Just a statement that once a layout's known, that information should be provided to DMR.

A. Understood.

MS. MADCHE: Let's see. I think that's all I have currently. Thank you.

EXAMINATION

BY MR. STOLLDORF:

Q. Jimmy, I asked a question earlier that they punted to you, so I'll ask it again. At its

closest, approximately how far away is the facility for the TB Leingang from an occupied dwelling?

A. (BY MR. POWELL) I apologize because I don't have each site memorized, but I believe the closest dwelling to either -- any of the well sites is about 4400 feet -- I'm sorry -- 2200 feet. 2200 feet. I believe the furthest is about 4100 feet. But it's 2200 feet. And we can clarify if that's Leingang or if that's one of the other two.

MS. MADCHE: I think we might just ask that a supplemental is provided as far as the proximity of how close the flowline is for each individual one to the closest dwelling.

MR. POWELL: Okay. And I believe the closest dwelling to a flowline at either location is 700 feet, but we could provide the exact distances for all three.

MS. MADCHE: Could you add to that also closest distance to a wind turbine, specifically for the TB Leingang application?

MR. POWELL: Yes, we can do that.

MS. MADCHE: Sorry to jump in.

Q. (MR. STOLLDORF CONTINUING) So Section 7, the Emergency Remedial and Response Plan, that's

you, Jay; is that correct?

A. (BY MR. VOLK) Yes.

Q. Under the Section 7.6 -- I'll let everybody get there. It indicates that the company organizational structure is still in flux and in development. Do you know -- I'd note that it's expected that we -- to complete that before being provided authorization to inject. We would expect that to be nailed down.

A. Without a doubt. We're continuing to work on, as the rest of the project continues to develop, an integrated response plan as well which will be consistent with this one, and we will supply that when done and prior to injection.

Q. Okay. So this is in the PISC section. Hopefully one of you can answer this. For all three applications on Figure 6-2 -- give me a second and I'll get a page number for you. That is page 6-6 in Exhibit 1A for the TB Leingang application.

Can you -- oh, sorry. Are you guys there?

Explain how the CO_2 extent ten-year postinjection boundary was determined?

A. (BY MR. HUNT) I think we would want to bring one of the other witnesses up to answer that.

MR. STOLLDORF: Probably Amanda?

MR. BENDER: (Nods head.)

Q. (MR. STOLLDORF CONTINUING) What's the setback being proposed for the flowlines?

A. (BY MR. POWELL) Again, the setbacks for the flowlines, similar to the -- to the pipeline in North Dakota that's under PSC jurisdiction, complies with State law, 500 feet as a minimum.

Q. What type of notification system's in place should residents or -- and/or businesses need to be notified in an emergency?

A. (BY MR. VOLK) We've had numerous conversations with Oliver County, Mercer County and Morton County, and this is an area we've determined to work cumulatively on and develop. So right now there's multiple systems being used between Mercer County and Morton County. I believe Mercer County and Oliver are both using reverse 911. Morton County is using that as well as I believe some secondary options.

So we have committed to continuing working with all three counties to provide the data needed to make sure the notification system is -- is going to be consistent throughout all three counties.

Q. How often do you plan on doing training

with these local emergency response teams?

A. On an annual basis at minimum. I believe it's not to exceed 15 months, but it is on the annual basis.

MR. POWELL: Yeah. I'll just add that since we know that North Dakota -- and I'm not sure of a specific -- Jay, you could help me on Mercer or Morton or Oliver, but a lot of the counties have volunteer fire departments and sometimes those personnel interchange or are unavailable, so we've committed to providing training on a more frequent basis as needed.

Q. (MR. STOLLDORF CONTINUING) I hope you guys will -- someone here at the table will be able to answer this one, but this has come up in the past, but are there any special considerations for DMR field inspection staff to be coming onto the sites? Do you have -- or do you have any -- are you aware of any issues that might bring up, having a DMR inspector on site -- some of the sites?

A. (BY MR. VOLK) As expected, unrestricted access for any regulatory items such as DMR access. With that being said, previous work I've done has always provided on-site hazard training for and up to and including inspectors so they have the proper

notices of what is out there or what needs to be out there. And if any special training would be required for those inspectors, we will make sure that's available.

Q. Would you be able to provide us --

MR. SUGGS: Sorry.

MR. STOLLDORF: Oh, go ahead.

MR. SUGGS: On that note, if there is anything anticipated, at this time I would ask that it be provided as a supplemental for what you'd anticipate the DMR inspection staff needing to have under their belt or have training for accessing your facilities.

MR. VOLK: We will provide that.

MR. SUGGS: Thank you.

Q. (MR. STOLLDORF CONTINUING) As it relates to Sections 9, 10 and 11, the construction plugging and completion plans for the Class VI wells and monitoring wells, we just want to note that it will require typical DMR approvals prior to executing, just so you understand.

A. (BY MS. ODDY) Understood.

Q. I want to move to Section 11, the injection well. I have one question -- or a couple questions. Can I -- okay. Then we'll go to 12.

Sorry. Excuse me.

You're approximating it'll cost about $583,000 to plug one injection well. Are you guys considering that it's going to probably require a big rig to handle that size of tubing?

A. That's correct. With a 7-inch tubing, we will need a bigger workover rig. In addition to that, the anticipation of the plugging plan is also to set CO_2 resistant cement. So those estimated costs are included in the plugging costs.

Q. Okay. And you touched on this earlier about the surety bonds, but you're proposing to use a surety bond for the injection well plugging phase and the PISC phase. Are you planning to have one surety bond or two separate bonds for each phase?

A. (BY MR. VOLK) At this point in time we have not one -- allocated -- or we have not committed to a certain provider, so that'll be forthcoming, at minimum 30 to 60 days prior to injection it would be submitted to you. We know we will be using the surety and the pollution liability for those, and I can't today tell you in certainty if those will be split between the phases you asked.

MS. MADCHE: I'm just going to jump in,

and not necessarily a recommendation but something to consider is clearly as you work through closing one of these facilities, plugging the injection wells is going to be the first item. If they are on separate sureties, that would allow you the ability to request one to be released while maintaining the other one for continued PISC monitoring. So, again, just something to consider.

MR. VOLK: Appreciate that, and we will provide additional information to you.

Q. (MR. STOLLDORF CONTINUING) Can you elaborate a little more on the emergency and remedial response plan and how the endangerment to USW -- or underground sources of drinking water costs were determined?

A. I just want to make sure I'm getting to the right figure. If you bear with me for one second. There it is. So I'm going to direct your reference to page 12-10 and Table 12-7. So, first of all, I want to start off with what the actual scenario was used to determine the estimated cost on ERRP as well as to your specific question the USDWs.

The scenario that was used was a well failure or integrity issue with the well in which a

containment -- loss in containment event happened. To get into more specific details on that, I will have Jean talk through that. But to the specific cost as it relates to the USDWs, it is broken out between -- in Table 12-7, the general response actions, delineation and water replacement at 1.89 million as well as the quarterly monitoring which is dictated on a ten-year period for 750,000. And then the plugging and abandonment cost of the groundwater -- groundwater monitoring wells in that area is another 55,000, which came up to 2.6 million.

Q. And you did mention that the failure mechanism is a loss of a containment event?

A. That's correct.

Q. Okay. Just want to note that the average -- okay. I don't need to. All right. Never mind.

MS. MADCHE: No. I do have a follow-up on that. Clearly, the costs are slightly different for all three facilities for the emergency remedial response. Can you just kind of go over what parameters were used to determine those costs that would cause that fluctuation?

MR. VOLK: Yes. The difference largely

comes into on the general response delineation and water replacement line item. What we tried to do is look at more site-specific characterizations in those areas, how many wells, what would be their water replacement cost, and that was the distinguishing difference that drove the number up or down.

MR. STOLLDORF: Nothing further for me.

EXAMINATION

BY MR. SUGGS:

Q. Just a couple of additional items. I'm going to jump back up to 5-13. The second-to-last paragraph on that page related to custody transfer of the CO_2, the way that's described is that the CO_2 when it reaches the terminus point will become the custody of SCS1 and it will remain that way until it goes down the hole at any of the three different facilities. Am I understanding that intention correctly?

A. (BY MR. POWELL) So that's page 5-15?

Q. Page 5-13, the second-to-last paragraph.

A. Oh, sorry. All right. That's my understanding.

Q. Okay. As the flowlines are anticipated to be owned by the individual storage facilities,

SCS1, 2 and 3, would Summit be opposed to a requirement that would require a flow meter at each -- I guess at the beginning of each of the individual flowlines and an actual custody transfer happening as it moves from one line into the other?

A. So versus having measurement at the terminus of the main line for the -- sorry. As opposed to just having the single meter at the terminus of the main line at the -- at the jurisdiction breakpoint and then an individual meter at each well pad or well site, you're suggesting or recommending that we'd have an intermediate meter, then, at the beginning of each of the laterals from that segment of main line, flowline to each well site.

Q. (MR. SUGGS CONTINUING) Yeah. I think you would end up with at least two additional meters in play, one being where the CO_2 would go north to the KJ Hintz facility and one at the point where it goes west from the Leingang to the Fischer.

A. I'm not opposed to that.

Q. Okay. With respect to the cathodic protection system that's being proposed, has that already been designed at this point?

A. It hasn't been -- the impressed current

cathodic protection system?

Q. Yeah.

A. Generally. We're going to have to -- since we've added additional source points and additional laterals along the whole system, we're going to have to go back and rebalance the system and figure out if the location of the ground well -- the ground beds have changes, where they need to be expanded, et cetera. So it needs to be reconfigured upstream of the sequestration area.

Q. Okay.

A. As far as the sequestration area, it's generally been designed but we'll refine.

Q. Okay. So that is still under works and will be refined?

A. Correct.

Q. Okay. So when that is determined, we'll want the location of the ano beds identified, and pursuant -- there's -- on page 5-15 in Section 5.3.1, there's indication of -- what am I reading -- Summit Carbon Solutions will supply DMR with a map of cathodic protection boreholes to meet the requirements of 43-05-01-5. Do you anticipate actually drilling any cathodic protection boreholes or will this system entirely utilize ano beds?

A. It's my understanding ano beds. We'll clarify.

Q. Okay. And so, regardless, we'd want those locations identified.

A. Yeah.

Q. And I think, John, you testified to this earlier, but there's some narrative on 5-29 that indicates that you will be running 3D seismic at years two, four and nine. It is the intent to run 3D seismic as early as year two after injection?

A. (BY MR. HUNT) That's -- yes. Yeah, and in the narrative it says "by year two," so just to be clear.

Q. Okay. But my point -- my confirmation is that there will be a sequence of 3D seismic run shortly after beginning injection and another one prior to the five-year review?

A. Correct.

Q. Okay. I'll point out that if anything looks significantly off at that two-year mark, it is expected that you will report that and we'll begin the determination whether or not we need to accelerate that hearing.

A. Understood.

Q. On page 5-32 there's the narrative about

the traffic light system for the passive seismicity, and you have the cutoff points of 2.7, 4.0 and 4.5. Can you elaborate on what the significance of those values as cutoff points are?

A. So 2.7 is the point at which humans can begin to feel seismicity, and so that's why that one is listed there. For events 4 and 4.5, I don't have off by memory -- I would need to go and refer back to the team on that one.

Q. Okay. If that's something that can't be provided in short notice or short period as part of this testimony, possibly a supplemental just confirming what the importance of those values is in that system.

A. Understood.

Q. And I think this one is for Jay. On 7-17, the last sentence under the 5 -- sorry -- 7.5.1 section, it reads, "In addition, assistance has been secured from local emergency services to implement this ERRP."

Which emergency services have you specifically worked with and secured their assistance in execution?

A. (BY MR. VOLK) So we continue to develop this. This is an overarching plan. We have

reached out to, as I've said, Morton County, Oliver County as well as Mercer County, including the fire departments in numerous of the surrounding towns. A couple of them are Beulah, Hazen, Center, Zap. So without having what I would call -- and I'm going to say maybe that statement today is not totally defined as the ERRP isn't, but continued working agreements with -- or continued working with them to commit to: One, I understand there's a memorandum of understanding of mutual aid between all of them or actually statewide now. So they have recognized that. Two is they've recognized that we will continue to work together in developing that plan and know they have different capabilities between the units. And that is what we're going to continue to work on to supply what I would call as an integrated plan between all three counties.

Q. So in -- I guess with respect to this statement in the application --

A. We have not secured an agreement, so I would say that wording probably should be changed at this point.

Q. Okay.

A. I would say commitment's a better word

than agreement.

MR. SUGGS: That's all I need. Thank you.

HEARING EXAMINER GARNER: Okay. Before we recall those witnesses, why don't we take a ten-minute break.

MR. BENDER: Okay.

(Recessed at 2:56 p.m. and reconvened at 3:12 p.m.)

HEARING EXAMINER GARNER: We are back on the record. Attorney Bender, you wanted to recall some witnesses.

MR. BENDER: Yes. We're going to recall Caitlin Olsen.

HEARING EXAMINER GARNER: Microphone.

MR. BENDER: Oh, sorry. We're going to recall Caitlin Olsen. We're going to recall Wade Boeshans. And then to answer some of the questions that came up from staff, we'll be recalling Amanda Douglas, and then we'll have one new witness. As you may recall, there were questions to the previous group and they were deferred to Jamey Backus.

And I apologize, I misspelled his name earlier when there was a question on it. It's B-a-c-k-u-s.

So with that in mind, we'll call Caitlin Olsen back.

HEARING EXAMINER GARNER: Ms. Olsen, just a reminder, you're still under oath.

REDIRECT EXAMINATION

BY MR. BENDER:

Q. Caitlin, I'm going to show you what's been previously marked as Exhibit 8B. Can you tell me what 8B is?

A. (BY MS. OLSEN) 8B is the Storage Facility Permit Application Comparison Summary Table.

Q. And when we started the hearings, I briefly explained to the --

MR. SUGGS: Lawrence, have you handed that out yet?

HEARING EXAMINER GARNER: Do you have one?

MR. SUGGS: No.

Q. (MR. BENDER CONTINUING) When we started the hearing, Caitlin, you may recall me talking very briefly about the fact that we were going to spend a lot of time on the Leingang application and then we were going to sort of do -- contrast and compare Leingang with Fischer and Hintz after that. Do you recall that?

A. I do.

Q. Okay. And is 8B sort of a visual aid and you being able to go through and make those comparisons?

A. That's right.

Q. Okay. Let's start -- I'm not going to interrupt you much, but why don't you start by first talking about the various columns and what your method was for laying this out and then you can explain it to the Commission.

A. Sure. So the intent of this comparison summary table was just to lay out the differences between all three permits. Listening to the hearings today, I feel like most of those points have been covered by DMR or otherwise in testimony.

But you'll see here across the top the column named SFP Permit Section, that relates to the section of the permit that we're talking about. Then you'll see Summit Carbon Storage #1, TB Leingang/Milton Flemmer 1, that's referring to permit number one, the TB Leingang permit. Likewise, the second column is the BK Fischer permit. And the third column is the KJ Hintz permit.

Q. Okay. Then let's -- why don't we start out first with the Project Summary, and what I'll

probably do is have you explain that in detail, and then we can kind of walk through the -- the other sections and you can probably more abbreviate your discussion of it.

A. Sure. So as Wade testified to the project summary earlier today, the only material difference in the three permits in relation to the project summary is the applicant name listed. All other aspects of Wade's testimony apply to the TB Leingang, the BK Fischer and the KJ Hintz as you'll see noted in that row.

Q. Okay. Let's go to the next column -- or not the next column, the next row.

A. Section 1, Pore Space Access. There's minimal content changes between the permits, as you'll see noted. There is one thing to specify in the BK Fischer permit and that is that there is Coyote Creek -- Coyote Creek mining -- mine land located within the hearing notification area.

Q. And I think as a result of some questions that came to Amanda, she pointed that out in one of the exhibits; is that correct?

A. That's right.

Q. Let's go on then to Section 2.

A. That's the geologic exhibits portion of

the storage facility permit. You'll remember as Amanda testified to yesterday and earlier today that the model extents used across all three permits are the same. Logging efforts are the same. Microfracture in situ stress tests were performed in all three wells and all three -- excuse me -- all three permits, and all three permits used the same 2D and 3D seismic surveys.

The differences that we'll talk about here mainly have to do with site-specific characterization work. You'll note that in the TB Leingang permit the Minnekahta Formation is present as Amanda had testified to earlier. The Minnekahta Formation is absent in the BK Fischer permit and in the KJ Hintz permit.

Again, site-specific storage complex formation data is -- varies between all three permits as noted here. That includes core data, log testing, things like that.

And the last point to make sure on Section 2, Geologic Exhibits, is that the number of borehole image logs varies between all three permits.

Q. All right. Then let's go to Section 3, please.

A. Section 3 discusses the geologic model construction and numerical simulation of CO_2 as Amanda had testified to previously. The same data inputs were used. Again, as described in Section 2, the same model was used across all three permits. The same simulation was performed where all three well sites were simulated as injecting at the same time. You'll note here that there are minor variations in Section 3 where site-specific data is used to derive individual injection pressures, rates, temperatures and critical threshold pressure estimations. Those are the only differences of material value.

Q. All right. Then we'll go -- the next row is Section 4, the Area of Review. Can you briefly discuss what's contained in that row?

A. Area of review, as I testified to earlier, uses the same groundwater sampling method across all three permits. The methodology remains the same. There are site-specific differences that have to do with the number of wells based on the specific area of review and what wells exist there.

Other differences include other site-specific surface features which may include springs, mining land as I discussed previously, and

any legacy oil or gas wells. To note, there are no legacy oil and gas present in the TB Leingang or BK Fischer area of review. There is one KJ -- there is one legacy oil and gas well in the KJ Hintz permit as I had testified to earlier.

Q. I'm going to try to get some points here with the court reporter, so can you slow down just a little bit?

A. I thought I was.

Q. Let's go to the next section, Section 5.

A. Section 5 discusses the testing and monitoring plan. Across all three permits, leak detection plans are similar. Flowline corrosion, prevention plans are similar, and baseline testing and logging plans are similar. There are minimal differences for mechanical integrity testing across all three permits.

You'll note that in the TB Leingang permit the Milton Flemmer 1 will use tubing-conveyed gauges, as Jean had previously testified to in Section 9. The other two stratigraphic monitoring -- excuse me -- stratigraphic test/monitoring wells will use casing-conveyed gauges. Environmental monitoring plans, again, are site specific but the methodology remains the same.

Q. Okay. The next section, please.

A. Section 6, the Postinjection Site Care and Facility Closure Plan. The monitoring programs are similar across all three storage facility permits. There are minimal differences related to monitoring well-specific details, for example, the maximum pressures seen across each storage facility.

Q. All right. And then Section 7 I have labeled on my exhibit Emergency and Remedial Response Plan. Can you discuss that for us, please?

A. The content between all three permits is the same materially.

Q. Okay. And Section 8?

A. Again, the material content is the same and there are no -- no large differences.

Q. And Section 9?

A. All three storage facility permits abide by the same North Dakota rules and regulations, such as requiring surface casing 50 foot below the lowermost USDW and CO_2 resistant cement casing within the injection reservoir zones.

You'll note that the biggest differences are that the Milton Flemmer 1 stratigraphic test well and monitoring well was drilled deeper. It

was drilled to 12,000 feet. The other two wells, the Archie Erickson and the Slash Lazy H, were drilled to approximately around 6,000 feet. That would result in just differences in cementing. Some are two stages for the shorter wells and some are three stages in those completions.

Q. All right. Let's go to Section 10, the plugging plan.

A. There are no material differences in the plugging plans across all three permits. Plug placement will vary based on formation depths, you know, depending on where those formations exist within each specific wellbore.

Q. And Section 11, Injection Well and Storage Operations?

A. Again, the Milton Flemmer 1 well, since it will be using tubing-conveyed pressure gauges, tubing will be installed in the Milton Flemmer 1 well. Prior to injection operations beginning in that storage facility permit in the TB Leingang, that well will be plugged back. It's currently drilled to about 12,000 feet.

There will be no tubing installed in either the Archie Erickson monitoring well or the Slash Lazy H monitoring well.

There are site-specific differences in maximum bottomhole pressures, injection amounts, et cetera, as seen in Table 11-1.

Q. Okay. And Jay spent some time comparing and contrasting the financial assurance. So keeping that in mind, can you just discuss Section 12 for us?

A. Yeah. Jay did a great job testifying to the differences already. There are minimal differences between all three storage facility permits. The total bond amount between the three storage facility permits varies slightly, and those minimal differences are related to the cost estimates of the postinjection site care and facilities plan, and namely the number of monitoring wells at each site, the reservoir monitoring well design characteristics, flowline lengths and costs associated with endangerment of USDWs.

Q. All right. Now let's spend a little time with the appendices that are attached to each one of the applications. Let's start with Appendix A.

A. There are no material differences between all three permits other than they use site-specific information.

Q. And Appendix B?

A. There are, again, no material differences in Appendix B, Freshwater Well Sampling Analysis, other than the results are site specific.

Q. And Appendix C?

A. There are no material differences in Appendix C across all three storage facility permits. You'll note here that site-specific information, namely XRD data, was used to inform mineralogical compositions for injection zone and confining zones. Again, stratigraphic well-specific water ionic compositions were used and, therefore, the simulation results are site specific.

Q. And Appendix D?

A. There are no material differences between the three storage facility permits. You'll note that TB Leingang does list information for those tubing-conveyed pressure temperature gauges.

Q. And then finally Appendix E?

A. There's no material differences. The differences relate to the permits themselves.

MR. BENDER: Mr. Examiner, you know, I don't -- I think I'll offer the exhibit, and I don't have any other further -- I don't have any

further questions for Ms. Olsen.

HEARING EXAMINER GARNER: Any objections?

MR. BRAATEN: No objection.

HEARING EXAMINER GARNER: Exhibit is admitted.

You can proceed to your next witness.

MR. BENDER: Next witness is Wade Boeshans.

HEARING EXAMINER GARNER: And just a reminder, Mr. Boeshans, you're still under oath.

MR. BOESHANS: Yes.

REDIRECT EXAMINATION

BY MR. BENDER:

Q. Wade, while we're handing out the exhibits, I'm just going to have you direct your attention to what's been previously marked as Exhibit 1C-1.

MR. BENDER: Derrick, can you tell me when you get a copy?

MR. BRAATEN: Sure. Okay. I'm ready.

MR. BENDER: Okay. Thank you.

Q. (MR. BENDER CONTINUING) Wade, can you tell me what Exhibit 1C-1 is?

A. (BY MR. BOESHANS) It is the storage agreement for SCS3 for the KJ Hintz storage site.

Q. And can you briefly describe the amendment to the Hintz storage unit that Summit is proposing with this exhibit?

A. Yes. So in this exhibit it includes an amendment in what is labeled in here as Section 3.12.

Q. And can you explain to the Commission staff why Summit is proposing the addition of Section 3.12 to the Hintz storage agreement?

A. Yes. So as you're aware in the -- from the previous -- or my testimony yesterday, the KJ Hintz is in proximity to the DCC facilities. I think I mentioned yesterday -- or I did mention yesterday that approximately, you know, three miles between the storage boundary of -- storage area boundary of the KJ Hintz and the DCC West facility. And so Summit and Minnkota have been in discussions around a border agreement in terms of how we would work together to, you know, manage our storage operations or cooperate in storage operations. And so this amendment outlines what we have agreed to in terms of general terms, and those discussions have advanced to this point.

Q. It's my understanding, Wade, that the -- the Hintz storage agreement already has language

for a border agreement -- for the parties to enter into a boarding -- border -- I'm having trouble talking here -- border agreement. Why was it necessary to add Section 3.12?

A. Yeah. So you're correct in that the application or the border -- the storage agreement in the application includes border agreements. This section is specific to a border agreement between Summit SCS3 and the DCC facilities.

And so we thought it was prudent at this time given our discussions to lay out the general terms that we've agreed to at this point in anticipation of finalizing that border agreement of coming here, but this would set forth in essence the -- call it general terms and expectations of the border agreement which the parties have agreed to work together on. We believe it's in our best interest to do so, and so we're submitting it here today.

Q. So it's Summit's request and Minnkota's request that the storage agreement for the Hintz storage facility be amended to include the language which is set forth in 3.12; is that a fair statement?

A. Yes. That's correct.

MR. BENDER: That's all the questions I have for this witness. Offer that exhibit which is Exhibit 1C-1.

HEARING EXAMINER GARNER: Any objection?

MR. BRAATEN: I don't have an objection to the admission of the exhibit. I have an objection to the amendment itself to the application at this point given the circumstances, but not to the admission of that exhibit into the record.

HEARING EXAMINER GARNER: We will note your objection and admit the exhibit.

MR. BENDER: Mr. Examiner, we'd now like to move to Amanda Douglas. If you recall, there were some questions when we had the larger group up here that we believe Amanda can respond to. So I believe she's still sworn.

HEARING EXAMINER GARNER: Yeah. Just a reminder you're still under oath.

MS. DOUGLAS: Understood.

REDIRECT EXAMINATION

BY MR. BENDER:

Q. Do you want to handle it the way you did last time, Amanda, where you indicate what the question is and then respond?

A. (BY MS. DOUGLAS) Yes. And DMR staff, if

I -- I miss any, please let me know.

The first question I believe that was asked and deferred was how a fracture pressure gradient influenced CO_2 plume size. Generally, the fracture pressure gradient is used to calculate the bottomhole pressure constraint, so 90 percent of the fracture pressure gradient is used to define the bottomhole pressure constraint as required by regulations. A higher fracture pressure gradient would result in a higher bottomhole pressure allowing for more injection of CO_2 which would generally result in a larger plume.

However, I'd like to point out in the modeling cases that we ran in the permits in Section 3, the 2100 psi wellhead pressure constraint was met prior to the bottomhole pressure constraint being met. So in this case the higher fracture pressure gradient at one of the sites is not dictating a larger plume size for the case -- simulation case presented in the permit application.

Q. That's -- I believe that's the only question that -- oh, there's another one?

A. I was just pausing. Sorry.

Q. Oh, okay.

A. Waiting for --

Q. That was a long pause, so --

A. Waiting for the Commission to -- to write their notes.

Another question I believe -- Travis, you asked a question on stabilized plume. Could you please restate your question, or postinjection period?

MR. STOLLDORF: Oh, okay. Hang on one second. Yeah. On Figure 6-2, can you explain the CO_2 extent ten-year postinjection -- how that ten-year postinjection boundary was determined? It's on page 6-6 or 6, dash, 6.

MS. DOUGLAS: Yep. So the simulation model was used to simulate the 20 years of injection and several years postinjection. And so the plume as labeled here is showing the CO_2 plume extent at ten years postinjection as determined -- as predicted by that modeling simulation.

MR. STOLLDORF: Okay. What parameters are used to determine when the plume is stable -- when the plume is stabilized?

MS. DOUGLAS: So plume stabilization is determined by looking at the rate of change in plume area over time. So the rate of change in the

plume area over time decreases, and so we used -- we calculated the rate of change over one-year time steps and looked at the point in time where rate of change slowed down. And in that case the cutoff was determined to be less than two square miles of change per year in plume area, and that was used as our cutoff to determine when the CO_2 plume stabilized. .2 -- .2 miles, sorry, if I misstated.

MS. MADCHE: And that's using the 5 percent saturation cutoff as well within those square footage movements?

MS. DOUGLAS: That's correct.

MR. STOLLDORF: Thank you. That's all I had.

MS. DOUGLAS: So, Tammy, you asked a question about the pressure from the flowlines and the wellhead pressure used in modeling. Could you restate that question?

MS. MADCHE: Yes. So on Table 11-1 on page 11-2, for all three applications there's a note that maximum injection pressure during operations will be limited to surface equipment pressure ratings and the maximum bottomhole pressure constraint. In Table 11-1 and in Section 3 in the model you report that you used a wellhead

pressure constraint of 2100 psi alongside the bottomhole pressure constraints. However, in the testing and monitoring section in Table 5-4, the flowline maximum operating pressure is listed at 2183 psi along with a maximum discharge pressure of 2160 psi. So my question was why those operational values on the flowline are higher than the wellhead pressure constraint that was used in the model.

MS. DOUGLAS: So can you restate the value? Did you say it was 2,160?

MS. MADCHE: 2183 for max operating pressure, 2160 for max discharge pressure.

MR. BENDER: Do you want to hand that off to Jamey or --

MS. DOUGLAS: Yes.

MR. BENDER: Reluctantly?

MS. DOUGLAS: So before Lawrence introduces Jamey, then, you guys had a question on the stoplight system and the magnitude of earthquakes used in that stoplight system. So John described 2.7 is the low value for that stoplight system. Again, that's the threshold for a felt earthquake.

Greater than a magnitude of 4 was chosen essentially for that next step in the stoplight

system. At an earthquake magnitude level 4, that's where the magnitude of the earthquake would be sufficient to -- it's generally described by the USGS as shake or rattle dishes. That's how the USGS describes it. So at that point the stoplight system states that SCS will stop injection, perform inspection on surface facilities and wells to ensure there's no damage, and then reduce operations while a detailed analysis is done to determine whether or not injection operations caused that or that could have been a natural earthquake that their monitoring array is just picking up.

And then over 4.5 is the cutoff for complete stop of operations and working with the regulator to determine if any changes to injection operations are needed.

MR. SUGGS: So why the 4.5? What's the significance of that transition?

MS. DOUGLAS: So as you get from 4 moving up till 5, so earthquake magnitude 5 -- as described by the USGS, at earthquake magnitude 5, that's where you might start seeing potential damages to structure, such as cracked drywall, things like that. And so 4.5 is below that 5

threshold to provide that safeguard to make sure that operations are shut down before any earthquakes are induced that could cause damage.

MR. SUGGS: Okay. Thank you.

MS. DOUGLAS: Were there any other questions that you recalled that were deferred?

MS. MADCHE: No.

MS. DOUGLAS: Okay.

MR. BENDER: We'll now call Jamey Backus, I think, who can respond to the remaining questions. Jamey will -- and Jamey has not been sworn.

HEARING EXAMINER GARNER: I'm going to swear him in.

MR. BENDER: Okay.

JAMEY BACKUS,

being first duly sworn, was examined and testified as follows:

DIRECT EXAMINATION

BY MR. BENDER:

Q. Jamey, state your full name for the record.

A. Jamey Backus.

Q. And, Jamey, I misspelled your name earlier, so will you spell your last name?

A. B-a-c-k-u-s.
Q. And, Jamey, by whom are you employed?
A. Summit Carbon Solutions.
Q. In what capacity?
A. Project manager of topside facilities.
Q. Okay. And can you spend just a few moments providing us with a summary of your educational background and work experience?
A. Bachelor's degree in mechanical engineering. I worked at DGC for a number of years, which is the chemical plant up near Beulah, and then I also worked in coal-fired power generation in roles such as engineer, maintenance superintendent and plant manager.
Q. And what are some of your duties and responsibilities with respect to your employment at Summit?
A. That would be design of the topside facilities and equipment selection.
Q. Okay. I don't have any other questions. He's available for the questions that -- I don't remember exactly what they were, but I think Tammy may have had a few, or do you recall the questions?
A. Well, I think I can -- I'll go through all the ones I have and then let me know if I forgot

any.

So if we begin with the max pressure one that Amanda referenced, the max operating pressure of the pipe is set by thickness, flange ratings, et cetera. The maximum output pressure of the pump is set by the pump manufacturer, but we will have controls in place so that the wellhead pressure never exceeds the 2100 psi.

MS. MADCHE: Sounds good.

MR. BACKUS: Okay. The other question, the block valve where NDL-327 breaks off to NDL-325, we did not have intentions of putting a block valve there. Now, with the discussion of potentially putting a Coriolis meter there, we may revisit that, but we did not originally have intentions of putting one there because the mileage of the pipeline in that area did not require it.

MS. MADCHE: So I guess I would just state we would probably highly recommend it just because it gives you that extra ability to isolate between the facilities since they are owned by separate LLCs.

MR. BACKUS: You'd asked about location of where NDL-327 goes to 325, that is 141 North, 87 West, Section 5. The terminus point is 141 North,

86 West, Section 5.

MS. MADCHE: Okay.

MR. BACKUS: Those were the ones that I had.

EXAMINATION

BY MS. MADCHE:

Q. Okay. So additional ones I have were what you anticipate the average flow rate to be for the three individual flowlines?

A. Yeah. So I would -- I would reference the Section 11 for each one of the applications, and our average -- average injection rate between the two wells utilizing the 2100 psi wellhead constraint, I would -- I would utilize the total of that number as to what will actually flow through the line to the -- to the well site.

Q. So just to confirm, you plan to maximize right up until the 2100 psi wellhead pressure constraint?

A. Depending on flow coming in from the capture facilities --

Q. Sure.

A. -- you know, the 16 -- I'll talk in rough numbers -- the 16 million tons that is currently slated.

MS. MADCHE: Okay. I'm just checking to make sure I don't have anything else here. I think that's all I have for deferred questions. I'll let anyone else go. I do have one question on the Exhibit 8B afterwards, so --

MR. BENDER: When you say "afterwards," I'm sorry, I don't mean to question you, but --

MS. MADCHE: Anyone else in DMR that --

MR. BENDER: Oh, I see.

MS. MADCHE: -- has --

MR. BENDER: Okay.

MS. MADCHE: -- deferred questions. Sorry.

MR. BENDER: Okay. Thank you.

HEARING EXAMINER GARNER: I think you can ask, Tammy.

Q. (MS. MADCHE CONTINUING) All right. So on Exhibit 8B, on page 5 of 6 I think there might be a typo on the KJ Hintz column under Section 12, number 2. It states, "Additional groundwater monitoring well and soil gas profile station has been added at legacy well 4942." Based on the figure in the application it's an additional Fox Hills monitoring, not a soil gas station, just to confirm. And that would be figure -- give me a

second.

A. (BY MS. OLSEN) You're correct. That's a typo. There is not a soil gas station planned near that additional legacy well. Just a Fox Hills monitoring well.

MS. MADCHE: Okay. Thank you.

HEARING EXAMINER GARNER: Well, at this time I guess we'll move to cross-examination unless there's anything else.

MR. BENDER: Yeah. And I will -- I'll accommodate Derrick in any way. If you would prefer the -- that other group of people that we had up a few moments ago and have -- and do your -- conduct your cross-examination on those witnesses first or if you want to use this group, whatever you prefer, I'll try to accommodate you.

MR. BRAATEN: Give me just one moment, please. Maybe for efficiency, if you don't mind, I can just start with some of the questions I had for these witnesses and then finish that and recall any that I need that were up prior.

MR. BENDER: I guess I'll try not to object, but I would hope you would keep it to --

MR. BRAATEN: Yeah. I have questions based on this testimony.

MR. BENDER: On the direct we just had?

MR. BRAATEN: Yeah.

MR. BENDER: Okay. Fine.

RECROSS-EXAMINATION

BY MR. BRAATEN:

Q. Ms. Douglas, I think you had testified about the plume stabilization parameters and indicated that the stabilization cutoff was determined to be when less than .2 square miles of change occurred in any given year at the 5 percent saturation cutoff; do I have that right?

A. (BY MS. DOUGLAS) Correct.

Q. Did you also model -- let me start over.

Did you run the model to determine the total duration over which the plume would keep moving regardless of rate?

A. I can't recall off of the top of my head. I know we modeled it for a significant postinjection duration. I was not directly involved in determination of stabilized plume so I don't have that information readily available.

Q. Who made the determination for stabilized plume or who was involved with that?

A. Apologies, I don't have those names readily available.

Q. Was it people at EERC?

A. Yes.

Q. Okay. There was some discussion of the stoplight system. Why not notify DMR of events between a 4 and a 4.5?

A. That's not included here as written, but I think that'd be prudent to add that.

Q. Okay. Ms. Olsen, you testified on Exhibit 8B regarding the different depths for the three wells. Do you have an understanding as to why they drilled the three different wells to those specific depths?

A. (BY MS. OLSEN) Generally, yes.

Q. And just generally, what is your understanding?

A. My understanding is they were drilling the Milton Flemmer to get core data from deeper formations.

Q. Okay. Did they complete or are there plans to complete that at a higher interval at some point with a plug?

A. There are no plans, to my knowledge.

MR. BRAATEN: I have some questions, Lawrence, related to surface facilities, and Mr. Volk did some testifying but it sounds like

Mr. Backus has an understanding as well. Do you mind if I ask him the questions, and if he can't answer, we can call Jay Volk up?

MR. BENDER: I have no problem with that. It may save time if you just try that approach.

Q. (MR. BRAATEN CONTINUING) Okay. Mr. Backus, can I have you turn to the generalized flow diagram on page 5-12 of Exhibit 1A?

A. (BY MR. BACKUS) Okay.

Q. Can you describe the purpose of the blowdown which is indicated on the generalized flow diagram?

A. Thank you. In hopes of not getting called up, I didn't bring my glasses.

Oh, the blowdown on the receiver?

Q. Correct.

A. Yes. That would be for when the -- when a pig is received in there and the receiver is isolated, that blows down the pressure and CO_2 so that the pig can be removed and data can be retrieved from it.

Q. Are there emergency pressure relief valves on the system anywhere as far as what we're looking at in the generalized flow diagram?

A. There is a thermal relief valve, but not

emergency pressure relief valve.

Q. How do you deal with an unexpected spike in pressures coming through this system?

A. I think that is dealt with through controls of the pipeline pump pressure control valves to maintain pressures that are -- that can be withheld within the existing facility.

Q. Can you explain that a little more?

A. In order to have a pressure spike, something would need to do that, and a pump would be the obvious thing, and there are controls on the pump, be it vari -- variable frequency drive or just the nature of the pump that would keep it underneath of the failure pressure of the piping -- or the maximum operating pressure, I should say. I'm sorry.

Q. Do you believe there's a 0 percent chance of pressure causing some kind of a release from the surface facilities post Midwest Carbon Express' terminus point?

A. I don't know that I can say there is a 0 percent chance of that ever happening.

Q. Have you done any kind of dispersion modeling to determine the areas in which you would need to provide notice to people if you did have a

release in one of those sites?

MR. BENDER: Before you answer that question, I want to caution you that there's been some -- there's been a dispersion model that's been prepared and it's been submitted to the Public Service Commission and it's confidential. So you can answer the question, but be very careful that you don't answer it in a way that provides information with the model that was supplied to the PSC.

MR. BACKUS: I can say that I was not personally involved with any of the dispersion modeling that has been done.

MR. BRAATEN: And fair objection, Lawrence. I'm actually not trying to get into that.

MR. BENDER: I appreciate that.

Q. (MR. BRAATEN CONTINUING) But my understanding of the dispersion model with the PSC is that that relates to the main line and to that, and I'm asking just specifically if there was any dispersion modeling done post main line on the flowlines in those facilities?

A. I was not involved in any of that.

Q. Okay. And so you're not saying there

wasn't one done. You're just saying you don't know?

A. Yes. That's what I'm saying.

Q. Okay. Is there -- do you know of anyone else that's testifying that would know whether or not one was done?

A. You could ask Mr. Powell.

Q. Okay. If Mr. Powell didn't know, is there anyone else that would?

A. He would be the one to ask that question to.

Q. Okay. What is the purpose of the thermal relief valve?

A. So in cases where you can isolate a section of pipe and it would be full of CO_2 at pressure, if it heats up through whatever means, say the sun is shining on that pipe, the CO_2 will expand and this -- the thermal relief makes sure it does not exceed safe operating limits.

Q. How does the thermal relief valve do that?

A. More than likely it would be the type of thermal relief valve that is spring operated, so as the pressure would increase, it would relieve that and then close again.

Q. Is the valve opened based on temperature

or pressure?

A. The valve would open based on pressure.

Q. What pressure?

A. I believe that number is 5 percent over maximum operating pressure.

Q. Wouldn't that risk a failure if the max operating pressure is based on the manufacturer's recommendations?

A. No, I don't believe it would. That -- that is a normal thing when you talk about, say, a vessel. Normally they operate -- the pressure safety valve in that case is normally set 10 percent over -- 5 to 10 percent over the operating pressure.

Q. And when you say "the operating pressure," are you saying the max operating pressure as established by the manufacturer of the pipe?

A. I'm saying the 900-pound class standard we are working off of, that operating pressure, as set by ASME, I believe.

Q. Okay. Does the valve, then, close by itself automatically once it gets back down below that pressure?

A. It does.

Q. Okay. So I asked you earlier about a

dispersion model, but are you aware of any testing done on predicted maximum release from the line through that valve?

A. Because -- because of that thermal relief valve?

Q. Correct.

A. Yes, I am.

Q. And what -- what kind of studies were done to determine what the maximum release would be from that thermal relief valve?

A. It was -- a third party performed a study based on a temperature rise in that line and the thermal expansion of the CO_2 given the size of the line and the volume contained in, how much it would need to relieve.

Q. As well as the intended flow rate?

A. Yes.

Q. And operating pressure?

A. Yes. Well, it -- when you say flow rate, do you mean through the valve or through the line?

Q. I don't know.

A. I can say this: If that would happen, it is because everything is stopped. There is no flow through the line and valves are closed.

Q. Okay. Yeah, so through the valve.

What was the maximum amount of CO_2 predicted to be released from the thermal valve in the scenario you described?

A. Approximately .136 tons per minute.

Q. And did they determine the maximum length of time they thought such a release would potentially occur under those parameters?

A. Based on the largest segment of line that one of these exists on, I think there would be approximately three tons of CO_2. That would be if you emptied the line completely, which would be highly unlikely, but that would be if you emptied the line completely.

Q. So when the thermal valve is released, does that trigger other valves to stop flow in the line or do you have to manually shut that off?

A. Well, as I said for -- for that to trip, that means that there is no injection going into that well. We have isolated the valves because it is only as the temperature warms up, the pressure would increase to release that. So there would be no replacement CO_2 coming into that line. It's simply to protect the line.

Q. Okay. Do you have an understanding of how far three tons of CO_2 would disperse under natural

wind and weather conditions?

A. I do not.

Q. I'm not sure who this question is for, but I think there was some testimony about who would be operating the flowlines, so not the main line, Midwest Carbon Express, but the flowlines. Was there testimony that the flowlines would be owned by the storage facilities but operated by SCS Transport?

A. (BY MR. BOESHANS) That's correct.

Q. And when did that arrangement -- when was that arrangement decided upon?

A. That -- I don't know that I can give you a specific timeline in which that decision was made.

Q. Was it within --

A. I think it was generally that the intent that -- from my recollection, it was always the intent that it would be an integrated system operated -- connected with a common control system as Jamey described earlier.

Q. Are there any contracts signed between the various entities to formalize that relationship for operating the flowlines?

A. We do not have interoperating agreements in place today between the entities.

Q. Or any other kinds of contracts to govern that?

A. Not at this time.

Q. I apologize, I'm jumping around a little now, but, Ms. Douglas, I think you had talked about this traffic light system, and under the event of greater than 4.01 one of the plans is to continue operations at a reduced rate and/or below a revised maximum operation pressure. How would you make those determinations as to how much to reduce the rate or the maximum operation pressure?

A. (BY MS. DOUGLAS) At this time what's specified is injection rate would be reduced to no less than 50 percent.

Q. How do you decide if it'll be 50 or 55 or 60, for example?

A. So as part of this stoplight system and as this traffic light system is part of this seismic monitoring, we'd be acquiring continuous seismic data. So we'd take into account not just that larger event but if there were other events, how many, their magnitude, time duration, as well as their epicenters.

Q. Mr. Backus, do you know what the diameter is of the thermal valve?

A. (BY MR. BACKUS) 1 inch, I believe.

Q. Okay. Are there any other pressure relief systems post terminus of the Midwest Carbon Express that we haven't discussed?

MR. BENDER: I think I'd rather have you address that question to Jimmy. He's more familiar with those things, and he'll be coming up after this.

MR. BRAATEN: Okay. Okay. I think that's all the questions I have for these witnesses. I have a few, I think, for Mr. Powell and Ms. -- one -- well, a couple quick ones for Ms. Oddy.

MR. BENDER: Do you want the whole group or --

MR. BRAATEN: No, I think -- well, I think we can start here. I think that they may be able to answer them all.

MR. BENDER: Okay.

CROSS-EXAMINATION

BY MR. BRAATEN:

Q. Ms. Oddy -- am I saying that right, Oddy?

A. (BY MS. ODDY) Yes. Oddy.

Q. You made a reference to CO_2 resistant cement. Can you describe what that is?

A. Yep. So as part of the design plan, we

have consulted with contractors who specialize on cementing design in the basin, and part of that is evaluating the downhole pressures and temperatures as well as the interactions between the CO_2 stream as well as the formation water in accordance to the regulations. And so we're not looking at your conventional oil and gas cement, primary cement. The cementing system is tailored to provide resistance to CO_2 with additions to different chemicals and different formulations within the cement.

Q. Other than the pH, are there other properties of the cement that are specific to CO_2 resistant cement that make it different than your regular cement used for plugging wells in the oil patch?

A. So -- yeah, so for both plugging as well as primary cementing in our -- in our injection wells and monitoring wells, some parameters I can name off the top of my head is the permeability would be significantly reduced in the formulation. Those -- I can't recall any other parameters. Like I said, we contracted specialized cementing contractors.

Q. So just as a general matter, would the

lower permeability in that cement result from a greater clay content?

A. So it would just mean that, generally speaking, there'd be less chances on interactions with, you know, potential oxidation or any chemical reactions downhole.

Q. What do they add to the cement to prevent oxidation or chemical reactions downhole that is different than the cement used for normal cementing or plugs in the oil patch?

A. I'm not privy to the specific additives by the contractor.

Q. Do you know if anyone at Summit or EERC is?

A. Again, we've contracted technical experts from a cementing company and so they would know the -- they, as in the contractor, have, you know, a proprietary formulation of the cement system, and then it would just be our responsibility to make sure that those are rated for the bottomhole pressures that we expect.

Q. What is the name of the contractor?

A. So the two commonly contracted out for carbon portfolios would be either Schlumberger or Halliburton.

Q. Okay. Is there any requirement to use CO_2 resistant cement in these wells?

A. So under Administrative Code 43-05-1-11 -- this would be in my own summarization, but in the selection of casing and cement, you know, where -- some of the factors that we need to take into place in the design is bottomhole pressures, temperatures, as well as the potential corrosiveness when CO_2 is introduced with formation water.

Q. And the cement both used to cement in a casing as well as the plugs interacts with CO_2 in the reservoir with these wells, the injectors?

A. With respect to the injection wells, yes, it would be -- yep, because it'd be isolating the injection zone. So it would -- the CO_2 would be going through the casing into the cement into the reservoir.

Q. Did they use CO_2 resistant cement to cement in the casing or plug the Raymond Jensen well?

A. I don't have the details of what type of grade of cement that was used in the Raymond Jensen well.

Q. Why wouldn't that be as important as knowing the cement in the injector wells?

A. We don't anticipate, as per Caitlin or Amanda -- I can't remember which one, but we don't anticipate the CO_2 plume at this time to reach the Raymond Jensen well. However, it is part of the area of review and therefore that was reviewed as -- as Caitlin testified to.

Q. Okay. And the surface casing for the Raymond Jensen well is not 50 feet below the lowest USDW; right?

A. I'd have to -- I'd have to refer to that diagram.

Q. Would you mind taking a look?

A. Oh, this is the TB Leingang.

Q. You know, I might be able to speed this up. Are you confident that the depth of the casing of the Raymond Jensen is in the application?

A. I do not know. I'd have to refer back to the --

Q. Okay. I'll have you go ahead and look.

A. Can you repeat your question, please?

Q. Is the surface casing for the Raymond Jensen well 50 feet -- at least 50 feet below the lowest USDW?

A. According to the diagram here, I guess I'm not sure in this area what would be considered what

the lowest underground source of drinking water is.

Q. What's the depth of the surface casing?

A. On the diagram it's 330 -- 330 feet.

Q. Okay.

MR. BENDER: Mr. Braaten, if you don't mind, I think Caitlin can address that question, if you want.

MR. BRAATEN: Oh, okay. Thank you.

MS. OLSEN: Can you repeat the question? Sorry.

Q. (MR. BRAATEN CONTINUING) Is the surface casing of the Raymond Jensen at least 50 feet below the lowest USDW?

A. (BY MS. OLSEN) It's not.

Q. Okay. When you did the model for the leaky well scenario, were you doing that based on the location of the Raymond Jensen well?

A. No, we did that leaky well scenario to delineate the AOR using the risk-based AOR method.

Q. Okay. I'm going to -- just a couple more here, and I'm not sure who this one's for, but it relates to the -- the valves in the surface facilities we discussed. And, Mr. Powell, I think these were for you.

But the first question is have you

designed that system to accommodate a situation with a blocked flow in the system?

A. (BY MR. POWELL) Yes. So the general flow diagram is not the piping and instrument diagram. So the thermal relief was just to relieve pressure in that bypass on that valve. So, yes, in all segments where the -- a segment could be isolated by a valve or shut in, yes, there is pressure relief in those segments.

As far as design pressure, the pipe is designed for 195. It's hydro tested to 125 percent of that maximum operating pressure. The valves were designed at Class 900 and bench-tested to 150 percent of pressure.

THE REPORTER: Can I have you speak up, please?

MR. POWELL: Oh, sorry. I'll repeat it.

So as far as the design pressure of the pipeline, it's per 195 regulation and then it's hydro tested to 125 percent of the MAOP, which would be 125 percent of the 2183. The valves are designed to Class 900 and that pressure value and then they're bench-tested at 150 percent of that.

Q. (MR. BRAATEN CONTINUING) Why was the piping and instrumentation diagram not provided as

part of the application?

A. I can't answer that question.

Q. Can it be provided?

A. Yes.

Q. Rather than asking you to identify the location and size of every valve in there, would you be willing to simply provide the piping and instrumentation diagram?

A. Yes.

Q. Oh, what is the diameter of those other valves that you just discussed?

A. Again, we'll reference them on the piping and instrument diagram. To Jamey's testimony, they're typically 1-inch to 2-inch valves.

Q. But the diameter of those valves will be listed on the piping and instrumentation?

A. Not the diameter of the valve. The size of the valve. The valves themselves are standard, at least in my experience, but the connections to the piping, to the carrier pipe, that's typically three-quarter inch to 1 inch, but we'll have that on the P&I data.

Q. Okay.

A. And just to clarify, any relief of pressure would not be external to the pipe. It

would be relieved into the pipeline. So if it's -- if you've got pressure relief between two segments -- a segment of the pipe that could be isolated with two closed valves, the pressure would be iso -- or relieved downstream. It would not be released to the atmosphere. So that wasn't clear from what I heard before.

Q. Okay. Thank you. So the only valve that would release to the atmosphere would be the temperature valve --

A. No. The temperature.

Q. -- or thermal valve? Sorry.

A. The thermal relief should be -- should be via tubing connected downstream. So if you have those two -- if there's pressure built up in that valve bypass, which would typically be closed in normal operation, then you could -- to Mr. Backus' testimony, you could have a thermal pressure buildup, and if that's the case, there's a set point on that valve, 110 percent, whatever it is -- we'll have that set point and that should be indicated on the P&ID, at least at this point. Then when it reaches that set point, it relieves downstream of that closed valve so it relieves the pressure on that piping, that segment of piping.

Q. The thermal valve releases the pressure downstream?

A. That thermal relief valve relieves the pressure from that small segment of bypass piping downstream of the closed valve.

Q. So it doesn't release anything to the atmosphere?

A. No. The only thing that would be released to the atmosphere is where you saw the blowdown referenced. That would be a controlled blowdown or release to the atmosphere if that were needed for normal or abnormal operating conditions.

Q. What kind of a spike in pressure would you expect if you had a valve shutdown at the wellhead?

A. Again, these -- these set points -- I'll back up.

I mentioned earlier in previous testimony about a surge analysis. So that surge analysis is -- was conducted on every -- or every main line valve, including in the flowline segments, was evaluated for an inadvertent closing. And the regulation is 110 percent of maximum operating pressure so it cannot exceed that. And in our case I believe the maximum was 107 percent. We can tell you exactly what the segments were in the

flowlines, I don't remember off the top of my head, but they were less than 110 percent.

Q. What was the time duration that was modeled over?

A. The -- the valves themselves are all actuated and have the capability to close in seconds, and we can confirm, but I believe the time frame was minutes, two to five minutes.

Q. So if all of your pressure relief systems relieves pressure within the line downstream and you have a valve unexpectedly shut at the wellhead, how do you relieve that pressure?

A. You're talking about upstream of the wellhead --

Q. Right.

A. -- to the inlet valve?

Q. Right. Yeah.

A. If it's the segment up -- well, let me back up.

Because there's -- remember, this is all automatically or automated or controlled by a control center, and there are -- there will be tight operating pressure boundaries. So they're continually seeing when any pressure changes may happen in a line, so -- and if -- there will be set

points, and I can't tell you what they are at this ten seconds, but there will be an alarm and then there will be a secondary alarm. And so the control center operator will have notification if there's a -- if there's a pressure increase, and so there will be procedures or protocol they take to relieve that pressure before there's a buildup that would overpressure any equipment, whether it's that inlet valve to the wellhead or that segment of piping. So there shouldn't be a situation even in an abnormal operating condition where that equipment will be overpressured.

Q. But the protocol you mention for ensuring that that doesn't get overpressured relies on human judgment?

A. No. There will be an automatic -- or you can't have automatic set points, but, yes, the first -- the first response would be from an individual in the control center. That's correct. Per procedures on what to do in a what-if situation.

Q. Will there be protocols provided to the DMR or any regulatory bodies with respect to the decision tree for the person making that decision?

A. Those will be in the standard operating

procedures. So I'm not -- I don't have the experience with the DMR to see if that's something that they are -- that they want to audit or interested in reviewing. If they do, they would be available. They're not confidential or will not be confidential.

Let me clarify. We're not going to publish them on the website, but if a regulatory body wants to see our operating procedures, absolutely.

Q. Mr. Powell, were you here during my questioning of, I believe, Ms. Douglas when I was asking about what Summit would do if after, for example, the five-year review you determined that you needed to change the boundaries of the storage facility and then my questions following that were about how you would allocate compensation in that event? Did you -- were you here during that testimony?

A. I was.

Q. So let's just take as a hypothetical a situation where Summit makes the determination after five years that the data on the ground justifies adjusting those storage facility boundaries. What is Summit's plan with respect to

how to adjust the compensation to the landowners that has been paid up until that point?

A. I don't have that knowledge of how the -- how the compensation may or may not be adjusted to landowners.

Q. Is there anyone else in the company that would have that knowledge?

A. I'll defer to Mr. Boeshans.

Q. Okay.

MR. BRAATEN: I'm not trying to get out of order, Lawrence, but do you mind -- this is like right near the end. Do you mind if we have Mr. Boeshans come up?

MR. BENDER: If you're getting close to the end, I don't have any problem with that.

Q. (MR. BRAATEN CONTINUING) Mr. Boeshans, do you have an under -- well, I'll just start over.

In the hypothetical scenario that five years down the road Summit determines that it wants to adjust the boundary of the storage facility based on the data it gets from its monitoring activities, how would it allocate or reallocate payments already made to the owners in the storage facility?

A. (BY MR. BOESHANS) So in that situation,

what I would see is, you know, it's an it-depends answer. It depends on what the adjustment is to the boundary. And then if we were going to make an adjustment to the boundary, it would be -- you know, be decided, you know, by hearing like this with the Commission because that would be a major modification to the permit.

And so at that time we would have more information around what the change is, the adjustment is, how much -- how long it's been operated and have a -- probably have -- we'd have a recommendation in terms of how to do that. We don't have a plan exactly today in terms of how that would happen.

Q. If you expand the storage facility after five years, the boundary of the -- I'm going to start over.

If Summit were to make a major modification and expand the border of the storage facility through a hearing with the DMR, would you agree that you need to pay the new owners now being included in the storage facility for prior injections?

MR. BENDER: I'm going to object because I think you're asking for a legal conclusion.

MR. BRAATEN: That's fair.

Q. (MR. BRAATEN CONTINUING) But what I'm actually asking is what Summit's opinion would be on that issue. Not whether they need to, just whether you would.

A. So you're asking me if there was an adjustment -- your situation, if there was an adjustment after five years and we had been injecting, would we pay the landowners that were added to the unit?

Q. For the past injections.

A. For the past injections. I don't know that I can answer that. It's a -- I think you'd have to understand more about that situation, what led to the changing of the units.

Q. What more do you want to understand? What information are you missing to make the determination?

A. Well, I'm missing the historical operation and what led to the need for a change.

Q. Well, let's presume -- sorry. This was implied, but I should be explicit. You're going to change the size of the storage facility because you've determined that it was inaccurate and that the plume is going to move further than you

originally anticipated such that you need to expand the boundary of the storage facility.

MR. BENDER: And I'm going to object. You've asked that question previously in a little bit different manner and he said he needs to know more information before he can answer the question -- answer the question. So I'm going to object.

HEARING EXAMINER GARNER: I'm going to let him answer if he knows.

MR. BOESHANS: I don't know.

Q. (MR. BRAATEN CONTINUING) You don't know what?

A. I don't know the answer to your question right now.

Q. So Summit won't make a commitment to pay owners added into an expanded storage facility for prior injections?

MR. BENDER: Objection. Asked and answered.

HEARING EXAMINER GARNER: Sustained.

Q. (MR. BRAATEN CONTINUING) Was the answer no?

MR. BENDER: He said he didn't know.

Q. (MR. BRAATEN CONTINUING) Okay. But if

you don't know whether or not Summit will make a commitment to do that, then the answer is that they're not making a commitment right now to do that; right?

MR. BENDER: Objection. I mean, we've covered this ground now three times.

HEARING EXAMINER GARNER: Sustained.

Q. (MR. BRAATEN CONTINUING) Does anyone at Summit know the answer to that question?

MR. BENDER: Objection.

MR. BRAATEN: What's the objection?

HEARING EXAMINER GARNER: He can -- he can answer that one.

MR. BOESHANS: I don't know. It's not a question that I've raised with anybody at Summit.

Q. (MR. BRAATEN CONTINUING) Has anyone else at Summit raised the question with you or anyone else that you're aware of?

A. Not that I'm aware of.

Q. I apologize if someone did ask this, but there was a question earlier -- Mr. Powell, I think it might have been deferred to you, but -- or Mr. Boeshans -- with respect to the payments being made to landowners on the CO_2 stream, is that -- are those payments being made based on the full stream

or the actual CO_2 mass in the stream?

MR. BENDER: I'm going to object. You seem to be using the past tense. You said that we have paid or am I misunderstanding you?

MR. BRAATEN: Well, I can -- I'll just change it to avoid that.

MR. BENDER: Okay.

MR. BRAATEN: I see what you're saying.

Q. (MR. BRAATEN CONTINUING) So when you go to pay landowners for injections, is it your intent to pay based on the full stream of substances injected or the CO_2 mass in the stream?

A. The intent is to pay on the -- the full stream as it's defined in the storage agreement --

Q. Okay.

A. -- which is associated substances.

MR. BRAATEN: Okay. No further questions.

HEARING EXAMINER GARNER: I believe the staff might have some questions. Already answered?

Okay. Lawrence, any further witnesses?

MR. BENDER: Not at this time.

HEARING EXAMINER GARNER: Okay.

MR. BRAATEN: Could we take a break?

HEARING EXAMINER GARNER: Take a break before you call?

MR. BRAATEN: Yeah.

HEARING EXAMINER GARNER: Sure. Take a ten-minute break.

(Recessed at 4:42 p.m. and reconvened at 4:59 p.m.)

HEARING EXAMINER GARNER: We are back on the record. Attorney Braaten, you can proceed with your first witness.

MR. BRAATEN: All right. We are calling Shane Bofto to appear by phone. Shane, can you hear me okay?

MR. BOFTO: I can hear you.

HEARING EXAMINER GARNER: Okay. Let me swear him in real quick.

MR. BRAATEN: Okay. Shane, the hearing examiner is going to swear you in.

SHANE BOFTO,

being first duly sworn, was examined and testified as follows:

DIRECT EXAMINATION

BY MR. BRAATEN:

Q. Shane, can you state your full name and spell your last name for us?

A. My name is Shane Bofto. Last name is B-o-f-t-o.

Q. And by whom are you employed?

A. HydroSolutions, Incorporated.

Q. And just generally speaking, what kind of company is HydroSolutions, Incorporated?

A. We're a services, disabled veteran-owned, small business associated with consulting and environmental and water resources.

Q. Okay. Can you describe your educational background, please?

A. Sure. I have a bachelor of science in chemical engineering from Montana State University and an M.B.A. from the University of Mary in Bismarck.

Q. And can you give us a description of your professional experience from college up until you began with HydroSolutions?

A. Sure. I initially out of college worked at a petroleum refinery in the environmental health and safety department. I then went to work out in Seattle where I focused on mining internationally, consulting primarily in water quality, acid rock drainage and treatment.

Following that, I moved back to Montana and was a general environmental engineering consultant and went through several companies till

I ended up here at HydroSolutions.

Q. And approximately how long have you been working at HydroSolutions?

A. Since -- since 2004.

Q. And can I have you pull up Exhibit No. LO-56, Shane?

A. I have it.

MR. BENDER: Can you just give me a minute to get there?

MR. BRAATEN: It's his résumé.

MR. BENDER: Okay. I'm there. Thank you.

Q. (MR. BRAATEN CONTINUING) Does this curriculum vitae accurately reflect your educational and professional qualifications and experience, Mr. Bofto?

A. Yes, it does.

MR. BRAATEN: Move to admit Exhibit LO-56.

HEARING EXAMINER GARNER: Any objections?

MR. BENDER: No objection.

HEARING EXAMINER GARNER: Motion granted.

Q. (MR. BRAATEN CONTINUING) And, Shane, can you describe for us with respect to your work at HydroSolutions the kinds of clients and the kinds of work that you've been involved in?

A. At HydroSolutions, clients mainly consist

of private individuals, ag and ranching clients, federal, state and local governments and municipalities. We have a GSA contract with the federal government. We work with developers, conservation groups and other NGOs and then companies including mining, oil and gas pipelines, and we also work with attorneys.

Q. And as a general matter, you mentioned environmental consulting services, but can you give us just some specific examples of the kinds of projects and the kinds of consult -- different kinds of consulting work that the folks at HydroSolutions do?

A. Generally, we provide independent services and environmental engineering, hydrogeology, remedial investigations, remediation, permitting, water resource development, compliance, due diligence, environmental impact statements and expert work.

Q. And, Mr. Bofto, are you familiar with the applications and the Class VI well permit applications that bring us to the hearing today?

A. Yes, I've briefly reviewed them.

Q. And do you have any -- we've talked generally about the experience of HydroSolutions

and your experience. Do you have any experience on particular or specific projects that you think informs your ability to work on -- or work in this proceeding or on this matter?

A. Yes. Several projects come to mind. In 2011, the Wyoming Land Quality Division issued an RFP that resulted in a competitive bid, and HydroSolutions was hired where I was the project manager to look at mining regulations in Wyoming, specifically with respect to rare earth elements in mining. And we reviewed all of the regulations and permitting process with respect to Wyoming and implications of kind of a different mining type that the state wasn't used to seeing. It was out of the ordinary.

And following that, the Montana Board of Oil and Gas Conservation issued an RFP and we were awarded that to explore primacy for the Class VI program in 2014. They were looking at setting up a program and reviewing it as an exploratory project to see if they wanted to gain primacy, and this was about the time -- a little after the time North Dakota did that same pursuit, so we followed it very closely.

Q. And so did Montana end up submitting an

application to obtain primacy for its Class VI program?

A. We provided the State with a draft program and we went back and forth with them, and ultimately they had an administrative decision at that time to not submit for primacy.

Q. And as you were working on the -- drafting the Class VI program for Montana, did you review any documents or guidance that informed your understanding of how to develop a Class VI program?

A. Yes. I heavily relied on a lot of BPA documents. Specifically for the Class VI program, there were a lot of guidance documents associated with implementing programs, well characterization, area of review, recordkeeping, to name a few.

Q. Can I have you turn to Exhibit LO-18?

A. I have it.

Q. Is this one of the guidance documents you just referenced that helped inform your understanding of the Class VI program while you were drafting Montana's regulations?

A. Yes, it was one of the documents I used to understand and outline our draft program.

Q. And can you just describe briefly the topic of this guidance?

A. Sure. The guidance generally provides information regarding modeling and recommendations for delineating the area of review. It also describes the circumstances under which the AOR or area of review is to be reevaluated, and also describes how to perform an AOR reevaluation and development of corrective actions.

Q. Okay. Let me have you turn to Exhibit LO-19.

A. All right. I have it.

Q. Is this also one of the documents you referenced that you reviewed to inform your understanding of Class VI regulatory regimes?

A. Yes, it was one of the documents I used to understand and so outline the draft program.

Q. And can you just describe generally what the topic of this document is and what it covers?

A. It provided a basic framework for the permitting process and the required activities through the Class VI injection well and activities associated with that.

Q. Okay. Can I have you turn to Exhibit LO-20?

A. I have it up.

Q. Is this also one of the guidance documents

you referenced a moment ago that informed your understanding of the Class VI well program when you were drafting Montana's regulations?

A. Yes. I used it similar to the others.

Q. Okay. And just generally speaking, what does this guidance document cover topically?

A. I would say it provides a general outline of the data to be collected and how to use the data to identify potential risks and eliminate unacceptable sites. It also provides information for inputs into whatever geologic model is chosen for use to evaluate any geological modeling.

Q. Okay. And now I'm going to have you -- it's marked a little out of order here, but there's an Exhibit LO-82. I'll have you switch -- or flip to Exhibit LO-82.

MR. BRAATEN: And, Lawrence this one didn't get into the binder. I've got an extra copy.

MR. BOFTO: Okay. I'm pulling it up. Yes, I have this one.

Q. (MR. BRAATEN CONTINUING) I'm sorry, Mr. Bofto, I might have missed it. Did you get yourself to that exhibit?

A. Yes, I have -- have that exhibit, the one

for recordkeeping and reporting, generally.

Q. And specifically Exhibit 82 that indicates it's the Underground Injection Control Program Class VI Well Recordkeeping, Reporting, and Data Management Guidance for Owners and Operators. Is that the exhibit you have up?

A. Yes.

Q. Okay. Is this also one of the guidance documents that you reviewed that informs your understanding of the Class VI program that you used in developing Montana's regulation?

A. Yes.

Q. Okay.

MR. BRAATEN: Move to admit Exhibits 18, 19, 20 and 82.

HEARING EXAMINER GARNER: Any objections?

MR. BENDER: No objection.

HEARING EXAMINER GARNER: Exhibits are admitted.

Q. (MR. BRAATEN CONTINUING) Mr. Bofto, can I have you now open up -- or turn to Exhibit No. 21?

A. I have that up.

Q. Do you have an understanding of what the first two sentences of this data tool mean?

A. Yes.

Q. And can you tell us what that is?

A. Under the rule that's cited there, that the owners and operators must submit the project information -- their geological sequestration project information directly to the EPA and I take it through the geologic sequestration data tool in that this requirement applies regardless of primacy, whether it's still EPA or a particular state or entity has primacy.

Q. Mr. Bofto, are you ready, willing and able and have you been ready, willing and able for the past three weeks to assist in running and analyzing models related to these Class VI well applications had you received data and input files to do so?

A. I'm capable and ready to run the geochemical model PHREEQ, given that if I had the input files and the right thermal dynamic database or a reference to it if -- if the reference one that comes with the model, is unaltered.

MR. BRAATEN: No further questions.

HEARING EXAMINER GARNER: Mr. Bender, any questions?

MR. BENDER: Yeah, I do.

CROSS-EXAMINATION

BY MR. BENDER:

Q. Mr. Bofoto [sic], my name is Lawrence Bender and I represent the applicant, Summit, in this case. Nice to meet you today.

A. Nice to meet you.

Q. Okay.

A. My name is Bofto.

Q. Okay. Thank you for correcting me. I appreciate that. Do you mind if I call --

A. No problem.

Q. Do you mind if I call you Shane?

A. Please do.

Q. Okay. Thank you. I want to just delve a bit into your discussion about what you did for the State of Montana. First of all, what was the time period in which you were working on that? I think you said it was about the time that North Dakota was adopting its rules, but I want to make sure that I understood that correctly.

A. Yes. I believe I started it in 2012, but a lot of these documents that I had just referenced were in draft form, so a lot of it we waited for the final versions of the EPA guidance documents to be issued. And I believe my last final draft was

submitted to the Board of Oil and Gas following discussions with them in mid to late 2014.

Q. Okay. And when you -- when you referred to these documents were in draft form, I'm sure you're talking about Exhibits LO-18, 19 -- let's see here -- looks like 20 and is it 83?

MR. BRAATEN: 82.

Q. (MR. BENDER CONTINUING) 82. Is that correct?

A. They may have included some of those, but there were also some other guidance documents and some of the things I'm trying to recall with the environmental justice, bonding, things like that. So that was why we waited a little while longer so we could work with final documents that were included. I think they're currently included on EPA's Class VI website.

Q. And what was it that you were requested to do by the Montana Oil and Gas Conservation Commission?

A. To review that type of information and draft a program that the State could use for their primacy application should they desire to go after primacy for the Class VI program.

Q. And were involved in drafting the statutes

that were necessary for the Montana Board of Oil and Gas to adopt the rules or were you -- was that statutory enactment already in place and all you were asked to do was prepare the regulations?

A. I was asked -- I was not involved with the statutes or anything like that. I was just involved with gathering information that the board needed to get the primacy application in place.

Q. Are the statutes already in place in Montana and that all they're lacking at this point in time is the regulations?

A. I believe at that time there was a statute associated with it that was in place.

Q. Okay.

A. It's been a while, but I seem to recall it was in place prior to them issuing approval for us to do this work.

Q. Okay. And I believe you said you started in 2012, probably finished in 2014; is that correct?

A. That sounds about right.

Q. Okay. Approximately -- well, strike that.

During that period of time, were you working full-time on this project?

A. No.

Q. Okay. Were you working on the project by yourself?

A. No. I was part of a team of other consultants and internal people. We had an attorney because there was a portion where we had to draft a letter from I believe the attorney general or something to EPA and there were several other documents that needed to be drafted that were best suited for an attorney. And I had another company that had petroleum engineers and petroleum geologists associated that were reviewing some of the draft documents at that time as well.

Q. Okay. Well, thank you for that. I had misunderstood your testimony. I thought that you were primarily responsible for doing all the work. But since it was a team, let me ask you a couple questions about that. What were -- what were your specific responsibilities on that team?

A. I was the project manager, and areas -- I would collect information as well as derive information that I could and I put them into the draft program. I took and I followed a lot of the guidance to establish, you know, a general procedure for permitting.

Q. And did you ultimately draft some rules

that were submitted to the Oil and Gas Conservation Commission?

A. Not at that time.

Q. When you say "not at that time," you're talking about the period from 2012 to 2014?

A. I'm talking -- well, I never drafted any rules based on the draft program.

Q. Okay. I misunderstood you then. I -- I had understood you to testify when Mr. Braaten was asking you questions that you drafted the rules but the -- the board ultimately made a decision that it was not going to adopt the rules. Did I misunderstand?

A. I drafted a permitting program for somebody that we could run past EPA so someone could get a permit for a Class VI well should Montana get primacy.

Q. Okay.

A. Does that make sense?

Q. I think so.

Do you know why the board never went forward with the rules?

A. No, that was an administrative decision far above my pay grade.

Q. Okay. Let's talk a little bit more about

your experience. You've explained to us that as a result of reviewing these guidance documents that have now been entered into the record, I think it was 17, 18, 19, 20 and also 82, you were involved in this project. Have you ever been involved in making application in a state that has primacy for a Class VI permit?

A. No.

Q. Okay. You haven't been -- I apologize. I wasn't listening to my question very well when I asked it. Did I -- well, let me rephrase it.

Have you ever been involved in any way in making a Class VI application to a state that has primacy?

A. No.

Q. Okay. Have you ever reviewed an application, other than the one before the Commission -- or the ones that are before the Commission today, for a Class VI permit?

A. I'm trying to recall. I may have looked at some when I was drafting a program. I have a faint recollection that I tried to look at others that had gone through EPA at the time. I just cannot recall the specifics.

Q. Yeah. And I apologize, I think I said

this, but I asked -- my question was specific to being involved in an application with a state that had primacy.

A. None with a state that had primacy.

Q. Other than the applications that are before the Commission today, have you ever reviewed an application for a Class VI well?

A. Back to my previous statement, I believe I did when I was drafting the program to look at what an application looks like. I just don't recall because it was so long ago on what it was.

Q. That would have been back in the 2012 period, 2014 period; is that right?

A. Somewhere in there.

Q. And would those have been applications before the EPA?

A. Yes.

Q. Okay. When were you hired by the intervenors in this case?

A. Oh, it's been a month or so.

Q. Okay. You don't know the exact date? I mean, today is the 11th. Would it have been probably May 11?

A. It could have been about that time, but I don't know specifics.

Q. What were you asked to do on May -- on May 11?

MR. BRAATEN: I'm going to object to that characterization of testimony. I don't believe he testified to doing something on the 11th.

HEARING EXAMINER GARNER: Overruled.

Q. (MR. BENDER CONTINUING) Okay. What -- okay. I guess you can answer the question.

A. What was I -- could you repeat that question again?

Q. What were you asked to do when you were hired for this project?

MR. BRAATEN: I'm going to object to questions eliciting communications between me and the experts.

HEARING EXAMINER GARNER: Overruled.

MR. BRAATEN: You can go ahead, Shane.

MR. BOFTO: Oh, okay. Just to provide my experience with the Class VI guidance and programs that I had early on and just my general environmental background information.

Q. (MR. BENDER CONTINUING) And how many hours do you believe you've worked on this project since you were retained?

A. Outside of this, probably 15 reviewing

documents and such and --

Q. And have you had an opportunity to review each one of the -- what I'm going to refer to as the final form of applications for the three applications that are before the Commission?

A. I've generally reviewed them, yes, and -- I'm trying to think if I've done any others. So I'd say I generally reviewed the three applications.

Q. Okay. And when you say reviewed them, did you just -- did you just read them or did you do anything beyond reading? Did you do any independent research?

A. I looked closely at some of the models on what were being used and what they did exactly.

Q. Okay. And if I -- and please correct me if I'm wrong, Shane, but I understood your testimony when Mr. Braaten was asking you some questions that you -- if you'd had the materials that he requested from the Industrial Commission, you could have run a model in a relatively short period of time. Was that your testimony?

A. Yes. I specifically referenced the PHREEQC model by U -- that is put out by the USGS.

Q. Okay. And do you have the necessary

software packages that you would need to run the model?

A. Yes, I do. It's on my computer now.

Q. Okay. Can you tell me what some of those programs are?

A. I'm specifically talking about the PHREEQC model. It's downloaded freely from the USGS, and I have routinely used the program through my career and have used it to write specific reports.

Q. And do you believe that that's the only software you would need to analyze the information that Summit has filed with the Industrial Commission on this matter?

A. It's the only one that I'm focused on.

Q. Okay. Do you agree with me that there are other software programs?

MR. BRAATEN: I'm going to object to the form of the question.

MR. BENDER: What's that?

MR. BRAATEN: I object to the form of the question. There are.

MR. BENDER: Well, let him answer.

HEARING EXAMINER GARNER: If he can understand it, he can answer it.

MR. BOFTO: There are numerous geochemical

models outside of PHREEQ. There's Geochem Workbench® that I've used and several others, but the application specifically said they used PHREEQC and that was the one I was focused on.

Q. (MR. BENDER CONTINUING) But you don't know if this PHREEQC is the only program that would be necessary to evaluate the information that's been supplied to the Commission, do you?

MR. BRAATEN: For the --

MR. BOFTO: I'm just going off the application that said that was the program that they used.

Q. (MR. BENDER CONTINUING) Okay.

A. I did not see any other geochemical programs to evaluate the upper and lower confining units.

Q. Okay. Tell me a little bit about your experience working in North Dakota. I know you said you went to the University of Mary. Have you done any work in your current role with -- I believe it's HydroSolutions. Have you worked in North Dakota with that company?

A. Yes. I've had probably -- probably six or seven projects in the last ten years in North Dakota.

Q. What were those projects?

A. Some of them were work with attorneys for oil and gas impacted sites. Done some incidental air quality work there from facilities. Trying to think. Looked at different reviewing remediation plans for cleanup for saline impacts or produced water impacts.

Q. Okay. So it sounds to me, and please correct me if I'm wrong, that most of that work that you've done in North Dakota has been from the standpoint of surface issues; is that a -- is that a fair statement?

A. No. There's been other issues associated with contaminated groundwater and cleanup.

Q. Okay. Have you ever been involved in North Dakota in making application to the Commission relative to saltwater disposal wells or Class II wells?

A. I've been part of such projects exploring commercial Class II saltwater disposal wells.

Q. Ever prepare an application to the Commission for a saltwater disposal well?

A. I've provided information for somebody else to submit a Class II application.

Q. Okay. What sort of information did you

supply?

A. Looked at things like deriving maximum pressure at the wellhead. Working with other geologists in my company, suitable formations. Looking at areas of review for other wells that could be within the area of review, things along that line.

Q. But you never were involved in a saltwater disposal application in North Dakota where you were the lead individual in making that application; isn't that correct?

A. That'd be fair to say.

MR. BENDER: No further questions.

HEARING EXAMINER GARNER: Any questions from the staff? Any redirect, Mr. Braaten? Oh, I'm sorry, you do.

EXAMINATION

BY MR. HELMS:

Q. Shane, this is Lynn Helms with the Industrial Commission. Nice to meet you, maybe some day face-to-face.

A. Nice to meet you.

Q. Yes.

North Dakota made its application for Class VI primacy on June 21 of 2013 and received

final approval April 24 of 2018. Shane, did you comment on North Dakota's application?

A. No, I did not.

Q. Did you review the North Dakota documents when you were preparing Montana's prospective documents?

A. I seem to recall that we were following at that time whether North Dakota was going to draft their own specific rules or adopt it by rule, and that was -- we had a lot of discussions about that on whether Montana should or shouldn't, and I seem to recall North Dakota going back and forth maybe once on what the appropriate action was, and we were going to try to learn at that point from you.

MR. HELMS: Okay. Thank you.

REDIRECT EXAMINATION

BY MR. BRAATEN:

Q. Mr. Bofto, do you have a copy of -- well, do you recall signing an engagement letter for this matter?

A. Yes.

Q. And do you recall the date of that?

A. May 1.

MR. BRAATEN: Okay. No further questions.

HEARING EXAMINER GARNER: Okay. You can

call your next witness. Can I get the name?

MR. BRAATEN: Ted Doughty.

HEARING EXAMINER GARNER: Doughty. Okay.

MR. BRAATEN: Yeah.

MS. ZASTE: He has a first initial, P, but he goes by Ted. So it's P. Ted Doughty.

HEARING EXAMINER GARNER: Gotcha.

MR. BRAATEN: Mr. Doughty, we're getting some feedback from you. Can you mute -- well, no, we're still getting feedback. Can you mute -- what was it -- what did you -- okay.

P. TED DOUGHTY,

being first duly sworn, was examined and testified as follows:

DIRECT EXAMINATION

BY MR. BRAATEN:

Q. Mr. Doughty, can you state your full name and spell your last name for us, please?

A. It's Paul Ted Doughty, D-o-u-g-h-t-y.

Q. And you go by Ted; right?

A. Yes, I do.

Q. Okay. Can you tell me briefly your educational background?

A. I have a bachelor's in geology from Washington University in St. Louis, a master's in

geophysics from the University of Montana, and a PhD from Queen's University in Ontario, Canada.

Q. And can you start by just briefly describing your professional background?

A. Yes, sir. So I've worked with Exxon -- I worked in the Exxon research lab for four years in the late '90s. I taught at Eastern Washington University for eight years as a professor. And since 2008 I've been a consultant on my own working for various companies like Talisman Energy, Halliburton, various other companies in the Rockies.

Q. Can you tell us a little bit about the kinds of work you did with your time at Exxon?

A. Yes. So at Exxon I was in the fault -- fault seal group, also did -- which is analyzing how fault seal in the various environments in the -- in the -- we did a whole research project looking at fault seal across the entire -- all the basins that Exxon worked in.

I also did 3D seismic interpretation in various basins across the world. Did a lot of field research on the Bakken and various other groups in the western U.S. as analogs for subsurface formations.

Q. And can I have you pull up in front of you, Ted, the Exhibit LO-58?

A. I'm not in the office, so if you describe it to me, though, I can do that.

Q. Do you recall the information contained on your curriculum vitae?

A. Your -- can you repeat the question?

Q. So I'll tell you Exhibit 58 is your curriculum vitae. Are you familiar with --

A. Oh.

Q. -- the contents of your curriculum vitae?

A. Oh, yes. Yes, sir. Yes.

Q. Okay. And does that accurately describe your educational and professional background and experience.

A. Yes, sir. With the exception of several items that I left off that I did recently. I actually was the well site geologist on the J-Loc Minnkota well that was drilled as part of their carbon sequestration project. I logged -- personally logged 1600 feet of core on site for that project.

Q. Okay.

A. And I've also done a lot of helium exploration in the last, oh, six months.

MR. BRAATEN: Okay. Move to admit LO-58.

HEARING EXAMINER GARNER: Any objection?

MR. BENDER: No objection. Oh, thank you. No objection.

HEARING EXAMINER GARNER: The exhibit is admitted.

MR. BENDER: My mike was off.

HEARING EXAMINER GARNER: Exhibit is admitted.

Q. (MR. BRAATEN CONTINUING) And, Ted, did you review the applications submitted by EERC and Summit that bring us here today?

A. Yes, I have, in extensive detail.

Q. And can you start by just describing to us the areas of those applications regarding which you would have particular expertise?

A. Yes. So they have core data on the Broom Creek Formation of which I mentioned I personally logged all the J-Loc wells. So I'm familiar with that. Also I have expertise in 3D seismic interpretation. I haven't seen their 3D seismic, but it's a critical part of their application, as well as the formation mechanical integrity work that they did doing the testing in their test well.

Q. What data would you need in order to

create a PHI-H map to map out the porosity and permeability of a reservoir?

A. So from what I've seen of their applications, the -- there's only one -- no, there's three -- I think there's three -- there's two wells that are close together and another well in their AOR which encompasses about -- actually, I'm not sure how big the AOR is, but if you take their simulation area, there's 26 wells in the simulation area -- or the simulation area, there's 26 wells. It's about a well per 55 square miles which is not very many data points. So within the AOR there's only 3 data points. There's no legacy wells.

So you would need to coordinate it, which they provided, but as well it appears like the seismic data was a critical part of how they defined the reservoir properties in the AOR. There's only -- like I mentioned, there's very few wells within the AOR. So we'd need access to the 3D seismic to actually do a facies analysis to determine what the seismic data tells you about the reservoir within that AOR.

And within that application, there's only one map that shows the permeability distribution

within their stimulation -- their simulation area. Excuse me. So there's very little data within their application with which to evaluate exactly how they derive their permeability parameters for the AOR that they're applying for.

Q. Mr. Doughty, do you recall approximately how long ago you were asked about the possibility of working on this matter?

A. It was, what, a month ago, maybe three weeks ago, something like that.

Q. And are you ready, willing and able to conduct additional review and particularly review of seismic data if you receive it?

A. Yes, I am.

MR. BRAATEN: No further questions.

HEARING EXAMINER GARNER: Attorney Bender.

CROSS-EXAMINATION

BY MR. BENDER:

Q. Mr. Doughty, are you -- Mr. Doughty, are you in a position today to make any recommendations to the Commission as to whether this application should be approved or denied?

A. I am.

Q. And what are your conclusions?

A. I would recommend that it's denied on the

basis that the applicant did not -- has not provided enough of the data from which the Commission or another party could evaluate how they came up with some of their reservoir properties.

Q. Okay.

A. Without the 3D seismic, you cannot determine the distribution of permeability and porosity across the AOR.

Q. Okay. And I believe it was your testimony at this point in time all you have reviewed is the three applications; is that correct?

A. That is correct. And --

Q. And you haven't reviewed -- you haven't reviewed the other data that's on file with the Commission?

A. I've reviewed the data that's publicly available.

Q. Okay.

A. Yes.

Q. Did you -- have you seen a letter dated May 15, 2024, from Mr. Braaten to the Commission requesting certain information?

A. I have not seen the letter. I've heard that there's a motion to compel.

Q. Okay. Do you know if the Commission

indicates that they supplied that information to Mr. Braaten?

A. I do not.

Q. Okay. You talked a little bit about a PHI-H map, and I don't want to put -- I don't want to testify for you, but I understood you to say that a PHI-H map would have been important for the Commission in this case. Is that a -- is that a fair statement of your testimony?

A. Yes, that is a fair statement. If you -- if you want to understand where the CO_2's going as you inject it, you need a PHI-H map to determine the -- the storage capacity to the formation.

Q. Okay. And you --

A. And like I -- like I said earlier, there's only three data points within the AOR. So I'm -- I don't quite understand how the EERC came up with such a complex map of permeability and porosity without having additional data. It should have been provided in their submittal.

Q. Okay. And I think you also indicated that you were involved -- you sat the -- the well for Minnkota's -- the J-Loc?

A. The J-Loc.

Q. Yeah, the J-Loc.

A. Yep. J-Loc. Yep.

Q. So you know somewhat about that -- you know some things about that application that was made to the Commission for a Class VI well; is that correct?

A. I -- no. I don't -- I set the well. I described the core. I was not involved in anything after they drilled the well.

Q. You knew the --

A. But I.

Q. -- you know the Commission granted the application; correct?

A. Yes.

Q. Do --

A. But I wasn't involved in it. I do know what the core looked like and somewhat of the reservoir properties of the Broom Creek.

Q. And, you know, thank you for all that, but we can get through this a little bit quicker if you just answer my questions.

Do you know --

MR. BRAATEN: I think he did.

MR. BENDER: Well, I think he went on a little bit more than he needed to, but I'll move on.

Q. (MR. BENDER CONTINUING) Do you know if Minnkota submitted a PHI-H map in its application?

A. I do not.

Q. Are you familiar with the application that was filed by Blue Flint?

A. No.

Q. Do you know if they submitted a PHI-H map?

A. I do not.

Q. Are you familiar with the application that was submitted by Dakota Gasification?

A. No.

Q. Do you know if they submitted a PHI map -- PHI-H map?

A. No.

Q. Are you familiar with the application that was filed by Red Trail?

A. No.

Q. Do you know if they submitted a PHI-H map?

A. No.

Q. Do you know all those applications were granted by the Commission?

A. No.

MR. BENDER: No further questions.

HEARING EXAMINER GARNER: Any questions from the staff?

Redirect, Attorney Braaten?

MR. BRAATEN: No, I don't have any further questions. Thank you very much, Mr. Doughty.

MR. DOUGHTY: Thank you.

HEARING EXAMINER GARNER: Okay. You can call your next witness.

MR. BRAATEN: We are calling Paul Button.

HEARING EXAMINER GARNER: Button?

MR. BRAATEN: Yes.

PAUL BUTTON,

being first duly sworn, was examined and testified as follows:

DIRECT EXAMINATION

BY MR. BRAATEN:

Q. Mr. Button, can you state your full name and tell us -- well, let's start there. Just state your full name, please.

A. My name is Paul Michael Button.

Q. And can you give us a business or residential address?

A. My residential address is 1119 South Ophir Street in Butte, Montana.

Q. All right. Can you tell us just a little bit about your educational background?

A. I have a bachelor of science degree in

petroleum engineering from Montana Tech.

Q. All right. And tell us a bit about your professional experience.

A. My professional experience is I've worked 26 years as a petroleum engineer. I started off my career as a reservoir engineer for Marathon Oil Company working the Yates Field in West Texas doing simulation on gas oil gravity drainage with nitrogen injection and then converting it over to CO_2 injection.

From there I moved to -- on to Kinder Morgan when they acquired the Yates asset. I did a little bit of reservoir simulation on Yates, and then I worked the SACROC CO_2 flood unit in Scurry County, Texas.

After I left Kinder Morgan, I worked for SM Energy in Billings, Montana, for a number of years doing enhanced oil recovery studies on fields in the state of Wyoming. Also worked several water floods and shale development wells within the Powder River Basin, Richland County, Montana, and a little bit of experience in Divide County, North Dakota.

From there I left SM Energy and I went out on my own as a consultant. I did numerous

consulting jobs for multiple clients, including purchase and acquisition, evaluation, State evaluations and reservoir simulation for enhanced oil recovery on the Poplar Dome in Montana.

I then joined a company called Poplar Resources as a vice president where we implemented a pilot for enhanced -- a nitrogen injection flood. And I have been with that ever since.

And then I also started a startup for a battery energy storage corporation. We do compressed air energy storage. And I'm currently working both the Poplar job, the consulting job, and battery energy storage job.

Q. Okay. Can I have you turn in the exhibits to what we marked as LO-57?

A. Yes.

Q. Let me know, do you have that in front of you now?

A. Yes, I do.

Q. And what is Exhibit 57?

A. I would call it my résumé or CV.

Q. Okay. And does this CV accurately reflect your educational and professional experience and qualifications?

A. I would probably -- I caught a couple of

errors in here. The Button Petroleum Management, it was no longer active until recently again, so I would add that through 2024.

Q. Okay.

A. And I believe the name of the -- my educational school is no longer accurate because it's no longer Montana Tech of the University of Montana. I believe it's the Montana Technological University.

Q. Okay. Other than those, does the Exhibit 57 accurately reflect your professional and educational experience and qualifications?

A. Yes.

MR. BRAATEN: Move to admit Exhibit 57.

MR. BENDER: No objection.

HEARING EXAMINER GARNER: Exhibit is admitted.

Q. (MR. BRAATEN CONTINUING) Mr. Button, can you tell me if you have any experience with Class II wells or permitting Class II wells?

A. Yes. I have permitted a num -- a number of Class II wells in the state of Montana.

Q. And with respect to any of those Class II wells, was it necessary to obtain an aquifer exemption?

A. Yes. We worked on an aquifer exemption for one of the wells within the Poplar unit, east Poplar unit.

Q. Okay. Was there any kind of a volumetric limit imposed as part of that aquifer exemption?

A. Yes, I believe so.

MR. BENDER: Objection. Relevance.

HEARING EXAMINER GARNER: Overruled.

Q. (MR. BRAATEN CONTINUING) And are you familiar with the manner in which the volumetric limits are calculated for aquifer exemptions by either the EPA or state authorities?

A. I am familiar with how the volumetric extensions were calculated and approved for the permits that I worked on. Yes.

Q. Okay. And so with respect to the permits you worked on, can you just provide a general description of how those volumetric limits are calculated for the aquifer exemptions?

A. Basically, these were pretty simple calculations in that you would calculate the -- the volume within a given X number of foot radius that you believe you'll affect with the water injection, you know, so you get a volume of a cylinder, multiply it by your porosity, divide it by your

formation volume factor of water and that is the volume that will be affected.

Q. Do you have experience with reservoir modeling and -- well, you've already talked about this. Can you tell us a little bit about the experience you have with EOR and water floods with respect specifically to field development analysis?

A. Yes. I've had several major modeling projects over my career. The first one was for Yates field. We spent quite a few years looking at and running sensitivities on gas oil gravity drainage, enhanced oil recovery process as far as looking at gas oil contact movement speed versus the drainage of oil from the matrix in the reservoir. We also looked at viscosity effects with the injection of different gases and the swelling effects in the oil with different composition of injected gases, whether it was nitrogen, CO_2 or a mixture of recycled gas to determine the most effective recovery and most economic recovery mechanism with an EOR process.

My other major modeling project which I've worked on most recently is developing a full-field simulation model to model the history and also the enhanced oil recovery potential for Poplar Dome in

Montana, the East Poplar unit. That is a 70-year-old field that's probably undergone primary depletion with a strong natural water drive where I deal with gas on the top of it and expose the matrix to gas oil gravity drainage and determine if that was an economically feasible project.

Q. And can you tell us about any other specific experiences you have related to doing reservoir modeling and analysis?

A. I'm currently working on setting up the parameters to look at natural -- or compressed air storage in salt caverns and looking at the pressure volume and temperature effects and the rock stress effects within salt caverns to determine the feasibility for the active storage reservoirs.

Q. Mr. Button, do you have an understanding of different ways that pore space can be used in a commercial manner?

A. Yes, I do.

Q. And if a landowner wants to make a commercial use of pore space, can you tell us what you understand to be the options for making that commercial use of pore space?

A. It's basically three options of which there can be multiple derivatives of each option,

but either you remove fluid and market it as a -- as a quantity, you temporarily store something in your pore space, or you permanently sequester something in your pore space.

Q. And how would you assess the degree to which the pore space of a given landowner is being used in a way that forecloses other commercial uses?

A. I guess I would attempt to evaluate the change in the pressure volume temperature of the fluids contained within the pore space, and knowing that there are certain constraints on the upper end of the pressure and certain constraints on the lower end of the pressure and try to determine what the current impacts, what the proposed impacts and what the -- the final limits were of that pore space.

Q. Mr. Button, if you were provided with the data decks and input files required to run models in CMG and Schlumberger's Petrel software for this project, would you be ready, willing and able to run those models and analyze them for the intervenors?

A. The CMG model, I would be ready to upload those and run those and do some sensitivity

analysis on those models. As far as the Petrel model, the Petrel model is a static model. It's basically a geologic database, so those -- unless you're trying to redistribute properties or something like that, there's -- it's not a dynamic model where the answer changes, so I don't think there's nothing -- there's nothing to run there.

MR. BRAATEN: Understood. No further questions.

HEARING EXAMINER GARNER: Attorney Bender.

CROSS-EXAMINATION

BY MR. BENDER:

Q. Mr. Button, you -- you spent some time describing your experience as an engineer and involved in various enhanced oil recovery projects around the country. Is that a fair statement?

A. Yes.

Q. And you also talked about a compressed air project that you're working on. Do you recall that?

A. Yes.

Q. And in those projects, both the enhanced oil recovery projects and the compressed air project, you were involved in running some models; is that a fair statement?

A. Yes.

Q. Okay. Would you agree with me that running -- preparing and running models for enhanced oil recovery projects and a compressed air project is different than preparing and running a model for CO_2 storage?

A. Can you clarify what you mean by "different"?

Q. Well, if you've run -- or prepared and run models for CO_2 on a number of projects, are you going to have more knowledge and experience than someone who has not run models for CO_2, only for enhanced oil recovery and compressed air?

A. Well, the models that I've ran for enhanced oil recovery, especially for when I worked the Yates field, those directly involved the injection of CO_2 in the pore space --

Q. Okay.

A. -- so they're not too dissimilar. The only -- the main dissimilar between those two models is that in the carbon sequestration, the CO_2's interaction is primarily with water, where in those other models it was with both water and oil. So they were actually more complex.

Q. Okay. Are you familiar with the data

requests that Mr. Braaten made to the Industrial Commission?

A. I --

Q. Pardon me?

A. Yes, I am.

Q. Okay.

A. Yes, I am.

Q. Okay. And are you familiar with the type of data that would be contained within a CMG data file?

A. Yes, I am.

Q. Could someone produce a PHI-H map if they had a CMG data file?

A. I believe that within CMG's program you could get that, yes.

Q. Okay. And are you aware that it's the -- in the Commission's position that they provided a CMG data file to Mr. Braaten?

A. I am not aware of the CMG data file, if Mr. Braaten is in possession of it or -- I am certainly not in possession of that CMG data file.

Q. He didn't provide it to you?

A. I have not seen it, no.

Q. Is it a fair statement that -- well, let me back -- strike that.

A. Let me --
Q. How many hours -- just let me ask the questions. Just let me ask the questions.
A. Okay.
Q. How many hours of time have you spent working on this project?
A. I have -- up until the start of this hearing, I spent 14-and-a-half hours working on it.
Q. Okay. And what were you asked to do?
MR. BRAATEN: Same objection to privileged communications with experts.
HEARING EXAMINER GARNER: Overruled.
MR. BUTTON: What was I asked to do?
Q. (MR. BENDER CONTINUING) Yes.
A. I was asked by Mr. Braaten to evaluate the impact of the pore space of his clients.
Q. Okay. And to do that at this point in time, all you have done is reviewed the applications that were submitted to the Commission; is that correct?
A. No.
Q. You didn't review the applications?
A. I did review the applications, but that is not all that I've done.
Q. What else did you do in the 15 hours that

you've spent on this project?

A. I have looked through the well files of the wells in the immediate area to see what information was available.

Q. How many hours did you spend reviewing the applications?

A. Probably the majority of the 14 hours.

Q. Okay.

A. But I don't have a specific number, but I could get that number for you.

Q. More than ten?

A. I would say yes. Probably in the ten range.

Q. Well, you said more than 10. Would it be 11 or 12?

A. We'll go with more than ten.

Q. Okay. And then the other -- the only other time you would have -- well, strike that.

The additional time you would have spent between 10 hours and 15 hours would have been to review some logs; is that what you said?

A. I did not say I reviewed logs. I said I reviewed the well files on the Commission website.

Q. Okay. What are in the well files?

A. The well files contain the core reports

and some of that type of information. They have like casing size and the drilling completion information, things like that.

Q. Okay. Would you agree with me that you really haven't reviewed enough to make any sort of recommendation to the Commission whether this application should be granted or denied?

A. Absolutely.

MR. BENDER: Okay. No further questions.

HEARING EXAMINER GARNER: Any questions from the staff?

Mr. Braaten, any redirect?

MR. BUTTON: Are you waiting for a response from me?

MR. BRAATEN: Sorry. No, Mr. Button, that was on me. I'm just taking a moment to review my notes to see if I have anything else to ask. Give me one moment, please.

I have nothing further.

HEARING EXAMINER GARNER: Okay. I know you said you only expected to get through three witnesses, but you still have 20 minutes.

MR. BRAATEN: I'm -- yeah, I'm sorry, I have one more, but he is no longer available.

HEARING EXAMINER GARNER: He's not

available right now?

MR. BRAATEN: Right.

HEARING EXAMINER GARNER: Let's go off the record for a minute.

(Recessed at 6:10 p.m. and reconvened at 6:11 p.m.)

HEARING EXAMINER GARNER: Okay. We are back on the record, and we are going to recess these hearings and resume tomorrow morning at 9 a.m. That concludes our hearings for the day.

(Recessed at 6:12 p.m., Wednesday, the 12th day of June, 2024.)

CERTIFICATE OF COURT REPORTER

I, Stephanie A. Smith, a Registered Professional Reporter,

DO HEREBY CERTIFY that I recorded in shorthand the foregoing proceedings had and made of record at the time and place hereinbefore indicated.

I DO HEREBY FURTHER CERTIFY that the foregoing typewritten pages contain an accurate transcript of my shorthand notes then and there taken.

Dated at Bismarck, North Dakota, this 3rd day of July, 2024.

(The following proceedings were had and made of record herein, commencing at 9:06 a.m., Wednesday, the 12th day of June, 2024:)

HEARING EXAMINER GARNER: We are on the record for hearings in the matters listed in the North Dakota Industrial Commission Hearing Docket for June 12. I'm David Garner, hearing examiner for these hearings. We're at the hearing room for the Department of Mineral Resources, Oil & Gas Division, and it is 9:08 a.m.

We will resume our hearings for Case Numbers 30869 through 30880. I notice new counsel appeared at the table, so I'll give everyone an opportunity for all interested parties to please come forward again.

MR. BENDER: Thank you, Mr. Examiner. I'll introduce Tom. He doesn't need any introduction, but with us today is Tom Throne. He's going to be assisting with Summit in this application.

HEARING EXAMINER GARNER: Okay.

MR. BRAATEN: Derrick Braaten, Braaten Law Firm, on behalf of the landowner intervenors. With me is my paralegal, Desirae Zaste, and client Kirk Swenson.

290

MR. BENDER: I apologize. I thought you were just looking for an introduction of the new counsel.

HEARING EXAMINER GARNER: No, that's --

MR. BENDER: Did you want me to make another appearance or --

HEARING EXAMINER GARNER: No. That's fine.

MR. BENDER: Okay.

HEARING EXAMINER GARNER: That's fine. Just a quick note. We're going to resume with the cross-examination of the two witnesses that were being crossed by Mr. Braaten yesterday. Change, though. We're going to then at that point in time allow Summit to call its remaining witnesses, give the Commission a chance to respond to them -- or question them. And then you'll have the remainder of the time to cross-examine those witnesses.

MR. BRAATEN: Okay. And, Your Honor, I don't want to be difficult or take up time. I just want to put on the record that I do object to that process.

HEARING EXAMINER GARNER: Okay.

MR. HELMS: 6:30.

HEARING EXAMINER GARNER: Oh, I'm sorry.

291

And we're going to have a deadline today again of 6:30 p.m., and if we are not done, we will be back here tomorrow morning at 9 a.m.

Okay. With that, I think we can proceed.

MR. HELMS: They're still under oath.

HEARING EXAMINER GARNER: They're still under oath.

CONTINUED CROSS-EXAMINATION

BY MR. BRAATEN:

Q. I wasn't going to ask this, but since it came up, do you understand that you're still under oath?

A. (BY MS. DOUGLAS) I do.

Q. Okay. We were discussing the CO_2 plume model yesterday, and I want to start by just asking if you have an understanding within the regulatory framework for Class 6 wells why a plume model is constructed?

A. I do.

Q. And what is that understanding?

A. So under the North Dakota UIC Class VI regulations, a geologic model is constructed to help define the horizontal and vertical boundaries of a storage reservoir.

Q. For what purpose or reason?

292

A. The purpose of this is to define the boundaries of the storage reservoir, in this case which would be the storage facility, which the regulations require pore space owners within that storage facility to be equitably compensated. Also, the modeling and simulation, it's constructed to help delineate the area of review, which is also a requirement of the statutes to delineate the area of review.

Q. And the delineation of the area of review is also the primary requirement or reason for creating that model under the Safe Drinking Water Act?

A. So we're talking about two sets of regulations here. So in -- in North Dakota UIC Class VI regulations, as I mentioned, the modeling is a tool to determine the AOR in the storage facility area. The Safe Water Drinking Act, under that, I believe, the EOA has its own set of UIC Class VI rules, which the North Dakota UIC Class VI rules are based on and are more stringent than. In the EPA rules, it is my understanding that modeling and simulation is used to define an area of review as well.

Q. Is North Dakota's underground injection

293

control program regulation for Class VI wells adopted pursuant to the Safe Drinking Water Act?

A. It is, and it is more stringent in terms that it goes above and beyond and also has stipulations for a storage facility area, pore space leasing, which the EPA UIC Class VI rules do not.

Q. And when the EPA promulgated its Class VI rules, the methodologies it used for delineating -- delineating an area of review were focused on the purpose and function of protecting USDWs; right?

A. That's correct, and North Dakota Administrative Code is as well. So they define the area of review as the region surrounding the geologic sequestration project where underground sources of drinking water may be endangered by the CO_2 injection activities.

Q. And so you're modeling the areal extent of the CO_2 plume because the regulations require you to do that in order to protect drinking water sources?

A. Modeling the simulation is required to evaluate potential impact and endangerment on any underground sources of drinking water in which you're required to define an area of review where you're required to monitor and ensure that you're

294

not endangering any underground sources of drinking water.

Q. You've noticed -- you've noted a couple of times that North Dakota's regulations are more stringent than the EPA regulations. That's because the EPA regulations require that any state being granted primacy have a set of regulations that are more stringent than EPA's?

A. I'm not familiar with the specific requirements. I know that they can't be any lesser.

Q. Okay. I've handed you what has been marked as Exhibit LO-83. Can you tell me if you've seen that document before?

A. I personally have not.

Q. And when you say "I personally have not," are you aware of others who have that you're thinking of?

A. Not specifically, no.

Q. If you look at the bullet points in the middle, you'll notice a number of descriptions of various data and input files. Is there anything in those bullet points that you can identify that was not provided to the Industrial Commission by EERC?

A. Upon request from the Commission, the EERC

295

had provided the DMR with the .DAT file, which is our simulation model input file for CMG, as well as our results file in the form of a .SR3, as well as shapefiles for the maps that were generated. Outside of those data sets, we did not provide any additional data to the DMR.

Q. You said for the maps that were provided outside of the data. What maps are you referring to?

A. The maps in the storage facility area. So we provided shapefiles for the storage facility boundary, the area of review boundary and such.

Q. Okay. And you're saying you provided the shapefiles but not necessarily the particular maps you generated from them?

A. Correct.

Q. Okay.

A. Let me correct for that. The maps are provided in the permit itself, so we didn't provide maps separately. They're within the permit itself.

Q. Okay. That's fair.

So this first one, all of the input files for the PHREEQC model were provided to the Commission?

A. No. As I stated, just the .DAT file for

296

the numerical simulations which were used to define the horizontal and the vertical boundaries of the reservoir.

Q. You didn't give them an input file for the PHREEQC model?

A. We did not, no. It was not requested.

Q. It's in your possession, though?

A. The EERC has the data.

Q. Sorry. Yes. EERC.

And EERC is Summit's agent and representative with respect to that data?

A. The ownership of the data is governed under our specific contracts with Summit including our NDA with them that govern data ownership.

Q. EERC has a nondisclosure agreement with Summit?

A. Yes.

Q. Who proposed that?

A. I was not involved in those discussions. It's a standard -- standard practice we have with most of our clients, though.

Q. Is that because your licenses for the computer modeling programs are academic licenses?

A. No. Commercial licenses were procured for this project as this was a commercially contracted

297

project.
Q. Did Summit compensate for the cost of the subscriptions for the programs on a commercial basis?
A. The EERC procured commercial licenses and the costs of those commercial licenses were billed to Summit. Yes.
Q. Okay. Were they temporary subscriptions?
A. Yes. So the licenses have a time period associated with them. Commonly, we procure licenses on the order of a month, two-month, three-month licenses, depending on the duration of the time period in the project we need the license to perform the scope.
Q. So I want to go back to my prior question. Other than the input model for the PHREEQC model -- sorry. Let me start over.
Other than the input file for the PHREEQC model, is there anything listed in these bullet points that was not provided by EERC to the Industrial Commission?
A. Yes. As I mentioned, the only input data that was provided can be found in your last bullet point in terms of what I would call the simulation -- or the numerical reservoir simulation

298

model data decks and the output files. Those were the two pieces of data which I am saying is the .DAT file and the .SR3 file. Those are the only two data sets from this list that were provided.
Q. So if you look at the third bullet point, is there anything there that was provided to the Industrial Commission?
A. Yes. Thank you for correcting me. So all core analysis data was provided to the Industrial Commission as well as the North Dakota Geological Survey through submission to the North Dakota core library staff. And as required, all well log data, formation testing, fluid analysis was provided as -- as part of completions reports for the three stratigraphic test wells that were drilled. So those were technically provided.
Q. When you look through these bullet points on this letter, do you have an understanding of what is being referenced in all of these? Is there anything you don't understand what is being referenced?
A. No. I understand.
Q. If I asked you to go back to EERC today and sit down and pull together an external hard drive and put this data on that external hard drive

299

and give it to me, approximately how long would it take you to do that?
A. That would involve the procurement of commercial licenses to access.
Q. No. Assuming that you have a commercial license, which you do for all of this, if you needed to go to your office, take all of this data and put it on an external hard drive, how long would that take you?
A. Days to weeks.
Q. It would take you weeks to put this data on a hard drive? You're telling me that?
A. To ensure that we have the proper data, QC it, and we ran multiple iterations.
Q. No. I'm asking you to take this data that you understand what all of it is, export it, transfer those files onto an external hard drive, how long?
A. One to two weeks.
Q. It would take you one to two weeks to transfer those files to a hard drive, but you can start from scratch with publicly available data and replicate and recreate that entire model in four weeks?
A. So the publicly available data would be

300

coming from single data bases. The way the EERC's file structure and the iterations of our models, the amount of data we have, it's my opinion knowing our data storage, the amount of data we have, the different iterations of modeling simulations done for this project, I would estimate it would take our staff that amount of time to ensure that we had the proper data to be transferred.
Q. But you keep saying -- you're saying ensure we have the proper data to be transferred. I'm saying physically how long does it take to click the buttons on the computer to tell the files in the computer to transfer them to an external hard drive and how long does it take the computer to process that file transfer and get it onto the external hard drive? I'm not talking about quality control or review.
A. Okay. I can't speculate. I don't know the size of the data in terms of megabytes, gigabytes or the speed to upload it.
Q. So you have no idea how long it would take to put this on an external hard drive and send it to us?
A. I gave you an estimated range of what I believe it would take.

301

Q. Three weeks?
A. I believe I said one to two.
Q. One to two weeks.
And you're still saying that you could also replicate the entire model yourself from public data in just four weeks? Can you explain that?
A. I believe I did already answer that.
Q. Why does it only take two weeks to transfer the files onto a hard drive but you can take and recreate everything in four weeks?
A. I believe I already answered that.
Q. And you think that sounds plausible?
A. I gave a range and in my opinion of what it would take.
Q. Okay. Were you asked to do that at any point?
A. No.
Q. Were you at any point advised that you might need to make data available to an opposing party in any kind of legal proceeding for Summit?
A. I was made aware that data may be requested. Not specifically that it would need to be provided.
Q. Were you told that it would not need to be

302

provided?
MR. BENDER: I'm going to object insofar as it might get into issues on attorney/client privilege. So if any of this was discussed with you while I was present on the phone or whatever or Ty, I'd instruct you not to answer it.
MR. BRAATEN: Are you asserting the privilege on behalf of Summit or EERC?
MR. BENDER: Summit.
Q. (MR. BRAATEN CONTINUING) At any time when there was no representative of Summit, other than Mr. Bender, were you told that -- or there was no representative of Summit present for the conversation, at any point were you told that you would not need to provide data?
A. No. I was involved in discussions to determine what it would take for us to provide that data. I was not told we would not have to provide it. I was told as a potential we may have to.
Q. Who were you told that by?
A. Mr. Lonny Jacobson who is our direct point of communication with the Summit team.
Q. Is he with EERC or Summit?
MR. BENDER: Your Honor, I'm going to object. We're getting into issues having to do

303

with discovery. These issues are before the Commission in a motion to compel. I don't think it's appropriate to try to litigate that here. We haven't had an opportunity to respond to that motion to compel, so I'm going to object to this whole line of questioning.
HEARING EXAMINER GARNER: I'm going to overrule.
MR. BENDER: Okay. Thank you.
Q. (MR. BRAATEN CONTINUING) Who does Lonny -- did you say Lonny Jacobson?
A. Yeah.
Q. Who does he work for?
A. The Energy & Environmental Research Center.
Q. Okay. When did you talk to him about the potential of having to provide data?
A. Can you clarify "provide data"? To whom?
Q. We just talked about a conversation you had had with Lonny in which you indicated that you had not been told that you would not need to provide data. Do you recall that conversation?
A. I do. It was after discovery was submitted.
Q. And when you say "after discovery was

304

submitted," are you referring to the request for data and information that were sent by me on behalf of the intervenors?
A. Correct.
Q. Okay. What did he ask you about that data?
A. What effort and software licenses would be needed to compile that data.
Q. And just tell me fully what your response to that was when you talked to him at that time?
A. We provided him with a specific list of the software licenses needed, the data as well as things, like I discussed yesterday, about some of the data sets being acquired from data brokers that the specific digitized logs in question are governed by a license agreement.
Q. Did you make a determination that because of those license agreements you were unwilling to provide those data sets?
A. EERC did not make that determination. We provided information to Summit on what it would take for us to produce those data sets.
Q. With respect to everything that's listed in Exhibit 83 in those bullet points, first, EERC has itself all of that data related to Summit's

305

project; right?
A. Yes.
Q. And has EERC provided all of that data to Summit itself?
A. I'm unsure. I don't believe we have provided every piece of data yet.
Q. So Summit doesn't even have all of the data that EERC has?
A. I can't comment on that with certainty.
Q. Well, did you just say that EERC has not provided all of this data to Summit?
MS. DOUGLAS: Could you read back what I stated?
(Record read as requested.)
MS. DOUGLAS: So I believe I said I'm unsure, I'm uncertain about that. I don't have a definitive answer.
Q. (MR. BRAATEN CONTINUING) Okay. What did Lonny tell you about his conversations with Summit about it?
A. That we would just not have to provide it at this time. A determination was not made on whether we would be providing it or not.
Q. At any point were you asked to start compiling the data in the potential event that you

306

did have to provide it?
A. No, because as I mentioned, we'd be required to procure software licenses.
Q. For what?
A. To open the model, take out any data. For example, to open the Petrel model, we'd need a Petrel license in order to take out the digitized well logs that are governed by that license agreement.
Q. So the temporary subscriptions you had for the models, have those lapsed at this point?
A. They have.
Q. Okay. So you didn't want to export the data because in order to do that, you would have had to buy another subscription just to export the data out of the models?
A. Again, the EERC's contracted to perform this scope by Summit Carbon Storage, and so they would have had to approve and authorize us to procure the software.
Q. And they didn't want to pay for the software?
MR. BENDER: If you know.
MS. DOUGLAS: I -- I don't know. I was not involved in those discussions.

307

Q. (MR. BRAATEN CONTINUING) Well, you're the one that just told me that the need to procure new licenses was part of the reason for not exporting or starting on the export of the data; right?
A. We would need to be authorized by Summit to start those activities.
Q. And they never did that?
A. No.
Q. Did Lonny ask them if they would like to authorize that?
A. I'm not privy to those discussions.
Q. The PHREEQC model is a free model, though, that anyone can use and there would be no barrier with subscriptions to putting all that data together; right?
A. Correct. As I testified, though, yesterday, I believe that all of the input data used for that is described in the permit itself.
Q. Have you personally had any direct communications with the employees or members of the North Dakota Industrial Commission about this matter in the last two weeks?
A. I have not, no.
Q. Do you know if Lonny has?
A. I'm not aware if he has or not, but I do

308

not believe he has.
Q. As part of your work on the -- the Summit project, did you do any work related to the surface facilities?
A. No, I did not.
Q. There was a comment yesterday that I believe -- and you can correct me if I'm wrong, but I believe you said that these injection wells will not endanger human health. Would you agree with that?
A. I believe Caitlin testified to human health.
Q. Okay. And did I hear it right or do you agree that the testimony was that these injection wells, the Class VI wells, will not endanger human health?
A. (BY MS. OLSEN) I believe I testified to the injection wells have engineering protocol in place that would not endanger human health or the environment in relation to CO_2 injection activities.
Q. Thank you. In making that statement, did you consider the potential of CO_2 releases from those surface facilities such as valves, blowouts, things of that nature?
A. That was discussed later on in the permit.

309

So my references to that are in relation to the injection well and the review that was done on the injection well specifically.

Q. Would it also be accurate to say specifically with respect to the things that happen downhole at the injection well?

A. The engineering safeguards in place downhole are such that they would prevent migration of CO_2 into USDWs or the atmosphere.

Q. What about the engineering safeguards between the terminus point of the Midwest Carbon Express Pipeline and the wellhead?

A. (BY MS. DOUGLAS) We believe we have witnesses coming up who are better suited to testify to that.

Q. Okay. We had a discussion yesterday about the permeability adjustment with the 2.5 multiplier. Do you recall that?

A. I do.

Q. Did you or Lonny have conversations with Summit at any point regarding that issue?

A. We did.

Q. And what were those conversations?

A. So as I testified yesterday, the results showed a slightly higher permeability that could

310

have been used to justify a higher multiplier. In discussions with EERC and Summit, EERC providing technical advisement to use a lower value, those discussions included discussions with Summit from a business case. They wanted to permit the site to take a certain amount of CO_2 and store CO_2 within a certain area.

And so through sensitivity modeling and business considerations, it was a joint determination to use 2.5. Additionally, the Commission has approved a permit for the Broom Creek Formation that has used 2.5 as well.

Q. What were the business considerations Summit expressed regarding the use of the 2.5 factor?

A. Again, I just discussed the amount of CO_2 they were targeting and the area -- the area to be permitted for CO_2. I discussed a little bit yesterday I didn't want to overestimate the storage facility area and then not inject that amount of CO_2 to where we would be over-leasing the area and not using it.

Q. So Summit was -- Summit's preference would be that that perm adjustment be a lower number based on that business consideration?

311

A. Through discussions with EERC and Summit, the 2.5 multiplier was selected.

Q. But specifically because in part of Summit's business considerations of wanting to keep the storage facility as small as possible for the amount of CO_2 they want to inject; right?

A. I wouldn't say it's as small as possible. There's just some consideration to not overestimate the area needed.

Q. Because if they reduce the size or the boundary of that storage facility, then if there are people just on the other side of that, they don't need to pay for any property rights for that; is that accurate?

A. Can you repeat that?

Q. If they reduce the geographic areal extent of the storage facility boundary, it reduces the number of landowners for whom they need to compensate for the use of the property rights and that's the business consideration; right?

A. It's a fact a smaller storage facility area would result in less landowners having to be permitted. The -- the business consideration wasn't related to number of landowners as it was area.

312

Q. What business interest does Summit have in reducing the size or boundary of that storage facility if it's not related to not having to compensate landowners?

A. I --

MR. BENDER: If you know the answer.

MS. DOUGLAS: I don't know that. I'd have to defer to Summit.

Q. (MR. BRAATEN CONTINUING) And so the compensation of landowners is the only thing you know of as a business consideration that they would have been thinking about in --

MR. BENDER: I think that's a mischaracterization of her testimony. Can you ask the question again?

Q. (MR. BRAATEN CONTINUING) Sure. You've testified to the business consideration of the need to lease landowners; right?

A. Yes.

Q. And that's the only business consideration that you've testified to related to Summit's consideration of which permeability adjustment factor to use?

A. Yes, but it's not the only business consideration. There's also operational costs

313

associated with monitoring. If they -- they use a permeability multiplier in a larger permeability multiplier as we discussed, it may result in a larger plume, likely a larger associated pressure front, larger AOR that would require additional acreage to monitor, meaning additional monitoring costs.

Q. And every five years or so Summit is going to rerun the models based on the data acquired thus far from that monitoring; right?

A. Yeah. So the regulations require a reevaluation of the AOR determination, no less than every five years, meaning that Summit will be using operational and monitoring data to history match, calibrate their models and confirm their permitted AOR and storage facility area are still sufficient.

Q. What if they found out it wasn't?

A. So the North Dakota Century Code 43-05-01-12 --

MR. BENDER: Let me -- let me correct you. That's the Administrative Code.

MS. DOUGLAS: Thank you for that correction.

Q. (MR. BRAATEN CONTINUING) 43-05-01, and what was the next one?

314

A. 12. Dash 12.

Q. Okay.

A. Okay. This contains the -- the regulation language regarding any changes to the storage facility area on that reevaluation. If it was deemed that the CO_2 would potentially go outside the boundaries and Summit determined they needed to expand the area, they would need to go through the modification process.

Q. And the result being potentially an adjustment to the boundaries of the storage facility?

A. That would require a major modification which I believe requires an additional hearing at that point if they needed to modify the permitted boundaries.

Q. But if the data indicated that the storage facility boundary had not been modeled in a way that was accurately reflecting the conditions in the last five years, that is a potential result of the five-year review, that you redraw the storage facility boundary; right?

A. Potentially.

Q. And if you did that, what do you do about all the payments you've made to the landowners so

315

far?

A. I can't speak to that.

Q. Is there any process you're aware of that would address that?

A. Again, I believe it would be addressed in that major modification proceedance, which would be a hearing just like the one we're in today.

Q. Were there any communications about using the 2.5 multiplier between EERC and the Industrial Commission?

A. I can't recall specifically. Potentially in their review of initial permit drafts submitted, it could have been discussed.

Q. If you had used 2.7 for the factor instead of 2.5, how many more acres of property would have been included in the storage facility?

A. I can't speak to that. We did not run that case.

Q. Okay. Do you have any sense of what that might be?

A. I do not because simulations are a complex, multi-physics approach, and so adjusting the permeability is not a straight ratio to plume size.

Q. Would you agree that it would result in

316

some additional acreage?

A. Yes, I believe I stated that.

Q. Just a couple minutes ago you made a reference to sensitivity analysis. Do you recall that?

A. Yes.

Q. What do you mean by "sensitivity analysis"?

A. So the EERC performs sensitivity analysis. Some of that is discussed in -- in the permit as well. We looked at parameters that affectively -- or could affect simulation results. In addition to that, to the sensitivity analysis, we also did uncertainty analysis to look at how various properties and distribution of properties, such as permeability, could potentially impact the -- the model and the simulation results.

Q. And that's essentially doing quality control to test the predictive utility of your model?

A. I wouldn't classify it as testing the utility of our model. We did those things to determine what parameters we thought were appropriate and justifiable for use in the model.

Q. Could you do that assessment of the

317

parameters chosen without running sensitivity analysis on the model?
A. Could you repeat that?
Q. Could you assess the propriety of the parameters used in the model without running any sensitivity analysis on it? Let me ask a different question.
What properties did you run sensitivity analysis on?
A. Sensitivity analysis, you said?
Q. Yep.
A. So we ran sensitivity analysis on injection rates, bottomhole pressure conditions, wellhead temperatures, wellhead pressures.
Q. For what purpose?
A. So on page 3-15, we have a paragraph talking about sensitivity analysis.
Q. And you indicate that because of the availability of data in the form of well logs, core sample data and rock fluid properties, the need for typical sensitivity studies of influential reservoir parameters has been reduced. Has it been eliminated?
A. No, which is why we ran a sensitivity analysis.

318

Q. What's the difference between the sensitivity analysis you ran and what you would refer to here as typical sensitivity studies?
A. Typical sensitivity studies would vary more parameters potentially. So we felt confident in site-specific data to define limits of certain variables so we didn't need to test those.
Q. Up until you ran the injection test?
A. I -- I don't understand the question.
Q. Well, what were the parameters you were comfortable with that you didn't need to run sensitivity analysis on?
A. Things like model size, grid cell size, boundary conditions. We ran certainty cases on property distribution. We didn't necessarily run sensitivity cases on property distribution.
Q. Would you have been confident using your model to develop this application for Summit with running zero sensitivity analysis?
A. I think it points back to your questions earlier where you asked about what is the intent of running these models to define the storage facility area in an area of review taking into consideration the required five-year reevaluation, the amount of CO_2 that would be injected in -- in that time. I

319

believe running a model without sensitivity analysis would -- would still provide enough insight to be able to safely inject for those -- at least those five years until the reevaluation time period.
Q. So you're comfortable with a larger margin of error in the first five years?
A. Given the amount of CO_2 that will be injected, the proposed CO_2 plume size, other variables such as the area of review evaluation that looked at proximity of legacy wellbores and things like that, given the testing and monitoring plan, yes.
Q. Because ultimately what we're talking about here are pressures and the extent of the plume, and given what's going to be injected in the first five years, you don't have those same safety concerns in those first five years; would that be fair?
A. Could you restate that?
Q. You're comfortable with a greater margin of error in the first five years; right?
A. Given the amount of CO_2 that would be injected, that's -- that's correct, because we're -- the model as a whole was used to define a

320

boundary which is for 20 years of injection plus a period of postinjection plus a buffer. So within that five years, we're talking about a much smaller area.
Q. And if it's not exact, it's not going to be problematic because you're not going to have injected enough to get out to that boundary by that time anyway?
A. That's my belief. Correct.
Q. Except that you're treating all of the landowners inside that boundary exactly the same with the first ton that goes down that well and everyone on the outside of that line exactly the same, meaning they get nothing; right?
MR. BENDER: If -- if you understand how the allocation formula works for paying royalties, you can answer the question, but if you don't, I would not -- I would not answer it if I were you.
MS. DOUGLAS: Could you restate your question?
MR. BRAATEN: I can't even remember. May I have you read it back, please?
(Record read as requested.)
Q. (MR. BRAATEN CONTINUING) With respect to compensation.

321

A. I guess I don't understand your question. If the CO_2's still in the boundaries, you're in compliance with your permit and you're compensating those within the boundary.

Q. Regardless of where that CO_2 is actually?

A. I guess to Mr. Bender's point, I'm not comfortable talking on the compensation rates for landowners or how that's going to be distributed across owners within the area.

Q. And so to the extent you ran sensitivity analysis on the model and to the extent you're comfortable with the predictive utility of the model in the ways that you used it for this application, it was never a consideration to you how that would affect how landowners get compensated?

A. This modeling and simulation was done to define the boundaries. Summit made decisions related to compensation of pore space owners.

HEARING EXAMINER GARNER: Why don't we take a ten-minute break.

(Recessed at 10:00 a.m. and reconvened at 10:12 a.m.)

HEARING EXAMINER GARNER: We are back on the record. Mr. Braaten, you can resume your

322

questioning.

Q. (MR. BRAATEN CONTINUING) You had mentioned that the Industrial Commission had previously accepted the use of a 2.5 factor. Was that for the Project Tundra project?

A. For those permits, correct.

Q. And was the EERC similarly involved with developing those applications?

A. We were involved, but they had -- we were involved.

Q. Did someone from EERC make that determination in the prior case? That was a bad question. Let me ask it again.

Did someone from EERC make the determination to use the 2.5 permeability adjustment factor in the prior proceedings related to Project Tundra in which EERC was involved?

A. I can say we participated in those discussions. I can't provide more details on who made the determination and the parties involved as that project is -- is still actively being conducted and is governed by an NDA with Minnkota.

Q. If you were going to assess someone else's work developing the same models that EERC developed for Summit's application, how would you go about

323

assessing those models that were developed by others?

MR. BENDER: Do you understand what he's talking about when he says "assess"?

MS. DOUGLAS: I was just going to ask, assessing for what purposes?

Q. (MR. BRAATEN CONTINUING) If you were asked to determine if the inputs and parameters and ways in which the models were set up and run would be acceptable to you in your professional experience such that they would support an application for Class VI wells.

A. The EERC's been contracted in this capacity before, so I'm speaking from direct experience here. Typically, that review process would come in the form of presentations about inputs and assumptions used in the model by those that created the model. We would evaluate their inputs and assumptions for reasonability and if they're justifiable based on the data sets that they had available to them, and we'd take into considerations Class VI requirements related to compliance. But EERC has not in these roles -- where we've been contracted to perform this work before, we have not reviewed people's models or

324

rerun their simulations to -- to double-check things in that manner. We've reviewed their inputs and assumptions through presentations, reviews of reports, that type of thing.

Q. Presentations by whom?

A. As I mentioned, those that generated the models presented to us their inputs and assumptions. A lot of the information that would have been in those presentations is captured -- for our models that information is similarly captured in the storage facility permits.

Q. Did you run the model at a 2.7 adjustment factor for permeability?

A. I just previously mentioned earlier today that we did not.

Q. Why not?

A. We didn't feel it was necessary. We made a decision to run it with 2.5 and so we ran it with 2.5.

Q. Would it have cost you anything to run it at 2.7?

A. Yes, it would have cost us time, so --

Q. How much time?

A. -- hours, and it would have cost us time running it with the model license. So we only

325

have -- we pay for a model license for a month. Running the model would tie up that license for a week or so.

Q. Because that's how long it takes to run the model?

A. A model this size typically could be anywhere from two days to a week of run time, depending on if any errors are encountered and you have to restart the model.

Q. Meaning that if you had to restart the model, it could take up to a week?

A. Potentially.

Q. Could it take longer than a week?

A. Potentially, if there are model errors which can't be necessarily predicted when the simulator is going to experience a numerical error and give an error file.

Q. But you think an engineer could replicate it in four weeks?

A. You asked me how much time it would take to -- to build a model and I said four weeks to build the model. That's different than running the simulations.

Q. Okay. So several weeks to replicate the model and then at least another week to run it?

326

A. Correct.

Q. So it's your testimony that another engineer could both replicate and run that model in five weeks?

A. If the model they built ran and didn't experience any numerical errors that they would have to troubleshoot.

Q. Have you ever set up and run a model that didn't have any numerical errors that had to be troubleshooted?

A. Myself personally, no.

Q. There's a binder directly in front of you there with a number of tabbed exhibits. If you don't mind, can I have you open it to landowner -- or LO-63.

A. I'm there.

Q. Are there features on this map that you recognize from the shapefiles submitted by Summit to the DMR?

A. These appear to be the storage facility boundaries and the AOR for the three permits.

Q. Are you also familiar with the maps that were produced to indicate the 5-, 10- and 20-year pressure increases in the area of the injectors?

A. Yes, I'm familiar with those.

327

Q. And does it appear that one of those is also overlaid on this exhibit?

A. It does appear that way, but it's difficult to see given the color scale for that layer.

Q. You are familiar with the maps that were generated to indicate the areal extent of the pressure increases in the reservoir that were in the application; right?

A. I am.

Q. And so you'd agree that there will be increases in the pressure in the formation well outside the boundaries of the storage facility?

A. Yes. If we may, I'd like to speak off page 4-2 of the permit.

Q. Okay.

A. Figure 4-1.

Q. And just for the record, the permit being referenced is Exhibit 1A?

A. Correct. So this map is showing the predicted maximum subsurface pressure due to injection from the three sites. So this is at 20 years is where -- of injection is where we see the maximum. And as you can see, the pressure increase extends beyond the proposed facility

328

boundaries in the area of review.

Q. What variable of Darcy's law limits the amount and rate at which you can inject CO_2?

A. I don't think I could speak to that without the equation in front of me.

Q. What limits your ability to inject CO_2 into these Class VI wells? Let me ask that again.

What limits the rate and amount of CO_2 that you can inject into that reservoir through these Class VI wells?

A. So the bottomhole pressure constraint is the -- the regulatory constraint that dictates the amount of CO_2 that can be injected into these wells. So that bottomhole pressure constraint is derived as 90 percent of the fracture pressure gradient. So bottomhole pressure is the regulatory constraint for the Class VI.

Q. And the bottomhole pressure is obviously directly impacted by existing pressures in the formation; right?

A. That's correct.

Q. Are you familiar with the intervention by Minnkota in this proceeding?

A. Generally.

Q. Are you familiar with where the well is

329

that they had concerns about?
A. Yes.
Q. Is Summit's project going to affect the ultimate bottomhole pressure that limits Minnkota's project?
A. There will be pressure interference.
Q. Can I have you go back to Exhibit LO-63?
A. I'm there.
Q. Do you see in the legend there there's a number of different colors, and I'll agree with you the color scale's a bit off, but down near the bottom next to Swenson there's a white color. Do you see that?
A. Yep.
Q. Do you see the land that sits right in between the areas of review of the three different storage facilities?
A. Yes.
Q. Is there going to be pressure interference with Mr. Swenson's lands and pore space?
A. Define "pressure interference with."
Q. From the Class VI injectors that Summit is going to inject CO_2 into.
A. There will be a pressure increase in the reservoir due to injection. The map does show the

330

pressure increase will be in the pore space below that land.
Q. Which would similarly limit the ability to inject into the pore space in that part of the reservoir based on limits to bottomhole pressure that are being affected by that pressure interference by Summit's Class VI wells?
A. Yes, potentially.
Q. How much is Summit compensating for that?
A. They're not required to compensate based on North Dakota Class VI laws. They're required to compensate for use of pore space for CO_2 storage. Injection will cause pressure increase.
Q. Which reduces the availability of pore space for storage of substances?
A. No. The pore space is still there. It's not taking the pore space away.
Q. It reduces the availability of the pore space for the storage of substances?
A. I don't agree with that characterization.
Q. Why not?
A. An operator could come in and still develop that and store CO_2 in that pore space.
Q. Subject to a bottomhole pressure limitation that has been significantly impacted by

331

the three Class VI wells surrounding him; right?
A. For the amount. Bottomhole pressure might impact potential injection rates, not necessarily the volumes that could be stored there. So one thing to note that while injection operations will increase pressure, when injection stops or if injection rates are limited, after injection stops pressure will die off in the reservoir, and we have a map that demonstrates that.
During operations, you know, if Summit's injecting at a lower rate, there will be a lower pressure increase. It could also, you know, shut in wells which would result -- or decrease -- which would result in additional pressure decreasing there. The pressure increase is temporary, but a developer could come in and still inject CO_2 there.
Q. And you show equilibrium of pressures ten years after operations; right?
A. The permit has a map that demonstrates this pressure decrease. It doesn't represent pressure equilibrium.
Q. What would you project that to be in time from the end of operations?
A. We did not simulate that.
Q. Would you expect it to be more than

332

20 years?
A. We'd have to simulate that.
Q. Significant pressure interference for at least 30 years of Mr. Swenson's pore space caused by the Summit project?
A. Again, it would limit injection rates. It wouldn't limit the total volumes that could be stored on his land. So to answer your question, there would be a pressure increase of approximately 500 psi up to a thousand psi increase over the current pressure of the Broom Creek today for up to 30 years.
Q. What's the economic incentive for injecting CO_2 into the pore space?
A. Can you clarify that question?
Q. Is Summit being paid in the form of tax credits by the federal government to inject CO_2 in the pore space?
A. I believe Wade testified yesterday as to the -- the economic drivers behind their project. I can't answer questions on that.
Q. Will the 45Q credits be in place in the same form and amount 30 years from now?
MR. BENDER: Objection. Calls for speculation.

333

HEARING EXAMINER GARNER: Overruled.
MS. DOUGLAS: As written today?
Q. (MR. BRAATEN CONTINUING) Correct.
A. No. But as I mentioned, while Summit's operating, there's nothing that would preclude an operator from coming in and injecting to store CO_2. The same amount of pore space would still exist. They would just have to inject at lower injection rates, but they could still get the same amount of CO_2 in that pore space over time.
Q. How much longer amount of time?
A. We have not run that model.
MR. BRAATEN: Real quick, I apologize, on the prior exhibit, LO-83, I did not move to admit, and I would move to admit LO-83.
MR. BENDER: Did you say 83 or 63?
MR. BRAATEN: 83.
MR. BENDER: Oh, that one. I'm sorry.
MR. BRAATEN: I'm skipping back.
HEARING EXAMINER GARNER: Any objections?
MR. BENDER: No objection.
HEARING EXAMINER GARNER: The exhibit is admitted.
Q. (MR. BRAATEN CONTINUING) You talked yesterday briefly about the area of review and

334

corrective action. Did you look at the old wells that have been P and A'd around the area of the storage facilities?
A. (BY MS. OLSEN) We did.
Q. What did you look at in those wells?
A. Particular to this permit, there are no legacy wells in this area.
Q. Within the area of review?
A. Within the area of review for the TB Leingang, that's correct.
Q. Did you look at the legacy wells that are closest but not within your area of review?
A. We did not evaluate wells outside of the area of review.
Q. Okay. Are you aware of the Fritz-Lutz 1 well?
A. I don't believe that was in the area of review.
Q. Are you aware of where it is in relation to the area of review?
A. Which area of review?
Q. Any of them.
A. Not at this moment.
Q. And are you familiar with the Richter 1 well?

335

A. I recall the Richter 1 well.
Q. Did you assess that well in any way as part of your work on the Summit project?
A. No. Class VI rules only require evaluation of wells within the area of review.
Q. Can I have you turn to Figure 4-1, the pressure map we were taking a look at a moment ago.
A. (BY MS. DOUGLAS) We're there.
Q. Are the dots on this pressure map indicative of wells?
A. Yes.
Q. Are you generally familiar with the two wells I mentioned being to the southwest of the storage facility represented on this map? Sorry. I don't know who I'm talking to. Either of you who knows.
A. Not based on the current map. They're not labeled or have well names, so I can't identify them based on this map.
Q. And just based on your familiarity with your location, does it appear that the -- let me ask a different question.
Based on your familiarity with the Richter 1 well, is it your understanding that that well is generally to the south or southwest of the storage

336

facilities?
A. (BY MS. OLSEN) I don't recall that information, but if you say it is.
Q. So if we look directly south from the SCS1 injection wells that is indicated on the map with the green triangle, if you go south of that until you're outside of the area of review and storage facility boundaries, almost directly south in blue there is a dot and it is a dot directly south of the green triangle and within the area that I believe is indicated as a 400 psi pressure differential. Do you see where I'm pointing at that?
A. I do.
Q. Does that well have surface casing below the depth of the uppermost freshwater aquifer or U.S. drinking water aquifer?
A. I don't have that information in front of me.
Q. Have you assessed the integrity of the plugs on that well?
A. For this permit, only wells within the area of review are required to be assessed.
Q. I understand. But as a factual matter regardless of a requirement, did you assess the

337

integrity of the plugs on that well?
A. I did not.
Q. And did EERC assess that?
A. I don't recall.
Q. Do you know if Summit assessed that?
A. I don't know.
Q. You'd agree that the reservoir pressures in the area of that well are going to increase by 400 psi based on your modeling as indicated on this map at Figure 4-1?
A. That's correct.
Q. Did you run an MIT on the well?
A. We did not. I assume the well is plugged.
Q. When was it plugged?
A. I don't know. Most of the wells in this area are vintage and drilled in the '70s. That's my assumption.
Q. Or even earlier?
A. Sure.
Q. Some of them plugged before the 1950s even?
A. Perhaps.
Q. So plug job that's 70 years old now?
A. Seven years?
Q. 70.

338

A. Perhaps.
Q. And it was plugged before we had the oil and gas conservation laws on the books in North Dakota we have now?
A. Plugging rules were different, yep.
Q. How much time and expense would be required to pressure up an MIT and run it at 400 psi on that well?
A. (BY MS. DOUGLAS) That -- that well's abandoned and so it's -- it's not accessible at the surface. You'd have to redrill out the plugs and recomplete it to get any information out of it.
Q. Was there an assessment of whether that might need to be replugged?
A. No. Again, Caitlin's testified and stated here a couple times we're only required to evaluate the wells in our AOR.
I would like to say -- point out, we did look at potential leakage or ribbing of leakage in that well. So if I could direct you to page 3-41 to map -- to the map in Figure 3-2. So we modeled a case here assuming hypothetical leakage pathways, again, hypothetical leakage pathways, meaning that there's a leakage pathway through plugs for this model. If there was a leakage pathway due to the

339

pressure increase -- maximum pressure increase from injection, we're estimating over the life of the project only .005 meters cubed of formation fluid could leak up through that well, again assuming it's leaking, into overlying formations.
So, again, we have not evaluated that particular well. It's outside of our AOR. We don't believe that there is endangerment of USDWs due to leakage.
Q. But if the plugs were bad, your modeling indicates that fluids from the formation would travel up that well in some amount to the freshwater drinking aquifer that is not protected by a surface casing?
A. The Broom Creek as it sits today is overpressurized. If those plugs were bad because the Broom Creek is overpressurized, fluids would already be flowing.
Q. How much psi would it take to bust those plugs?
A. I don't have that calculation.
Q. So you don't know if the pressure formation would cause those plugs to burst right now?
A. (BY MS. OLSEN) Class G cement is

340

typically rated to 5,000 psi.
Q. Is that what they used in 1945?
A. I'd have to look at the plugging records to look at that specific well.
Q. Do they have plugging records?
A. I don't know.
Q. Do you have any familiarity with how wells were plugged in North Dakota in the 1940s?
A. Generally, yes.
Q. Based on what?
A. My experience working for the Department of Mineral Resources.
Q. If you put a Class VI injector on the Swenson land and ran it at the same rates and volumes that Summit is going to run its wells, would that have any impact on Summit's project?
A. (BY MS. DOUGLAS) Yes, potentially.
Q. Do you think Mr. Swenson could get a Class II disposal well into the Broom Creek Formation permitted on his land in between the three Class VI injectors?
A. So my understanding is that the -- the Commission -- and I might not be using the proper terms -- but if they grant this permit, they will define this as a field, and so my understanding is

341

Mr. Swenson could permit the Class II or a Class VI well on his land. He would have to work with the Commission and make sure that he abides by any Commission orders related to those field rights.

Q. Given your knowledge of the technical feasibility of that, do you think the Commission's going to grant that permit?

A. I think development of any subsurface resources in the state require the cooperation of many entities, including landowners and project developers.

Q. How is Summit cooperating with Mr. Swenson to allow him to develop his pore space subject to the pressure increases caused by Summit's Class VI wells?

A. Is Mr. Swenson actively trying to develop those?

Q. Do you have the answer to my question?

A. I don't have any knowledge of Mr. Swenson actively trying to develop those.

Q. And so if Summit is preventing him from developing those, what does it matter if he's actively trying to develop them right now or not?

A. Could you clarify how Summit's --

Q. Why are you saying it's significant or

342

relevant whether or not Mr. Swenson is actively trying to develop a Class II well?

A. Your question you asked me, I believe -- and it can be repeated back here, but I believe you asked why is Summit preventing Mr. Swenson from developing his pore space.

Q. Okay. Well, if I asked that, I apologize. My intended question is has Summit worked with Mr. Swenson or reached out or talked to him about how their operations are going to affect his ability to use his pore space?

A. I was not privy to the discussions between Summit and Mr. Swenson.

Q. Would you agree there's going to be about a 900 psi pressure increase in the pore space in the reservoir under Mr. Swenson's land?

A. Approximately, yes.

Q. Is the max bottomhole pressure about 3,000, 3,500? What's the max bottomhole pressure on the BK Fischer?

A. It's on the range of, yeah, 3,600 psi to 3,800 psi, depending on what site-specific data --

Q. So you're going to increase the pressure in his pore space by approximately 25 percent of the max bottomhole pressure?

343

A. I've not done the specific calculations, but if you're saying that's what it is --

Q. Is 900 approximately one-fourth of 3600?

A. Yep.

Q. There was testimony yesterday about the delineation of the CO_2 plume boundary, and I believe the testimony was that it was determined to be at a 5 percent concentration of CO_2 in the aquifer as the edge of the CO_2 plume; is that right?

A. That's correct.

Q. And can you tell me again why 5 percent?

A. Yes. So there's several studies out there that suggest that 5 percent is the detection limit for monitoring techniques, particularly 3D seismic.

Q. Would it be fair and accurate to say that at the bottom of the injector, bottomhole, you've got about a hundred percent CO_2 in the formation, would that be fair, during injections?

A. Right -- right at the injection well?

Q. Right. I'm just saying if you start aground like right at -- where you're injecting, we can make an assumption that the CO_2 is a hundred percent of the fluid right there; right? Within one inch of the bottom of the well -- actually, let me ask you something. Are they perforating the

344

well?

A. They will be perforating the well.

Q. Okay.

A. Or -- yes, they will be perforating the well.

Q. Is there going to be a lateral?

A. No.

Q. Okay. So within the wellbore we're at a hundred percent CO_2?

A. Correct.

Q. And you're indicating the edge of the plume is 5 percent CO_2?

A. Correct.

Q. Does the concentration of CO_2 become more diluted in a linear manner as you move away from the wellbore?

A. No, not necessarily. I'd like to point you to page 3-25 and 3-26.

Q. Okay.

A. So these are showing cross-sections through the simulated plume. These are representing the gas saturation in the model cells. So saturation of CO_2 is also dictated by the porosity and permeability of the rock, so you'll note -- so, again, this has the 5 percent

345

saturation cutoff. You'll note along the wellbore you see an area of white, so this is on Figure 3-15a. Even at the wellbore saturation is below 5 percent due to the porosity and permeability in that model layer.

So it's -- it's dependent on porosity and permeability and how the CO_2 would flow in the formation.

And just a point of clarification, saturation will never be a hundred percent. CO_2 injection can never move all of the formation fluid out of -- out of the rock.

Q. Okay. Thank you. If we held constant permeability and porosity, would the CO_2 become more diluted in a linear or logarithmic function as you move away from the wellbore?

A. Not directly linear or logarithmic, but generally it would. At the edges of the plume is where you see more mixing of CO_2 with -- with brine.

Q. So, generally speaking, if we were to plot the reduction in CO_2 concentration on a linear scale out to 1 percent, and let's pretend we can measure, would the area of that line representing 6 percent to 1 percent be much longer than the rest of the line?

346

A. Based on the volumes being simulated here, no, it would be much, much smaller because you'd have a larger area with higher saturation.

Q. Would the area over which the saturation changes from 10 percent to 0 percent be significantly longer than the area over which it changes from 20 percent to 10 percent?

A. I can't really make an educated guess on that --

Q. What would you expect?

A. -- at this time.

Q. Would you expect that area from 10 to 0 percent to take longer or be longer than the area from 10 to -- or 20 to 10 percent based on what you know about how it dilutes as it moves away from the wellbore as an engineer?

A. Again, I don't think I could -- could speak on that.

Q. Okay. And the 5 percent, again, though, was chosen because that's essentially the detection limit and that's the lowest limit you can detect with running the models? Sorry. Let me start over.

The 5 percent is used because that is the detection limit from the seismic?

347

A. Correct. Based on published studies --

Q. Okay.

A. -- from other carbon capture and storage sites that are in operation.

Q. But you agree that's not actually the border or the edge of where the actual CO_2 being injected is traveling to?

A. As discussed, it's the boundary we can detect.

Q. How?

A. With seismic.

Q. But only to a 5 percent concentration of CO_2; right?

A. Yep.

Q. So we know that there is CO_2 outside of that boundary if that boundary is set at 5 percent. It sure doesn't go from 5 percent to 0 within a millimeter; right?

A. There's the potential for CO_2 to be --

Q. It's not just potential. Just as a matter of physics, there's obviously CO_2 outside of that boundary; right?

A. Yeah.

Q. Is there a plan to put two different wellbores in at each injector site?

348

A. That's my understanding.

Q. Is the intent to do any kind of directional drilling with the wellbores?

A. I believe so, but I can defer questions of that to a witness who can answer in more detail.

Q. Okay. Did someone generate a PHI-H map for the reservoir in the area -- areas of review?

A. I don't believe one was provided in the permit and I'm not sure if one was produced.

Q. Would the -- would EERC have produced the PHI-H map if one was produced?

A. Yes.

Q. Can I have you look at Figure 3-1?

A. I'm there.

Q. It says the distributed PHIE property along a roughly west-east cross-section. It seems obvious, but I want to make sure I understand. The little callout in the upper left with the red line, does that indicate the cross-section?

A. That does. The red line's the path of the cross-section.

Q. Okay. Do you see the vertical line for the Archie Erickson 2?

A. I do.

Q. And do you see just to the left of that

349

there's a couple areas with some fairly significant pockets of red, I'll call them?

A. Yep.

Q. And then if we look over at the Milton Flemmer, just to the right of that there's an area that is mostly blue and green with just a little yellow. Do you see where that is?

A. I do.

Q. If we took a hundred-foot diameter core in that area with the red splotches just to the left of the Archie Erickson and then we took a hundred-foot diameter core in that area with the blue and green just to the right of the Milton Flemmer, would one of those cores contain more available pore space for the storage of substances than the other?

A. Yes. If we're -- we're -- in a hypothetical case if we're assuming that this model is a hundred percent accurate and represents the rocks there, where you have higher porosity, you're going to have more pore space just mathematically.

Q. And there's also a difference -- if we did that same exercise, there's also a difference in the amount of pore space available for storage based on the vertical extent of the formation;

350

right?

A. You're saying based on the thickness?

Q. Correct.

A. Yes. That would be a factor in that calculation -- sorry. That would be a factor of the calculation, would be height, if you're calculating volume.

Q. And would a PHI-H map show us geographically what the various values were, taking into account the porosity as well as the thickness?

A. It would for the realization of the model in the permit. One thing to understand, while we use site-specific data as controls, we used variograms and other means to distribute properties to the best of our ability. It doesn't mean that the model will be a hundred percent accurate, which is why we have that five-year reevaluation period in case our model -- or the actual subsurface geology is slightly different than our model, so that we can account for those differences in how bottomhole pressure is responding to injection as well as how the CO_2 plume is migrating in the reservoir.

Q. But if we look at Figure 3-1 in that area of red just to the left of the Archie Erickson,

351

you're not saying that the model just randomly allocated an area of higher porosity to that specific location based on, you know, a factor of variability. It's doing that because it is predicting that that actually has more porosity there in that specific location; right?

A. It's being informed by control points, but we did uncertainty analysis looking at a hundred different cases for property distribution -- sorry, not a hundred -- a thousand different cases for property distribution. We chose the one P50 case which we feel is the most likely.

Q. And you couldn't have done that unless you were able to do sensitivity analysis?

A. Uncertainty analysis.

Q. Sorry.

A. But, yes, that's correct. Those are the steps we performed to determine which model we had the highest confidency in being the most probable case.

Q. And it's important to do that; right?

A. When you're the operator looking to define the boundaries of your storage facility area, it's important as you will be obligated to operate and CO_2 must stay within those bounds.

352

Q. What if you're the landowner with pore space on the outside of that boundary, is it important for them?

A. I don't understand what context it would be important for them. The operator's required to keep CO_2 within their boundaries. If CO_2 is going to go outside their boundaries, they're in noncompliance with their permit. If they have to adjust their boundaries, they are going to have to amalgamate or acquire that additional pore space outside, go through this major modification and hearing process to get that approved.

Q. With respect to the compensation being paid to the landowners whose property is being used by Summit, is there any consideration given to the actual porosity or actual thickness of their pore space?

A. I believe Summit chose to treat all landowners within the storage facility area equally, meaning that the compensation is based by a total amount of CO_2 injected and they're given the proportional payment for the amount of land they have within the storage facility area. They did not use a volumetric approach. So in a volumetric approach landowners would be paid for the actual

353

amount of CO_2. Why that's not done is it -- it would -- it would benefit the landowners directly around the injection well, so Summit chose to treat all landowners within the storage facility area equally instead of --

Q. Accurately?

A. I don't agree with that classification.

Q. Well, they're not paying the landowners based on the amount of CO_2 being stored in their pore space; right?

A. Summit's paying for the use of the pore space, so they are leasing the pore space.

Q. Are they leasing the pore space from my clients?

A. My understanding is that your clients are outside of the storage facility area boundary, so their pore space is not being leased for storage of CO_2.

Q. Can I have you flip back to Landowner 63.

A. I'm there.

Q. If you see the different colors next to the names and you look at the map, there are blocks of colors both within and without the storage areas, areas of review and outside of those boundaries?

354

A. Yep.

Q. I apologize. Bear with me one moment. I think I may be done.

Is there a place in the permit application where thickness or porosity is broken down by landowner or tract?

A. No.

Q. Okay. Whether it's in the application or not, was that ever done or attempted by EERC, to your knowledge?

A. No.

Q. How does it affect the accuracy of your 3D seismic if you are not doing it on certain tracts?

A. It has the potential to reduce the resolution and quality of the seismic data.

Q. And does it reduce the resolution and quality just for that area specifically or does that lack of seismic in that area impact the quality of the other data?

A. So the quality of the seismic data is dependent on the fold as well as the source receiver offsets, so it's dependent -- the quality of the image is dependent on the fold within each area. Fold is lower when you aren't allowed to have source and receivers in a specific tract.

355

However, if you have sufficient source receiver offset, the quality of data will be lesser for shallower formations, but you would -- depending on the side of the land where you don't have source and receivers, you may still have source -- sufficient source and receiver offset to produce high-quality images with a seismic of the deeper formations.

Again, that's going to be dependent on the depth of the reservoir, the source receiver offset and the area where receivers and source weren't allowed to be placed or operated.

MR. BRAATEN: I don't have any further questions.

HEARING EXAMINER GARNER: Any questions from the staff?

EXAMINATION

BY MS. MADCHE:

Q. I have some questions. I would like to start out with some of the questions that were deferred to this group from earlier. Let's see here.

So you had given testimony on the location of coal reserves and coal leases within the three storage facility permits. Would you be able to

356

answer approximately how close mining activity currently is from proposed equipment, aboveground infrastructure for the three facilities? So to repeat, for each three storage facility permits, what's the proximity to current mining activity to date from the aboveground surface infrastructure? And if you need to defer that, that's fine. Just let me know.

A. (BY MS. DOUGLAS) All right. I'm going to point you to the Exhibit 2.

MR. BENDER: It's 1B.

MS. DOUGLAS: 1B. Exhibit 1B, page 280. This is the Archie Erickson/BK Fischer permit.

Q. (MS. MADCHE CONTINUING) Yep.

A. Figure 2-50. So these reflect the closest mining operations from the Coyote Creek and Beulah Mine which are the closest mining operations to any of the three storage facility areas. And you can see on this map green shows future mining activities and brown shows mined out -- or areas where mining has already taken place. And you can see the approximate distance from those to the proposed injection sites as well as the flowlines. So here the scale we're looking at, I believe those are townships. So it's approximately three to

357

four miles, the surface facilities are, from the future mining activities.

Q. And just to confirm, yesterday in your testimony you had stated that there were no active coal leases where surface infrastructure was planned for the three facilities; correct?

A. Correct.

Q. So earlier I had asked a question on why the Milton Flemmer 1 was used as the type log in Article 1.15 for all three storage agreements. Could you elaborate as to why?

A. I can. So the Milton Flemmer well penetrates the entire thickness of the Amsden, so it was used as the type log so that we could accurately represent the depth to the top and the bottom of the Amsden and the thickness. The other two stratigraphic test wells drilled for the other storage facility areas do not penetrate the entire Amsden. That is why the Milton Flemmer 1 well was used as the type log for all three storage facilities.

Q. When it comes to the royalty payments, would you agree that due to the lack of history matching data that we have that there would be more uncertainties to allocating via volumetric versus

358

the tract participation as Summit has chosen to go forward with?

A. I would agree with that. I'd also add that there are limitations for using monitoring methods to quantify the amount of CO_2 in a given area in the subsurface. Monitoring methods such as 3D seismic and time lapse changes that can be captured in 3D seismic are susceptible to both changes in pressure and changes in fluid saturation, so you would not be able to accurately separate out effects of pressure from CO_2 saturation in order to assure you're compensating landowners using a volumetric approach.

Q. So now I'm going to move forward to questions that I have from Section 2 on the geologic exhibits. For the storage facility permit for the TB Leingang, what was the maximum pressure applied during the microfracture testing in the Milton Flemmer 1 well within the Spearfish/Opeche Formation?

A. I'll defer that question to a later witness who was involved in those tests.

Q. Would you be able to state who it's being deferred to specifically?

A. Ms. Jean Oddy.

359

Q. Okay. As it pertains to all three of the storage facility permits and to their stratigraphic test wells, can you explain how you determined which sand package within the Broom Creek you target for your microfracture in situ stress test to determine the fracture propagation pressure gradient?

A. I'll also have to defer that to Ms. Oddy.

Q. Okay. For all three of the applications and the three stratigraphic test wells, was the next dissipation zone above the injection zone, so your Inyan Kara, sampled at all three facilities?

A. I believe so, yes.

Q. And did those samples show evidence that the formations are currently hydraulically separated?

A. That's our interpretation of the data, yes.

Q. And in all three storage facility permits, has any Fox Hills wells been sampled?

A. (BY MS. OLSEN) There's historical groundwater sampling data in Appendix B throughout each of the three permits. Plans to test those wells in the baseline sampling plan are described in Section 5 and will be testified to later.

360

Q. So just to confirm, you reviewed any data that already existed which would be in Appendix B, but no baseline sampling has started in the Fox Hills?

A. That's correct.

Q. Core plugs taken from the base of the upper confining zone in the Milton Flemmer 1 well had a fairly high anhydrite weight percentage, around 86 to 98 percent. Similar in the Archie Erickson, there was around 95 and a half percent shown. Did geochemical modeling indicate that it was likely that the boundary between the two formations would dissolve due to that percentage of anhydrite?

A. (BY MS. DOUGLAS) Geochemical modeling done for the upper confining zone showed little to no dissolution of anhydrite due to geochemical reactions with the modeled CO_2.

Q. And would that apply for both the TB Leingang and the BK Fischer?

A. That's correct.

Q. So I'm going to ask some questions related to the formation imaging logs. Would you be the correct witness to answer for all three storage facility permit applications? I only ask because

361

it was discussed that you were going to have another witness at the end that would talk about differences between the three facilities, or are you good with answering them?

A. We're good with answering the questions to all three.

Q. Okay. So in the Milton Flemmer 1 well, both in the formation imaging logs and within the thin sections specifically where high anhydrite content existed, there were a handful of fractures that were shown. Can you please explain why these fractures don't pose a risk to the storage facility?

A. You said for the upper confining zone?

Q. Yes.

A. Could you point to specifically what depth interval?

Q. So in figure 2-33 and into 2-34 in the TB Leingang application, it shows that there are a handful of resistive litho-bound fractures present in the Opeche/Spearfish interval. Why are these fractures not a concern as far as containment?

A. They're not a concern for containment because they're commonly filled. In the case of the resistive bound fractures, they're commonly

362

filled with anhydrite.

Q. So they wouldn't have transmissibility to have CO_2 move through them?

A. Correct. They wouldn't have transmissibility in the sense of they wouldn't have sufficient permeability.

Q. So now in the BK Fischer application, similarly in the Archie Erickson 2 well, the investigation also found fractures, including one minor fault. I would have the same questions for that one. I'll let you get to the -- the figure here. So Figure 2-30 (c) specifically would show some of the fractures and the minor fault that was found within the Opeche/Spearfish interval.

A. For this well the fractures were also commonly filled either with anhydrite or clay. In the case of the minor fault, it -- it appears to be isolated. It doesn't appear to transect a sufficient vertical extent to -- to serve as a fluid migration pathway or to be transmissible. Meaning it's a minor fault and it doesn't cut through the entirety of the upper confining zone.

Q. And similarly in the last application, in the Slash Lazy H 5 well there were fractures found and a minor fault in the Amsden Formation.

363

A. Again, the minor fault -- or the fractures are commonly filled, in this case commonly with anhydrite. Similarly, given the geometry of this minor fault, it appears to be isolated and does not have properties to -- for it to serve as a fluid migration pathway.

Q. So I want to go back to the BK Fischer application. In the 3D seismic survey that was done across these three storage facilities, was the Stanton fault that was suspected to run through the northwest corner of the BK Fischer storage facility area found in the 3D seismic?

A. No. The proposed location of the Stanton fault is on the edge of the 3D seismic survey. We saw no indication of the fault or any deformation associated with the fault.

Q. So now I'm going to move to questions related to Section 3 for the model and simulation. Do you know what the geographical projection was used in Petrel for the geologic model?

A. I don't have that information on hand, but perhaps I could provide it after a break.

Q. Okay. And what is the cell size in the model both within and outside of the refinement grid?

364

A. Outside the refinement grid, it's a thousand by a thousand feet. Within the refinement grid, I believe it's 250 feet by 250 feet.

Q. So on Figure 2-3 on page 2-5 that shows a boundary for the simulation model, could you explain why the boundary was centered as shown in that figure within the geologic model?

A. Are you asking why the simulation model extent was centered within the geologic model extent?

Q. Yes. Or how it was determined as far as placement for the centering with it?

A. So the -- the simulation model extent was selected to cover Summit's sites and have enough of a boundary -- or have enough cells as to model the pressure plume and not have artifacts due to boundary conditions. Additionally, we wanted to incorporate the nearest site, the DCC West site, to evaluate potential pressure interference.

Q. In the numerical simulation, are all three facilities injecting across the same 20-year injection period?

A. Yes. That's what was modeled.

Q. In this section it's stated that the TDS value of the Broom Creek measured from the Milton

365

Flemmer 1 was used as the input for the numerical simulation. Can you explain why the Milton Flemmer 1 sample was chosen out of the three?

A. Yes. So the Milton 1 sample was the -- the meeting of the three values. We selected that as it was a site-specific value close to what could be considered an average between the three.

Q. And could you explain what effect the TDS input would have on the CO_2 plume?

A. Yeah. A higher TDS could potentially result in a smaller plume.

Q. Similarly, it's stated that the temperature and pressure gradients derived from the Milton Flemmer 1 were used in the simulation. Similarly the reasoning behind why the Milton Flemmer 1 was chosen?

A. One of the reasons being wanting to apply the same reservoir conditions associated with the salinity value.

Q. And could you explain what effect temperature has on the CO_2 plume? Movement, to clarify.

A. A difference in temperature could result in either a larger or smaller plume.

Q. So let's say like an increase in

366

temperature.

A. I can't recall at the moment. I could provide that answer potentially after a break.

Q. You had noted earlier that the CO_2 stream used in the geochemical modeling was done at 95 percent CO_2 and 2 percent oxygen to be more conservative because oxygen is likely what's going to be most reactive. Could you explain additionally -- so in earlier testimony with group one, they had stated that the minimum requirement for the CO_2 purity would be 95 percent to be able to take CO_2 from sources to send to these storage facilities. Can you explain why in the numerical simulation 98.25 percent was used instead of 95 percent? 95 percent being the minimum cutoff for Summit to take CO_2 from third-party sources.

A. Just to clarify, that's what Wade testified to, 95 not 98.

Q. Correct. But the model uses 98.25 percent. I'm just asking why 98.25 percent was used in the numerical simulation.

A. Sure. So 98 percent is the expected operational composition.

Q. And could you just explain what effect CO_2 purity also has on the CO_2 plume movement? So like

367

a higher CO_2 purity would have what influence on CO_2 plume movement?

A. In this case because of the compositions where we're talking about, the potential would be changes in plume size, but they -- it would be very minimal.

Q. As proposed well injectors are drilled, so for the three applications the six injectors haven't been drilled yet. As they are drilled and logging and coring and testing data is gathered, that planned to be incorporated into the geologic model and an updated simulation ran prior to starting injection?

A. I don't know specific plans to update the model, but I believe regulations require validation of the proposed model inputs with the injection well data, including the injection test that's required for each injection well.

Q. So to confirm, if -- if the results indicated a substantial change and the regulatory group requested that it be done, at that time it would likely be done?

A. By the regulatory group you mean the DMR?

Q. DMR.

A. Yes, we would.

368

Q. At what frequency will plume predictions be updated once operations are underway?

A. No less than every five years.

Q. So I'd like to go to Figure 3-6 on page 3-10 in the TB Leingang application.

A. I'm there.

Q. For all of the applications when showing the permeability curves used for siltstone and anhydrite, they were used equivalently. Could you explain why you're using the same? So to clarify, can you explain why the same permeability curve is used for siltstone and anhydrite?

A. Sure. That's related in part to the core analysis sampling and the data points available. Because siltstone and anhydrite are expected to be low permeability and porosity lithologies, we felt it was sufficient to apply this data set to both lithologies in the model.

Q. So I'd like to move to Table 3-5 on page 3-35.

A. I'm there.

Q. So for all of the applications when having this table shown for the EPA Method 1, you are using the proposed locations of one of the injection wells, being the TB Leingang 1, the BK

369

Fischer 1 and the KJ Hintz 1. Considering these wells haven't been drilled yet, can you explain how these values are derived?

A. Sure. So these values are taken from the geologic model and the simulation model.

Q. And can you explain why it was chosen to use these rather than the three stratigraphic test wells?

A. Given that we modeled to populate these, you'll note that, for example -- so I'd -- just trying to find a map I'd like to point you to. So I'd like to point you to page 3-22. So here is a map of the -- the average pressure change after 20 years of injection. Again, the AOR was defined using pressure data from the simulations. If you look at -- here in this case the green triangle represents the injection well and just to the southwest of that, that gray triangle represents the Milton Flemmer well, and you can see that there is a large difference in pressure between those two locations. So in that sense it was more appropriate to use data from the injection well location to be able to evaluate pressure change.

MS. MADCHE: That is all the questions I have. Thank you.

370

EXAMINATION

BY MR. STOLLDORF:

Q. Moving on to Section 4, I have some questions about locations. If you guys can't answer these, just let me know who can. Start on page 4-4, Figure 4-2. Just an AOR map showing occupied structures, among other things. How far exactly -- or approximately how far away from the facility are -- are occupied structures?

MR. BENDER: We have another witness who can provide that unless you know.

MR. STOLLDORF: Do you know who just so I know who to ask?

MR. BENDER: It will be Jimmy Powell.

MR. STOLLDORF: Jimmy.

Q. (MR. STOLLDORF CONTINUING) For the TB Leingang, BK Fischer and KJ Hintz wells, have any baseline samples been taken from these wells to date?

A. (BY MS. OLSEN) Not in this part of the Summit project.

Q. Okay.

A. Water -- Fox Hill -- you mean groundwater monitoring wells; correct?

Q. Correct.

371

A. Yep.

Q. This one is just related to the KJ Hintz facility area of review. The Raymond Jensen 1-34 well, File No. 4942, is a plugged and abandoned well within that facility. Can you briefly explain the protective measures that are being made to monitor the CO_2 plume movement near that well?

A. 3D seismic surveys will be taken at least every five years as part of the testing and monitoring plan to track the plume. And at or around year 19, Summit proposes putting in an additional groundwater monitoring well in the Fox Hills Formation nearby that legacy wellbore.

Q. Do you know how -- approximately how close?

A. I don't think the final location has been determined yet.

MR. STOLLDORF: Okay. That's all I have.

EXAMINATION

BY MR. SUGGS:

Q. Okay. Bear with me. A lot of my questions have been asked at different levels, so I'm going to have to pan through this as I go.

But I'm also going to start with a couple of questions that were deferred. One being the --

372

looking at Figure 1-1 on 1-2 -- on page 1-2 of the Leingang application. Okay. I'll start with the odd shape of the CO_2 plume as it exists in the modeled stabilized CO_2 extent. Is there any explanation for why we don't see CO_2 in that central area, the southwest central area?

A. (BY MS. DOUGLAS) Yeah. In this region of the model, we had low porosity and permeability layers. That's why you don't see predicted migration of CO_2 plume there.

Q. The low PHIE and perm, I guess, layers that exist in that area, were they arbitrarily -- and when I say "arbitrarily," just purely due to the variograms were they assessed or was there additional seismic evaluation that supported that low porosity/perm area?

A. There is additional seismic data that was used as control points and to -- to support the distribution of properties, but it should be noted that seismic data has resolution images for resolving thicknesses of different porosity and permeability layers, so there's potentially some uncertainty.

Q. Okay. So I guess in that explanation, did it just -- I'm going to tie this back to some of

373

the discussion on the depositional environment. Would the seismic in that area indicate it was partially interdunal or do you see the dune structures there or not?

A. Correct. That would suggest the low porosity and permeabilities typically associated with those interdunal dolomites as well as anhydrite deposits.

Q. Okay. And then I asked this as well earlier, but in Township 141 North, Range 88 West, Section 35, you'll note that on this exhibit, at least, the stabilized CO_2 plume extent does appear to contact the storage facility area border. Do you know what the distance is between there? What kind of buffer is applied at approximately around that area?

A. Yes. So regarding the stabilized CO_2 plume extent, it's a short distance, you know, on the order of 10 feet, but I would like to point out the red line is the CO_2 extent at the end of injection. So we feel that that buffer is reasonable, and we will, you know, reevaluate the predicted plume movement and our storage facility area boundaries no less than every five years to confirm that.

Q. So just to clarify, the red line is the

374

extent of the CO_2 migration at the end of the 20-year injection cycle?

A. Correct.

Q. And the gray that goes outside of that would be where the model is predicting that CO_2 to migrate during a ten-year postinjection phase?

A. Correct.

Q. Okay. Moving on to Sections 2 and 3, on page 2-17 -- I've got to get there myself. The narrative right above the figure indicates that the net sandstone thickness in the simulation model area ranges from 6 feet to 397 feet with an average of 140 feet. Can you point me at -- somewhere on the figure below, Figure 2-10a where it would approach 6, or is that a typo in any way?

A. I believe the typo should say -- I believe those values are from the geologic model extent, not the simulation model extent, so that is an error.

Q. Okay. So that wouldn't be -- so what should that read, then?

A. Because it's sandstone thickness, I'd have to calculate that from the model. I can't derive that from the thickness map.

Q. I guess looking at the isopach of the

375

Broom Creek, then, do you see anywhere on that map that you're presenting where the thickness would approach 6 feet? I mean in glancing at it, I thought the -- the thinnest that was represented was on the order of a hundred feet.

A. Yes. That's why I believe that that's an error. It should say those values are from the geologic model extent where the Broom Creek actually --

Q. Oh.

A. -- does pinch out, not the simulation model.

Q. Got you. So not the simulation, but the whole --

A. Correct.

Q. -- geologic?

A. So that -- I believe that sentence is in error.

Q. And that'd be where it would punch out to the northeast and the Broom Creek wouldn't exist --

A. Correct.

Q. -- far northeast of the whole model area?

A. Correct.

Q. Okay. Page 2-22. At the bottom of that page you indicate that there's, I guess, a sample

376

bias towards the sandstones that were sampled. Does that sample bias affect the overall model in any way?

A. No. So the core samples were used to calibrate petrophysical logs of porosity -- calculated porosity and permeability, and those logs were what were used to help derive model properties. So I -- I don't believe that that bias impacted the model in a significant fashion.

Q. Figure 2-16 on page 2-25.

A. I'm there.

Q. At the very top of the Broom Creek here, you have an anhydrite facies identified in column 7 on that figure. And then in column 8 when you upscale those for the modeling purposes, it's being applied the siltstone facies. Is there any effect on the modeling due to that or is there a reason that was applied instead of the anhydrite facies?

A. There is not an effect of that. Both the anhydrite and siltstone are populated as low porosity and permeability.

Q. So functionally they both act as confining layers in the modeling?

A. That's correct.

Q. That drives me to the geochemical side of

377

this so I'm going to jump probably largely over into Appendix C, but bear with me. The -- the narrative -- so I'm looking at C-15 and 16 here -- or sorry -- Figures C-15 and 16. I think I'm on C-12.

A. Figure C-15 and 16 or page --

Q. So the narrative that I'm asking about is on page C-12 where you reference Figures C-9 and 10, which those figures are on pages C-15 and C-16.

A. Okay.

Q. This narrative indicates that dolomite is the primary entity in dissolution and that anhydrite is precipitating it. I just want to confirm that.

A. That's correct.

Q. Okay. So in previous applications, the anhydrite has been identified as a primary dissolving element in those models, in those geochemical analyses. So I guess my questions here are what is different about the modeling that was done here or the chemistry of the water or the chemistry of the rock that is causing anhydrite to be a precipitant instead of a dissolving --

A. I don't have that answer readily available.

378

Q. Is that something that may be provideable in short term or is that something I might need a supplemental response on?

A. I could potentially provide it after a break.

Q. Okay. I guess I'll -- I guess I'll ask that if it's not something that can be answered in testimony after a break, that it would be submitted as explanation in supplemental.

A. Okay.

Q. Still on C-12 here -- bear with me. So actually on page C-14, Figure C-8. In this figure, the bottom figure, shows that mineral trapping is still on the negative side of the equation so more dissolution has taken place than precipitation at this point through the extent of what's presented on this figure; correct?

A. Yes. So what this figure is showing is why there's negative amount for mineral trapping. It's because of that dolomite being dissolved and that those dissolved carbonates are being attributed to as carbon that was added into the system.

Q. Okay. In previous testimony you indicated that it would be on the order of hundreds of years

379

before true mineralization started happening for CO_2 in the storage reservoir. Have you projected that out? Do you know a rough time frame when that negative trend starts moving the other way?

A. We have not modeled that.

Q. Okay. C-18.

A. Maybe just one point very quickly. Sorry, we're going back to Figure C-8. You can see by the slope of the curve, after CO_2 injection ends, we have less of that mineral trapping and that slows down over time.

Q. But you still haven't taken it to the point of when that actually reverses? It's just --

A. That's correct.

Q. -- expected or anticipated that it does reverse?

A. Correct.

Q. Okay. Going on to page C-18, the -- the narrative here for your PHREEQC model, and you've testified to this earlier, that you used the diffusion process for the mechanism by which the CO_2 would enter. And, conversely, if you look at later in the -- in the appendix when you're talking about the lower confining zone and the simulation that was done there, you're talking about advection and

380

dispersion. Can you elaborate a little bit on why the two different mechanisms are used for the two different confining zones?

A. Yes. So diffusion was used for the upper confining zone as CO_2 is a buoyant fluid which is -- so CO_2 is a buoyant fluid which is why we needed to use advection and dispersion which allowed the CO_2 to dissolve in -- in -- in brine and the density to allow it to enter the model cells for the lower confining zone.

Q. So for the lower confining zone -- sorry, I'm going to have to ask you to clarify that. Focus on why diffusion was used for the upper confining zone modeling.

A. I don't think I can elaborate and provide that specific answer at this time, but I could potentially provide it after a break.

Q. Okay. Probably the same situation, if I don't get that answer as part of testimony, I might want it as a supplemental.

A. Correct. We would be able to provide that.

Q. Page C-18 still. The formation brine for the simulation that was done on the Opeche and as well as the -- or the Opeche/Spearfish as well as

381

what was done on the Amsden for the lower confining zone, in both cases you used the brine composition as it was determined from Broom Creek samples?

A. That's correct.

Q. Can you elaborate on why?

A. Just let me confirm something real quickly.

So it's my understanding given the porosity and permeability of at least the Opeche/Spearfish, we weren't able to collect a fluid sample due to the immobility of the water due to low permeability. Therefore, we used the Broom Creek as a representative sample as we don't believe the composition will vary greatly.

Q. Okay. Still on page C-18, Table C-4 the average mineral composition of the Opeche/Spearfish that was used here, can you confirm which facies within the Spearfish that would represent -- or the Opeche/Spearfish?

A. This sample -- the average sample here is approximately 60 percent mineral weight anhydrite, so I'd interpret that as anhydrite.

Q. On page C-19, middle paragraph there when you're discussing Figure C-13, you indicate that the net change due to precipitation or dissolution,

382

in this case you're referencing C2, which is a cell within the model that was done, has less than 5 kilograms per cubic meter net change. That net change, is that positive or negative?

A. I'd have to clarify how that was calculated and provide that as a supplement.

Q. I don't think I could confirm or guesstimate with the figure in front of me which way that would be going, so if we could confirm that as well.

A. Yep. We could provide that as a supplement.

Q. Page C-25, similar question. This happens to be the -- Table C-6 on page C-25 -- averaged mineral composition for the Amsden formation that's being presented in this table. Could you elaborate and confirm which facies that were represented in your modeling?

A. I'd characterize that as a -- well, it would be represented as a dolostone in our model.

Q. Okay. I guess a similar question on page C-28. The narrative at the -- in the bottom paragraph, again you're referencing an overall net porosity change as less than 2 percent. And can you tell me whether that's a positive change or a

383

negative?

A. I would like to provide that as a supplement.

Q. Okay. Then back up to Section 3, page 3-7, I believe. The bottom paragraph on page 3-7 you discuss the distances from the edge of the model and the volume modifiers that were applied as boundary conditions. Can you spend just a few moments confirming what those distances are measured from and to within the model? And then -- well, I'll let you do that first.

A. So those distances are measured from the Broom Creek extent interpreted by the EERC which is shown on page 2-16 in Figure 2-9.

Q. So the distance you're referencing there is the distance from the edge of the Broom Creek to the edge of the modeled area?

A. To the edge of the simulation modeled --

Q. The whole simulation.

A. -- area. That is correct.

Q. Okay. And then when applying your volume modifiers as boundary conditions, can you elaborate on what the effect of those are within the model?

A. Yes. So we applied the volume modifiers to represent the fact that we don't have an

384

infinitely acting aquifer where the Broom Creek pinches out. Because we don't have an infinitely acting aquifer, there will be differences in how pressure responds in the reservoir due to that pinch-out. And so these modifiers were applied to take into account that difference in boundary condition between an infinitely acting aquifer and the closed boundary.

And so the volume modifier is used in the CMG calculations with the boundary condition to account for the specific distance beyond the model where that pinch-out occurs, and so that is accounted for with the boundary conditions as it relates to the simulated pressure.

Q. So the -- the cell -- the modifier being applied to a boundary cell allows -- allows that cell to act as if it has a larger volume than its individual cell size?

A. That's correct. To allow the computational simulator to account for how that pressure would respond outside of the model.

Q. So the smaller values have less distance or less volume in the reservoir in that direction --

A. Correct.

385

Q. -- towards a pinch-out or towards a boundary of the -- the -- I guess the Broom Creek as a whole as opposed to what's actually simulated within the model?

A. That's correct.

Q. So this was asked a little bit, so I'm on page 3-8, the description your capillary pressure curves, and you indicate that they were derived from mercury capture -- mercury injection capillary pressure testing on the cores; right?

A. Correct.

Q. But then that they were modified. Can you elaborate on the need why they were -- why it was necessary to modify those core-derived values and what that process looked like?

A. So those values were calculated using data for -- from a single sample, so we looked at the porosity and permeability from that sample to upscale it to the ranges of the porosity and permeability reflected in our model.

Q. Okay. When you say that, was that -- when you say the single sample, you're referring to the single sample that was used to derive the two confining zones, being anhydrite facies values and siltstone facies values, or am I -- yeah, siltstone

386

and anhydrite.

A. We took capillary entry pressure data from a single sample from those units to derive these curves.

Q. Okay. And so, I guess, the modification of that mercury -- mercury-injection-derived data to be representative for CO_2 injection, what was done to, I guess, adjust the mercury fluid properties to the CO_2 fluid properties?

A. I could provide that answer after a break.

Q. Okay. Same, I guess, question or same response, then, if it's something that doesn't come as part of direct testimony, we'll want supplemental explanation for it.

Down in the AOR page 4-14, it was actually referenced in a number of locations, including on page 4-12 in Table 4-6, but there's a reference that's being used to the Tongue River Formation for a freshwater aquifer. I just -- I guess I'm just going to point out and confirm that Tongue River isn't a formation recognized on the North Dakota stratigraphic column at this time. There's an RI 59 -- Report of Investigation 59 that was published in 1977 that proposed renaming the Tongue River and the Ludlow as they correlate from Montana and

387

Wyoming to the Slope and -- drawing a blank on the other one and I don't have it written here -- but rename those two formations. The Tongue River as you're referencing here would be equivalent to those two formations that are represented on the geologic strat column in North Dakota; correct? Or can we confirm that?

A. (BY MS. OLSEN) We can confirm that.

Q. Okay. On page 4-16, there's a line here in your narrative that reads, "The Pierre Formation is the thickest shale formation in the AOR and primary geologic barrier between the USDWs and the injection zone."

The primary barrier would be the upper confining zone; correct?

A. (BY MS. DOUGLAS) That's correct. So that's a misstatement.

Q. It would just be an additional barrier --

A. Correct.

Q. -- of significant thickness as what's indicated?

A. Yeah. We -- we consider it as a tertiary confining zone because there's the primary confining zone, a secondary confining zone, and then we consider the -- everything between the

388

Inyan Kara Formation and the Fox Hills as a tertiary confining zone.

Q. One last item I'm going to jump -- it kind of mixes between the AOR and the -- and Section 3. It's actually on 3-42 I think where the -- page 3-42 where the narrative is. Right at the bottom of this page there's a statement, "Therefore, the AOR is delineated as the storage facility area plus a 1-mile buffer."

This immediately follows a discussion of the risk-based AOR approach that was taken, but the one-mile buffer that's applied for that AOR, is that -- is there any importance to the one mile that's being used or is that just a value that is chosen?

A. I can confirm during break, but to my understanding, that the AOR at a minimum has to be the storage facility area plus a one-mile buffer, but I will confirm that my understanding is correct during the break.

MR. SUGGS: Okay. That'll be all I've got on these sections.

HEARING EXAMINER GARNER: Okay. At this time why don't we take a break for lunch for an hour.

389

(Recessed at 12:29 p.m. and reconvened at 1:30 p.m.)

HEARING EXAMINER GARNER: Okay. We are back on the record.

Attorney Bender, how would you like to proceed? Are we going to answer some questions that were pending?

MR. BENDER: Yes. I don't know if I should say we'll recall -- we'll bring back Amanda Douglas who -- and there were some questions posed for her and she said she needed a little time during the break to research those answers. What we were proposing, perhaps to save some time, is she can read what she believes to be the question and then she can give the answer. And then there was a question or two also that Caitlin Olsen got that needed a little time to respond to. So I can just ask Amanda a few questions and proceed that way, if that's okay with you, Mr. Examiner.

HEARING EXAMINER GARNER: Is that okay? That's fine.

REDIRECT EXAMINATION

BY MR. BENDER:

Q. All right. Amanda, before we took the break, when you were answering some questions that

390

were posed to you by the Commission staff, I believe it was your testimony that if you had a little time during the break, you could take a look at some of your notes and some of the documents you have and respond to those questions; is that correct?

A. (BY MS. DOUGLAS) That's correct.

Q. Do you want to just walk through the questions as you understood them and then provide us with the responses?

A. Yes.

Q. Okay.

A. With respect to the projection system used, it was NAD27 North Dakota State Plane South U.S. feet.

The Commission had a question about generally how would having a higher reservoir temperature impact plume size. So it should be noted that temperature isn't the main driver in dictating plume size. There's other parameters that are more sensitive or the -- the -- the CO_2 plume size is more sensitive to other parameters. But generally a higher temperature could result in a bigger plume.

I had a question on why we saw

391

precipitation of anhydrite and dissolution of dolomite and what constituents in the water chemistry or the mineralogy used for those models was different than previous permit submitted that would cause this. We would like to provide that answer as a supplement.

I had questions about the transport mechanisms for the PHREEQC modeling. For the upper confining zone, diffusion is expected to be the dominant transport mechanism due to the buoyancy of the CO_2. At the boundary between the reservoir and the confining zone, the reservoir will have a higher CO_2 concentration, so diffusion will allow the movement of gas from an area of high concentration to an area of low concentration.

So with respect to advection and dispersion, these are the expected dominant transport mechanisms for the lower confining zone. So dispersion in the sense of the CO_2 mixing and forming saturated brine and that saturated brine mixing with unsaturated CO -- brine that's unsaturated with CO_2 and the different densities between the two and that mixing by dispersion, so between that and advection, those are the expected dominant transport mechanisms, and that's why those

392

were used for the lower confining zone.

And there was a question on the use of MICP data and calculated relative permeability data, and we'd like to provide that as a supplement.

Q. That's all you have? Those were the questions you received; is that correct? Those are the questions?

A. Those are the questions I received. There is one more question that I received that Ms. Olsen will be providing the answer to.

MR. BENDER: Mr. Examiner, unless there's other questions from the staff of Ms. Douglas, I would move to Ms. Olsen.

HEARING EXAMINER GARNER: Okay. That's fine.

Q. (MR. BENDER CONTINUING) Caitlin, can you recite for us what the question was that you're going to address for us now?

A. (BY MS. OLSEN) Yeah. The first question, Rich, I believe you asked -- I don't remember the order in the questions, but you had asked about the nomenclature for some of those aquifers and namely the Tongue River. The new name that is more recently used is Bullion Creek, and so that is the

393

same formation. We're talking about the same thing there, just to clarify.

And then the second question you had asked about the AOR and the minimum one-mile buffer outside of the storage facility area. That language comes from 43-05-01-05 and it's -- that language is outside throughout that rule, and it references it -- the area several times. And just to give an example, it will say something like the evaluation must do X, Y, Z in the facility area and within one mile of its outside boundaries.

So the AOR, when we talk about reviewing wells and items inside of the AOR, is the storage facility area and one-mile boundary pursuant to 43-05-01-05.

MR. BENDER: Okay. If there's no questions from the staff, Mr. Examiner, we're ready to move forward with our next witness as we talked. Oh, I'm sorry.

MR. SUGGS: I did have a couple questions that weren't addressed.

FURTHER EXAMINATION

BY MR. SUGGS:

Q. The net positive or net negative?

A. (BY MS. DOUGLAS) I had stated earlier

394

that we'd like to provide those, too, as supplements.

Q. Okay. As a supplement still. Okay. And then I apologize, but I did have one set of questions that I forgot to hit and I have to find it again in my notes. Page 2-66.

MR. BRAATEN: Of Exhibit 1A?

MR. SUGGS: Yes.

MR. BRAATEN: Thank you.

Q. (MR. SUGGS CONTINUING) And I guess the narrative actually starts on page 2-65 regarding your Mohr-Coulomb Critical Stress Analysis of Faults. The faults that you have depicted in Figure 2-42, can you identify what depths those were identified at or what range of -- there's been testimony that there's no faults in the injection reservoir or the confining zones. So where are these faults coming from? How were they identified?

A. Yes. So the 3D seismic survey acquired over the project area led to the identification of several deep faults within the storage -- all three storage facility areas. These faults originate within the Precambrian basement and all of them terminate below the top of the Interlake Formation,

395

which is approximately 3,000 feet below the Broom Creek Formation.

Q. So they're all deep --

A. Correct.

Q. -- features?

Okay. And those are some of the items that are identified or at least visibly identifiable on Figure 2-41 on page 2-64?

A. That's correct.

MR. SUGGS: Okay. Thank you.

MR. BENDER: Okay. Mr. Examiner, if there aren't any further questions, our plan now is to call four new witnesses, and then we will recall Caitlin Olsen to do the comparison between what we've discussed in great detail, which is the Leingang with the Fischer and the Hintz. And then we're going to recall Wade Boeshans to talk about the amendment that the Commission received a letter on from Minnkota.

HEARING EXAMINER GARNER: Okay.

MR. BENDER: So our first witness will be James Powell.

HEARING EXAMINER GARNER: Mr. Powell, please raise your right hand.

396

JAMES POWELL,

being first duly sworn, was examined and testified as follows:

DIRECT EXAMINATION

BY MR. BENDER:

Q. You go by Jimmy; is that correct?

A. Yes, sir.

Q. Will you state your full name for the record?

A. James Earnest Powell.

Q. And, Jimmy, by whom are you employed?

A. Summit Carbon Solutions.

Q. And in what capacity?

A. Chief operating officer.

Q. What I'd like you to do is briefly highlight for the examiner, Commission staff and opposing counsel your educational background and work experience.

A. Okay. I have a bachelor of science in engineering, and I have about 35 years of experience in the energy industry, predominantly upstream/midstream, with the last 25 leading large projects such as this, both internationally and in the U.S.

Q. Okay. So I'm just going to have a

397

question or two for you having to do with engineering and operational design. To what standard will the flowlines be constructed?

A. The flowlines, like the remainder of the pipeline system, will be constructed -- designed, constructed and operated in accordance with DOT regulations, CFR 49, 195.

Q. Okay. And can you explain how the three entities that have made application for the storage permits are going to work together and monitor this system and utilize the data that's provided throughout the SCADA system?

A. Yeah. So from receipt of the CO_2 molecules at the capture facilities through transportation of the pipeline system and through -- to the sequestration system to the injection site and subsurface, it will all be operated as one integrated system under one supervisory control and data acquisition system, and it will be controlled from a single control center.

MR. BENDER: And, Mr. Examiner, after I finish with a few questions of these other witnesses, Mr. Powell will be available for questions from the staff. So if I can move to the next witness, I'll do so.

398

HEARING EXAMINER GARNER: Sure.

MR. BENDER: Next witness is John Hunt.

HEARING EXAMINER GARNER: Mr. Hunt. Please raise your right hand.

JOHN HUNT,

being first duly sworn, was examined and testified as follows:

DIRECT EXAMINATION

BY MR. BENDER:

Q. John, would you state your name for the record, please?

A. (BY MR. HUNT) John Hunt.

Q. And, John, by whom are you employed?

A. By EERC.

Q. And in what capacity?

A. I'm a senior geoscientist and measurement reporting verification, or MRV, specialist.

Q. And can you briefly provide for the Commission staff your educational background and work experience?

A. Sure. So I hold bachelor of science and master of science degrees in geology. I'm a licensed professional geologist. And prior to the EERC, I worked at Chesapeake Energy as a petroleum geologist.

399

Q. Okay. And you're going to talk just a little bit about -- at least from questions from me, about Section 5 of the application which is -- has to do with testing and monitoring; is that correct?

A. That's correct.

Q. Okay. And my first question is can you provide a brief summary of Table 5-2 in the application?

A. Yes. So Table 5-2 begins on page 5-4 of the TB Leingang application or Exhibit 1A. And let me back up here just a little bit. So the testing and monitoring plan, the full plan is laid out between Tables 5-1, 5-2 and 6-1. So 5-1 being the preinjection plan, 5-2 is the operational plan and 6-1 is the postinjection plan. We're hitting the highlights of Table 5-2 simply because this makes up the bulk of testing and monitoring and includes all of the different various activities that Summit will -- will perform.

And so let's -- yeah, again, let's go to Table 5-2. This is an overview of the operational testing and monitoring plan. And just to start us off, a brief description of the -- of really what's contained in this table. So if we're looking at

400

the columns and we're stepping left to right, we see the first thing is the Monitoring Type. I'll touch on that a little bit more in a minute, but essentially, you know, whether it's a CO_2 stream or surface facilities, the wellbores or the environment, those generally make up the monitoring types.

Then we step over and we have the Parameter, so what parameters are we interested in measuring. And then the next column describes the activity that will collect those data. Then we have the primary purpose of the activity listed, the equipment and any tests associated with gathering that data. The location where that data will be gathered and a sampling frequency described.

Finally, in the last three columns, we have how that data -- what data will make its way into the reporting to DMR. So we have the Report Content, the Reporting Method and then the Reporting Schedule specified.

So how I like to think about this plan overall is you're really following the CO_2 stream as it enters the sequestration facility, and you're first and foremost analyzing the CO_2 stream in terms

401

of composition and end-to-end metering. So those are some of the things highlighted in the rows within the CO_2 Stream Analysis section. There's also the Surface Facilities Leakage Detected -- Detection Plan as well as the Corrosion Prevention and Detection Plan. Those generally at a high level have already been touched on a little bit so I won't go into great detail there.

And then we move to the wellbore sections. Now the CO_2 stream has traveled through the surface facilities and it's entered the wellbore, so here we're primarily focused on activities that look at monitoring wellbore integrity. So, for example, pressure, temperature gauges, fiberoptic cable, all of which provide continuous readings to monitor the -- the operations of those wells, of the injection wells.

And, finally, we have -- I guess continuing on the wellbore monitoring part, we also include a Downhole Corrosion Detection Plan, and the key activity there is the pulse neutron log which is also feeding into the wellbore mechanical and integrity piece where we have periodic pulse neutron logs planned to be acquired throughout the life of the project.

402

And then, finally, the -- so now we've injected the CO_2 into the storage reservoir and what we're interested in is monitoring the volume in a targeted way as that CO_2 expands within the storage reservoir and ultimately that volume contained within the area of review boundary. So we have a Near Surface monitoring plan, which is primarily made up of soil, gas and groundwater -- I guess wholly made up of soil, gas and groundwater sampling, and then an Above-Zone Monitoring Interval, which is defined as the Opeche/Spearfish to the Skull Creek. Again, pulse neutron logging for logging saturations, and then the fiberoptic cable to look at temperature.

And -- and then, finally, we end with the monitoring of the storage reservoir itself which, again, will be conducted with the fiberoptic cable to monitor the temperature profile of the storage reservoir as well as casing-conveyed pressure temperature gauges on the injection wells and -- and also a downhole pressure temperature gauge installed in the reservoir monitoring well. And then we have planned 3D seismic surveys as has been testified to a little bit prior to this point, as well as a plan for monitoring seismicity with a

403

surface array of seismometers.

MR. BENDER: No further questions of this witness. And the next witness will be -- yeah, next witness is going to be Jay Volk.

HEARING EXAMINER GARNER: Jay Volk. Mr. Volk, please raise your right hand.

JAY VOLK,

being first duly sworn, was examined and testified as follows:

DIRECT EXAMINATION

BY MR. BENDER:

Q. Jay, can you state your full name for the record, please?

A. (BY MR. VOLK) Yes. Thank you, Lawrence. Jay Volk.

Q. And, Jay, by whom are you employed?

A. Summit Carbon Storage.

Q. In what capacity?

A. I am the sequestration director of health, safety, environmental.

Q. Okay. And can you provide for us briefly your educational background and work experience?

A. Yes. Lawrence, I have a bachelor's degree, master's degree and PhD -- PhD from North Dakota State University. My PhD is in the

404

department of natural resources with range sciences. My work history has largely been through BNI Coal. Spent approximately 17 years there working on permitting, compliance, testing and monitoring, financial assurance plans and site closures. The last two years I've been employed with Summit Carbon Solutions working within the Class VI regulations.

Q. You're going to have to slow down a little bit.

A. I apologize. Thank you for the reminder.

Q. And, Jay, you're here today to discuss Section 7, which is emergency and remedial response plans; is that correct?

A. That is correct.

Q. As well as financial assurance which appears in Section 12; is that correct?

A. That is correct.

Q. Okay. So you'll be able to handle questions from the Commission staff on those two subject areas; is that correct?

A. That is correct.

Q. Okay. Let me just ask you a question or two, first with respect to emergency and remedial response. Can you tell us generally what is the

405

purpose of emergency and remedial response plans?
A. Yes. Lawrence, the purpose of the ERRP in Section 7 is really to provide guidance for a quick, safe and effective response plan to keep the community and -- community, workers and the environment safe. Items that we look at included in there are definitions and reviews of local resources --
Q. Slow down a little bit.
A. I am sorry for a second time.
Looking at areas such as what are the local resources in the areas, identification of potential events, as well as the response to the events.
Q. And can you explain for us, slowly, the interactions that you've had with local first responders in Oliver, Mercer and Morton Counties?
A. Yes. Our interactions between the three counties have really included a multilayered approach to outreach. We've engaged all three counties with LEPC meetings. We've worked within dispersion methodology of meetings. We've worked individually with LEC portfolio holders, as well as with local responders on an individual basis through safety tours or landowner meetings.

406

Q. Okay. Jay, let's shift gears a bit and talk a little bit about Section 12, which is Financial Assurance Demonstration Plan. Can you provide for us a brief overview of the methodologies used to determine the financial assurance? And if you have to direct the Commission's attention to any part of the application, that'd be great.
A. Thank you, Lawrence. And I would direct you to Table 12 -- or excuse me -- 12-1 on page 12-2. The methodology that we used in developing the financial assurance plan really consisted of known cost, which included areas such as plugging in injection wells, the PISC -- the PISC plans, testing and monitoring, as well as site closures and the flowline abandonment sections.
Other areas we looked at were estimated costs, and that was used to determine the ERRP as well as endangerment to USDWs. We also looked at previous literature as well as previous Class VI permits in developing the financial assurance plan.
Q. Okay. And can you provide for us an overview of the cost estimates associated with the financial assurances?
A. Yes. So, again, referring to Table 12-1,

407

for the TB Leingang, the plugging and injection well cost was 1,166,000. Likewise, the PISC storage and facility monitoring was 4,225,000, as well as the flowline plugged and abandoned at 243,000.
And, I apologize, I'd have to ask -- the PISC and storage facility is 4,225,000 if I misspoke on that. The ERRP is 11,100,000. And the endangerment of USDW is 2,695,000. And that gives a total of 20,316,000 between the three -- or excuse me -- between the TB Leingang.
I do want to make a quick reference before I move on to the other two sites is what is covered by the surety bond versus pollution liability policies is also outlaid in Table 12-1 in which the plugging of injection wells, PISC storage facility and monitoring, flowline plugged and abandonment cost, as well a site closure and remediation will be covered under a surety. Whereas, an ERRP as well as the endangerment of USDWs, a pollution liability policy will be used.
Again, there is minor differences between SCS2 and SCS3 in which the total bond for SCS2 proposed is $20,868,800 as well as the KJ Hintz at $20,817,800.

408

Cumulatively, the three are bonded at just over $62 million.
MR. BENDER: Mr. Examiner, that's all the questions I have for this witness. We do have another witness that we'd like to call at this time, Jean Oddy.
HEARING EXAMINER GARNER: Ms. Oddy, please raise your right hand.

JEAN ODDY,

being first duly sworn, was examined and testified as follows:

DIRECT EXAMINATION

BY MR. BENDER:

Q. Jean, would you state your full name for the record, please?
A. (BY MS. ODDY) Jean Oddy.
Q. And by whom are you employed?
A. Summit Carbon Solutions.
Q. In what capacity?
A. Sequestration project engineer.
Q. And could you briefly highlight for the Commission staff your educational background and work experience?
A. Yes. I have a bachelor of science in petroleum engineering from Montana Technological

409

University. Before Summit I worked for Neset, which is an engineering and geological consulting firm, in which most of my responsibilities was around drilling engineering, design and operations, as well as plugging and abandonment projects in the Williston Basin, including wells such as Class II saltwater disposal wells. And I joined Summit last year in January.

Q. Okay. And you're here to discuss any questions the Commission staff might have about well design, casing, cementing, plugging and completion; is that correct?

A. That's correct.

Q. Okay. A question or two having to do with well design and casing. Can you -- excuse me. With respect to Section 9, can you describe the well construction plan design? And if you have to refer to a particular figure or exhibit, please do so.

A. Yes. I'd like to direct your attention to Figure 9-1 on page 9-2. So in this well construction program, starting with the surface section, the surface hole will be drilled with freshwater-based drilling fluid down to a depth within the Pierre Formation. Surface casing will

410

then be set and placed at least 50 feet below the base of the lowest underground source of drinking water. Surface casing will then be set and cemented in place from the surface casing shoe all the way to the surface of the ground to provide isolation to and from the underground source of drinking water.

Moving on to the next section, we've got the long string casing, so that section will be drilled and cored at specific intervals. And then in accordance to Class VI regulations and administrative code, corrosion resistant alloy casing will be set in place to a depth below the Broom Creek Formation which is in the Amsden. The long string casing will then be cemented in place with CO_2 resistant cement from the shoe all the way through the Mowry Formation, then cemented to surface.

MR. BENDER: Mr. Examiner, that's all the questions I have for this witness.

I would point out that at this point in time, given the space that we have here for witnesses to sit, I would like to give the Commission an opportunity to ask these witnesses questions, and then also point out that we do have

411

two other individuals who are in the audience. And in the event these witnesses have some questions that they feel can be better answered by someone else, I would bring those people up. One is Jamey Backus, B-a-k-k-e-s [sic], and the other is Luis -- how do I pronounce that?

MR. POWELL: Piasco.

MR. BENDER: Piasco, P-i-a-s-o [sic].

HEARING EXAMINER GARNER: Okay. Any questions from the staff?

EXAMINATION

BY MS. MADCHE:

Q. I will go ahead and start. As before I'm going to start with what I think are deferred questions for this group. Early on Richard Suggs had asked on whether or not you would be able to provide industrial codes that best reflect the capture sources, such as the ethanol facilities. Is that something that you can provide at this time?

A. (BY MR. VOLK) Yes. The ethanol NAICS is 325193 reflecting as asked for the capture NAICS code, and that is for ethanol.

Q. Earlier an answer was provided for approximately how many miles of the MCE pipeline

412

transmission pipeline system is within the North Dakota PSC jurisdiction. 352 miles was provided, but I believe, Jimmy, you would be able to confirm that number?

A. (BY MR. POWELL) Yes. It's 3 -- approximately 332 miles are in the jurisdiction of the Public Service Commission. In the delta roughly 19 miles is within the NDIC jurisdiction. So Wade had it accurate and correct. But the PSC is 332.

Q. Okay. I had asked earlier on with the first group yesterday on whether or not royalties were being paid on the full CO_2 stream or just the CO_2 mass of the stream. Is there anyone in this group that can confirm that or is that something that would need to be a supplemental?

MR. BENDER: No one can answer that. We'll have to supply you with supplemental information on that one.

MS. MADCHE: Okay.

Q. (MS. MADCHE CONTINUING) In Section 2 earlier I had asked what the maximum pressure was applied during the microfracture testing in the Milton Flemmer 1 that was done across the Spearfish/Opeche Formation.

413

A. (BY MS. ODDY) Yes. I would like to direct your attention to Figure 2-7 on the TB Leingang 1 permit.

Q. I'm ready.

A. So relative to Milton Flemmer 1, the maximum injection pressure is highlighted with the black square box on the image on the upper section there, and from that graph it looks like around 5580 psi was -- was pumped as a maximum. However, after evaluation, there was no breakdown pressure observed at that maximum pressure injected.

And then referring to Table 2-4, we do have a summary on the Opeche/Spearfish microfracture stress test breaking down your breakdown pressure as well as your propagation pressure.

Q. So some additional questions as it pertains to the microfracture testing that was done. A question that I had posed earlier was how do you determine which sand package within the Broom Creek to target for these tests?

A. So prior to the micro in situ stress tests, we ran logs such as your magnetic resonance log as well as an FMI log and sonic log, and in combination of that along with the core photos that

414

we observed, along with some field description, were able to pick the representative sand package within the Broom Creek Formation and pick the test steps.

Q. Could you elaborate a little bit more on what makes a representative sample?

A. Yes. So I'm going to go back here to another figure. Figure 2-5. We looked at the sonic log, and on column 7 we've got the facies there, so we looked at, you know, a good, thick sandstone package. And then looking at the magnetic resonance log, that showed us good porosity in that test point. Then looking at making sure there are no visible bedding or fractures within the core photos that was -- that was collected and any field description that was noted by the geologists on site.

Q. So just to confirm, you're looking for a sand package that would represent good porosity and permeability but without fractures that could possibly affect the results of the MBT test?

A. That's right.

Q. So as a follow-up to that, on average to date across the Broom Creek on previous applications, the frac grading has between 0.69 psi

415

per foot to 0.712 psi per foot. Could you explain why we're seeing a larger variation across these three facilities, specifically as it relates to the Slash Lazy H 5 which was at 0.784 psi per foot which would be above that range, or what you anticipate might have caused it to be higher than what we've seen to date on past applications?

A. So with that for the KJH -- or sorry -- the Slash Lazy H 5, cause of that could potentially be activities during the drilling operation that may impact. Also could be some bedding within the FMI logs that was observed.

However, we are willing to, you know, work with the DMR on solutions on confirming that -- that value at the KJH sites. It is also part of our plan to perform an in situ stress test in the KJH, at least on one of the wells. In addition, we are planning on performing an injectivity test in the injection wells again to confirm these values, and that also applies in all six injection wells.

Q. Would you be able to explain what effect the frac gradient has on the CO_2 plume size?

MR. BENDER: That's probably a question that we'll have to recall Amanda to answer.

MS. MADCHE: Okay. And am I correct that

416

we'll want to do that at the end as far as recalling?

MR. BENDER: Yeah. What I thought we'd do is after we finish with this group, once again, because of the size of the group, we're going --

MS. MADCHE: Sure.

MR. BENDER: -- to have to recall Wade Boeshans and also Caitlin, and perhaps we could bring Amanda up at the same time and get that done if the examiner's okay with that.

HEARING EXAMINER GARNER: I am okay with that. I was going to allow cross of these four before they go to sit down and bring them back up and sit down and bring them back up. Does that work? Is that fine?

MR. BENDER: I mean, there's a lot of people. I think it's a lot of cross. We can finish our -- the remaining witnesses, I think, very quickly. That's kind of what I had in mind this morning, but it's certainly your call, Mr. Examiner.

HEARING EXAMINER GARNER: Mr. Braaten, any input? Are you okay waiting with the other witnesses to be called and then we can -- then you'll have an opportunity to cross any one of the

417

witnesses and recall them up here.
MR. BRAATEN: Yeah. I think with respect to that, I just want to be clear on record that specifically because what I'm running into now is difficulty with scheduling with experts and when they're going to be here, but thinking about what Mr. Bender is saying whether I cross these folks now or cross all of these folks right after, I don't think that's going to help me on anything else, so --
HEARING EXAMINER GARNER: Okay.
MR. BRAATEN: -- I'm okay with that --
HEARING EXAMINER GARNER: Okay.
MR. BRAATEN: -- but reserving my prior objections --
HEARING EXAMINER GARNER: Sure.
MR. BRAATEN: -- on the scheduling.
HEARING EXAMINER GARNER: Your objection's noted, so we'll go then with your witnesses.
MR. BENDER: Thank you.
Q. (MS. MADCHE CONTINUING) Okay. Just to continue on the microfracture testing which you've already given some testimony on, just confirming that we would want to see a microfracture test done on either the KJ Hintz 1 or 2 just to confirm that

418

value which was proposed in the testing and monitoring plan.
Let's see here. So as it pertains to the -- how the microfracture test data is used in the simulation to calculate the bottomhole pressure constraints that are used in the model, if the results do come out substantially different on the KJ Hintz 1 or 2, whichever you decide to do to confirm that result, it is likely DMR would want the model reran because of the bottomhole pressure constraint being affected by that frac gradient.
A. Understood.
Q. Okay. I'm now moving into Section 5, so I would like to go to Table 5-3. So on this table you have the CO_2 stream composition specification that must be met for you to, I believe, accept a third-party source. My question related to this is whether or not all the sources you currently have contracts with have had samples taken or FEED studies completed to confirm they meet or exceed that stream composition?
A. (BY MR. POWELL) So the individual quality spec for each course is greater than 95 percent --
Q. Okay.
A. -- carbon dioxide, and we did -- we had

419

done a stack test at each facility, and that will be done -- the plants typically do them annually. Unless we have a reason to do them intermittently, we'll follow their schedule, but the individual spec is not greater than 95 percent CO_2.
Q. Yeah. I think the confusion was the narrative right above Table 5-3 since it states, "Any new CO_2 streams from third-party entities not accounted for at the time of permitting must also meet or exceed the specification once commingled."
And you're saying at a minimum at the source side they would be greater than 95 percent with the anticipation that the commingled stream would be greater than 98.25 percent; correct?
A. Correct. And it's my recollection I think all but one of the 57 sources were 98 percent or higher. There was one facility that was about 96. So commingled, yes, it would be greater than the 98 percent.
Q. And for any new sources that might come down the line, I'm guessing additionally you would want a stack test done before to confirm that they're going to meet the specifications to take that source?
A. You're correct.

420

Q. Could you -- yeah, we would require that that data be submitted to us before we would approve new sources too.
A. Okay.
Q. Could you elaborate on how the baseline isotopic signature of the CO_2 stream will be resampled if new sources are added later on?
MR. HUNT: So I think I can respond.
MR. POWELL: Okay. Go ahead because I was just going to read a paragraph, but go ahead, John.
A. (BY MR. HUNT) Okay. So in the event that a new source is added and approved by DMR, Summit would sample that new commingled CO_2 stream within one year after adding that additional CO_2 source to get its composition and isotopic signature.
Q. (MS. MADCHE CONTINUING) Let's see. Will the meters that exist -- or sorry. Let me rephrase that.
Will meters exist at all the outlets at the CO_2 source facilities, both in state and out of state, to be able to account for how much CO_2 mass and total injection stream volumes each individual source is contributing?
A. (BY MR. POWELL) Yes. So Coriolis meters will be installed consistently throughout the

421

system.
Q. And how do you plan to ratio those mass and volumes back to the individual three storage facility permits for reporting?
A. So I'm not the measurement expert, but it would be reconciled. We'll have custody transfer from the -- on the outlet or discharge side of the capture facilities, and then we'll have -- we'll have a measurement station at the terminus of the main line. And then we'll have Coriolis meters or measurement facilities at each of the injection sites. And so it'll be a mass balance from volume in from each of the 57 source plants all the way through what's injected at each of the well sites and that'll be reconciled.
Q. So I want to move us to Figure 5-3 on page 5-12 of the TB Leingang application. So this figure shows a generalized flow diagram. Could you walk us through this figure specifically as it relates to the capabilities to isolate individual flowlines from each other and how pigging of the flowline system will take place?
A. Yes, and I'd -- this is a difficult diagram to do that from. If you start from right to left -- so each line segment on the discharge

422

side of a capture facility will have a launcher. And so -- and then each pipe diameter change within the pipeline system will also have a launcher and receiver. And then when you get to the sequestration site, there will be a receiver at each of the well sites.
So if you're looking right to left, so in a common pipeline diameter size, you know, the launcher will be the initiation of that pipe segment, and then it'll go through right to left and then you will be -- for instance, at the sequestration site before it reaches the injection facility, then it will go through a receiver, and then downstream will be a meter or measurement station which will include a gas chromatograph, Coriolis meter and pump. And then the -- the -- the line of demarcation will be on the inlet valve upstream of the shutdown valve at the injection facility.
Q. So just to confirm, with the three -- with the three individual flowlines, are you able to pig those separately?
A. Yes. Each pipe diameter will be able to be pigged independently. So in the sequestration where we have 16, 20 and 24, each of those diameter

423

changes, the entire segment will be able to be pigged independently.
Q. And as a follow-up, are there any plans for an isolation valve at the junction of where the BK Fischer flowline, called NDL-325, splits off from the TB Leingang flowline known as NDL-327?
A. I may -- may need help from Jamey if that's a diameter change.
MR. BENDER: Okay. We'll bring him up later.
Q. (MS. MADCHE CONTINUING) Can you confirm the land description of where that junction occurs at those two flowlines? Looking at the prior figure, Figure 5-2 it looks like it's Section 5, Township 141 North, Range 87, but it's pretty small scale on the map.
A. It looks correct to me as well, but it is small scale.
MR. POWELL: And, again, perhaps Jamey can confirm, Lawrence.
Q. (MS. MADCHE CONTINUING) So now I'd like to go to Table 5-4 on page 5-14. In this table the flowline has a maximum rate of 936 million standard cubic feet per day, approximately equivalent to 18 million metric tons a year. Earlier on in the

424

project summary, the modeling had shown that this facility, the TB Leingang specifically, would be able to take 124.4 million metric tons over a 20-year period which would average around 6.22 million metric tons annually. Can you please confirm there's no intent to send -- even though the line has the capacity to send the full 18 million metric tons, there's no intent to send it all to this one facility?
A. That is correct. There is no intent.
Q. And on average, what do you anticipate the flow rate to be on this flowline?
MR. POWELL: Again, I'm going to have to defer to Jamey for that, Lawrence. Sorry.
Q. (MS. MADCHE CONTINUING) Similarly, on the BK Fischer application instead, and on its Table 5-4 on page 5-14, it has a maximum rate of 314.5 million standard cubic feet per day, equivalent to around 6 million metric tons a year, and its modeling had more of an annual amount of 4.92 million metric tons.
So, again, just confirming again that you would not be exceeding what the modeling had showed in those bottomhole pressure constraints even if the flowline capacity would allow you to?

425

A. That's correct.
Q. And I'm interested in what the average flow rates will be for all three flowlines for when that gets deferred.
MR. BENDER: That's another Jamey question?
MR. POWELL: Yes.
Q. (MS. MADCHE CONTINUING) So, additionally, on that table, for all three of the applications a typical operating pressure has a 900 psi range, roughly, going from 1250 to 2150 psi. And this might be a question that you need to defer again. I'm wanting to know why such a big range was given and whether or not you have -- kind of more within that range where you actually typically plan to be for all three facilities.
A. The range is just -- it's to keep the CO_2 in super critical state, and so that's the range from 1250 to 2150, and it's really applicable over the -- predominantly over the pipeline system because over the 2500 miles we have about -- including -- excluding the pumps at the discharge site of the capture facilities, we have 17, I believe -- if I recollect properly, 17 intermediate pump stations, so you have that pressure gradient

426

from the discharge down to the suction side of the -- of the next intermediate pump station, so that's the range of pressures.
As it says, the maximum operating pressure is 28 -- 2183, but the discharge set points will be 2160, and then we'd run the surge analysis and, of course, you know that's 110 percent so that's, according to the math off the top of my head, about 2400.
Q. So a couple follow-ups to that. In the modeling, the model was done as being pressure constrained both on bottomhole pressure and wellhead pressure and not weight constrained. I'm curious as to why you have a maximum discharge pressure of 2160 psi when the wellhead pressure constraint in the model was only 2100 psi.
A. Yeah, I might have to defer that one.
MR. BENDER: Jamey again.
Q. (MS. MADCHE CONTINUING) And just a statement, because this isn't a weight-constrained model, typically DMR would be going forward with setting a wellhead pressure constraint based on the model and not on operating conditions.
When it comes to kind of the fluctuation that you had mentioned that you have on the

427

pressure to keep it in a super critical state, will the metering that you're planning to use be able to handle those fluctuations knowing that the density of CO_2 is affected greatly by both temperature and pressure and both the temperature and pressure on this Table 5-4 is a fairly substantial range?
A. Yes, it is. It will. The Coriolis meters can handle that variation.
Q. And are those mass flow meters or volumetric meters?
A. Again, I'm not the measurement expert, but I believe that they're mass flow meters.
MR. BENDER: Do you have the answer?
MR. HUNT: No.
MR. BENDER: Okay.
Q. (MS. MADCHE CONTINUING) So some questions related to the corrosion prevention and monitoring detection that's being implemented for all three storage facilities. Can you elaborate a little bit more on the ER -- the ER probes that are proposed and the impressed current cathodic protection system that's going to be used along the flowline system?
A. (BY MR. HUNT) Yes. So for the ER probe, DMR can think of those as -- you know, you guys are

428

familiar with a corrosion coupon. So imagine this as a miniaturized corrosion coupon that is then attached to a probe that's then attached to the -- to the flowline where it's subjugated to the -- the stream continuously, and in real time there will be continuous measurements of the electrical resistance of that -- of that miniaturized coupon or -- or that probe, said another way. Those -- those resistivity measurements are sensitive to changes in mass and thickness in particular.
Q. What material is the composition of the ER probes?
A. So they will be of the flowline material as well as the wellbore material.
Q. So there will be two probes at at least each injection site?
A. That is my understanding.
Q. And with the impressed current cathodic protection system, is that combined as far as the same system that's going to be across the flowline and the transmission pipeline operated as a continuous protection?
A. (BY MR. POWELL) It is.
Q. Referencing back to that Figure 5-2, I'm just looking for confirmation on what the land

429

description would be for the terminus point. Again, on this one it looks like it's Section 5, Township 141 North, Range 86 West.

MR. BENDER: Is that something we can supply you in a supplement?

MS. MADCHE: Yeah. Both of those locations could be confirmed in a supplement. That would be fine.

Q. (MS. MADCHE CONTINUING) So a question on the seal pot system that is planned to be used to maintain the tubing/casing annulus pressure to approximately 300 psi. Are you anticipating any on-site tank storage such as vessels needing to be on site for that system that would be holding, like, packer fluid or brine, not necessarily a nitrogen vessel?

A. (BY MS. ODDY) At this time I don't believe we plan on having storage tanks for corrosion-inhibited fluid, but we will have the nitrogen seal pot like you said adjacent to the wellhead.

Q. I guess just a note. If at any point those plans do change, secondary containment such as a dike would be required around any brine storage or the packer fluid.

430

And also a note that a Sundry variance would be required to have the 300 psi annulus pressure just because currently as rule requires, it's to be greater than the injection pressure.

A. Understood.

Q. I believe this has already been answered earlier in part, but just to confirm, no baseline soil, gas sampling or groundwater sampling has taken place yet; correct?

A. (BY MR. HUNT) That is correct.

Q. And that would be anticipated to begin approximately a year in advance of injection operations beginning?

A. That is also correct.

Q. So this question is specific to the KJ Hintz and it may need to be deferred. I'm just looking for how that year 19 was determined for the year to install the Fox Hills monitoring well next to the Raymond Jensen 1-34 P&A well.

A. Yeah. So in general the idea there was, as has been testified to, you know, previously, seismic surveys will be acquired at least every five years, so, you know, year 2, year 4, year 9, year 14, year 19. And so the idea there was that as Summit is monitoring the CO_2 plume expanding in

431

the storage reservoir, we don't anticipate at this time that that legacy wellbore will see CO_2 and certainly within that time frame.

But, you know, taking a proactive approach and after taking the seismic data and then reviewing that data to see how is the CO_2 plume progressing, is it conforming to expectations, so that year 19 really just allows some of the opportunity, the -- the optionality to wait to install that well until, you know, it is needed. And, of course, if it's determined that it may be needed prior to then, then they have that option as well.

Q. So I want to reference Section 5.7.2. Let me get a page number. So that would be page 5-26 in the TB Leingang application. And it's paragraph 4, and this language is in all three applications. There's a statement that Summit reserves the right to evaluate and modify, if necessary, appropriate groundwater sampling locations and frequency. Just a note that any changes to the frequency or locations should go through DMR for approval and review.

A. Yes. Acknowledged.

Q. And that would apply as well as far as any

432

changes made to the near surface monitoring during the PISC period.

A. Understood.

Q. Could you give a little more testimony on the local passive seismicity array that's planned to monitor for potential induced seismicity?

A. Sure. So at this time Summit has plans to install multiple seismometers at the site. At this time -- well, a specific layout or design or number of stations is unknown, but prior to injection Summit would request bids from vendors to put together a site-specific strategy.

We understand today that by multiple -- in order to properly triangulate and locate any seismicity events, you would need at least three seismometer stations as a minimum.

Q. Just a statement that once a layout's known, that information should be provided to DMR.

A. Understood.

MS. MADCHE: Let's see. I think that's all I have currently. Thank you.

EXAMINATION

BY MR. STOLLDORF:

Q. Jimmy, I asked a question earlier that they punted to you, so I'll ask it again. At its

433

closest, approximately how far away is the facility for the TB Leingang from an occupied dwelling?

A. (BY MR. POWELL) I apologize because I don't have each site memorized, but I believe the closest dwelling to either -- any of the well sites is about 4400 feet -- I'm sorry -- 2200 feet. 2200 feet. I believe the furthest is about 4100 feet. But it's 2200 feet. And we can clarify if that's Leingang or if that's one of the other two.

MS. MADCHE: I think we might just ask that a supplemental is provided as far as the proximity of how close the flowline is for each individual one to the closest dwelling.

MR. POWELL: Okay. And I believe the closest dwelling to a flowline at either location is 700 feet, but we could provide the exact distances for all three.

MS. MADCHE: Could you add to that also closest distance to a wind turbine, specifically for the TB Leingang application?

MR. POWELL: Yes, we can do that.

MS. MADCHE: Sorry to jump in.

Q. (MR. STOLLDORF CONTINUING) So Section 7, the Emergency Remedial and Response Plan, that's

434

you, Jay; is that correct?

A. (BY MR. VOLK) Yes.

Q. Under the Section 7.6 -- I'll let everybody get there. It indicates that the company organizational structure is still in flux and in development. Do you know -- I'd note that it's expected that we -- to complete that before being provided authorization to inject. We would expect that to be nailed down.

A. Without a doubt. We're continuing to work on, as the rest of the project continues to develop, an integrated response plan as well which will be consistent with this one, and we will supply that when done and prior to injection.

Q. Okay. So this is in the PISC section. Hopefully one of you can answer this. For all three applications on Figure 6-2 -- give me a second and I'll get a page number for you. That is page 6-6 in Exhibit 1A for the TB Leingang application.

Can you -- oh, sorry. Are you guys there?

Explain how the CO_2 extent ten-year postinjection boundary was determined?

A. (BY MR. HUNT) I think we would want to bring one of the other witnesses up to answer that.

435

MR. STOLLDORF: Probably Amanda?

MR. BENDER: (Nods head.)

Q. (MR. STOLLDORF CONTINUING) What's the setback being proposed for the flowlines?

A. (BY MR. POWELL) Again, the setbacks for the flowlines, similar to the -- to the pipeline in North Dakota that's under PSC jurisdiction, complies with State law, 500 feet as a minimum.

Q. What type of notification system's in place should residents or -- and/or businesses need to be notified in an emergency?

A. (BY MR. VOLK) We've had numerous conversations with Oliver County, Mercer County and Morton County, and this is an area we've determined to work cumulatively on and develop. So right now there's multiple systems being used between Mercer County and Morton County. I believe Mercer County and Oliver are both using reverse 911. Morton County is using that as well as I believe some secondary options.

So we have committed to continuing working with all three counties to provide the data needed to make sure the notification system is -- is going to be consistent throughout all three counties.

Q. How often do you plan on doing training

436

with these local emergency response teams?

A. On an annual basis at minimum. I believe it's not to exceed 15 months, but it is on the annual basis.

MR. POWELL: Yeah. I'll just add that since we know that North Dakota -- and I'm not sure of a specific -- Jay, you could help me on Mercer or Morton or Oliver, but a lot of the counties have volunteer fire departments and sometimes those personnel interchange or are unavailable, so we've committed to providing training on a more frequent basis as needed.

Q. (MR. STOLLDORF CONTINUING) I hope you guys will -- someone here at the table will be able to answer this one, but this has come up in the past, but are there any special considerations for DMR field inspection staff to be coming onto the sites? Do you have -- or do you have any -- are you aware of any issues that might bring up, having a DMR inspector on site -- some of the sites?

A. (BY MR. VOLK) As expected, unrestricted access for any regulatory items such as DMR access. With that being said, previous work I've done has always provided on-site hazard training for and up to and including inspectors so they have the proper

437

notices of what is out there or what needs to be out there. And if any special training would be required for those inspectors, we will make sure that's available.

Q. Would you be able to provide us --

MR. SUGGS: Sorry.

MR. STOLLDORF: Oh, go ahead.

MR. SUGGS: On that note, if there is anything anticipated, at this time I would ask that it be provided as a supplemental for what you'd anticipate the DMR inspection staff needing to have under their belt or have training for accessing your facilities.

MR. VOLK: We will provide that.

MR. SUGGS: Thank you.

Q. (MR. STOLLDORF CONTINUING) As it relates to Sections 9, 10 and 11, the construction plugging and completion plans for the Class VI wells and monitoring wells, we just want to note that it will require typical DMR approvals prior to executing, just so you understand.

A. (BY MS. ODDY) Understood.

Q. I want to move to Section 11, the injection well. I have one question -- or a couple questions. Can I -- okay. Then we'll go to 12.

438

Sorry. Excuse me.

You're approximating it'll cost about $583,000 to plug one injection well. Are you guys considering that it's going to probably require a big rig to handle that size of tubing?

A. That's correct. With a 7-inch tubing, we will need a bigger workover rig. In addition to that, the anticipation of the plugging plan is also to set CO_2 resistant cement. So those estimated costs are included in the plugging costs.

Q. Okay. And you touched on this earlier about the surety bonds, but you're proposing to use a surety bond for the injection well plugging phase and the PISC phase. Are you planning to have one surety bond or two separate bonds for each phase?

A. (BY MR. VOLK) At this point in time we have not one -- allocated -- or we have not committed to a certain provider, so that'll be forthcoming, at minimum 30 to 60 days prior to injection it would be submitted to you. We know we will be using the surety and the pollution liability for those, and I can't today tell you in certainty if those will be split between the phases you asked.

MS. MADCHE: I'm just going to jump in,

439

and not necessarily a recommendation but something to consider is clearly as you work through closing one of these facilities, plugging the injection wells is going to be the first item. If they are on separate sureties, that would allow you the ability to request one to be released while maintaining the other one for continued PISC monitoring. So, again, just something to consider.

MR. VOLK: Appreciate that, and we will provide additional information to you.

Q. (MR. STOLLDORF CONTINUING) Can you elaborate a little more on the emergency and remedial response plan and how the endangerment to USW -- or underground sources of drinking water costs were determined?

A. I just want to make sure I'm getting to the right figure. If you bear with me for one second. There it is. So I'm going to direct your reference to page 12-10 and Table 12-7. So, first of all, I want to start off with what the actual scenario was used to determine the estimated cost on ERRP as well as to your specific question the USDWs.

The scenario that was used was a well failure or integrity issue with the well in which a

440

containment -- loss in containment event happened. To get into more specific details on that, I will have Jean talk through that. But to the specific cost as it relates to the USDWs, it is broken out between -- in Table 12-7, the general response actions, delineation and water replacement at 1.89 million as well as the quarterly monitoring which is dictated on a ten-year period for 750,000. And then the plugging and abandonment cost of the groundwater -- groundwater monitoring wells in that area is another 55,000, which came up to 2.6 million.

Q. And you did mention that the failure mechanism is a loss of a containment event?

A. That's correct.

Q. Okay. Just want to note that the average -- okay. I don't need to. All right. Never mind.

MS. MADCHE: No. I do have a follow-up on that. Clearly, the costs are slightly different for all three facilities for the emergency remedial response. Can you just kind of go over what parameters were used to determine those costs that would cause that fluctuation?

MR. VOLK: Yes. The difference largely

441

comes into on the general response delineation and water replacement line item. What we tried to do is look at more site-specific characterizations in those areas, how many wells, what would be their water replacement cost, and that was the distinguishing difference that drove the number up or down.

MR. STOLLDORF: Nothing further for me.

EXAMINATION

BY MR. SUGGS:

Q. Just a couple of additional items. I'm going to jump back up to 5-13. The second-to-last paragraph on that page related to custody transfer of the CO_2, the way that's described is that the CO_2 when it reaches the terminus point will become the custody of SCS1 and it will remain that way until it goes down the hole at any of the three different facilities. Am I understanding that intention correctly?

A. (BY MR. POWELL) So that's page 5-15?

Q. Page 5-13, the second-to-last paragraph.

A. Oh, sorry. All right. That's my understanding.

Q. Okay. As the flowlines are anticipated to be owned by the individual storage facilities,

442

SCS1, 2 and 3, would Summit be opposed to a requirement that would require a flow meter at each -- I guess at the beginning of each of the individual flowlines and an actual custody transfer happening as it moves from one line into the other?

A. So versus having measurement at the terminus of the main line for the -- sorry. As opposed to just having the single meter at the terminus of the main line at the -- at the jurisdiction breakpoint and then an individual meter at each well pad or well site, you're suggesting or recommending that we'd have an intermediate meter, then, at the beginning of each of the laterals from that segment of main line, flowline to each well site.

Q. (MR. SUGGS CONTINUING) Yeah. I think you would end up with at least two additional meters in play, one being where the CO_2 would go north to the KJ Hintz facility and one at the point where it goes west from the Leingang to the Fischer.

A. I'm not opposed to that.

Q. Okay. With respect to the cathodic protection system that's being proposed, has that already been designed at this point?

A. It hasn't been -- the impressed current

443

cathodic protection system?

Q. Yeah.

A. Generally. We're going to have to -- since we've added additional source points and additional laterals along the whole system, we're going to have to go back and rebalance the system and figure out if the location of the ground well -- the ground beds have changes, where they need to be expanded, et cetera. So it needs to be reconfigured upstream of the sequestration area.

Q. Okay.

A. As far as the sequestration area, it's generally been designed but we'll refine.

Q. Okay. So that is still under works and will be refined?

A. Correct.

Q. Okay. So when that is determined, we'll want the location of the ano beds identified, and pursuant -- there's -- on page 5-15 in Section 5.3.1, there's indication of -- what am I reading -- Summit Carbon Solutions will supply DMR with a map of cathodic protection boreholes to meet the requirements of 43-05-01-5. Do you anticipate actually drilling any cathodic protection boreholes or will this system entirely utilize ano beds?

444

A. It's my understanding ano beds. We'll clarify.

Q. Okay. And so, regardless, we'd want those locations identified.

A. Yeah.

Q. And I think, John, you testified to this earlier, but there's some narrative on 5-29 that indicates that you will be running 3D seismic at years two, four and nine. It is the intent to run 3D seismic as early as year two after injection?

A. (BY MR. HUNT) That's -- yes. Yeah, and in the narrative it says "by year two," so just to be clear.

Q. Okay. But my point -- my confirmation is that there will be a sequence of 3D seismic run shortly after beginning injection and another one prior to the five-year review?

A. Correct.

Q. Okay. I'll point out that if anything looks significantly off at that two-year mark, it is expected that you will report that and we'll begin the determination whether or not we need to accelerate that hearing.

A. Understood.

Q. On page 5-32 there's the narrative about

445

the traffic light system for the passive seismicity, and you have the cutoff points of 2.7, 4.0 and 4.5. Can you elaborate on what the significance of those values as cutoff points are?

A. So 2.7 is the point at which humans can begin to feel seismicity, and so that's why that one is listed there. For events 4 and 4.5, I don't have off by memory -- I would need to go and refer back to the team on that one.

Q. Okay. If that's something that can't be provided in short notice or short period as part of this testimony, possibly a supplemental just confirming what the importance of those values is in that system.

A. Understood.

Q. And I think this one is for Jay. On 7-17, the last sentence under the 5 -- sorry -- 7.5.1 section, it reads, "In addition, assistance has been secured from local emergency services to implement this ERRP."

Which emergency services have you specifically worked with and secured their assistance in execution?

A. (BY MR. VOLK) So we continue to develop this. This is an overarching plan. We have

446

reached out to, as I've said, Morton County, Oliver County as well as Mercer County, including the fire departments in numerous of the surrounding towns. A couple of them are Beulah, Hazen, Center, Zap. So without having what I would call -- and I'm going to say maybe that statement today is not totally defined as the ERRP isn't, but continued working agreements with -- or continued working with them to commit to: One, I understand there's a memorandum of understanding of mutual aid between all of them or actually statewide now. So they have recognized that. Two is they've recognized that we will continue to work together in developing that plan and know they have different capabilities between the units. And that is what we're going to continue to work on to supply what I would call as an integrated plan between all three counties.

Q. So in -- I guess with respect to this statement in the application --

A. We have not secured an agreement, so I would say that wording probably should be changed at this point.

Q. Okay.

A. I would say commitment's a better word

447

than agreement.

MR. SUGGS: That's all I need. Thank you.

HEARING EXAMINER GARNER: Okay. Before we recall those witnesses, why don't we take a ten-minute break.

MR. BENDER: Okay.

(Recessed at 2:56 p.m. and reconvened at 3:12 p.m.)

HEARING EXAMINER GARNER: We are back on the record. Attorney Bender, you wanted to recall some witnesses.

MR. BENDER: Yes. We're going to recall Caitlin Olsen.

HEARING EXAMINER GARNER: Microphone.

MR. BENDER: Oh, sorry. We're going to recall Caitlin Olsen. We're going to recall Wade Boeshans. And then to answer some of the questions that came up from staff, we'll be recalling Amanda Douglas, and then we'll have one new witness. As you may recall, there were questions to the previous group and they were deferred to Jamey Backus.

And I apologize, I misspelled his name earlier when there was a question on it. It's B-a-c-k-u-s.

448

So with that in mind, we'll call Caitlin Olsen back.

HEARING EXAMINER GARNER: Ms. Olsen, just a reminder, you're still under oath.

REDIRECT EXAMINATION

BY MR. BENDER:

Q. Caitlin, I'm going to show you what's been previously marked as Exhibit 8B. Can you tell me what 8B is?

A. (BY MS. OLSEN) 8B is the Storage Facility Permit Application Comparison Summary Table.

Q. And when we started the hearings, I briefly explained to the --

MR. SUGGS: Lawrence, have you handed that out yet?

HEARING EXAMINER GARNER: Do you have one?

MR. SUGGS: No.

Q. (MR. BENDER CONTINUING) When we started the hearing, Caitlin, you may recall me talking very briefly about the fact that we were going to spend a lot of time on the Leingang application and then we were going to sort of do -- contrast and compare Leingang with Fischer and Hintz after that. Do you recall that?

A. I do.

449

Q. Okay. And is 8B sort of a visual aid and you being able to go through and make those comparisons?

A. That's right.

Q. Okay. Let's start -- I'm not going to interrupt you much, but why don't you start by first talking about the various columns and what your method was for laying this out and then you can explain it to the Commission.

A. Sure. So the intent of this comparison summary table was just to lay out the differences between all three permits. Listening to the hearings today, I feel like most of those points have been covered by DMR or otherwise in testimony.

But you'll see here across the top the column named SFP Permit Section, that relates to the section of the permit that we're talking about. Then you'll see Summit Carbon Storage #1, TB Leingang/Milton Flemmer 1, that's referring to permit number one, the TB Leingang permit. Likewise, the second column is the BK Fischer permit. And the third column is the KJ Hintz permit.

Q. Okay. Then let's -- why don't we start out first with the Project Summary, and what I'll

450

probably do is have you explain that in detail, and then we can kind of walk through the -- the other sections and you can probably more abbreviate your discussion of it.

A. Sure. So as Wade testified to the project summary earlier today, the only material difference in the three permits in relation to the project summary is the applicant name listed. All other aspects of Wade's testimony apply to the TB Leingang, the BK Fischer and the KJ Hintz as you'll see noted in that row.

Q. Okay. Let's go to the next column -- or not the next column, the next row.

A. Section 1, Pore Space Access. There's minimal content changes between the permits, as you'll see noted. There is one thing to specify in the BK Fischer permit and that is that there is Coyote Creek -- Coyote Creek mining -- mine land located within the hearing notification area.

Q. And I think as a result of some questions that came to Amanda, she pointed that out in one of the exhibits; is that correct?

A. That's right.

Q. Let's go on then to Section 2.

A. That's the geologic exhibits portion of

451

the storage facility permit. You'll remember as Amanda testified to yesterday and earlier today that the model extents used across all three permits are the same. Logging efforts are the same. Microfracture in situ stress tests were performed in all three wells and all three -- excuse me -- all three permits, and all three permits used the same 2D and 3D seismic surveys.

The differences that we'll talk about here mainly have to do with site-specific characterization work. You'll note that in the TB Leingang permit the Minnekahta Formation is present as Amanda had testified to earlier. The Minnekahta Formation is absent in the BK Fischer permit and in the KJ Hintz permit.

Again, site-specific storage complex formation data is -- varies between all three permits as noted here. That includes core data, log testing, things like that.

And the last point to make sure on Section 2, Geologic Exhibits, is that the number of borehole image logs varies between all three permits.

Q. All right. Then let's go to Section 3, please.

452

A. Section 3 discusses the geologic model construction and numerical simulation of CO_2 as Amanda had testified to previously. The same data inputs were used. Again, as described in Section 2, the same model was used across all three permits. The same simulation was performed where all three well sites were simulated as injecting at the same time. You'll note here that there are minor variations in Section 3 where site-specific data is used to derive individual injection pressures, rates, temperatures and critical threshold pressure estimations. Those are the only differences of material value.

Q. All right. Then we'll go -- the next row is Section 4, the Area of Review. Can you briefly discuss what's contained in that row?

A. Area of review, as I testified to earlier, uses the same groundwater sampling method across all three permits. The methodology remains the same. There are site-specific differences that have to do with the number of wells based on the specific area of review and what wells exist there.

Other differences include other site-specific surface features which may include springs, mining land as I discussed previously, and

453

any legacy oil or gas wells. To note, there are no legacy oil and gas present in the TB Leingang or BK Fischer area of review. There is one KJ -- there is one legacy oil and gas well in the KJ Hintz permit as I had testified to earlier.

Q. I'm going to try to get some points here with the court reporter, so can you slow down just a little bit?

A. I thought I was.

Q. Let's go to the next section, Section 5.

A. Section 5 discusses the testing and monitoring plan. Across all three permits, leak detection plans are similar. Flowline corrosion, prevention plans are similar, and baseline testing and logging plans are similar. There are minimal differences for mechanical integrity testing across all three permits.

You'll note that in the TB Leingang permit the Milton Flemmer 1 will use tubing-conveyed gauges, as Jean had previously testified to in Section 9. The other two stratigraphic monitoring -- excuse me -- stratigraphic test/monitoring wells will use casing-conveyed gauges. Environmental monitoring plans, again, are site specific but the methodology remains the same.

454

Q. Okay. The next section, please.

A. Section 6, the Postinjection Site Care and Facility Closure Plan. The monitoring programs are similar across all three storage facility permits. There are minimal differences related to monitoring well-specific details, for example, the maximum pressures seen across each storage facility.

Q. All right. And then Section 7 I have labeled on my exhibit Emergency and Remedial Response Plan. Can you discuss that for us, please?

A. The content between all three permits is the same materially.

Q. Okay. And Section 8?

A. Again, the material content is the same and there are no -- no large differences.

Q. And Section 9?

A. All three storage facility permits abide by the same North Dakota rules and regulations, such as requiring surface casing 50 foot below the lowermost USDW and CO_2 resistant cement casing within the injection reservoir zones.

You'll note that the biggest differences are that the Milton Flemmer 1 stratigraphic test well and monitoring well was drilled deeper. It

455

was drilled to 12,000 feet. The other two wells, the Archie Erickson and the Slash Lazy H, were drilled to approximately around 6,000 feet. That would result in just differences in cementing. Some are two stages for the shorter wells and some are three stages in those completions.

Q. All right. Let's go to Section 10, the plugging plan.

A. There are no material differences in the plugging plans across all three permits. Plug placement will vary based on formation depths, you know, depending on where those formations exist within each specific wellbore.

Q. And Section 11, Injection Well and Storage Operations?

A. Again, the Milton Flemmer 1 well, since it will be using tubing-conveyed pressure gauges, tubing will be installed in the Milton Flemmer 1 well. Prior to injection operations beginning in that storage facility permit in the TB Leingang, that well will be plugged back. It's currently drilled to about 12,000 feet.

There will be no tubing installed in either the Archie Erickson monitoring well or the Slash Lazy H monitoring well.

456

There are site-specific differences in maximum bottomhole pressures, injection amounts, et cetera, as seen in Table 11-1.

Q. Okay. And Jay spent some time comparing and contrasting the financial assurance. So keeping that in mind, can you just discuss Section 12 for us?

A. Yeah. Jay did a great job testifying to the differences already. There are minimal differences between all three storage facility permits. The total bond amount between the three storage facility permits varies slightly, and those minimal differences are related to the cost estimates of the postinjection site care and facilities plan, and namely the number of monitoring wells at each site, the reservoir monitoring well design characteristics, flowline lengths and costs associated with endangerment of USDWs.

Q. All right. Now let's spend a little time with the appendices that are attached to each one of the applications. Let's start with Appendix A.

A. There are no material differences between all three permits other than they use site-specific information.

457

Q. And Appendix B?
A. There are, again, no material differences in Appendix B, Freshwater Well Sampling Analysis, other than the results are site specific.
Q. And Appendix C?
A. There are no material differences in Appendix C across all three storage facility permits. You'll note here that site-specific information, namely XRD data, was used to inform mineralogical compositions for injection zone and confining zones. Again, stratigraphic well-specific water ionic compositions were used and, therefore, the simulation results are site specific.
Q. And Appendix D?
A. There are no material differences between the three storage facility permits. You'll note that TB Leingang does list information for those tubing-conveyed pressure temperature gauges.
Q. And then finally Appendix E?
A. There's no material differences. The differences relate to the permits themselves.
MR. BENDER: Mr. Examiner, you know, I don't -- I think I'll offer the exhibit, and I don't have any other further -- I don't have any

458

further questions for Ms. Olsen.
HEARING EXAMINER GARNER: Any objections?
MR. BRAATEN: No objection.
HEARING EXAMINER GARNER: Exhibit is admitted.
You can proceed to your next witness.
MR. BENDER: Next witness is Wade Boeshans.
HEARING EXAMINER GARNER: And just a reminder, Mr. Boeshans, you're still under oath.
MR. BOESHANS: Yes.

REDIRECT EXAMINATION

BY MR. BENDER:

Q. Wade, while we're handing out the exhibits, I'm just going to have you direct your attention to what's been previously marked as Exhibit 1C-1.
MR. BENDER: Derrick, can you tell me when you get a copy?
MR. BRAATEN: Sure. Okay. I'm ready.
MR. BENDER: Okay. Thank you.
Q. (MR. BENDER CONTINUING) Wade, can you tell me what Exhibit 1C-1 is?
A. (BY MR. BOESHANS) It is the storage agreement for SCS3 for the KJ Hintz storage site.

459

Q. And can you briefly describe the amendment to the Hintz storage unit that Summit is proposing with this exhibit?
A. Yes. So in this exhibit it includes an amendment in what is labeled in here as Section 3.12.
Q. And can you explain to the Commission staff why Summit is proposing the addition of Section 3.12 to the Hintz storage agreement?
A. Yes. So as you're aware in the -- from the previous -- or my testimony yesterday, the KJ Hintz is in proximity to the DCC facilities. I think I mentioned yesterday -- or I did mention yesterday that approximately, you know, three miles between the storage boundary of -- storage area boundary of the KJ Hintz and the DCC West facility. And so Summit and Minnkota have been in discussions around a border agreement in terms of how we would work together to, you know, manage our storage operations or cooperate in storage operations. And so this amendment outlines what we have agreed to in terms of general terms, and those discussions have advanced to this point.
Q. It's my understanding, Wade, that the -- the Hintz storage agreement already has language

460

for a border agreement -- for the parties to enter into a boarding -- border -- I'm having trouble talking here -- border agreement. Why was it necessary to add Section 3.12?
A. Yeah. So you're correct in that the application or the border -- the storage agreement in the application includes border agreements. This section is specific to a border agreement between Summit SCS3 and the DCC facilities.
And so we thought it was prudent at this time given our discussions to lay out the general terms that we've agreed to at this point in anticipation of finalizing that border agreement of coming here, but this would set forth in essence the -- call it general terms and expectations of the border agreement which the parties have agreed to work together on. We believe it's in our best interest to do so, and so we're submitting it here today.
Q. So it's Summit's request and Minnkota's request that the storage agreement for the Hintz storage facility be amended to include the language which is set forth in 3.12; is that a fair statement?
A. Yes. That's correct.

461

MR. BENDER: That's all the questions I have for this witness. Offer that exhibit which is Exhibit 1C-1.

HEARING EXAMINER GARNER: Any objection?

MR. BRAATEN: I don't have an objection to the admission of the exhibit. I have an objection to the amendment itself to the application at this point given the circumstances, but not to the admission of that exhibit into the record.

HEARING EXAMINER GARNER: We will note your objection and admit the exhibit.

MR. BENDER: Mr. Examiner, we'd now like to move to Amanda Douglas. If you recall, there were some questions when we had the larger group up here that we believe Amanda can respond to. So I believe she's still sworn.

HEARING EXAMINER GARNER: Yeah. Just a reminder you're still under oath.

MS. DOUGLAS: Understood.

REDIRECT EXAMINATION

BY MR. BENDER:

Q. Do you want to handle it the way you did last time, Amanda, where you indicate what the question is and then respond?

A. (BY MS. DOUGLAS) Yes. And DMR staff, if

462

I -- I miss any, please let me know.

The first question I believe that was asked and deferred was how a fracture pressure gradient influenced CO_2 plume size. Generally, the fracture pressure gradient is used to calculate the bottomhole pressure constraint, so 90 percent of the fracture pressure gradient is used to define the bottomhole pressure constraint as required by regulations. A higher fracture pressure gradient would result in a higher bottomhole pressure allowing for more injection of CO_2 which would generally result in a larger plume.

However, I'd like to point out in the modeling cases that we ran in the permits in Section 3, the 2100 psi wellhead pressure constraint was met prior to the bottomhole pressure constraint being met. So in this case the higher fracture pressure gradient at one of the sites is not dictating a larger plume size for the case -- simulation case presented in the permit application.

Q. That's -- I believe that's the only question that -- oh, there's another one?

A. I was just pausing. Sorry.

Q. Oh, okay.

463

A. Waiting for --

Q. That was a long pause, so --

A. Waiting for the Commission to -- to write their notes.

Another question I believe -- Travis, you asked a question on stabilized plume. Could you please restate your question, or postinjection period?

MR. STOLLDORF: Oh, okay. Hang on one second. Yeah. On Figure 6-2, can you explain the CO_2 extent ten-year postinjection -- how that ten-year postinjection boundary was determined? It's on page 6-6 or 6, dash, 6.

MS. DOUGLAS: Yep. So the simulation model was used to simulate the 20 years of injection and several years postinjection. And so the plume as labeled here is showing the CO_2 plume extent at ten years postinjection as determined -- as predicted by that modeling simulation.

MR. STOLLDORF: Okay. What parameters are used to determine when the plume is stable -- when the plume is stabilized?

MS. DOUGLAS: So plume stabilization is determined by looking at the rate of change in plume area over time. So the rate of change in the

464

plume area over time decreases, and so we used -- we calculated the rate of change over one-year time steps and looked at the point in time where rate of change slowed down. And in that case the cutoff was determined to be less than two square miles of change per year in plume area, and that was used as our cutoff to determine when the CO_2 plume stabilized. .2 -- .2 miles, sorry, if I misstated.

MS. MADCHE: And that's using the 5 percent saturation cutoff as well within those square footage movements?

MS. DOUGLAS: That's correct.

MR. STOLLDORF: Thank you. That's all I had.

MS. DOUGLAS: So, Tammy, you asked a question about the pressure from the flowlines and the wellhead pressure used in modeling. Could you restate that question?

MS. MADCHE: Yes. So on Table 11-1 on page 11-2, for all three applications there's a note that maximum injection pressure during operations will be limited to surface equipment pressure ratings and the maximum bottomhole pressure constraint. In Table 11-1 and in Section 3 in the model you report that you used a wellhead

465

pressure constraint of 2100 psi alongside the bottomhole pressure constraints. However, in the testing and monitoring section in Table 5-4, the flowline maximum operating pressure is listed at 2183 psi along with a maximum discharge pressure of 2160 psi. So my question was why those operational values on the flowline are higher than the wellhead pressure constraint that was used in the model.

MS. DOUGLAS: So can you restate the value? Did you say it was 2,160?

MS. MADCHE: 2183 for max operating pressure, 2160 for max discharge pressure.

MR. BENDER: Do you want to hand that off to Jamey or --

MS. DOUGLAS: Yes.

MR. BENDER: Reluctantly?

MS. DOUGLAS: So before Lawrence introduces Jamey, then, you guys had a question on the stoplight system and the magnitude of earthquakes used in that stoplight system. So John described 2.7 is the low value for that stoplight system. Again, that's the threshold for a felt earthquake.

Greater than a magnitude of 4 was chosen essentially for that next step in the stoplight

466

system. At an earthquake magnitude level 4, that's where the magnitude of the earthquake would be sufficient to -- it's generally described by the USGS as shake or rattle dishes. That's how the USGS describes it. So at that point the stoplight system states that SCS will stop injection, perform inspection on surface facilities and wells to ensure there's no damage, and then reduce operations while a detailed analysis is done to determine whether or not injection operations caused that or that could have been a natural earthquake that their monitoring array is just picking up.

And then over 4.5 is the cutoff for complete stop of operations and working with the regulator to determine if any changes to injection operations are needed.

MR. SUGGS: So why the 4.5? What's the significance of that transition?

MS. DOUGLAS: So as you get from 4 moving up till 5, so earthquake magnitude 5 -- as described by the USGS, at earthquake magnitude 5, that's where you might start seeing potential damages to structure, such as cracked drywall, things like that. And so 4.5 is below that 5

467

threshold to provide that safeguard to make sure that operations are shut down before any earthquakes are induced that could cause damage.

MR. SUGGS: Okay. Thank you.

MS. DOUGLAS: Were there any other questions that you recalled that were deferred?

MS. MADCHE: No.

MS. DOUGLAS: Okay.

MR. BENDER: We'll now call Jamey Backus, I think, who can respond to the remaining questions. Jamey will -- and Jamey has not been sworn.

HEARING EXAMINER GARNER: I'm going to swear him in.

MR. BENDER: Okay.

JAMEY BACKUS,

being first duly sworn, was examined and testified as follows:

DIRECT EXAMINATION

BY MR. BENDER:

Q. Jamey, state your full name for the record.

A. Jamey Backus.

Q. And, Jamey, I misspelled your name earlier, so will you spell your last name?

468

A. B-a-c-k-u-s.

Q. And, Jamey, by whom are you employed?

A. Summit Carbon Solutions.

Q. In what capacity?

A. Project manager of topside facilities.

Q. Okay. And can you spend just a few moments providing us with a summary of your educational background and work experience?

A. Bachelor's degree in mechanical engineering. I worked at DGC for a number of years, which is the chemical plant up near Beulah, and then I also worked in coal-fired power generation in roles such as engineer, maintenance superintendent and plant manager.

Q. And what are some of your duties and responsibilities with respect to your employment at Summit?

A. That would be design of the topside facilities and equipment selection.

Q. Okay. I don't have any other questions. He's available for the questions that -- I don't remember exactly what they were, but I think Tammy may have had a few, or do you recall the questions?

A. Well, I think I can -- I'll go through all the ones I have and then let me know if I forgot

469

any.
So if we begin with the max pressure one that Amanda referenced, the max operating pressure of the pipe is set by thickness, flange ratings, et cetera. The maximum output pressure of the pump is set by the pump manufacturer, but we will have controls in place so that the wellhead pressure never exceeds the 2100 psi.
MS. MADCHE: Sounds good.
MR. BACKUS: Okay. The other question, the block valve where NDL-327 breaks off to NDL-325, we did not have intentions of putting a block valve there. Now, with the discussion of potentially putting a Coriolis meter there, we may revisit that, but we did not originally have intentions of putting one there because the mileage of the pipeline in that area did not require it.
MS. MADCHE: So I guess I would just state we would probably highly recommend it just because it gives you that extra ability to isolate between the facilities since they are owned by separate LLCs.
MR. BACKUS: You'd asked about location of where NDL-327 goes to 325, that is 141 North, 87 West, Section 5. The terminus point is 141 North,

470

86 West, Section 5.
MS. MADCHE: Okay.
MR. BACKUS: Those were the ones that I had.

EXAMINATION

BY MS. MADCHE:

Q. Okay. So additional ones I have were what you anticipate the average flow rate to be for the three individual flowlines?

A. Yeah. So I would -- I would reference the Section 11 for each one of the applications, and our average -- average injection rate between the two wells utilizing the 2100 psi wellhead constraint, I would -- I would utilize the total of that number as to what will actually flow through the line to the -- to the well site.

Q. So just to confirm, you plan to maximize right up until the 2100 psi wellhead pressure constraint?

A. Depending on flow coming in from the capture facilities --

Q. Sure.

A. -- you know, the 16 -- I'll talk in rough numbers -- the 16 million tons that is currently slated.

471

MS. MADCHE: Okay. I'm just checking to make sure I don't have anything else here. I think that's all I have for deferred questions. I'll let anyone else go. I do have one question on the Exhibit 8B afterwards, so --
MR. BENDER: When you say "afterwards," I'm sorry, I don't mean to question you, but --
MS. MADCHE: Anyone else in DMR that --
MR. BENDER: Oh, I see.
MS. MADCHE: -- has --
MR. BENDER: Okay.
MS. MADCHE: -- deferred questions. Sorry.
MR. BENDER: Okay. Thank you.
HEARING EXAMINER GARNER: I think you can ask, Tammy.
Q. (MS. MADCHE CONTINUING) All right. So on Exhibit 8B, on page 5 of 6 I think there might be a typo on the KJ Hintz column under Section 12, number 2. It states, "Additional groundwater monitoring well and soil gas profile station has been added at legacy well 4942." Based on the figure in the application it's an additional Fox Hills monitoring, not a soil gas station, just to confirm. And that would be figure -- give me a

472

second.
A. (BY MS. OLSEN) You're correct. That's a typo. There is not a soil gas station planned near that additional legacy well. Just a Fox Hills monitoring well.
MS. MADCHE: Okay. Thank you.
HEARING EXAMINER GARNER: Well, at this time I guess we'll move to cross-examination unless there's anything else.
MR. BENDER: Yeah. And I will -- I'll accommodate Derrick in any way. If you would prefer the -- that other group of people that we had up a few moments ago and have -- and do your -- conduct your cross-examination on those witnesses first or if you want to use this group, whatever you prefer, I'll try to accommodate you.
MR. BRAATEN: Give me just one moment, please. Maybe for efficiency, if you don't mind, I can just start with some of the questions I had for these witnesses and then finish that and recall any that I need that were up prior.
MR. BENDER: I guess I'll try not to object, but I would hope you would keep it to --
MR. BRAATEN: Yeah. I have questions based on this testimony.

473

MR. BENDER: On the direct we just had?
MR. BRAATEN: Yeah.
MR. BENDER: Okay. Fine.

RECROSS-EXAMINATION

BY MR. BRAATEN:

Q. Ms. Douglas, I think you had testified about the plume stabilization parameters and indicated that the stabilization cutoff was determined to be when less than .2 square miles of change occurred in any given year at the 5 percent saturation cutoff; do I have that right?

A. (BY MS. DOUGLAS) Correct.

Q. Did you also model -- let me start over.

Did you run the model to determine the total duration over which the plume would keep moving regardless of rate?

A. I can't recall off of the top of my head. I know we modeled it for a significant postinjection duration. I was not directly involved in determination of stabilized plume so I don't have that information readily available.

Q. Who made the determination for stabilized plume or who was involved with that?

A. Apologies, I don't have those names readily available.

474

Q. Was it people at EERC?

A. Yes.

Q. Okay. There was some discussion of the stoplight system. Why not notify DMR of events between a 4 and a 4.5?

A. That's not included here as written, but I think that'd be prudent to add that.

Q. Okay. Ms. Olsen, you testified on Exhibit 8B regarding the different depths for the three wells. Do you have an understanding as to why they drilled the three different wells to those specific depths?

A. (BY MS. OLSEN) Generally, yes.

Q. And just generally, what is your understanding?

A. My understanding is they were drilling the Milton Flemmer to get core data from deeper formations.

Q. Okay. Did they complete or are there plans to complete that at a higher interval at some point with a plug?

A. There are no plans, to my knowledge.

MR. BRAATEN: I have some questions, Lawrence, related to surface facilities, and Mr. Volk did some testifying but it sounds like

475

Mr. Backus has an understanding as well. Do you mind if I ask him the questions, and if he can't answer, we can call Jay Volk up?

MR. BENDER: I have no problem with that. It may save time if you just try that approach.

Q. (MR. BRAATEN CONTINUING) Okay. Mr. Backus, can I have you turn to the generalized flow diagram on page 5-12 of Exhibit 1A?

A. (BY MR. BACKUS) Okay.

Q. Can you describe the purpose of the blowdown which is indicated on the generalized flow diagram?

A. Thank you. In hopes of not getting called up, I didn't bring my glasses.

Oh, the blowdown on the receiver?

Q. Correct.

A. Yes. That would be for when the -- when a pig is received in there and the receiver is isolated, that blows down the pressure and CO_2 so that the pig can be removed and data can be retrieved from it.

Q. Are there emergency pressure relief valves on the system anywhere as far as what we're looking at in the generalized flow diagram?

A. There is a thermal relief valve, but not

476

emergency pressure relief valve.

Q. How do you deal with an unexpected spike in pressures coming through this system?

A. I think that is dealt with through controls of the pipeline pump pressure control valves to maintain pressures that are -- that can be withheld within the existing facility.

Q. Can you explain that a little more?

A. In order to have a pressure spike, something would need to do that, and a pump would be the obvious thing, and there are controls on the pump, be it vari -- variable frequency drive or just the nature of the pump that would keep it underneath of the failure pressure of the piping -- or the maximum operating pressure, I should say. I'm sorry.

Q. Do you believe there's a 0 percent chance of pressure causing some kind of a release from the surface facilities post Midwest Carbon Express' terminus point?

A. I don't know that I can say there is a 0 percent chance of that ever happening.

Q. Have you done any kind of dispersion modeling to determine the areas in which you would need to provide notice to people if you did have a

477

release in one of those sites?
MR. BENDER: Before you answer that question, I want to caution you that there's been some -- there's been a dispersion model that's been prepared and it's been submitted to the Public Service Commission and it's confidential. So you can answer the question, but be very careful that you don't answer it in a way that provides information with the model that was supplied to the PSC.
MR. BACKUS: I can say that I was not personally involved with any of the dispersion modeling that has been done.
MR. BRAATEN: And fair objection, Lawrence. I'm actually not trying to get into that.
MR. BENDER: I appreciate that.
Q. (MR. BRAATEN CONTINUING) But my understanding of the dispersion model with the PSC is that that relates to the main line and to that, and I'm asking just specifically if there was any dispersion modeling done post main line on the flowlines in those facilities?
A. I was not involved in any of that.
Q. Okay. And so you're not saying there

478

wasn't one done. You're just saying you don't know?
A. Yes. That's what I'm saying.
Q. Okay. Is there -- do you know of anyone else that's testifying that would know whether or not one was done?
A. You could ask Mr. Powell.
Q. Okay. If Mr. Powell didn't know, is there anyone else that would?
A. He would be the one to ask that question to.
Q. Okay. What is the purpose of the thermal relief valve?
A. So in cases where you can isolate a section of pipe and it would be full of CO_2 at pressure, if it heats up through whatever means, say the sun is shining on that pipe, the CO_2 will expand and this -- the thermal relief makes sure it does not exceed safe operating limits.
Q. How does the thermal relief valve do that?
A. More than likely it would be the type of thermal relief valve that is spring operated, so as the pressure would increase, it would relieve that and then close again.
Q. Is the valve opened based on temperature

479

or pressure?
A. The valve would open based on pressure.
Q. What pressure?
A. I believe that number is 5 percent over maximum operating pressure.
Q. Wouldn't that risk a failure if the max operating pressure is based on the manufacturer's recommendations?
A. No, I don't believe it would. That -- that is a normal thing when you talk about, say, a vessel. Normally they operate -- the pressure safety valve in that case is normally set 10 percent over -- 5 to 10 percent over the operating pressure.
Q. And when you say "the operating pressure," are you saying the max operating pressure as established by the manufacturer of the pipe?
A. I'm saying the 900-pound class standard we are working off of, that operating pressure, as set by ASME, I believe.
Q. Okay. Does the valve, then, close by itself automatically once it gets back down below that pressure?
A. It does.
Q. Okay. So I asked you earlier about a

480

dispersion model, but are you aware of any testing done on predicted maximum release from the line through that valve?
A. Because -- because of that thermal relief valve?
Q. Correct.
A. Yes, I am.
Q. And what -- what kind of studies were done to determine what the maximum release would be from that thermal relief valve?
A. It was -- a third party performed a study based on a temperature rise in that line and the thermal expansion of the CO_2 given the size of the line and the volume contained in, how much it would need to relieve.
Q. As well as the intended flow rate?
A. Yes.
Q. And operating pressure?
A. Yes. Well, it -- when you say flow rate, do you mean through the valve or through the line?
Q. I don't know.
A. I can say this: If that would happen, it is because everything is stopped. There is no flow through the line and valves are closed.
Q. Okay. Yeah, so through the valve.

481

What was the maximum amount of CO_2 predicted to be released from the thermal valve in the scenario you described?

A. Approximately .136 tons per minute.

Q. And did they determine the maximum length of time they thought such a release would potentially occur under those parameters?

A. Based on the largest segment of line that one of these exists on, I think there would be approximately three tons of CO_2. That would be if you emptied the line completely, which would be highly unlikely, but that would be if you emptied the line completely.

Q. So when the thermal valve is released, does that trigger other valves to stop flow in the line or do you have to manually shut that off?

A. Well, as I said for -- for that to trip, that means that there is no injection going into that well. We have isolated the valves because it is only as the temperature warms up, the pressure would increase to release that. So there would be no replacement CO_2 coming into that line. It's simply to protect the line.

Q. Okay. Do you have an understanding of how far three tons of CO_2 would disperse under natural

482

wind and weather conditions?

A. I do not.

Q. I'm not sure who this question is for, but I think there was some testimony about who would be operating the flowlines, so not the main line, Midwest Carbon Express, but the flowlines. Was there testimony that the flowlines would be owned by the storage facilities but operated by SCS Transport?

A. (BY MR. BOESHANS) That's correct.

Q. And when did that arrangement -- when was that arrangement decided upon?

A. That -- I don't know that I can give you a specific timeline in which that decision was made.

Q. Was it within --

A. I think it was generally that the intent that -- from my recollection, it was always the intent that it would be an integrated system operated -- connected with a common control system as Jamey described earlier.

Q. Are there any contracts signed between the various entities to formalize that relationship for operating the flowlines?

A. We do not have interoperating agreements in place today between the entities.

483

Q. Or any other kinds of contracts to govern that?

A. Not at this time.

Q. I apologize, I'm jumping around a little now, but, Ms. Douglas, I think you had talked about this traffic light system, and under the event of greater than 4.01 one of the plans is to continue operations at a reduced rate and/or below a revised maximum operation pressure. How would you make those determinations as to how much to reduce the rate or the maximum operation pressure?

A. (BY MS. DOUGLAS) At this time what's specified is injection rate would be reduced to no less than 50 percent.

Q. How do you decide if it'll be 50 or 55 or 60, for example?

A. So as part of this stoplight system and as this traffic light system is part of this seismic monitoring, we'd be acquiring continuous seismic data. So we'd take into account not just that larger event but if there were other events, how many, their magnitude, time duration, as well as their epicenters.

Q. Mr. Backus, do you know what the diameter is of the thermal valve?

484

A. (BY MR. BACKUS) 1 inch, I believe.

Q. Okay. Are there any other pressure relief systems post terminus of the Midwest Carbon Express that we haven't discussed?

MR. BENDER: I think I'd rather have you address that question to Jimmy. He's more familiar with those things, and he'll be coming up after this.

MR. BRAATEN: Okay. Okay. I think that's all the questions I have for these witnesses. I have a few, I think, for Mr. Powell and Ms. -- one -- well, a couple quick ones for Ms. Oddy.

MR. BENDER: Do you want the whole group or --

MR. BRAATEN: No, I think -- well, I think we can start here. I think that they may be able to answer them all.

MR. BENDER: Okay.

CROSS-EXAMINATION

BY MR. BRAATEN:

Q. Ms. Oddy -- am I saying that right, Oddy?

A. (BY MS. ODDY) Yes. Oddy.

Q. You made a reference to CO_2 resistant cement. Can you describe what that is?

A. Yep. So as part of the design plan, we

485

have consulted with contractors who specialize on cementing design in the basin, and part of that is evaluating the downhole pressures and temperatures as well as the interactions between the CO_2 stream as well as the formation water in accordance to the regulations. And so we're not looking at your conventional oil and gas cement, primary cement. The cementing system is tailored to provide resistance to CO_2 with additions to different chemicals and different formulations within the cement.

Q. Other than the pH, are there other properties of the cement that are specific to CO_2 resistant cement that make it different than your regular cement used for plugging wells in the oil patch?

A. So -- yeah, so for both plugging as well as primary cementing in our -- in our injection wells and monitoring wells, some parameters I can name off the top of my head is the permeability would be significantly reduced in the formulation. Those -- I can't recall any other parameters. Like I said, we contracted specialized cementing contractors.

Q. So just as a general matter, would the

486

lower permeability in that cement result from a greater clay content?

A. So it would just mean that, generally speaking, there'd be less chances on interactions with, you know, potential oxidation or any chemical reactions downhole.

Q. What do they add to the cement to prevent oxidation or chemical reactions downhole that is different than the cement used for normal cementing or plugs in the oil patch?

A. I'm not privy to the specific additives by the contractor.

Q. Do you know if anyone at Summit or EERC is?

A. Again, we've contracted technical experts from a cementing company and so they would know the -- they, as in the contractor, have, you know, a proprietary formulation of the cement system, and then it would just be our responsibility to make sure that those are rated for the bottomhole pressures that we expect.

Q. What is the name of the contractor?

A. So the two commonly contracted out for carbon portfolios would be either Schlumberger or Halliburton.

487

Q. Okay. Is there any requirement to use CO_2 resistant cement in these wells?

A. So under Administrative Code 43-05-1-11 -- this would be in my own summarization, but in the selection of casing and cement, you know, where -- some of the factors that we need to take into place in the design is bottomhole pressures, temperatures, as well as the potential corrosiveness when CO_2 is introduced with formation water.

Q. And the cement both used to cement in a casing as well as the plugs interacts with CO_2 in the reservoir with these wells, the injectors?

A. With respect to the injection wells, yes, it would be -- yep, because it'd be isolating the injection zone. So it would -- the CO_2 would be going through the casing into the cement into the reservoir.

Q. Did they use CO_2 resistant cement to cement in the casing or plug the Raymond Jensen well?

A. I don't have the details of what type of grade of cement that was used in the Raymond Jensen well.

Q. Why wouldn't that be as important as knowing the cement in the injector wells?

488

A. We don't anticipate, as per Caitlin or Amanda -- I can't remember which one, but we don't anticipate the CO_2 plume at this time to reach the Raymond Jensen well. However, it is part of the area of review and therefore that was reviewed as -- as Caitlin testified to.

Q. Okay. And the surface casing for the Raymond Jensen well is not 50 feet below the lowest USDW; right?

A. I'd have to -- I'd have to refer to that diagram.

Q. Would you mind taking a look?

A. Oh, this is the TB Leingang.

Q. You know, I might be able to speed this up. Are you confident that the depth of the casing of the Raymond Jensen is in the application?

A. I do not know. I'd have to refer back to the --

Q. Okay. I'll have you go ahead and look.

A. Can you repeat your question, please?

Q. Is the surface casing for the Raymond Jensen well 50 feet -- at least 50 feet below the lowest USDW?

A. According to the diagram here, I guess I'm not sure in this area what would be considered what

489

the lowest underground source of drinking water is.
Q. What's the depth of the surface casing?
A. On the diagram it's 330 -- 330 feet.
Q. Okay.
MR. BENDER: Mr. Braaten, if you don't mind, I think Caitlin can address that question, if you want.
MR. BRAATEN: Oh, okay. Thank you.
MS. OLSEN: Can you repeat the question? Sorry.
Q. (MR. BRAATEN CONTINUING) Is the surface casing of the Raymond Jensen at least 50 feet below the lowest USDW?
A. (BY MS. OLSEN) It's not.
Q. Okay. When you did the model for the leaky well scenario, were you doing that based on the location of the Raymond Jensen well?
A. No, we did that leaky well scenario to delineate the AOR using the risk-based AOR method.
Q. Okay. I'm going to -- just a couple more here, and I'm not sure who this one's for, but it relates to the -- the valves in the surface facilities we discussed. And, Mr. Powell, I think these were for you.
But the first question is have you

490

designed that system to accommodate a situation with a blocked flow in the system?
A. (BY MR. POWELL) Yes. So the general flow diagram is not the piping and instrument diagram. So the thermal relief was just to relieve pressure in that bypass on that valve. So, yes, in all segments where the -- a segment could be isolated by a valve or shut in, yes, there is pressure relief in those segments.
As far as design pressure, the pipe is designed for 195. It's hydro tested to 125 percent of that maximum operating pressure. The valves were designed at Class 900 and bench-tested to 150 percent of pressure.
THE REPORTER: Can I have you speak up, please?
MR. POWELL: Oh, sorry. I'll repeat it.
So as far as the design pressure of the pipeline, it's per 195 regulation and then it's hydro tested to 125 percent of the MAOP, which would be 125 percent of the 2183. The valves are designed to Class 900 and that pressure value and then they're bench-tested at 150 percent of that.
Q. (MR. BRAATEN CONTINUING) Why was the piping and instrumentation diagram not provided as

491

part of the application?
A. I can't answer that question.
Q. Can it be provided?
A. Yes.
Q. Rather than asking you to identify the location and size of every valve in there, would you be willing to simply provide the piping and instrumentation diagram?
A. Yes.
Q. Oh, what is the diameter of those other valves that you just discussed?
A. Again, we'll reference them on the piping and instrument diagram. To Jamey's testimony, they're typically 1-inch to 2-inch valves.
Q. But the diameter of those valves will be listed on the piping and instrumentation?
A. Not the diameter of the valve. The size of the valve. The valves themselves are standard, at least in my experience, but the connections to the piping, to the carrier pipe, that's typically three-quarter inch to 1 inch, but we'll have that on the P&I data.
Q. Okay.
A. And just to clarify, any relief of pressure would not be external to the pipe. It

492

would be relieved into the pipeline. So if it's -- if you've got pressure relief between two segments -- a segment of the pipe that could be isolated with two closed valves, the pressure would be iso -- or relieved downstream. It would not be released to the atmosphere. So that wasn't clear from what I heard before.
Q. Okay. Thank you. So the only valve that would release to the atmosphere would be the temperature valve --
A. No. The temperature.
Q. -- or thermal valve? Sorry.
A. The thermal relief should be -- should be via tubing connected downstream. So if you have those two -- if there's pressure built up in that valve bypass, which would typically be closed in normal operation, then you could -- to Mr. Backus' testimony, you could have a thermal pressure buildup, and if that's the case, there's a set point on that valve, 110 percent, whatever it is -- we'll have that set point and that should be indicated on the P&ID, at least at this point. Then when it reaches that set point, it relieves downstream of that closed valve so it relieves the pressure on that piping, that segment of piping.

493

Q. The thermal valve releases the pressure downstream?

A. That thermal relief valve relieves the pressure from that small segment of bypass piping downstream of the closed valve.

Q. So it doesn't release anything to the atmosphere?

A. No. The only thing that would be released to the atmosphere is where you saw the blowdown referenced. That would be a controlled blowdown or release to the atmosphere if that were needed for normal or abnormal operating conditions.

Q. What kind of a spike in pressure would you expect if you had a valve shutdown at the wellhead?

A. Again, these -- these set points -- I'll back up.

I mentioned earlier in previous testimony about a surge analysis. So that surge analysis is -- was conducted on every -- or every main line valve, including in the flowline segments, was evaluated for an inadvertent closing. And the regulation is 110 percent of maximum operating pressure so it cannot exceed that. And in our case I believe the maximum was 107 percent. We can tell you exactly what the segments were in the

494

flowlines, I don't remember off the top of my head, but they were less than 110 percent.

Q. What was the time duration that was modeled over?

A. The -- the valves themselves are all actuated and have the capability to close in seconds, and we can confirm, but I believe the time frame was minutes, two to five minutes.

Q. So if all of your pressure relief systems relieves pressure within the line downstream and you have a valve unexpectedly shut at the wellhead, how do you relieve that pressure?

A. You're talking about upstream of the wellhead --

Q. Right.

A. -- to the inlet valve?

Q. Right. Yeah.

A. If it's the segment up -- well, let me back up.

Because there's -- remember, this is all automatically or automated or controlled by a control center, and there are -- there will be tight operating pressure boundaries. So they're continually seeing when any pressure changes may happen in a line, so -- and if -- there will be set

495

points, and I can't tell you what they are at this ten seconds, but there will be an alarm and then there will be a secondary alarm. And so the control center operator will have notification if there's a -- if there's a pressure increase, and so there will be procedures or protocol they take to relieve that pressure before there's a buildup that would overpressure any equipment, whether it's that inlet valve to the wellhead or that segment of piping. So there shouldn't be a situation even in an abnormal operating condition where that equipment will be overpressured.

Q. But the protocol you mention for ensuring that that doesn't get overpressured relies on human judgment?

A. No. There will be an automatic -- or you can't have automatic set points, but, yes, the first -- the first response would be from an individual in the control center. That's correct. Per procedures on what to do in a what-if situation.

Q. Will there be protocols provided to the DMR or any regulatory bodies with respect to the decision tree for the person making that decision?

A. Those will be in the standard operating

496

procedures. So I'm not -- I don't have the experience with the DMR to see if that's something that they are -- that they want to audit or interested in reviewing. If they do, they would be available. They're not confidential or will not be confidential.

Let me clarify. We're not going to publish them on the website, but if a regulatory body wants to see our operating procedures, absolutely.

Q. Mr. Powell, were you here during my questioning of, I believe, Ms. Douglas when I was asking about what Summit would do if after, for example, the five-year review you determined that you needed to change the boundaries of the storage facility and then my questions following that were about how you would allocate compensation in that event? Did you -- were you here during that testimony?

A. I was.

Q. So let's just take as a hypothetical a situation where Summit makes the determination after five years that the data on the ground justifies adjusting those storage facility boundaries. What is Summit's plan with respect to

497

how to adjust the compensation to the landowners that has been paid up until that point?

A. I don't have that knowledge of how the -- how the compensation may or may not be adjusted to landowners.

Q. Is there anyone else in the company that would have that knowledge?

A. I'll defer to Mr. Boeshans.

Q. Okay.

MR. BRAATEN: I'm not trying to get out of order, Lawrence, but do you mind -- this is like right near the end. Do you mind if we have Mr. Boeshans come up?

MR. BENDER: If you're getting close to the end, I don't have any problem with that.

Q. (MR. BRAATEN CONTINUING) Mr. Boeshans, do you have an under -- well, I'll just start over.

In the hypothetical scenario that five years down the road Summit determines that it wants to adjust the boundary of the storage facility based on the data it gets from its monitoring activities, how would it allocate or reallocate payments already made to the owners in the storage facility?

A. (BY MR. BOESHANS) So in that situation,

498

what I would see is, you know, it's an it-depends answer. It depends on what the adjustment is to the boundary. And then if we were going to make an adjustment to the boundary, it would be -- you know, be decided, you know, by hearing like this with the Commission because that would be a major modification to the permit.

And so at that time we would have more information around what the change is, the adjustment is, how much -- how long it's been operated and have a -- probably have -- we'd have a recommendation in terms of how to do that. We don't have a plan exactly today in terms of how that would happen.

Q. If you expand the storage facility after five years, the boundary of the -- I'm going to start over.

If Summit were to make a major modification and expand the border of the storage facility through a hearing with the DMR, would you agree that you need to pay the new owners now being included in the storage facility for prior injections?

MR. BENDER: I'm going to object because I think you're asking for a legal conclusion.

499

MR. BRAATEN: That's fair.

Q. (MR. BRAATEN CONTINUING) But what I'm actually asking is what Summit's opinion would be on that issue. Not whether they need to, just whether you would.

A. So you're asking me if there was an adjustment -- your situation, if there was an adjustment after five years and we had been injecting, would we pay the landowners that were added to the unit?

Q. For the past injections.

A. For the past injections. I don't know that I can answer that. It's a -- I think you'd have to understand more about that situation, what led to the changing of the units.

Q. What more do you want to understand? What information are you missing to make the determination?

A. Well, I'm missing the historical operation and what led to the need for a change.

Q. Well, let's presume -- sorry. This was implied, but I should be explicit. You're going to change the size of the storage facility because you've determined that it was inaccurate and that the plume is going to move further than you

500

originally anticipated such that you need to expand the boundary of the storage facility.

MR. BENDER: And I'm going to object. You've asked that question previously in a little bit different manner and he said he needs to know more information before he can answer the question -- answer the question. So I'm going to object.

HEARING EXAMINER GARNER: I'm going to let him answer if he knows.

MR. BOESHANS: I don't know.

Q. (MR. BRAATEN CONTINUING) You don't know what?

A. I don't know the answer to your question right now.

Q. So Summit won't make a commitment to pay owners added into an expanded storage facility for prior injections?

MR. BENDER: Objection. Asked and answered.

HEARING EXAMINER GARNER: Sustained.

Q. (MR. BRAATEN CONTINUING) Was the answer no?

MR. BENDER: He said he didn't know.

Q. (MR. BRAATEN CONTINUING) Okay. But if

501

you don't know whether or not Summit will make a commitment to do that, then the answer is that they're not making a commitment right now to do that; right?

MR. BENDER: Objection. I mean, we've covered this ground now three times.

HEARING EXAMINER GARNER: Sustained.

Q. (MR. BRAATEN CONTINUING) Does anyone at Summit know the answer to that question?

MR. BENDER: Objection.

MR. BRAATEN: What's the objection?

HEARING EXAMINER GARNER: He can -- he can answer that one.

MR. BOESHANS: I don't know. It's not a question that I've raised with anybody at Summit.

Q. (MR. BRAATEN CONTINUING) Has anyone else at Summit raised the question with you or anyone else that you're aware of?

A. Not that I'm aware of.

Q. I apologize if someone did ask this, but there was a question earlier -- Mr. Powell, I think it might have been deferred to you, but -- or Mr. Boeshans -- with respect to the payments being made to landowners on the CO_2 stream, is that -- are those payments being made based on the full stream

502

or the actual CO_2 mass in the stream?

MR. BENDER: I'm going to object. You seem to be using the past tense. You said that we have paid or am I misunderstanding you?

MR. BRAATEN: Well, I can -- I'll just change it to avoid that.

MR. BENDER: Okay.

MR. BRAATEN: I see what you're saying.

Q. (MR. BRAATEN CONTINUING) So when you go to pay landowners for injections, is it your intent to pay based on the full stream of substances injected or the CO_2 mass in the stream?

A. The intent is to pay on the -- the full stream as it's defined in the storage agreement --

Q. Okay.

A. -- which is associated substances.

MR. BRAATEN: Okay. No further questions.

HEARING EXAMINER GARNER: I believe the staff might have some questions. Already answered? Okay. Lawrence, any further witnesses?

MR. BENDER: Not at this time.

HEARING EXAMINER GARNER: Okay.

MR. BRAATEN: Could we take a break?

HEARING EXAMINER GARNER: Take a break before you call?

503

MR. BRAATEN: Yeah.

HEARING EXAMINER GARNER: Sure. Take a ten-minute break.

(Recessed at 4:42 p.m. and reconvened at 4:59 p.m.)

HEARING EXAMINER GARNER: We are back on the record. Attorney Braaten, you can proceed with your first witness.

MR. BRAATEN: All right. We are calling Shane Bofto to appear by phone. Shane, can you hear me okay?

MR. BOFTO: I can hear you.

HEARING EXAMINER GARNER: Okay. Let me swear him in real quick.

MR. BRAATEN: Okay. Shane, the hearing examiner is going to swear you in.

SHANE BOFTO,

being first duly sworn, was examined and testified as follows:

DIRECT EXAMINATION

BY MR. BRAATEN:

Q. Shane, can you state your full name and spell your last name for us?

A. My name is Shane Bofto. Last name is B-o-f-t-o.

504

Q. And by whom are you employed?

A. HydroSolutions, Incorporated.

Q. And just generally speaking, what kind of company is HydroSolutions, Incorporated?

A. We're a services, disabled veteran-owned, small business associated with consulting and environmental and water resources.

Q. Okay. Can you describe your educational background, please?

A. Sure. I have a bachelor of science in chemical engineering from Montana State University and an M.B.A. from the University of Mary in Bismarck.

Q. And can you give us a description of your professional experience from college up until you began with HydroSolutions?

A. Sure. I initially out of college worked at a petroleum refinery in the environmental health and safety department. I then went to work out in Seattle where I focused on mining internationally, consulting primarily in water quality, acid rock drainage and treatment.

Following that, I moved back to Montana and was a general environmental engineering consultant and went through several companies till

505

I ended up here at HydroSolutions.
Q. And approximately how long have you been working at HydroSolutions?
A. Since -- since 2004.
Q. And can I have you pull up Exhibit No. LO-56, Shane?
A. I have it.
MR. BENDER: Can you just give me a minute to get there?
MR. BRAATEN: It's his résumé.
MR. BENDER: Okay. I'm there. Thank you.
Q. (MR. BRAATEN CONTINUING) Does this curriculum vitae accurately reflect your educational and professional qualifications and experience, Mr. Bofto?
A. Yes, it does.
MR. BRAATEN: Move to admit Exhibit LO-56.
HEARING EXAMINER GARNER: Any objections?
MR. BENDER: No objection.
HEARING EXAMINER GARNER: Motion granted.
Q. (MR. BRAATEN CONTINUING) And, Shane, can you describe for us with respect to your work at HydroSolutions the kinds of clients and the kinds of work that you've been involved in?
A. At HydroSolutions, clients mainly consist

506

of private individuals, ag and ranching clients, federal, state and local governments and municipalities. We have a GSA contract with the federal government. We work with developers, conservation groups and other NGOs and then companies including mining, oil and gas pipelines, and we also work with attorneys.
Q. And as a general matter, you mentioned environmental consulting services, but can you give us just some specific examples of the kinds of projects and the kinds of consult -- different kinds of consulting work that the folks at HydroSolutions do?
A. Generally, we provide independent services and environmental engineering, hydrogeology, remedial investigations, remediation, permitting, water resource development, compliance, due diligence, environmental impact statements and expert work.
Q. And, Mr. Bofto, are you familiar with the applications and the Class VI well permit applications that bring us to the hearing today?
A. Yes, I've briefly reviewed them.
Q. And do you have any -- we've talked generally about the experience of HydroSolutions

507

and your experience. Do you have any experience on particular or specific projects that you think informs your ability to work on -- or work in this proceeding or on this matter?
A. Yes. Several projects come to mind. In 2011, the Wyoming Land Quality Division issued an RFP that resulted in a competitive bid, and HydroSolutions was hired where I was the project manager to look at mining regulations in Wyoming, specifically with respect to rare earth elements in mining. And we reviewed all of the regulations and permitting process with respect to Wyoming and implications of kind of a different mining type that the state wasn't used to seeing. It was out of the ordinary.
And following that, the Montana Board of Oil and Gas Conservation issued an RFP and we were awarded that to explore primacy for the Class VI program in 2014. They were looking at setting up a program and reviewing it as an exploratory project to see if they wanted to gain primacy, and this was about the time -- a little after the time North Dakota did that same pursuit, so we followed it very closely.
Q. And so did Montana end up submitting an

508

application to obtain primacy for its Class VI program?
A. We provided the State with a draft program and we went back and forth with them, and ultimately they had an administrative decision at that time to not submit for primacy.
Q. And as you were working on the -- drafting the Class VI program for Montana, did you review any documents or guidance that informed your understanding of how to develop a Class VI program?
A. Yes. I heavily relied on a lot of BPA documents. Specifically for the Class VI program, there were a lot of guidance documents associated with implementing programs, well characterization, area of review, recordkeeping, to name a few.
Q. Can I have you turn to Exhibit LO-18?
A. I have it.
Q. Is this one of the guidance documents you just referenced that helped inform your understanding of the Class VI program while you were drafting Montana's regulations?
A. Yes, it was one of the documents I used to understand and outline our draft program.
Q. And can you just describe briefly the topic of this guidance?

509

A. Sure. The guidance generally provides information regarding modeling and recommendations for delineating the area of review. It also describes the circumstances under which the AOR or area of review is to be reevaluated, and also describes how to perform an AOR reevaluation and development of corrective actions.

Q. Okay. Let me have you turn to Exhibit LO-19.

A. All right. I have it.

Q. Is this also one of the documents you referenced that you reviewed to inform your understanding of Class VI regulatory regimes?

A. Yes, it was one of the documents I used to understand and so outline the draft program.

Q. And can you just describe generally what the topic of this document is and what it covers?

A. It provided a basic framework for the permitting process and the required activities through the Class VI injection well and activities associated with that.

Q. Okay. Can I have you turn to Exhibit LO-20?

A. I have it up.

Q. Is this also one of the guidance documents

510

you referenced a moment ago that informed your understanding of the Class VI well program when you were drafting Montana's regulations?

A. Yes. I used it similar to the others.

Q. Okay. And just generally speaking, what does this guidance document cover topically?

A. I would say it provides a general outline of the data to be collected and how to use the data to identify potential risks and eliminate unacceptable sites. It also provides information for inputs into whatever geologic model is chosen for use to evaluate any geological modeling.

Q. Okay. And now I'm going to have you -- it's marked a little out of order here, but there's an Exhibit LO-82. I'll have you switch -- or flip to Exhibit LO-82.

MR. BRAATEN: And, Lawrence this one didn't get into the binder. I've got an extra copy.

MR. BOFTO: Okay. I'm pulling it up. Yes, I have this one.

Q. (MR. BRAATEN CONTINUING) I'm sorry, Mr. Bofto, I might have missed it. Did you get yourself to that exhibit?

A. Yes, I have -- have that exhibit, the one

511

for recordkeeping and reporting, generally.

Q. And specifically Exhibit 82 that indicates it's the Underground Injection Control Program Class VI Well Recordkeeping, Reporting, and Data Management Guidance for Owners and Operators. Is that the exhibit you have up?

A. Yes.

Q. Okay. Is this also one of the guidance documents that you reviewed that informs your understanding of the Class VI program that you used in developing Montana's regulation?

A. Yes.

Q. Okay.

MR. BRAATEN: Move to admit Exhibits 18, 19, 20 and 82.

HEARING EXAMINER GARNER: Any objections?

MR. BENDER: No objection.

HEARING EXAMINER GARNER: Exhibits are admitted.

Q. (MR. BRAATEN CONTINUING) Mr. Bofto, can I have you now open up -- or turn to Exhibit No. 21?

A. I have that up.

Q. Do you have an understanding of what the first two sentences of this data tool mean?

A. Yes.

512

Q. And can you tell us what that is?

A. Under the rule that's cited there, that the owners and operators must submit the project information -- their geological sequestration project information directly to the EPA and I take it through the geologic sequestration data tool in that this requirement applies regardless of primacy, whether it's still EPA or a particular state or entity has primacy.

Q. Mr. Bofto, are you ready, willing and able and have you been ready, willing and able for the past three weeks to assist in running and analyzing models related to these Class VI well applications had you received data and input files to do so?

A. I'm capable and ready to run the geochemical model PHREEQ, given that if I had the input files and the right thermal dynamic database or a reference to it if -- if the reference one that comes with the model, is unaltered.

MR. BRAATEN: No further questions.

HEARING EXAMINER GARNER: Mr. Bender, any questions?

MR. BENDER: Yeah, I do.

513

CROSS-EXAMINATION

BY MR. BENDER:

Q. Mr. Bofoto [sic], my name is Lawrence Bender and I represent the applicant, Summit, in this case. Nice to meet you today.

A. Nice to meet you.

Q. Okay.

A. My name is Bofto.

Q. Okay. Thank you for correcting me. I appreciate that. Do you mind if I call --

A. No problem.

Q. Do you mind if I call you Shane?

A. Please do.

Q. Okay. Thank you. I want to just delve a bit into your discussion about what you did for the State of Montana. First of all, what was the time period in which you were working on that? I think you said it was about the time that North Dakota was adopting its rules, but I want to make sure that I understood that correctly.

A. Yes. I believe I started it in 2012, but a lot of these documents that I had just referenced were in draft form, so a lot of it we waited for the final versions of the EPA guidance documents to be issued. And I believe my last final draft was

514

submitted to the Board of Oil and Gas following discussions with them in mid to late 2014.

Q. Okay. And when you -- when you referred to these documents were in draft form, I'm sure you're talking about Exhibits LO-18, 19 -- let's see here -- looks like 20 and is it 83?

MR. BRAATEN: 82.

Q. (MR. BENDER CONTINUING) 82. Is that correct?

A. They may have included some of those, but there were also some other guidance documents and some of the things I'm trying to recall with the environmental justice, bonding, things like that. So that was why we waited a little while longer so we could work with final documents that were included. I think they're currently included on EPA's Class VI website.

Q. And what was it that you were requested to do by the Montana Oil and Gas Conservation Commission?

A. To review that type of information and draft a program that the State could use for their primacy application should they desire to go after primacy for the Class VI program.

Q. And were involved in drafting the statutes

515

that were necessary for the Montana Board of Oil and Gas to adopt the rules or were you -- was that statutory enactment already in place and all you were asked to do was prepare the regulations?

A. I was asked -- I was not involved with the statutes or anything like that. I was just involved with gathering information that the board needed to get the primacy application in place.

Q. Are the statutes already in place in Montana and that all they're lacking at this point in time is the regulations?

A. I believe at that time there was a statute associated with it that was in place.

Q. Okay.

A. It's been a while, but I seem to recall it was in place prior to them issuing approval for us to do this work.

Q. Okay. And I believe you said you started in 2012, probably finished in 2014; is that correct?

A. That sounds about right.

Q. Okay. Approximately -- well, strike that.

During that period of time, were you working full-time on this project?

A. No.

516

Q. Okay. Were you working on the project by yourself?

A. No. I was part of a team of other consultants and internal people. We had an attorney because there was a portion where we had to draft a letter from I believe the attorney general or something to EPA and there were several other documents that needed to be drafted that were best suited for an attorney. And I had another company that had petroleum engineers and petroleum geologists associated that were reviewing some of the draft documents at that time as well.

Q. Okay. Well, thank you for that. I had misunderstood your testimony. I thought that you were primarily responsible for doing all the work. But since it was a team, let me ask you a couple questions about that. What were -- what were your specific responsibilities on that team?

A. I was the project manager, and areas -- I would collect information as well as derive information that I could and I put them into the draft program. I took and I followed a lot of the guidance to establish, you know, a general procedure for permitting.

Q. And did you ultimately draft some rules

517

that were submitted to the Oil and Gas Conservation Commission?
A. Not at that time.
Q. When you say "not at that time," you're talking about the period from 2012 to 2014?
A. I'm talking -- well, I never drafted any rules based on the draft program.
Q. Okay. I misunderstood you then. I -- I had understood you to testify when Mr. Braaten was asking you questions that you drafted the rules but the -- the board ultimately made a decision that it was not going to adopt the rules. Did I misunderstand?
A. I drafted a permitting program for somebody that we could run past EPA so someone could get a permit for a Class VI well should Montana get primacy.
Q. Okay.
A. Does that make sense?
Q. I think so.
Do you know why the board never went forward with the rules?
A. No, that was an administrative decision far above my pay grade.
Q. Okay. Let's talk a little bit more about

518

your experience. You've explained to us that as a result of reviewing these guidance documents that have now been entered into the record, I think it was 17, 18, 19, 20 and also 82, you were involved in this project. Have you ever been involved in making application in a state that has primacy for a Class VI permit?
A. No.
Q. Okay. You haven't been -- I apologize. I wasn't listening to my question very well when I asked it. Did I -- well, let me rephrase it.
Have you ever been involved in any way in making a Class VI application to a state that has primacy?
A. No.
Q. Okay. Have you ever reviewed an application, other than the one before the Commission -- or the ones that are before the Commission today, for a Class VI permit?
A. I'm trying to recall. I may have looked at some when I was drafting a program. I have a faint recollection that I tried to look at others that had gone through EPA at the time. I just cannot recall the specifics.
Q. Yeah. And I apologize, I think I said

519

this, but I asked -- my question was specific to being involved in an application with a state that had primacy.
A. None with a state that had primacy.
Q. Other than the applications that are before the Commission today, have you ever reviewed an application for a Class VI well?
A. Back to my previous statement, I believe I did when I was drafting the program to look at what an application looks like. I just don't recall because it was so long ago on what it was.
Q. That would have been back in the 2012 period, 2014 period; is that right?
A. Somewhere in there.
Q. And would those have been applications before the EPA?
A. Yes.
Q. Okay. When were you hired by the intervenors in this case?
A. Oh, it's been a month or so.
Q. Okay. You don't know the exact date? I mean, today is the 11th. Would it have been probably May 11?
A. It could have been about that time, but I don't know specifics.

520

Q. What were you asked to do on May -- on May 11?
MR. BRAATEN: I'm going to object to that characterization of testimony. I don't believe he testified to doing something on the 11th.
HEARING EXAMINER GARNER: Overruled.
Q. (MR. BENDER CONTINUING) Okay. What -- okay. I guess you can answer the question.
A. What was I -- could you repeat that question again?
Q. What were you asked to do when you were hired for this project?
MR. BRAATEN: I'm going to object to questions eliciting communications between me and the experts.
HEARING EXAMINER GARNER: Overruled.
MR. BRAATEN: You can go ahead, Shane.
MR. BOFTO: Oh, okay. Just to provide my experience with the Class VI guidance and programs that I had early on and just my general environmental background information.
Q. (MR. BENDER CONTINUING) And how many hours do you believe you've worked on this project since you were retained?
A. Outside of this, probably 15 reviewing

521

documents and such and --
Q. And have you had an opportunity to review each one of the -- what I'm going to refer to as the final form of applications for the three applications that are before the Commission?
A. I've generally reviewed them, yes, and -- I'm trying to think if I've done any others. So I'd say I generally reviewed the three applications.
Q. Okay. And when you say reviewed them, did you just -- did you just read them or did you do anything beyond reading? Did you do any independent research?
A. I looked closely at some of the models on what were being used and what they did exactly.
Q. Okay. And if I -- and please correct me if I'm wrong, Shane, but I understood your testimony when Mr. Braaten was asking you some questions that you -- if you'd had the materials that he requested from the Industrial Commission, you could have run a model in a relatively short period of time. Was that your testimony?
A. Yes. I specifically referenced the PHREEQC model by U -- that is put out by the USGS.
Q. Okay. And do you have the necessary

522

software packages that you would need to run the model?
A. Yes, I do. It's on my computer now.
Q. Okay. Can you tell me what some of those programs are?
A. I'm specifically talking about the PHREEQC model. It's downloaded freely from the USGS, and I have routinely used the program through my career and have used it to write specific reports.
Q. And do you believe that that's the only software you would need to analyze the information that Summit has filed with the Industrial Commission on this matter?
A. It's the only one that I'm focused on.
Q. Okay. Do you agree with me that there are other software programs?
MR. BRAATEN: I'm going to object to the form of the question.
MR. BENDER: What's that?
MR. BRAATEN: I object to the form of the question. There are.
MR. BENDER: Well, let him answer.
HEARING EXAMINER GARNER: If he can understand it, he can answer it.
MR. BOFTO: There are numerous geochemical

523

models outside of PHREEQ. There's Geochem Workbench® that I've used and several others, but the application specifically said they used PHREEQC and that was the one I was focused on.
Q. (MR. BENDER CONTINUING) But you don't know if this PHREEQC is the only program that would be necessary to evaluate the information that's been supplied to the Commission, do you?
MR. BRAATEN: For the --
MR. BOFTO: I'm just going off the application that said that was the program that they used.
Q. (MR. BENDER CONTINUING) Okay.
A. I did not see any other geochemical programs to evaluate the upper and lower confining units.
Q. Okay. Tell me a little bit about your experience working in North Dakota. I know you said you went to the University of Mary. Have you done any work in your current role with -- I believe it's HydroSolutions. Have you worked in North Dakota with that company?
A. Yes. I've had probably -- probably six or seven projects in the last ten years in North Dakota.

524

Q. What were those projects?
A. Some of them were work with attorneys for oil and gas impacted sites. Done some incidental air quality work there from facilities. Trying to think. Looked at different reviewing remediation plans for cleanup for saline impacts or produced water impacts.
Q. Okay. So it sounds to me, and please correct me if I'm wrong, that most of that work that you've done in North Dakota has been from the standpoint of surface issues; is that a -- is that a fair statement?
A. No. There's been other issues associated with contaminated groundwater and cleanup.
Q. Okay. Have you ever been involved in North Dakota in making application to the Commission relative to saltwater disposal wells or Class II wells?
A. I've been part of such projects exploring commercial Class II saltwater disposal wells.
Q. Ever prepare an application to the Commission for a saltwater disposal well?
A. I've provided information for somebody else to submit a Class II application.
Q. Okay. What sort of information did you

525

supply?
A. Looked at things like deriving maximum pressure at the wellhead. Working with other geologists in my company, suitable formations. Looking at areas of review for other wells that could be within the area of review, things along that line.
Q. But you never were involved in a saltwater disposal application in North Dakota where you were the lead individual in making that application; isn't that correct?
A. That'd be fair to say.
MR. BENDER: No further questions.
HEARING EXAMINER GARNER: Any questions from the staff? Any redirect, Mr. Braaten? Oh, I'm sorry, you do.

EXAMINATION

BY MR. HELMS:

Q. Shane, this is Lynn Helms with the Industrial Commission. Nice to meet you, maybe some day face-to-face.
A. Nice to meet you.
Q. Yes.
North Dakota made its application for Class VI primacy on June 21 of 2013 and received

526

final approval April 24 of 2018. Shane, did you comment on North Dakota's application?
A. No, I did not.
Q. Did you review the North Dakota documents when you were preparing Montana's prospective documents?
A. I seem to recall that we were following at that time whether North Dakota was going to draft their own specific rules or adopt it by rule, and that was -- we had a lot of discussions about that on whether Montana should or shouldn't, and I seem to recall North Dakota going back and forth maybe once on what the appropriate action was, and we were going to try to learn at that point from you.
MR. HELMS: Okay. Thank you.

REDIRECT EXAMINATION

BY MR. BRAATEN:

Q. Mr. Bofto, do you have a copy of -- well, do you recall signing an engagement letter for this matter?
A. Yes.
Q. And do you recall the date of that?
A. May 1.
MR. BRAATEN: Okay. No further questions.
HEARING EXAMINER GARNER: Okay. You can

527

call your next witness. Can I get the name?
MR. BRAATEN: Ted Doughty.
HEARING EXAMINER GARNER: Doughty. Okay.
MR. BRAATEN: Yeah.
MS. ZASTE: He has a first initial, P, but he goes by Ted. So it's P. Ted Doughty.
HEARING EXAMINER GARNER: Gotcha.
MR. BRAATEN: Mr. Doughty, we're getting some feedback from you. Can you mute -- well, no, we're still getting feedback. Can you mute -- what was it -- what did you -- okay.

P. TED DOUGHTY,

being first duly sworn, was examined and testified as follows:

DIRECT EXAMINATION

BY MR. BRAATEN:

Q. Mr. Doughty, can you state your full name and spell your last name for us, please?
A. It's Paul Ted Doughty, D-o-u-g-h-t-y.
Q. And you go by Ted; right?
A. Yes, I do.
Q. Okay. Can you tell me briefly your educational background?
A. I have a bachelor's in geology from Washington University in St. Louis, a master's in

528

geophysics from the University of Montana, and a PhD from Queen's University in Ontario, Canada.
Q. And can you start by just briefly describing your professional background?
A. Yes, sir. So I've worked with Exxon -- I worked in the Exxon research lab for four years in the late '90s. I taught at Eastern Washington University for eight years as a professor. And since 2008 I've been a consultant on my own working for various companies like Talisman Energy, Halliburton, various other companies in the Rockies.
Q. Can you tell us a little bit about the kinds of work you did with your time at Exxon?
A. Yes. So at Exxon I was in the fault -- fault seal group, also did -- which is analyzing how fault seal in the various environments in the -- in the -- we did a whole research project looking at fault seal across the entire -- all the basins that Exxon worked in.
I also did 3D seismic interpretation in various basins across the world. Did a lot of field research on the Bakken and various other groups in the western U.S. as analogs for subsurface formations.

529

Q. And can I have you pull up in front of you, Ted, the Exhibit LO-58?
A. I'm not in the office, so if you describe it to me, though, I can do that.
Q. Do you recall the information contained on your curriculum vitae?
A. Your -- can you repeat the question?
Q. So I'll tell you Exhibit 58 is your curriculum vitae. Are you familiar with --
A. Oh.
Q. -- the contents of your curriculum vitae?
A. Oh, yes. Yes, sir. Yes.
Q. Okay. And does that accurately describe your educational and professional background and experience.
A. Yes, sir. With the exception of several items that I left off that I did recently. I actually was the well site geologist on the J-Loc Minnkota well that was drilled as part of their carbon sequestration project. I logged -- personally logged 1600 feet of core on site for that project.
Q. Okay.
A. And I've also done a lot of helium exploration in the last, oh, six months.

530

MR. BRAATEN: Okay. Move to admit LO-58.
HEARING EXAMINER GARNER: Any objection?
MR. BENDER: No objection. Oh, thank you. No objection.
HEARING EXAMINER GARNER: The exhibit is admitted.
MR. BENDER: My mike was off.
HEARING EXAMINER GARNER: Exhibit is admitted.
Q. (MR. BRAATEN CONTINUING) And, Ted, did you review the applications submitted by EERC and Summit that bring us here today?
A. Yes, I have, in extensive detail.
Q. And can you start by just describing to us the areas of those applications regarding which you would have particular expertise?
A. Yes. So they have core data on the Broom Creek Formation of which I mentioned I personally logged all the J-Loc wells. So I'm familiar with that. Also I have expertise in 3D seismic interpretation. I haven't seen their 3D seismic, but it's a critical part of their application, as well as the formation mechanical integrity work that they did doing the testing in their test well.
Q. What data would you need in order to

531

create a PHI-H map to map out the porosity and permeability of a reservoir?
A. So from what I've seen of their applications, the -- there's only one -- no, there's three -- I think there's three -- there's two wells that are close together and another well in their AOR which encompasses about -- actually, I'm not sure how big the AOR is, but if you take their simulation area, there's 26 wells in the simulation area -- or the simulation area, there's 26 wells. It's about a well per 55 square miles which is not very many data points. So within the AOR there's only 3 data points. There's no legacy wells.
So you would need to coordinate it, which they provided, but as well it appears like the seismic data was a critical part of how they defined the reservoir properties in the AOR. There's only -- like I mentioned, there's very few wells within the AOR. So we'd need access to the 3D seismic to actually do a facies analysis to determine what the seismic data tells you about the reservoir within that AOR.
And within that application, there's only one map that shows the permeability distribution

532

within their stimulation -- their simulation area. Excuse me. So there's very little data within their application with which to evaluate exactly how they derive their permeability parameters for the AOR that they're applying for.
Q. Mr. Doughty, do you recall approximately how long ago you were asked about the possibility of working on this matter?
A. It was, what, a month ago, maybe three weeks ago, something like that.
Q. And are you ready, willing and able to conduct additional review and particularly review of seismic data if you receive it?
A. Yes, I am.
MR. BRAATEN: No further questions.
HEARING EXAMINER GARNER: Attorney Bender.

CROSS-EXAMINATION

BY MR. BENDER:

Q. Mr. Doughty, are you -- Mr. Doughty, are you in a position today to make any recommendations to the Commission as to whether this application should be approved or denied?
A. I am.
Q. And what are your conclusions?
A. I would recommend that it's denied on the

533

basis that the applicant did not -- has not provided enough of the data from which the Commission or another party could evaluate how they came up with some of their reservoir properties.

Q. Okay.

A. Without the 3D seismic, you cannot determine the distribution of permeability and porosity across the AOR.

Q. Okay. And I believe it was your testimony at this point in time all you have reviewed is the three applications; is that correct?

A. That is correct. And --

Q. And you haven't reviewed -- you haven't reviewed the other data that's on file with the Commission?

A. I've reviewed the data that's publicly available.

Q. Okay.

A. Yes.

Q. Did you -- have you seen a letter dated May 15, 2024, from Mr. Braaten to the Commission requesting certain information?

A. I have not seen the letter. I've heard that there's a motion to compel.

Q. Okay. Do you know if the Commission

534

indicates that they supplied that information to Mr. Braaten?

A. I do not.

Q. Okay. You talked a little bit about a PHI-H map, and I don't want to put -- I don't want to testify for you, but I understood you to say that a PHI-H map would have been important for the Commission in this case. Is that a -- is that a fair statement of your testimony?

A. Yes, that is a fair statement. If you -- if you want to understand where the CO_2's going as you inject it, you need a PHI-H map to determine the -- the storage capacity to the formation.

Q. Okay. And you --

A. And like I -- like I said earlier, there's only three data points within the AOR. So I'm -- I don't quite understand how the EERC came up with such a complex map of permeability and porosity without having additional data. It should have been provided in their submittal.

Q. Okay. And I think you also indicated that you were involved -- you sat the -- the well for Minnkota's -- the J-Loc?

A. The J-Loc.

Q. Yeah, the J-Loc.

535

A. Yep. J-Loc. Yep.

Q. So you know somewhat about that -- you know some things about that application that was made to the Commission for a Class VI well; is that correct?

A. I -- no. I don't -- I set the well. I described the core. I was not involved in anything after they drilled the well.

Q. You knew the --

A. But I.

Q. -- you know the Commission granted the application; correct?

A. Yes.

Q. Do --

A. But I wasn't involved in it. I do know what the core looked like and somewhat of the reservoir properties of the Broom Creek.

Q. And, you know, thank you for all that, but we can get through this a little bit quicker if you just answer my questions.

Do you know --

MR. BRAATEN: I think he did.

MR. BENDER: Well, I think he went on a little bit more than he needed to, but I'll move on.

536

Q. (MR. BENDER CONTINUING) Do you know if Minnkota submitted a PHI-H map in its application?

A. I do not.

Q. Are you familiar with the application that was filed by Blue Flint?

A. No.

Q. Do you know if they submitted a PHI-H map?

A. I do not.

Q. Are you familiar with the application that was submitted by Dakota Gasification?

A. No.

Q. Do you know if they submitted a PHI map -- PHI-H map?

A. No.

Q. Are you familiar with the application that was filed by Red Trail?

A. No.

Q. Do you know if they submitted a PHI-H map?

A. No.

Q. Do you know all those applications were granted by the Commission?

A. No.

MR. BENDER: No further questions.

HEARING EXAMINER GARNER: Any questions from the staff?

537

Redirect, Attorney Braaten?
MR. BRAATEN: No, I don't have any further questions. Thank you very much, Mr. Doughty.
MR. DOUGHTY: Thank you.
HEARING EXAMINER GARNER: Okay. You can call your next witness.
MR. BRAATEN: We are calling Paul Button.
HEARING EXAMINER GARNER: Button?
MR. BRAATEN: Yes.

PAUL BUTTON,

being first duly sworn, was examined and testified as follows:

DIRECT EXAMINATION

BY MR. BRAATEN:

Q. Mr. Button, can you state your full name and tell us -- well, let's start there. Just state your full name, please.

A. My name is Paul Michael Button.

Q. And can you give us a business or residential address?

A. My residential address is 1119 South Ophir Street in Butte, Montana.

Q. All right. Can you tell us just a little bit about your educational background?

A. I have a bachelor of science degree in

538

petroleum engineering from Montana Tech.

Q. All right. And tell us a bit about your professional experience.

A. My professional experience is I've worked 26 years as a petroleum engineer. I started off my career as a reservoir engineer for Marathon Oil Company working the Yates Field in West Texas doing simulation on gas oil gravity drainage with nitrogen injection and then converting it over to CO_2 injection.

From there I moved to -- on to Kinder Morgan when they acquired the Yates asset. I did a little bit of reservoir simulation on Yates, and then I worked the SACROC CO_2 flood unit in Scurry County, Texas.

After I left Kinder Morgan, I worked for SM Energy in Billings, Montana, for a number of years doing enhanced oil recovery studies on fields in the state of Wyoming. Also worked several water floods and shale development wells within the Powder River Basin, Richland County, Montana, and a little bit of experience in Divide County, North Dakota.

From there I left SM Energy and I went out on my own as a consultant. I did numerous

539

consulting jobs for multiple clients, including purchase and acquisition, evaluation, State evaluations and reservoir simulation for enhanced oil recovery on the Poplar Dome in Montana.

I then joined a company called Poplar Resources as a vice president where we implemented a pilot for enhanced -- a nitrogen injection flood. And I have been with that ever since.

And then I also started a startup for a battery energy storage corporation. We do compressed air energy storage. And I'm currently working both the Poplar job, the consulting job, and battery energy storage job.

Q. Okay. Can I have you turn in the exhibits to what we marked as LO-57?

A. Yes.

Q. Let me know, do you have that in front of you now?

A. Yes, I do.

Q. And what is Exhibit 57?

A. I would call it my résumé or CV.

Q. Okay. And does this CV accurately reflect your educational and professional experience and qualifications?

A. I would probably -- I caught a couple of

540

errors in here. The Button Petroleum Management, it was no longer active until recently again, so I would add that through 2024.

Q. Okay.

A. And I believe the name of the -- my educational school is no longer accurate because it's no longer Montana Tech of the University of Montana. I believe it's the Montana Technological University.

Q. Okay. Other than those, does the Exhibit 57 accurately reflect your professional and educational experience and qualifications?

A. Yes.

MR. BRAATEN: Move to admit Exhibit 57.
MR. BENDER: No objection.
HEARING EXAMINER GARNER: Exhibit is admitted.

Q. (MR. BRAATEN CONTINUING) Mr. Button, can you tell me if you have any experience with Class II wells or permitting Class II wells?

A. Yes. I have permitted a num -- a number of Class II wells in the state of Montana.

Q. And with respect to any of those Class II wells, was it necessary to obtain an aquifer exemption?

541

A. Yes. We worked on an aquifer exemption for one of the wells within the Poplar unit, east Poplar unit.

Q. Okay. Was there any kind of a volumetric limit imposed as part of that aquifer exemption?

A. Yes, I believe so.

MR. BENDER: Objection. Relevance.

HEARING EXAMINER GARNER: Overruled.

Q. (MR. BRAATEN CONTINUING) And are you familiar with the manner in which the volumetric limits are calculated for aquifer exemptions by either the EPA or state authorities?

A. I am familiar with how the volumetric extensions were calculated and approved for the permits that I worked on. Yes.

Q. Okay. And so with respect to the permits you worked on, can you just provide a general description of how those volumetric limits are calculated for the aquifer exemptions?

A. Basically, these were pretty simple calculations in that you would calculate the -- the volume within a given X number of foot radius that you believe you'll affect with the water injection, you know, so you get a volume of a cylinder, multiply it by your porosity, divide it by your

542

formation volume factor of water and that is the volume that will be affected.

Q. Do you have experience with reservoir modeling and -- well, you've already talked about this. Can you tell us a little bit about the experience you have with EOR and water floods with respect specifically to field development analysis?

A. Yes. I've had several major modeling projects over my career. The first one was for Yates field. We spent quite a few years looking at and running sensitivities on gas oil gravity drainage, enhanced oil recovery process as far as looking at gas oil contact movement speed versus the drainage of oil from the matrix in the reservoir. We also looked at viscosity effects with the injection of different gases and the swelling effects in the oil with different composition of injected gases, whether it was nitrogen, CO_2 or a mixture of recycled gas to determine the most effective recovery and most economic recovery mechanism with an EOR process.

My other major modeling project which I've worked on most recently is developing a full-field simulation model to model the history and also the enhanced oil recovery potential for Poplar Dome in

543

Montana, the East Poplar unit. That is a 70-year-old field that's probably undergone primary depletion with a strong natural water drive where I deal with gas on the top of it and expose the matrix to gas oil gravity drainage and determine if that was an economically feasible project.

Q. And can you tell us about any other specific experiences you have related to doing reservoir modeling and analysis?

A. I'm currently working on setting up the parameters to look at natural -- or compressed air storage in salt caverns and looking at the pressure volume and temperature effects and the rock stress effects within salt caverns to determine the feasibility for the active storage reservoirs.

Q. Mr. Button, do you have an understanding of different ways that pore space can be used in a commercial manner?

A. Yes, I do.

Q. And if a landowner wants to make a commercial use of pore space, can you tell us what you understand to be the options for making that commercial use of pore space?

A. It's basically three options of which there can be multiple derivatives of each option,

544

but either you remove fluid and market it as a -- as a quantity, you temporarily store something in your pore space, or you permanently sequester something in your pore space.

Q. And how would you assess the degree to which the pore space of a given landowner is being used in a way that forecloses other commercial uses?

A. I guess I would attempt to evaluate the change in the pressure volume temperature of the fluids contained within the pore space, and knowing that there are certain constraints on the upper end of the pressure and certain constraints on the lower end of the pressure and try to determine what the current impacts, what the proposed impacts and what the -- the final limits were of that pore space.

Q. Mr. Button, if you were provided with the data decks and input files required to run models in CMG and Schlumberger's Petrel software for this project, would you be ready, willing and able to run those models and analyze them for the intervenors?

A. The CMG model, I would be ready to upload those and run those and do some sensitivity

545

analysis on those models. As far as the Petrel model, the Petrel model is a static model. It's basically a geologic database, so those -- unless you're trying to redistribute properties or something like that, there's -- it's not a dynamic model where the answer changes, so I don't think there's nothing -- there's nothing to run there.

MR. BRAATEN: Understood. No further questions.

HEARING EXAMINER GARNER: Attorney Bender.

CROSS-EXAMINATION

BY MR. BENDER:

Q. Mr. Button, you -- you spent some time describing your experience as an engineer and involved in various enhanced oil recovery projects around the country. Is that a fair statement?

A. Yes.

Q. And you also talked about a compressed air project that you're working on. Do you recall that?

A. Yes.

Q. And in those projects, both the enhanced oil recovery projects and the compressed air project, you were involved in running some models; is that a fair statement?

546

A. Yes.

Q. Okay. Would you agree with me that running -- preparing and running models for enhanced oil recovery projects and a compressed air project is different than preparing and running a model for CO_2 storage?

A. Can you clarify what you mean by "different"?

Q. Well, if you've run -- or prepared and run models for CO_2 on a number of projects, are you going to have more knowledge and experience than someone who has not run models for CO_2, only for enhanced oil recovery and compressed air?

A. Well, the models that I've ran for enhanced oil recovery, especially for when I worked the Yates field, those directly involved the injection of CO_2 in the pore space --

Q. Okay.

A. -- so they're not too dissimilar. The only -- the main dissimilar between those two models is that in the carbon sequestration, the CO_2's interaction is primarily with water, where in those other models it was with both water and oil. So they were actually more complex.

Q. Okay. Are you familiar with the data

547

requests that Mr. Braaten made to the Industrial Commission?

A. I --

Q. Pardon me?

A. Yes, I am.

Q. Okay.

A. Yes, I am.

Q. Okay. And are you familiar with the type of data that would be contained within a CMG data file?

A. Yes, I am.

Q. Could someone produce a PHI-H map if they had a CMG data file?

A. I believe that within CMG's program you could get that, yes.

Q. Okay. And are you aware that it's the -- in the Commission's position that they provided a CMG data file to Mr. Braaten?

A. I am not aware of the CMG data file, if Mr. Braaten is in possession of it or -- I am certainly not in possession of that CMG data file.

Q. He didn't provide it to you?

A. I have not seen it, no.

Q. Is it a fair statement that -- well, let me back -- strike that.

548

A. Let me --

Q. How many hours -- just let me ask the questions. Just let me ask the questions.

A. Okay.

Q. How many hours of time have you spent working on this project?

A. I have -- up until the start of this hearing, I spent 14-and-a-half hours working on it.

Q. Okay. And what were you asked to do?

MR. BRAATEN: Same objection to privileged communications with experts.

HEARING EXAMINER GARNER: Overruled.

MR. BUTTON: What was I asked to do?

Q. (MR. BENDER CONTINUING) Yes.

A. I was asked by Mr. Braaten to evaluate the impact of the pore space of his clients.

Q. Okay. And to do that at this point in time, all you have done is reviewed the applications that were submitted to the Commission; is that correct?

A. No.

Q. You didn't review the applications?

A. I did review the applications, but that is not all that I've done.

Q. What else did you do in the 15 hours that

549

you've spent on this project?
A. I have looked through the well files of the wells in the immediate area to see what information was available.
Q. How many hours did you spend reviewing the applications?
A. Probably the majority of the 14 hours.
Q. Okay.
A. But I don't have a specific number, but I could get that number for you.
Q. More than ten?
A. I would say yes. Probably in the ten range.
Q. Well, you said more than 10. Would it be 11 or 12?
A. We'll go with more than ten.
Q. Okay. And then the other -- the only other time you would have -- well, strike that.
The additional time you would have spent between 10 hours and 15 hours would have been to review some logs; is that what you said?
A. I did not say I reviewed logs. I said I reviewed the well files on the Commission website.
Q. Okay. What are in the well files?
A. The well files contain the core reports

550

and some of that type of information. They have like casing size and the drilling completion information, things like that.
Q. Okay. Would you agree with me that you really haven't reviewed enough to make any sort of recommendation to the Commission whether this application should be granted or denied?
A. Absolutely.
MR. BENDER: Okay. No further questions.
HEARING EXAMINER GARNER: Any questions from the staff?
Mr. Braaten, any redirect?
MR. BUTTON: Are you waiting for a response from me?
MR. BRAATEN: Sorry. No, Mr. Button, that was on me. I'm just taking a moment to review my notes to see if I have anything else to ask. Give me one moment, please.
I have nothing further.
HEARING EXAMINER GARNER: Okay. I know you said you only expected to get through three witnesses, but you still have 20 minutes.
MR. BRAATEN: I'm -- yeah, I'm sorry, I have one more, but he is no longer available.
HEARING EXAMINER GARNER: He's not

551

available right now?
MR. BRAATEN: Right.
HEARING EXAMINER GARNER: Let's go off the record for a minute.
(Recessed at 6:10 p.m. and reconvened at 6:11 p.m.)
HEARING EXAMINER GARNER: Okay. We are back on the record, and we are going to recess these hearings and resume tomorrow morning at 9 a.m. That concludes our hearings for the day.
(Recessed at 6:12 p.m., Wednesday, the 12th day of June, 2024.)

552

CERTIFICATE OF COURT REPORTER

I, Stephanie A. Smith, a Registered Professional Reporter,
DO HEREBY CERTIFY that I recorded in shorthand the foregoing proceedings had and made of record at the time and place hereinbefore indicated.
I DO HEREBY FURTHER CERTIFY that the foregoing typewritten pages contain an accurate transcript of my shorthand notes then and there taken.
Dated at Bismarck, North Dakota, this 3rd day of July, 2024.

AUDIO RECORDING

IN RE: NORTH DAKOTA INDUSTRIAL COMMISSION

CASE NOS. 30869 and 30880

(Due to the quality of the recorded media, portions were unable to be transcribed and include inaudible portions. The transcript may also include misinterpreted words and/or unidentified speakers. The transcriber was not present at the time of the recording; therefore, this transcript should not be considered verbatim.)

TRANSCRIBED BY: MELISSA EICKEN

OFFICER GARNER: We are back on the record for hearings in case number 30869 through 30880. I'm David Garner, the hearing examiner for the hearings. We're at the hearing room of the Department of Mineral Resources, Oil & Gas Division, and it is 9:00 a.m. We'll resume where we left off, which I believe was Attorney Braaten is going to call his next witness.

MR. BRAATEN: We'll get them on the phone real quick here.

UNIDENTIFIED FEMALE: Hi, Chris. You ready? Okay. I'll put you on.

OFFICER GARNER: What's his name?

MR. BRAATEN: Well, we are calling Chris Stockness, appraiser with Shenehon Company.

OFFICER GARNER: Stockness is his last name?

MR. BRAATEN: Yes.

OFFICER GARNER: Mr. Stockness.

THE WITNESS: Good morning.

OFFICER GARNER: Do you solemnly swear or affirm under the penalties of perjury the testimony you're about to give in this matter be true and correct to the best of your knowledge and belief?

THE WITNESS: I do.

DIRECT EXAMINATION

BY MR. BRAATEN:

Q. Mr. Stockness, can you state your full name and spell your last name for us, please?

A. Yeah. Christopher John Stockness, S-T-O-C-K-N-E-S-S.

Q. And can you tell us by whom you're employed and your position?

A. Yeah. I'm employed at Shenehon Company where I am the managing director of real estate.

Q. Can you tell us just briefly what your educational background is?

A. Yeah. I attended the University of St. Thomas, and then obtained a degree in real estate, and I'm a certified general real property appraiser, been working in the valuation industry since 2002.

Q. And can you just provide some general background on your professional experience as an appraiser?

A. Yeah. As I mentioned, I've been in the valuation industry since 2002, but in college, I actually started at Shenehon Company, initially hired as a valuation analyst, and then currently the vice president, managing director of real estate Shenehon and Shenehon Company is a real estate and business valuation firm that's been in business since 1927.

We're based out of Minneapolis, and we routinely complete assignments throughout the upper Midwest. Over the past 20 years, I've been performing a multitude of commercial real estate valuations ranging from -- to all types of commercial real estate. In the course of my work, I'm routinely valuing different property rights, interest, including, you know, fee simple, lease fee, surface right, mineral right, air rights, and various easements. I do also hold a full-time license as a certified general real property appraiser in the State of North Dakota and have testified as an evaluation expert in the state.

Q. Thank you, Mr. Stockness. We have a -- an exhibit marked as LO-55. Do you have a copy of that in front of you?

A. Yes, I do.

Q. And can you tell us what that is?

A. That's a -- my curriculum vitae.

Q. And does the curriculum vitae accurately represent your professional work and experience?

A. Yes, it does.

MR. BRAATEN: Move to admit Exhibit 55.

OFFICER GARNER: Any objection?

MR. GLUDT: No objection.

OFFICER GARNER: The exhibit will be

admitted.

Q. (By Mr. Braaten:) Mr. Stockness, have you done any valuation projects or appraisal work that are similar or that you think would be helpful to assessing compensation for the matter that brings us here today?

A. Yeah. Well, as I mentioned, I have a license in North Dakota for -- for appraising real estate, and I work throughout, you know, central North Dakota throughout the Bakken formation, all across the state, really, appraising everything from easements for various pipelines, been involved in some oil production valuation, and surface rights including the impact of surface rights from energy production (inaudible) utilities, and routinely value agricultural land throughout the state as well as that our firm does get involved in doing a lot of mineral rights valuation. One time, in particular, we -- what we're currently working on is a underground natural gas storage assignment that we're working on in the -- in Iowa, and in that particular instance, we are involved in appraising what the value -- what -- what a lease agreement should be for the rights to store natural gas underground.

Q. And with respect to the intervenor

landowners in this matter, and the time and work you've done, have you had time to put together a full appraisal for the valuation of pore space rights and the proceeding that brings us here today?

A. No. And this is something when I initially was reached out about this potential assignment, we had discussed given the time frame having to provide a potential report as to the valuation testimony by, you know, today, or by -- you know, from this hearing and that was approximately 30 days ago, and I said, I really am not going to be able to complete any type of credible analysis. And, so what I agreed to do was just begin doing some consulting analysis where we could study some of the appraisal issues related to the pore space in Mercer and Oliver County.

Q. And you mentioned a moment ago that your firm is working on a valuation and appraisal for pour space rights or for -- I shouldn't say -- you said you were working on a appraisal for a gas storage facility. How long has the firm been working on that project, approximately?

A. Yeah. We were first engaged on that back last fall. And we are just still kind of in the early stages of what I call kind of the research and fact gathering taking place. And one of the things that's

particularly challenging with that assignment is finding the market data that you need to really understand, you know, the market, and then apply that to what is, you know, a fair market value on a storage agreement.

Q. And what would you say is the approximate time frame to complete an appraisal on a valuation project as technical and complicated as valuing property rights as needed for a underground storage facility?

A. Well, so just to give you kind of a rough estimate, I mean, we're going to be spending six months here, we're already at six months, probably a year, setting it. Now we're not exclusively setting just that, obviously. I have other assignments going on, but what we have to do is, really, reach out on kind of a national basis and see what kind of gather -- we can gather. And, so we've been working with that and try to find other expert, other stakeholders, people that have been involved in the transaction, and often times when you -- when you find some of these market transactions, it takes a while for you to verify all the information and really understand all of the physical attributes with that particular property and how the -- the compensation or

the -- the payments were determined in a given instance, and then, of course, you have to pool all the data together, study it, and you know, this isn't something where you can just find a few different data points, and then quickly reconcile what a value is. And, so you're looking, and you're trying to find current data, if you can, and also, you know, understand thoroughly as you can, verifying all the transaction came together, was there some threat of evidence of domain or was it truly an open market transaction. And, so that just takes time and a lot of digging to occur. And that kind of mirrors what I'm finding in this -- in this, over the last 30 days, as I started to get into it.

Q. And as -- as you started your -- as you started your work on this assignment, have you had an opportunity to review any transactions that you might end up using in an appraisal analysis?

A. Yeah. So far to date, we've had the -- the opportunity to go through about 10, what I would say, maybe 20 potential transactions that we are beginning to kind of study and analyze. And, so we're at kind of a good starting point. However, as we've got into these agreements, we're seeing a lot of variation. There's some market -- market seems to be merging.

However, there's still a fair amount of variation within them. You know, for example, looking at, you know, what is the appropriate payment on a per metric ton. You know, we're seeing current data, ranging from 25¢ per metric ton to 50¢ on the lower end, all the way up to a $1.50 or more per metric ton on the upper end, and we're trying to really study to understand what are the reasoning behind that. Is there -- you know, what is the physical reasons in terms of how those rates are determined? Are they looking at the quality of the storage space or are they -- you know, the density or volume, metric ability you have of what you can store, and how does that affect the price? We're also trying to extrapolate from that, like, location of characteristics. So in the example of the pore space agreement in Mercer, Oliver County, clearly, you have kind of the infrastructure coming into play. And, so and a lot of ethanol plants in Iowa and the surrounding areas that you're going to be able to utilize the CO2. And, so how does that impact when we're comparing it to a lease that's down in Louisiana or Texas or, you know, somewhere in, like, Illinois, which I'm just citing some of the data points we've been looking at.

Q. And with respect to those agreements that you mentioned, that you've been reviewing, in the exhibits that we've marked, we marked Exhibit Numbers 32 through 53 and excluding Exhibit 50 which is a study that's unrelated that was marked in the middle of those, but excluding Exhibit 50 are Exhibits 32 through 53 copies of the agreements that you've agreed thus far as part of this assignment?

A. Yeah. That -- that especially is kind of the dataset that we've been working from at this point. And our goal to that would be to collect more of that data, and some of the -- I think the most recent is around 2022. And, so one of the things that I want to try to find is some more current data even through 2022 is relatively recent. We're dealing with an emerging market year. And, so as this market is merging and taking shape, it is very important to kind of study where are deals today. And, so one of the things within that dataset is, as I've said to myself and my team is, we've got to look at more current data to see where are things as of today, and there's also certainly some more stale data in terms of being several years or -- or multiple years as they occurred in the past and that has less relevance. And, so, yeah. Our goal would be to try to get maybe another

20 other deals, and then hopefully, we can start to really kind of understand and apply them back to a pore space evaluation we do in Mercer and Oliver County.

MR. BRAATEN: Move to admit Exhibits 32 through 53 excluding Exhibit 50.

OFFICER GARNER: Any objection?

MR. GLUDT: I'll note our objection on relevance and foundation.

OFFICER GARNER: Objection is noted. The exhibits are admitted.

Q. (By Mr. Braaten:) I'm going to just briefly switch gears here, Mr. Stockness, but in -- in situations where maybe you don't have as a real robust dataset, are there other methodological approaches that you might take to conducting evaluation or appraisal of this nature?

A. Yeah. So what we -- what we're looking at here is, a market comparison benchmark. And, so we're looking at other market transactions of like kind deals, and the more we can understand those deals and understand the research and the more data we can have in terms of being able to really review it is certainly going to be helpful, but. In any evaluation like this, you -- and really, any real estate

evaluation, you're looking at all applicable valuation approaches, and here, you have kind of the market base approach, which I just discussed, and then the other approach that we really haven't even gotten into yet, but that we would certainly be taking a look at is the -- the income evaluation, and what that is, is looking at what is the fair rate of return back to the real estate. In this case, you know, pore space storage based on the anticipated kind of enterprise value of the -- of the larger business operations and try to figure out how do you determine a fair rate of return on the real estate for that use.

Q. And would it be an accurate characterization to say that when you're looking at the income based approach, ultimately, what you would be considering is the proportionate share of the net revenues that should be going to the landowner based on their property interest in the facility?

A. That is correct.

MR. BRAATEN: Okay. No further questions.

OFFICER GARNER: I'm sorry. I don't know your name.

MR. GLUDT: Mr. Examiner, my name is Ty Gludt. I'm with Fredrikson & Byron appearing today on behalf of the applicants.

OFFICER GARNER: Okay. I should have given you an opportunity to appear, I apologize.

MR. GLUDT: I think my appearance was noted by Mr. Bender at -- on the first day.

OFFICER GARNER: Okay. Great. Okay. You can proceed, Attorney Gludt.

MR. GLUDT: Thank you, Mr. Examiner.

CROSS EXAMINATION

BY MR. GLUDT:

Q. Good morning, Mr. Stockness.

A. Good morning.

Q. Just a couple of quick questions. Based on my understanding of your testimony, you are not able to provide an opinion on what fair market value or what pore space in Mercer, Oliver, and Morton County, North Dakota, is worth today; is that correct?

A. That is correct.

Q. Okay. In fact, you said you weren't able to provide a credible analysis at all today; is that correct?

A. It is.

Q. And are you aware that the commission who is reviewing these applications only has jurisdiction or a determination of equitable compensation for nonconsenting owners, and they have no jurisdiction

over the actual compensation paid to pore space owners?

A. Yes. I understand what you're saying.

MR. GLUDT: Okay. I have no further questions.

OFFICER GARNER: Any questions from staff? You can call your next witness or you have --

MR. BRAATEN: I just have one quick redirect for Mr. Stockness.

REDIRECT EXAMINATION

BY MR. BRAATEN:

Q. Mr. Stockness, are you ready, willing, and able to complete the work on this appraisal assignment given the time and data to do so?

A. Yes. If we're able to get the appropriate time, we are ready to do it.

MR. BRAATEN: No further questions.

OFFICER GARNER: Okay. Now you can call your next witness.

MR. BRAATEN: And Hearing Examiner, I apologize. I know we're just getting underway here, but we need to just get a couple things set up for the next witness, just to prepare. Could we take, like, a couple minutes?

OFFICER GARNER: Sure.

MR. BRAATEN: Okay. Thank you.

OFFICER GARNER: We'll go off the record.

Okay. We're back on the record.

Mr. Braaten, you can proceed.

MR. BRAATEN: Thank you, Your Honor. We call the Swenson Living Trust intervenor by and through its trustee Kurt Swenson.

OFFICER GARNER: Mr. Swenson, please raise your right hand. Do you solemnly swear or affirm under the penalties of perjury the testimony you're about to give in this matter will be truth and correct to the best of your knowledge and belief.

THE WITNESS: I do.

DIRECT EXAMINATION

BY MR. BRAATEN:

Q. Can you state your name and address, please?

A. Kurt Michael Swenson. 5774 21st Street Southwest, Beulah, North Dakota.

Q. And do you live there with anyone?

A. I live there with my wife, Fay.

Q. Okay. And can you give us some background on how -- just how this project affects you in a general way?

A. Sure. Yeah. We have lived where we live

since 2008. We moved back to North Dakota then where we wanted to have our kids grow up next to their grandma, Donna, and live on the family farm. We wanted to enjoy our extremely valuable peace and quiet that we have out there. Unfortunately, the last 34 months has been anything but quiet in Oliver and Mercer Counties due to the applicant's actions.

Q. So what land do you own that is impacted by this project proposal?

A. We directly own or have an ownership interest in properties as a trustees for the Swenson Living Trust. It covers approximately 1,400 acres, and I believe there may be an exhibit that shows that.

Q. I'll pull up -- it's in the binders. Exhibit LO-81. All right. Can you tell us what we're looking at on Exhibit 81?

A. Yeah. Exhibit 81 is a -- a map showing the three disposal facility areas for the CO2. The colored boxes are shapes, are land that we have -- own or have ownership interest in, that is being affected by the proceedings or this hearing process. I can walk through the descriptions quickly of -- of what we have. We have the northwest quarter section, 22 tier one, 142 north, range 87 west. We nicknamed that one Thomases for the family that had lived there prior to

my wife's family acquiring it. We have the southeast quarter of Section 15, tier 142 north, range 87 west. That is Fay's Uncle Ralph's, World War II vet. Section 21, tier 142, north, range 87 west, all of that section, that includes the original homestead. That is where our house is. That is where my mother-in-law, Donna, lives. That is where Fay was raised. And where her family has lived for over 110 years.

Since moving back, we have worked to acquire other properties. The other properties would include the west half of the northeast quarter of Section 14, tier 142 north, range 88 west. That was from the Shide (phonetic) family that we acquired that -- and that is inside the BK Fisher disposal facility. We had the opportunity to purchase and acquire land from former secretary of state Jim Kusler's estate. Jim was affected by the pore space options and lease agreements. As he was dying, he asked us to make sure that we worked to advocate for landowners. It's one of the reasons why I'm here today to make sure that there's actually fair treatment to landowners in this process.

So section -- the southwest quarter of section 9, tier 142 north, range 87 west, that's a

windmill quarter where we have Indian rings, and it is just the most beautiful mule deer country you can see. We also have out lot B, the east half of the northwest quarter section 7, tier 142 north, range 87 west. That's where Jim grew up. And my son now owns that house. That's on that property. And we have the southeast quarter, section 27, 143 range, 88. That was Jim's uncle, Ace, that owned that.

So in addition to those properties, we've recently signed a purchase agreement for more land interest in 14, 87, Section 20. We have options on another 480 acres in that area. All of that land is either inside one of the disposal facilities or in between the three disposal facilities that are proposed in this application being heard here today.

Q. Have you had experience with renewable energy developers demanding the use of your land?

A. I have. We have. You know, it seems like everybody wants what isn't theirs. They want our land. We've had relentless developers from wind industry wanting to put up their noisy light flickers, red lights flashing all night in our windows. The solar developers wanting to blanket our native grass prairies and crop fields with silicon derivatives, and now we have the CO2 developers wanting unrestrained

use, not only of our pore space that is one to two miles below the surface but of the surface lands itself. All of these examples used our taxpayer funds to develop our land for the green new deal agenda. The 30 by 30 land grab, all be it the latter is only developer, unfortunately, that's trying to force their private for profit out-of-state enterprise upon our private property without our consent.

Other developers, they seem to respect us, and if we say no, they get the hell off our property. It's not that we're against the applicant or this project. Excuse me. While I do disagree with the use of taxpayer funds to reward their unconstitutional taking of private property, we simply want to be treated as an equal party in a private treaty that is negotiated between a willing seller and a willing buyer. The constitutional law in Century CODE 3822 that allows the applicant to take our private property without our consent making us a subservient party in a private treaty negotiation when the applicant holds the trump card of the heavy hand of government disguised as amalgamation. This private property taken does not allow our constitutionally guaranteed judicial hearing or a trial by a jury of our peers to determine just compensation if we can't arrive at that

private treaty.

Q. Have you had an opportunity to express any of your current concerns to the applicant?

A. We have. Yes. We were initially contacted in August of 2021. I got a notification on a Ring doorbell on my phone, saw the video, didn't quite recognize them, but recognized as our -- one of our neighbors, Jason Ericson. He indicated that -- that he'd like to talk, that we were going to be receiving a letter the next day. This is on a Sunday afternoon when I was running to put that corn planter away. And that they wanted to talk about a lease, and I said, well, I'm heading into town, but you -- I'm driving a tractor. You'll have to catch me, so he caught me. And he explained what was coming in this letter. We received the letter the next day or two. Upon reviewing the letter, we invited Jeff Skaare, the applicant's counsel, to our farm and ranch along with several of our neighbors to learn more about the project -- their project, and to our knowledge, this turned out to be the applicant's first landowner meeting. This is before any community or landowner outreach had taken place, and at this meeting at our farm and ranch with our neighbors we were provided the first hot off the press version of the lease that was

applicant's offer to place an option on our land to lease the pore space for their CO2 disposal allowing them the full use and access of our surface.

As I stated, it takes a willing seller and a willing buyer to reach an agreement. Unless, in this case, the heavy hand of government can be used to take it from one and give to another. Our family wasn't a willing seller that day when the applicant approached us. But we did give them the courtesy of hosting with open arms their first landowner meeting at our farm and ranch. You see we are in favor of development. We recognize that our state relies on industry to provide jobs and develop the resources that we have.

Q. Do you have -- I'm sorry.

A. Well --

Q. Go ahead.

A. I just wanted -- on that, I just wanted to say we're not against the project. We've never been against the project, but we simply don't agree with the terms and conditions. And that's still the case today as I sit here.

Q. And do you have any experience yourself with the energy industry or ethanol industry or with CO2 capture and sequestration?

A. I do.

Q. Can you tell us about that?

A. Sure. After completing, I went to NDSU and completed my engineering degree in 1991. In fact, probably crossed paths with Wade when he was there playing football. I went to work at an oil refinery in Minnesota. I was there for 12 years, filled 11 roles while I was at that refinery. Much of my time was spent in the maintenance and operations of certain process units, one of which was a carbon dioxide production unit. We produced high purity CO2 for multiple markets, sold it. In my final role at my time at the refinery, I was responsible for the total health, safety, environmental performance, and operational reliability of these process units. At that refinery I learned the characteristics and hazards of CO2. And while there are many hazards, the primary one applicable to the applicant's permit that deals with human health is the simple fact that CO2's heavier than air. And it can displace life-sustaining oxygen. In high enough concentrations, it can displace enough oxygen that it will deprive the body and the brain the oxygen needed to live. I left the refinery in 2003. We moved our young family to South Dakota to join a start-up ethanol business. While we

were in South Dakota, I had the opportunity to be a plant manager at the world's largest dry corn ethanol plant that was under construction. As we grew the business, I was promoted to vice president of operations. I was over a -- eventually 16 ethanol plants across the country, and we became the world's largest ethanol producer. Several of those plants that I had in my fleet at that time are now intending to send the CO2 into the proposed pipeline that the applicant has to North Dakota and bury it under our farm and ranch. And isn't that ironic?

While in the ethanol industry, my responsibilities included safe environmental, responsible, and compliant efficient operations. I had corporate wide responsibilities for the safety and health systems for over 1,500 people including employees and contractors. I oversaw complex safety systems. While safety systems included detailed process safety management analysis of risk, injury, and incident analysis, I had a detailed understanding of our feedstocks, our chemicals, and our products which included CO2. Carbon dioxide is a major product of the fermentation of -- as yeast convert the various sugars in the ethanol production process to alcohol, not unlike the distilled moonshine with approximately

a third of kernel of corn becomes CO2 by mass, and then the ethanol plants, traditionally, for the most part, release that CO2 to the atmosphere after scrubbing the pollutants, and then that CO2 was available to be consumed the next year by the corn to start that cycle all over again. In a year's time, we would produce over 5 million tons of CO2. In my tenure, we had to solve many safety risks. It was an emerging industry. One of the specific risks was leaking pressure safety vacuum and relief valves on the fermentation processes as an example. Our employees would need to physically be near or inside a cloud of carbon dioxide to perform maintenance work at times. Obviously, this required a lot of detailed planning, risk assessment, special purpose, personnel protective equipment, and significant oversight. CO2 is nothing to mess around with. I've had to oversee incident analysis of employees who are overcome by CO2 and the vapors that displaced the life sustaining oxygen that they needed to breathe.

I'm professionally qualified through training and experience to understand the actual hazards of carbon dioxide. Carbon dioxide is nothing to be casual about. It is not the same as crude oil. It is not the same as natural gas, refined petroleum

products or other things that the regional media pundits around here would have you believe. Its unique properties make it uniquely hazardous. CO2 can be extremely dangerous, and permitting these disposal facilities should be done with the utmost respect for the specific hazards that CO2 brings and the specific design of the injection facilities at each of the injection sites. The specific topography, potential release point heights, the process data, weather conditions for each of the disposal facilities will need to be considered.

So my other roles in my career have exposed me to detailed process plant design, process hazardous analysis, level of protection analysis, safe design methodologies which always consider requirements for safety systems to be incorporated into facility design training, and operating procedures. We would also review the system for likely leak points such as pump seals, flanges, and worst case scenario breaches. A dispersion analysis may have been conducted depending on what the serial was, and based on a specific set of process, environmental, and topography -- topographic and weather conditions, we would get a wide range of results that we would evaluate on how those gases dispersed. And how far out the concentrations that

were dangerous to our employees or the public. In many cases of those processes, gases may be realized at varying receptor points. Depending on the chemicals that were being released, these receptors could have been initial sources, public roads or rights-of-way, neighboring homes or other culturally or fauna important locations.

Q. So outside of the experience that you just discussed regarding your education as well as the industrial processes and facilities management and the work with the hazardous chemicals, can you tell us if there's any other experience you have that you bring to bear upon your work related to this project and the protection of your property?

A. Sure. Yes. In addition to my 30 plus years regarding process hazards, specifically some of that with carbon dioxide, I've also had 30 years of training and experience in contract negotiations, contract legal review, contract risk management strategies, including detailed insurance coverage analysis. Along with my practical contract experience, I've negotiated over hundreds of contracts. I've also had legal training from Cornell University on how to create effective contracts, how to interpret an effective contract, how to manage risk

in contracts, and enforce those contract terms.

Q. So you mentioned that you received some contract documents from the applicant at one point. What did you do with those contract documents after you received them?

A. So after we received those documents, they were the hot off the press version of the applicant's option and lease agreements. We reviewed them, of course. We shared them with Fay's family who, in many cases, owns interest in the land that we do and collectively after seeing the one-sided nature that in -- was in favor of the applicant with very little protections for the landowner, I decided we should have it reviewed by attorneys. We consulted with multiple attorneys. Every one of them, three, in fact, specifically recommended do not sign. Didn't get anybody to tell us to sign that document. So then it was decided that, you know what? We are in favor of the industry progressing in North Dakota. So what can we do as a family to help this move forward?

So we attempted or decided to attempt to negotiate a contract that would give equal protections to landowners as much as it would allow the developer to do what they needed to do. You see a good contract results when you get what you need, but not everything

you want; yet, you find it acceptable to sign. Initially, we reviewed -- or I should say we initially reviewed our feedback with the applicant on a virtual meeting during COVID, and we did that fairly quickly after receiving it and only to be met in the closing of that meeting with a statement by Mr. Boeshans of, thank you for your criticisms of our agreement. Well, we didn't think they were criticisms. We were thinking we were expressing what we felt we needed to enter into a mutual agreement. Thereafter, we formed a group of landowners in the area that was being targeted by the applicant. We had a common goal of arriving at a contract that could be used as a model contract for the Mason North Dakota CO2 disposal industry. And after, seriously, hundreds of hours of landowner input and attorney input, which they don't give us for free, sorry, Derrick, we invested in that red line of the applicant's initial agreement, and we provided that to the applicant on January 25th, 2022 which was a landowner version of the lease documents that we asked for their consideration of.

Q. All right. We're going to mark an exhibit here, but before I do that, a quick question, Mr. Swenson, did you have -- and I don't want you to talk about communications with attorneys, but did you

hire legal counsel as well when you were developing a response to those contract terms?

A. We did.

Q. And was I one of those attorneys?

A. You were.

Q. And was there another attorney that was also involved in helping with that effort?

A. Charles Carvell.

MR. BRAATEN: Okay. All right. We are marking Landowner Exhibit 87. Do you want to hand me those? I'll start. Thank you.

And Your Honor, I once again was remiss, but while we're paused here, I had discussed a map prior as Exhibit LO-81, and I failed to move to admit, so I move to admit Exhibit 81.

MR. GLUDT: No objection.

OFFICER GARNER: The exhibit is admitted.

Q. (By Mr. Braaten:) And Mr. Swenson, we've now handed out Exhibit LO-87. Can you -- is this a copy of some of the red lines that were generated to respond to the offer from the applicant?

A. Yes, it is.

MR. BRAATEN: Move to admit Exhibit 87.

OFFICER GARNER: Any objection?

MR. GLUDT: No objection.

OFFICER GARNER: The exhibit is admitted.

Q. (By Mr. Braaten:) Mr. Swenson, can you tell us about what happened when you sent your counteroffer with your edits and suggestions back to the applicant? What happened next?

A. Yes. So we sent it to the applicant. Initially, as I normally do, we asked for just more of a, you know, kind of business to business meeting. So I asked to have meetings with Mr. Boeshans. I invited him into my office, conference room, and we had several meetings with him, ultimately, to try to help explain what we had changed from the original document, why we had changed it, and to get a sense of what they might accept, specifically or maybe in concept, and what they would not accept. Some of the meetings were one-on-one. Some we had counsel present. I can tell you all of them we got significant amount of lip service from the applicant's attorney. We took this process very seriously on the landowner side expecting to get a red line version of the lease back from the applicant that would actually give us specific feedback to what they would take or what they would not take. I can swear as of today, we've waited 870 days since submitting the landowner lease versions, and we're still waiting for a contract

red line to be returned. And if they have one here today, I'd be glad to accept it and review it.

Through this process of learning about the CO2 disposal technology and regulations and legal theories behind this and dedicating hundreds of hours each year, I routinely field calls from my landowners across the country who have similar issues due to the lack of state regulations that provide protections for the landowner. I felt it was necessarily to get involved in the bigger picture of CO2 disposal. As a result, I have right here in this room met with Mr. Helms in his role as North Dakota's oil and gas and Department of Resources where he informed me that I was being faced with the state's perceived lease powers over our property. I was informed by Mr. Helms, and he acknowledged a lack of landowner protections in administrative code including safe setback distances from public receptors. I met with the industry leadership in ag, coal, and gas industries in all of the representative organizations to learn their views on this new disposal industry coming to North Dakota. We also had numerous landowner meetings in Oliver and Mercer Counties along with meetings in Hebron and Glen Ullin. I presented at the Northwest Landowner's Association annual

meeting, provided multiple presentations to state and county level North Dakota Farm Bureau meetings. My expertise and assistance on the topic were requested by a group of landowners between New Salem and Glen Ullin and Morton County was illegally trying to push a special use permit through for another CO2 developer which included a director capture facility.

I've written letters to the editor, co-authored articles for publication and have been interviewed on various TV programs, radio shows. I've advocated for legislative changes in the most recent 2023 session. Unfortunately, learning that most of our reg -- or legislators, they're under the spell of Mr. Helms, and the industry proponents have forgotten about the citizens whom they represent that are adversely affected by unconstitutional elements in our current century code. All of this effort has been done with a genuine overarching goal advocating for regulatory change while educating landowners on this emerging CO2 disposal industry in order to protect, not just my land and Fay's land but all landowners. Hopefully, this had resulted in some improvements for the landowners' ability to negotiate with these well-funded developers that resulted for them contract language that they felt was fair to both parties.

Q. So with all of that experience, did you also then engage with the applicant on negotiation or attempt to work on the suggestions for the contract documents with them?

A. Yes. I did -- I previously stated that we did -- you know, taken hundreds of landowner attorney hours in that red line to conform their agreement to something that we felt while I believe any North Dakota landowner would consider signing unless they were simply opposed to the applicant to their project. Much of the reclamation and restoration clauses were spearheaded by Mike Koept (phonetic) who was a former Department of Trust lands employee and generally is based on North Dakota Trust Land documents. If you look at our red line, what you're going to see is, it's mostly red or purple in the one that was handed out. So their contract was so poor that it really should have been flushed down the toilet and started new, but to aid in our discussions with the applicant, we narrowed the list town to some major topics.

Q. And what were the primary points of concern or those topics that you just referenced?

A. It really started out for us with what are you putting -- wanting to put under our property? What is it? The original versions of the lease were

very loose on the definitions. It could have been 50 percent carbon dioxide, 50 percent hydrogen sulfide, because it allowed incidental substances or other substances. So we added a definition, a simple one. We put a percentage in of what the purity of the CO2 should be so that we knew based on our knowledge what the hazards would be of what they were putting under our property. We focused on, what are you actually leasing? Because the lease was, we want to lease everything under your surface and more, and we'll get to that. You know, this -- this conference room probably talks more than any other conference room in the world about different subsurface stratum, different share plays, different levels within the share plays, such as a Three Forks or the Madison or the Bakken or whatever there are, and the applicant wanted everything. And we thought, you know, it's really only fair, and it's pretty standard in the oil and gas that, you know, you should just tell us exactly what you want, and you know, we'll agree to that. But no, they wanted everything, so we said, no, you're going to give us a single geological formation, and if that works out for you and you want to lease something else, like an oil and gas lease, you can give us a new lease for that. And, so that's what we

did. They also had these warranties reps, guarantees, things like that. Well, if you're not familiar with contract language, you may not know the importance of those, but those are very important in a contract to -- if you're signing for that.

Q. Can I pause you real quick, Mr. Swenson, though, and ask, so a title warranty clause was contained in Summit's contract, which they agreed yesterday they need to remove, but they weren't willing to remove that for you during the negotiation?

A. I think it was on Tuesday, Derrick, that they agreed to remove it, but yeah. They wouldn't remove it.

Q. Okay. What are the other topics that you had attempted to address with them that they wouldn't?

A. Well, the -- in the option, it included geophysical expiration activities. So as you know, that involves seismograph trucks and maybe some expiration in other ways. My mother-in-law, Donna, had, had a water well that her cattle relied on damaged by in -- earlier, all be it a little older technology seismograph process, that came through and that private property water well never produced water again for her cattle. And she was never compensated for that, so we asked for some setbacks in excess of

what the state rules that they were claiming applied to this gave us. And we felt that, that was fair to make sure that she was comfortable. We asked that in case you damage our water springs that provide life-sustaining water for the cattle or you damage our wells, you're going to do some testing, you're going to test the quality, and the quantity of our water wherever, whatever sources there are that we use and rely on before you do it, and you're going to do it afterwards, and you're going to be accountable. They asked us to indemnify them, and if you're not familiar with indemnifications, but it means that we will defend them and protect them and hold them harmless for actions. Well, we thought it was only fair that they defend us. And protect us and hold us harmless as well. So we asked for that.

What was interesting to me, and you know, Mike helped, especially, was the lease gave the applicant unrestricted full use of our surface, unrestricted full access to our surface lands, and they could put anything they wanted, wherever they wanted on our land. If you signed the document that they put in front of us, and many of our neighbors did, unfortunately. So because of that, Mike's experience said, you know what? We're not necessarily

opposed to things being on our land at that point if we can have some control, but we'd at least like restoration requirements in your -- in your documents so that we know that if you're forcing something on to our land that we know that our land is going to be restored and reclaimed after you leave. So we added those and that makes up a large part of those document red lines.

One of the concerns that we had was that this was a newer company, unproven in North Dakota. We didn't know them before my Ring doorbell went off that day in August of 2021. So we had no idea what their funding was. Are they going to follow through on their commitments? And, so we asked for bonds. We asked for, if you're going to bring people on to our land and have them do geophysical expirations survey activities, build a compression station outside of my bedroom window or whatever it is that you're doing, I want to make sure that you pay them, so they don't put a lien on my property. They didn't have that requirement. And, so we added that, that you would have a payment bond to pay your suppliers and your service providers. In addition, we asked for bonds for restoration. Because as we've seen exhibited in this room in hearings, the state doesn't stand for

landowner rights. The state stands for industry, and they don't make them reclaim wells and plug or -- the abandoned wells where companies have gone broke and left because they don't have a proper bonding program, so we asked for a bond. If you're going to put shit on our land, you're going to take it off our land, eventually, and there's going to be a financial instrument that ensures we have that covered if you go broke or when you sell and flip your company to some foreign country.

I was flabbergasted that they wanted to come on to our land in the option phase without insurance. The option had no insurance requirements for them to drive a major truck on our land, put a bunch of stuff on our surface, have people that we have no idea if they have employers' liability insurance or general liability insurance or pollution insurance for the antifreeze that leaked all over the state trust land that we rent. So we added insurance requirements. We added a significant amount of language that if they wanted to put something on our property again, evidenced by the fact that we put it into the document that if they wanted to put something on our property, we were going to have some control, but they were going to have -- we were going to know

ahead of time what that form of easement was. There was no form of easement included that we would understand what the terms and conditions would be to evaluate with their absolute right to put whatever they want, wherever they want on our land, so we added an easement structure. Because they wanted to use our surface, as I mentioned in my opening statement, we have very valuable, very valuable peace and quiet on our farm and ranch. I was greeted by antelope last night when I left here. Driving into our farm, I was greeted by mule deer and pheasants, and when I got out of my diesel truck, shut it off, so I could hear, you know what I heard? I heard doves cooing, I heard the pheasants cooing and greeting me when I came home. When I woke up this morning, I had two buck mule deer, one eating off the apple tree in our backyard and one eating off a Crataegus tree, having browls {sic} for their breakfast. Because of that, we wanted to have some restrictions on what they could do on our lands and where, so we defined some simple requirements that we would have to give some form of consent, and we wouldn't necessarily unreasonably withhold that, but you know what? You don't get to have lights shining in our bedroom window with your pump station. We don't want that. I like to see the stars. I like to

see the Northern Lights out on our north-facing bedroom. I like to see the Milky Way when I'm in my hot tub sitting on our south patio. I don't want your lights shining in me. I've already had hundreds of those damn red lights flashing to the south of us from those wind developers. I was also very concerned about noise. I'm sure you're all familiar with William Stone and William County lawsuit going on right now with the data center. I don't want to listen to a compressor station or pumping station injecting CO2 when I'm sipping my coffee on my deck in the mornings. I don't need that. I don't have it today. And I don't want it in the future, so we added some noise requirements.

In addition, we asked, because you're going to be paying us based on your injected tons of carbon dioxide and other substances, we want the right to audit your books. That's a standard clause when you're being compensated based on their records. We want to be able to audit it. And as I'm sure they'll tell you, we asked for some financial changes in the structure of the lease document, which you have in front of you. We felt our land and the use of our land was worth more than they were offering. We had started to do research and develop data points on what

our land was worth at that time or our pore space and the use of our surface. In fact, we developed a schedule of consideration, a schedule of consideration that would say, if you're going ahead of time, we will know what you're going to pay us, if you put a pipeline on our -- on our land. We're not going to sign this agreement like you're asking us to do, and then negotiate when you have the absolute right to put it on. We're going to negotiate the price of this up front. I'm not going to sign a contract, and then be held hostage by you. So we added a consideration of values for per rod of pipeline based on its size, per linear foot of communication cabling or devices, per communication towers, and all other surface facilities that at least we could imagine such as roads and -- and surface acres set aside for pumping stations and things like that. So we included that as well.

And you know, we really -- we didn't know what to think initially when we saw the 25¢ royalty based on their lease agreement, their option, and lease agreement for the injected tons, and where I went is, I said, how much -- how much is this project going to make for you? And how -- what are your economics, and what are your costs? And I sat in numerous presentations that ultimately happened and

Mr. Boeshans presented even one time at the Oliver County -- it was either -- I think it was a commission -- commission meeting and shared their economics of what the uplift of the ethanol plants and the revenue sharing agreements would bring them. 29 to 30¢ a gallon was what would be split between the developer and the applicant here. Or the ethanol plant and the applicant.

We saw that -- you know, we obviously understood the 45-Q tax credits, and we researched significantly California or the west coast low carbon fuel standard credit market, which I'm sure many of you know has tanked significantly since the time that this started. And in all of that, you know, we really felt that you're leasing a resource of ours. You're leasing pore space that's ours to develop, not unlike an oil and gas in some manners, and we felt, well, why don't you pay us a royalty, then, based off your profits and that net profits such as an oil and gas lease, so we proposed a three-sixteenth royalty on net profit.

So those were the major lease changes. Obviously, there's a lot of knits and mats in there as well, as you'll see as you walk through that document. I previously mentioned that I have not received a

formal return red line as a -- as is customary in contract negotiations. Waiting on today 870 days, and I'm still counting.

I would acknowledge that the applicant has made some changes in their agreements with landowners based on our feedback, and I'm glad for that. I'm glad that landowners have been made improvements from that first lease version that should have been just ripped up, burned, flushed down the toilet, taken up to the burning barrel at Donna's and just never saw it again.

Q. So the -- the red lines that were sent back, you indicated that both myself and Charles Carvell had worked on them, in addition to you and Mike Koept. Are you aware of who the attorney was on the task force that helped draft the Class 6 regulations for North Dakota?

A. I am.

Q. And who is that?

A. Charles Carvell.

Q. Okay. Are you familiar with the policy statements and law related to carbon sequestration in North Dakota?

A. I almost have them memorized.

Q. And you're fairly familiar with the project

at this point obviously?

A. Yes.

Q. And so I want to talk about --

OFFICER GARNER: Attorney Braaten -- Attorney Braaten, let's just take a 10-minute break right now.

MR. BRAATEN: Okay. Sounds great.

(Silence in audio.)

OFFICER GARNER: We are back on the record. Attorney Braaten, you can continue.

MR. BRAATEN: Thank you, Your Honor.

Q. (By Mr. Braaten:) Mr. Swenson, I was asking about the policy statements and the Class 6 statute and just to direct your attention at the -- the policy statement in 3822 notes, it is in the public interest to promote the geological storage of carbon dioxide, doing so will benefit the state and the global environment by reducing greenhouse gas emissions, doing so will help ensure the viability of the state's coal and power industries to the economic benefit of North Dakota and its citizens. Further, geologic storage of carbon dioxide, a potentially valuable commodity, may allow for its ready availability, if needed, for commercial, industrial or other uses, including enhanced recovery of oil, gas,

and other minerals. Do you feel the applicant would accomplish any of these policy goals with the project proposed for your land?

A. I do not.

Q. And why not?

A. Well, the first one is the whole kind of public interest piece. It's a pretty simple one. Their projects or their permits requested fail on that merit of that policy statement. You know, the legislator puts that in the policy to give cover to their unconstitutional practices of taking our private property without constitutionally mandated due process. The applicant has not just demonstrated with evidence on the record that their project meets the threshold of being in the public interest. They have told publicly that it will create jobs, and I'm sure it will. It will have economic benefits, economic health will improve because of it, and I agree, and they will have increased tax revenues on -- because of their project for the state and local jurisdictions. Unfortunately, these are all constitutionally barred by North Dakota's Constitution when you consider a physical taking of our private property. The only constitutionally allowed physical taking by a private company for a public interest is through a regulated

public utility or a common carrier. They're neither. They're not a regulated public utility in the disposal facility, and they're not a common carrier in the disposal facility. They stated their pipeline intends to be regulated as a common carrier, and this has no bearing on the pore space. Common carrier regulations are under the purview of the Public Service Commission, not the Industrial Commission. The PSC regulated pipeline ends at a terminus red dot that we discussed in this hearing, miles away, from the disposal facility. And those regulations cannot be applied under the Industrial Commission authorities. Additionally, the applicant has set up a maze of various LLCs and such. They're just a separate company from the pipeline.

Q. What about the other policy statements?

A. Well, let's talk about the environment that we're going to benefit the global environment by reducing greenhouse gas emissions. I can affirmatively state that the applicant has provided no data or evidence or proof on the record in these hearings that the project will meet this policy statement. Mr. Boeshans even testified that it will not change global temperature. Further, as a direct result of the applicant's request for amalgamation

which results in a physical, per se, taking of our private property, this goes in direct conflict with common law. That was handed down in 1976 in the North Dakota Supreme Court case Skjonsby versus Elkin and that opinion confirmed that in a physical taking, the applicant must meet the threshold of a substantial and a direct benefit to the public. Well, the public is a North Dakota citizen. There's clearly no substantial and direct global environmental benefit provided to North Dakota citizens, by the applicant's proposed energy intensive capture transport and disposal of carbon dioxide as they testified to. To meet this policy objective, the applicant should be required to demonstrate by the Industrial Commission to submit a complete carbon dioxide mass balance. The mass balance should include not only the carbon dioxide produced by the energy they use to capture, clean, transport, and dispose of the CO2, but all of their other operations produced by their employee vehicles use to work, office heating and cooling, the steel manufacturing for their pipelines, the transport, the compressors, the buildings. All of the manufactured items that go into it should be included in that CO2 mass balance, if you want to prove and find that it's in the public interest on this policy statement.

In addition, they really ought to include all the hot air they expel and the CO2 with that, too.

Q. What about the -- the state's coal and power industries and economic benefits in that regard?

A. Well, I don't see them tied into a coal power plant with a pipeline. Or a power -- any power plant for that matter. Coal or otherwise. They -- they publicly claim that the carbon dioxide will be disposing of 57 ethanol plants in our area and surrounding our farm and ranch, 56 of which are from out of state. In fact, if you were here, and you may have heard recent statements by Jason Bohrer, the head of the Lignite Energy Council that, you know, that is North Dakota's leading coal and power industry representative group, affirm they have no association with this project. So I don't see how it's benefitting them.

Q. And based on both your -- your experience as well as your negotiations with Summit, do you have an understanding as to whether they will have a ready availability, if needed, for commercial, industrial or other uses with respect to the CO2 they're putting down?

A. So I can rely only on what I have heard from others or have researched. I can tell you that

John Harju of the EERC and other employees -- Wes Pack is a good example. Wes's daughter went to college with my -- was one of my son's best friends in college, that it's not economically feasible to recover this carbon dioxide from these geological disposal facilities. And Mr. Harju even states specifically that there has been very little work done I'm trying to recover CO2 from injected masses.

Q. And did Mr. Harju state that at some point in any kind of public forum (inaudible)?

A. Sorry. Yes. He did.

Q. And in what forum did he make that statement?

A. It was in a presentation to the joint -- I lost the video here or -- thing. It was in a presentation to the joint Senate and House, Energy and Natural Resources Committee. We're having technical difficulties here. There you go. I'll play it here.

UNIDENTIFIED MALE: Is there any effort being made towards recoverable storage?

JOHN HARJU: Sure. So to -- to -- there's really been a -- a representative joint members of the committee. There's been very little work done on trying to recover CO2 from injected masses, so. In essence, when injecting into something like our Broom

Creek Formation, you're injecting into an already water-saturated zone. And, so our expectation would be very, very little ability to recover that CO2.

THE WITNESS: So I have to rely on others, and I would view that in that presentation that Mr. Harju is an expert on that, and that I don't think that it will be available for enhanced oil recovery. And they're not going to pump it out of my land once they put it in. It'll be there forever. You know, even if it were economically feasible for them to do that, the applicant would end up having to refund a portion of their 45-Q tax credits. They'd lose their revenue sharing along with their customer of any low carbon fuel centered credit price uplift they obtained because -- well, the ethanol producers for the ethanol producers, that LCF credit requires permanence, as Mr. Boeshans testified to in this hearing, and it seemed like in my opinion that the applicant's statement or lack of evidence on this record for this hearing do not meet that public interest threshold.

Q. As someone who pays state and federal taxes, what's your opinion on the use of your taxpayer funds to promote and fund the applicant's project?

A. So I think we've affirmed that the weight of the evidence in this hearing shows that the project

is not meeting North Dakota's policy objectives, so why are they pursuing this project? The simple answer is, to take part in any massive wealth transfer scheme, taking taxpayer dollars or maybe we should say debt of our grandchildren for those of you who may have grandchildren someday, and putting it in their out-of-state silk-lined pockets, all through North Dakota's complicit regulations that the applicant has not met the burden of proof for their projects to be approved.

So in addition to these 45-Q tax credits that are provided to the applicant's investors or finance SEERs at the reported project capacity of 18 billion metric tons per year which has been raised, obviously, since initially we met with them puts 1.5 billion in their foreign, silk-lined pockets of our money and future federal debt obligations. North Dakota, unfortunately, is, you know, they're contributing a bunch of dollars to this as well. You may have heard about the recent $300,000 grant awarded for a carbon dioxide re-education campaign putting more tax money into the silk-lined pockets of local media pundits, and engineering companies that suck it to teat of our government. Our taxpayers' monies would have been better spent putting up billboards

stating North Dakota's open for CO2 disposal. Don't worry. Our citizens are too stupid to understand it. At least that would have provided jobs. Changing the billboards out would have people employed, with that new signage going up. They would have put fuel in their trucks and their equipment. Bought some candy at the gas station. Driving our economy and probably would have had the signs made in North Dakota creating jobs. I'd like that one a lot better.

In addition to the deployment of state-funded EERC program, supporting the development of this applicant's application, the legislator provides a payment in lieu of taxes to the counties for more taxpayer dollars, so the applicant doesn't have to pay property taxes for 10 years on their pipeline infrastructure. You can catch the governor flying down to Iowa to meet with Rastetter or whoever he did. The EERC employees driving to Beulah for the public information meetings and so on and so on. It sickens me that we have bought into this green new deal agenda in North Dakota, and we're now funding it with our taxpayer dollars. I'm sick of it. You should be ashamed.

Q. Will you allow your land to be amalgamated by the Industrial Commission?

A. I can tell you right now the state can try and take it. You're going to end up taking for my cold dead hands. And you're going to see how that works out for you. The state knows good and well that the amalgamation provision in Century Code does not meet the requirements of North Dakota's Constitution. North Dakota private property owners are afforded the due process method of imminent domain in our constitution when the government allows the physical taking. The state knows that amalgamation is a physical taking, not a regulatory taking as they sometimes say by allowing CO2 physically invade our private property of pore space. The state knows in the lawsuit they lost at the North Dakota Supreme Court against the appellant, Northwest Landowners Association. These injection of fluids into pore space is a physical taking. It's not a regulatory taking. They lost. The Court -- the five justices of the Supreme Court of North Dakota affirmed that. The state knows that in the U.S. Supreme Court decision in Cedar Point that even a temporary physical invasion of private property is a physical taking. That's not a regulatory taking. The state knows that by allowing physical property such as pressure to migrate outside of CO2's disposal facility is the same as a physical

taking, and even that pressure, it might dissipate over centuries. I don't know. They couldn't tell us yesterday in testimony that the current and future landowners' ability to use their pore space is damaged as testified here by the applicant. The state knows they're not requiring the applicant -- the applicant to provide any compensation for this transfer of pressure or CO2 outside the bounds of the disposal facility leading to a taking without any compensation. The state is trying with a lot of effort while looking like a great contortionist to convince a judge that while the pore space is private property of the surface owner, it doesn't deserve the same protection as surface lands, and their police powers get to rule the day for pore space. Yet, despite all this great knowledge held to the state on these issues, I believe that their arrogance in the application of unconstitutional law is resulting in the closest thing I've seen in my lifetime to a tyrannical government. It's high time they're checked on this by the citizens with all of our God-given constitutional rights.

Q. Do you believe that equitable compensation that has been defined by Mr. Helms in the Industrial Commission is acceptable?

A. Honestly, I don't know how they've defined

it but absolutely not. I'll disagree, I'm sure, with based on what I've seen in the past. You know, it's common knowledge that when the state does a physical taking of private property, we, as a property owner, are granted certain due process in the form of an imminent domain hearing in front of a judge with the state or their proxy. They have to substantiate that it is in the public interest, and there's a necessity for the taking, and if agreed to by the judge, well, that property owner is granted an option, if they want a jury trial to determine just compensation. That's mandated by the constitution.

Here in this sham of due process, we are not being given an impartial judicial hearing as I mentioned earlier. The oil and gas division is charged with both a regulatory and a promotional nature of their efforts. How can this possibly be impartial when they're charged with industry promotion? A judge is impartial, as they are not tied to industry results. The property owner is, once again, in a subservient position to the applicant in determination of what should be just compensation. Ha. But it gets even better because the unconstitutional law states that the commission doesn't even have to meet the constitutional bar of

that just compensation, that a jury of my peers would determine. They simply determine what's equitable. Unfortunately, for that property owner, there is no definition in statute of what equitable means, and it's up to interpretation of this room. And clearly, we have heard testimony from the applicant that landowners are not being equitably compensated. They're not.

In fact, in an open records request from February 14th of 2023, the state has put on record that they do not have any records that would be used to determine how non compensating landowners are or will be equitably compensated as required by statute for the Minnkota Power Project Tundra and Retro Energy Carbon Sequestration Projects under 38220814. If the state has a burden of proof to determine that nonconsenting pore space owners are or will be equitably compensated as a requirement of this Century Code, wouldn't you think they have records of how they did that, how did you determine, and how did they meet that statutory requirement?

Q. We're going to hand out Exhibit LO-88.

A. Thank you.

Q. Mr. Swenson, we've handed out Exhibit LO-88. Can you walk us through what we are looking at

in this exhibit?

A. I can. The first page of the exhibit is a letter written by Mike Koept, February 9th, 2023, to the public information officer requesting to inspect or obtain copies of public records which is an open records request of how nonconsenting pore space owners are or will be equitably compensated for the Minnkota Power Project Tundra and Retro Energy Carbon Sequestration Projects under 38220814. So that's the first page. Now, the second page is internal to the DMR sent to a group that we're not sure who the actual recipients are. Please see below the open records request. If there are any questions, let me know. And the action requested was if less than one hour of time, please place documents here, and they gave a -- an internal file share description of where to put them. If more than that time, please let me know of an estimate by the end of day Monday, February 13th. The third page is the response that Mr. Koept got which is actually dated February 14th, 2023, so a prompt response. Thank you for that. It says, the records -- box is checked. The records you requested cannot be provided because there's no such records exist. Huh. Or the records are not records of this agency. And then it was typed in there, all

negotiations for compensation were private conversations with pore space owners. So how did you figure that one out? How did you figure that the landowners would be equitably compensated if you have no records?

MR. BRAATEN: Move to admit Exhibit 88.

OFFICER GARNER: Objections?

MR. GLUDT: No objection.

OFFICER GARNER: Exhibit is admitted.

Q. (By Mr. Braaten:) So Mr. Swenson, do you have concerns about how the compensation is being determined in these proceedings by the commission, if it is?

A. Huh. I do. You know, as it relates to this hearing, and again, just to be on the record again, we have been severely prejudiced by the state's lack of enforcement of North Dakota Rules of Civil Procedure that are required in a hearing of this matter. We have been denied the opportunity to dispose or depose -- I'm not going to dispose of you Jeff; okay? To depose or receive any discovery in this matter. None. Not one thing. Not one deposition. Not one piece of discovery. Given to us. Zero. That's zilch, nada. Setting aside this lack of due process by the state, the real matter is here,

what is equitable? Since the state doesn't define it, and it's not a constitutional term, I don't know what it means. Who really knows.

Now, Mr. Helms will tell you that equitable and just compensation are pretty much the same thing. Just as he did on February -- or Friday, January 13th, 2023, in a presentation to a joint meeting of the North Dakota House and Senate, Energy & Natural Resources Committee. Mr. Helms states, if there is just or equitable compensation, it's not a taking. And in the absence of it, of that it is. You know that's wrong. Of course, it's still a taking. Just because somebody gets compensation, it's still a taking.

Q. Can you play that video from Mr. Helms for us making that statement?

A. I'll find it here. Yep.

LYNN HELMS: My conclusion and my attorney's conclusion is that if there is just or equitable compensation, it is not a taking. In the absence of that, it is. But if there is just or equitable compensation, it is not a taking. That would --

Q. (By Mr. Braaten:) What's your response to that, Mr. Swenson?

A. Huh. Just compensation is required by and only granted in a taking. Mr. Helms knows this. That's a lie, what he did or a misleading statement or you're just as incompetent as the director of this agency. I'm not sure which it is. Furthermore, you admit that you don't know what the value is. Just that everybody gets paid the same. How can you possibly not consider pore space value under this pretend undefined by statute made-up term of equitable compensation that you state that you have no records of in this agency on how you evaluate if equitable compensation is being paid?

Q. Well, how do you feel about the compensation being offered by the applicant and proposed by the applicant?

A. In an agreement, there's usually an exchange of compensation. The compensation normally gets determined by mutual negotiation. In this case of the applicant, there was zero negotiation on compensation. One that Mr. Boeshans testified to was originally set on a value of freaking coal leases of all things. And then nothing to do with the actual value of my pore space. Their approach has been, take it or leave it. But we'll take your pore space through this freakin amalgamation clause if you don't

take our offer.

OFFICER GARNER: Okay. I'm going to ask you to refrain from swearing, please.

THE WITNESS: You left the rules of civil procedure when you swindled our --

OFFICER GARNER: I'm just asking you not to use the word freakin.

Q. (By Mr. Braaten:) Okay. What was the amount that the applicant was offering in that initial agreement?

A. 25¢ per ton disposed of under our native grass prairies, and then when the Inflation Reduction Act was passed by the federal government giving them more of our federal tax dollars and federal debt for our grandchildren to pay, they gave us an extra 25¢, making it 50¢ per metric ton for the landowner, a whopping 0.7 percent of their increase of $35 that they got for no additional cost on their part. Is that equitable? Or just? I don't think so.

In a meeting with the applicant's North Dakota leadership team, it was stated by Mr. Boeshans, well, he didn't have any market data that showed that they should pay more. While market data may be difficult to obtain or ascertain in this nascent industry, we did provide them examples. We had found

them. I'm not sure why they couldn't. On leases that were paying on different terms. All higher than the applicant.

So we received no counteroffer to our red line of their agreement in which we had proposed paying the landowner similar to how this agency normally sees things paid on a royalty model based on a share of net profits to which Mr. Boeshans turned this method untenable. It was untenable. I guess he won't have a career in oil and gas. But there are lease examples available.

Q. Can you --

A. Oh, go ahead.

Q. Well, I was just going to ask you, if you can give us a couple of examples of the available transactions you just mentioned.

A. Dakota Gasification Company. Just north of Beulah is offering a 1.70 per metric ton, 3.4 times higher than the applicant.

Q. Can I have you take a look at Exhibit LO-53? Sorry that's in the binder, everyone. All right. Looking at Exhibit 53, this has been previously marked. Is that the lease you reference with respect to the Dakota Gasification --

A. It is.

Q. Okay. And other than the Dakota Gasification at the $1.70 per metric ton 3.4 times higher than the applicant's, any other agreements that you think are more appropriate compensation?

A. Publicly available, the State of Louisiana entered into an agreement with Air Products Blue Energy, LLC, which shows royalty payments of 1.50 a ton. While the 45-Q was at $50 per metric ton. But it also included an escalation clause because they thought that value might go up, that the partner or their -- their other party on that agreement might receive, and in that case that escalation clause included a 9 percent escalator of any increases above 50 -- $50. That 9 percent versus Summit's measly 0.7 percent that they offered us, for no extra cost to them. So when the $50 per metric ton 45-Q payment went to $85, presumably, with that 9 percent escalator, that increased payment would be $4.65 per metric ton. 9.3 times higher than the applicant's offer.

Q. And is that agreement that you were just referencing contained in the record at Exhibit LO-45?

A. It is.

Q. Any other agreements you think are more appropriate context for considering the compensation

here?

A. The Permanent School Fund of the State of Texas entered into a transportation and storage lease in April 2022, with Bayou Bend CCS, LLC. This lease was structured much more like what we had been proposing as landowners in this case. They took it as a form of a percentage of facility proceeds which ranged between 3 and 6 percent versus our net profit, three-sixteenths offer that we provided them. In their case, facility proceeds were to find and include any consideration paid or delivered to the lessee, meaning the person that's injecting, including the value of the carbon credits on a cash paid basis or after tax valuation, very similar to what we had proposed just that they had a lower number on gross, and we had a bigger number on net.

Q. And is the lease you were just talking about in referencing Exhibit LO-43 in the record?

A. It is.

Q. And, so what are these -- these three agreements tell you about the compensation?

A. Well, I am -- I am disheartened that this hearing is considering forcing our private property into a lease that is undervalued by financial --

MR. GLUDT: Mr. Examiner -- Mr. Examiner,

I'm going to make an objection at this point on relevance. We're discussing compensation and leases that have nothing to do with this project and over which the commission has no jurisdiction. Second, this is all being done to lay a -- making a constitutional argument before this commission over which they have no jurisdiction.

OFFICER GARNER: The objection is noted. I'm going to allow him to continue.

THE WITNESS: I'll restate that. Why should we, as landowners, be subjected to a lease that is undervalued by national standards? Simply because that's what the applicant offered without any negotiation on their part. Do we not have the right to advocate for the best financial result for the use of our private property? I sure think we do. But not here. Not in the North Dakota apparently. Somehow that law got -- you know, that right got lost.

So they've demonstrated through the evidence of this hearing that they are not certain how far this CO2 even extends under the lines they drew on the map that show an arbitrary concentration cutoff level of 5 percent carbon dioxide in the aquifer. Ugh. They admitted on the record that carbon dioxide will extend beyond this line, and they're not able to

attest on the record to how far carbon dioxide will extend beyond that arbitrary 5 percent line. They've admitted that it will go out there, and eventually may invade neighboring properties that may or may not be leased, but in neither case, they're not going to compensate them. So how can the state possibly know if the pore space owners are being compensated equitably by statute when they don't know how far the CO2 will actually extend onto neighboring properties at which pore space owners actually should receive compensation for disposal of their CO2 in their pore space? But there is no plan or commitment by the applicant to pay them as testified to yesterday by Mr. Boeshans. How can this oil and gas division let us, as landowners, even evaluate the accuracy, the sensitivities or the completeness of the applicant's application when they didn't even ask for or receive the seismograph data as was testified to yesterday? Nor did we.

Q. (By Mr. Braaten:) And do you have property that is not located within the areas of review but is still being impacted by this proposed project?

A. We do.

Q. And can you explain that?

A. So the state is playing fast and loose with

their inconsistent application of intervenor rights by stating in your order, Mr. Garner, to our trust that the commission will not consider the trust position, insofar, as it fails or it falls outside the consideration of Summit Carbon storage number two. Much of our land was intentionally skipped over by the applicant surrounding these lands of ours with injection wells due to the applicant's simultaneous injection plans in these six wells. Their models predict that much of our property, as we saw on the record, will see an increase in pressure gradient of 8 to 900 pounds over the ambient conditions of today after their 20 years of injection rendering our pore space unable to realize the same net present value cash flow for any commercial use that we engage in and possibly risking our ability to modify -- monetize the 45-Q tax credits as was testified to by the applicant as our rates of injection will be reduced to the applicant's pressured by the applicant's trespass of their pressure onto our property ultimately reducing the volume of CO2 we could inject in limited 12 years for the 45-Q tax credits.

Q. Can we have everyone look at Exhibit LO-63? And Mr. Swenson, can you explain to us on this map that this illustrates in any way what you're

discussing now? Yeah.

A. As you'll see, these are the three disposal facility areas proposed by the applicant. The upper left one being the BK Fisher well. The green border around that well is the current boundary being proposed for the disposal facility. The orange surrounding that is the area of review. The right well is a JK Hence well, again, surrounded by a green line for the border of their proposed disposal facility, and then the, what, orange -- I'm not sure what color that is -- around that is the area of review, and then the bottom center well is a TB line gang well. The blue line is the proposed border by the applicant of the storage disposal facility, and the purple is the surrounding area of review. You'll see all of the intervenor lands marked on there in colored blocks. You'll see the white ones which are specific to our trust fall in between a lot of the storage disposal facility boundaries and areas of review even, but the boundaries are what's important. And overlaid on this map is the pressure gradient that the EERC, through the applicant, has provided of what the pressures will be after 20 years of injection by those three wells at their planned rates, and what you'll see is, much of our land will have pressure

trespass in our pore space rendering it unable to realize what we could realize today for a net cash flow, but yet, we're not being paid, but our pore space is being damaged.

MR. BRAATEN: Move to admit Exhibit 63.

OFFICER GARNER: Any objection?

MR. GLUDT: Yes. Mr. Examiner, foundation. We don't know who produced this map, how it was produced. If the witness's able to give us a little bit more foundation in those respects, we may be able to remove our objection.

OFFICER GARNER: Mr. Braaten.

Q. (By Mr. Braaten:) Do you have an understanding of the program in which this map was created, Mr. Swenson?

A. The Google Earth program?

Q. Correct.

A. I do.

Q. Is it your understanding that the images of the pressure maps produced by the applicant as well as the boundaries produced by the applicant are on this map alongside of the properties that are owned by the other intervenors?

A. Yes, it is.

Q. And all of those images are then compiled

on to a KMZ file within Google Earth that then produces the map that we're looking at in Exhibit 63?

A. It does.

MR. BRAATEN: Move to admit.

OFFICER GARNER: Do you have any objection?

MR. GLUDT: No objection.

OFFICER GARNER: The exhibit will be admitted.

Q. (By Mr. Braaten:) I'm going to take a look now at Exhibit 86.

A. Is that one --

Q. And this is the one that we e-mailed around to everyone, and I gave a flash drive to Judge Garner and to Mr. Bender. Mr. Swenson, can you tell us what we're looking at on Exhibit 86?

A. This map is a -- well, I'll call it a snippet, but a copy taken from Minnkota Power's -- I guess their process of -- the documents that they submitted, and then were ultimately replied on and stuff in their petition to intervene in this hearing. I added myself the red line and the letterings or words that are called Swenson Trust Land and Minnkota Power well.

Q. And what was your intent with creating this map, and what were you trying to illustrate here?

A. So as I previously mentioned, we were denied our petition to intervene on lands that we didn't have an interest in, and for some reason, for the same reason, of that potential increased pressure on their case of only 2 to 300, but in our case 8 to 900 in their leased pore space. Minnkota was granted their petition to intervene in all three of these disposal facilities of the applicant. But yet, we only get one. And we're affected by them way more than they are. How is this remotely fair? Once again, in the example of the state favoring the industry over the citizen.

MR. BRAATEN: Move to admit Exhibit 86.

MR. GLUDT: No objection.

OFFICER GARNER: The exhibit is admitted.

THE WITNESS: You know, one can only -- sorry. I can only get one conclusion from this, I believe, that the state is either trying to lay down some evidence in this action by evaluating correlative rights to prop up their unsubstantiated defense in an ongoing lawsuit with the Northwest Landowners Association or they're just simply prejudicing us in this hearing. Prejudicing us in this hearing with more lack of due process in this hearing by denying our ability to intervene on damaging our private

property due to the pressurization of pore space while allowing Minnkota to intervene, which is it? Unfortunately, as a state has refused to enforce North Dakota's Rules of Civil Procedure. We, as a petitioner, have not been given our discovery requests. We have not been able to depose anybody that would have allowed us to substantiate or refute the above-claimed pressure gradient data by the applicant and impact by the applicant's uncompensated use of our pore space. As well we have heard even more testimony by the applicant's experts, well, they're intentionally, influenced model perimeters resulting in smaller projected CO2 plume results, resulting in a voidance of signing up landowners, and keeping the money in their pockets.

Q. (By Mr. Braaten:) Did you review the storage agreement that is part of the application?

A. I did.

Q. And do you understand that you're going to be subject to the terms of that agreement in whether you've ever signed a contract with the applicant or not?

A. That's what it says, yes.

Q. Do you have any concerns with that or with the pore space lease -- pore space lease attached to

it that is purportedly going to be imposed upon you?

A. Well, as you've heard or seen, I should say, in testimony at this hearing, the resulting material changes agreed to by the applicant in the agreement that they committed to in this room this week, you're darn right I have concerns. We've been asking for some of that for 31 months. Yet, the only way to get them to change the insurance provision of all silly things, something they have, they just didn't want to give us was to publicly shame them in this room, in this hearing. What is up with that? Is that good faith negotiations? I don't know.

The applicant's project does not meet the threshold for public interest as it pertains to a physical invasion resulting in a physical taking of our land. They have failed to provide any evidence of the mass balance of greenhouse gas emissions reduced by their project, if any. And substantiate that the direct and substantial impact to North Dakota citizens are required by law for a physical taking. The applicant has not provided testimony of a direct impact on coal and power industries. The applicant has publicly stated that they will not be using the requested disposal facilities for enhanced oil recovery or other beneficial uses. They don't meet

the policy recitals, and because of that, the storage agreement and these permit requests should be denied, specifically in the unleased pore space interest 3.1 section, any pore space owner in the storage facility who owns a pore space interest in the storage reservoir that is not leased for the purpose of this agreement, and during the term here of shall be treated as if it were subject to the pore space lease attached to, hereto, as Exhibit D.

So I am a pore space owner, along with my wife, Fay. We own interest in one of the storage disposal facilities, and it's not leased for the purposes of this agreement. What gives the state the right to make me an indentured servant to them? Subjecting me to a private agreement that I don't agree to.

Mr. Helms, are you the king, and I'm the subject now? Once again, in your statements to the legislator on Friday, January 13th, 2023, you stated, our future orders are going to be a little bit different. We're not going to incorporate the storage facility agreement.

LYNN HELMS: Use of the service. Now, we've learned through the asking of that question that our future orders are going to be a little bit

different. We're not just going to incorporate the storage facility agreement that, you know, was privately worked out with the ratification people in total in there. We're going to address some of those issues. We're all --

THE WITNESS: Sure (inaudible) to be included in this current storage agreement by my reading.

Q. (By Mr. Braaten:) Do you have an understanding of whether you are going to have the same or a different lease as the North Dakota Department of Trust Lands?

A. My understanding is that a -- the North Dakota Trust Lands has not signed an agreement to date with the applicant, but I do know that the lease version under consideration today is not the one in the storage agreement. So do we not have equal protection under the law? Or is it the whole, rule for thee, but not for me. Typical of the king. Why does the state get a different lease agreement than I do?

So we've heard over the years starting in this room that they're simply trying to regulate our private property, but here, they give the applicant the right to use as much of our land without requiring

an easement that I've signed without constitutional due process and without that imminent domain hearing, jury trial. This is a blatant physical taking of our private property unconstitutional. They're not setbacks. There's not safety considerations, noise, light restoration, reclamation or other written into the agreement.

Yet, Mr. Helms, you told us that we would have that.

Well, Derrick, I might have lost it again. There we go. That's what's doing it; huh? All right. There we go.

LYNN HELMS: So very robust regulatory paradigm that you created, but it treats people fairly, it respects them, it runs things through multiple hearings. Man, have I learned a lot, so. You know, one of the questions that's been asked is, do these Industrial Commission orders actually allow use of the surface? Putting a pipe or a pump or -- or something like that on the surface, and yes, they do. The statute allows for reasonable and necessary use of the surface. Now, we've learned through the asking of that question that our future orders are going to be a little bit different. We're not just going to incorporate the storage facility agreement that, you

know, was privately worked out with the ratification people in total. In there, we're going to address some of those issues. We're also planning a rule change to make sure people understand that there are going to be setbacks that -- that you've got to keep this infrastructure that's on the surface away from people's homes and their businesses and roads and streets and streams and things like that, so. So there will be some rule changes. Am I looking forward to that? Guess what? Those rule changes have to go through EPA and be published in the federal register. How long will that take? I don't know. But if we're going to do this job right, we have to do it right. So that's our regulation paradigm.

THE WITNESS: So I'd asked, are we being treated fairly? I'd say the obvious lack of due process would say no. Favoring Minnkota over landowners is another egregious example of unfairness. Are we being respected? Well, I'd say no. The lack of reciprocal negotiations would say no. When are the other hearings scheduled that were mentioned? I only know of one. What are -- what statute references reasonable and necessary use of our surface? Where are these rule changes that Mr. Helms references? It's been 17 months since this legislative

presentation telling the legislators, so they wouldn't vote favorably on our senate bill we had in process. What progress has been made to establish setbacks to keep these things away from our homes, our roads, and streams as mentioned in the video. You seem to put a lot of things in these storage agreements that aren't required by law. You certainly could put setbacks in it. I've reviewed the legislative history on 3822. That was a lot of fun. It's clear that the legislator did not intend in any legislative testimony or hearing to make us as non-compensated landowners subject to a private agreement we didn't sign. They just wanted us to get paid for use of our pore space in an equal manner. That's -- that's it.

They also never intended the commission to require us to give up our surface lands. As the Century Code specifically limits the authority to pore space as stated in Century Code 382210, amalgamating property interest. If a storage operator does not obtain the consent of all persons who own the storage reservoirs pore space, the commission may require that the pore space owned by nonconsenting owners be included in the storage facility and subject to geologic storage. I don't see anything in there about surface lands. Not a thing. I don't see anything

about our surface lands in that on which Fay's mom had to learn to do all the farming and ranching by herself, and those activities after Fay's dad died while she was in high school, that same surface land provided wheat, oats, hay, and beef that were monetized to pay for Fay to go to college where I met the love of my life. Those surface lands were where my sons shot their first deer, their first pheasants, and their first grouse. The same surface lands that we host youth and veterans hunts every year on for our community. Those surface lands that the high school classes came out. Just this last month at 5:00 in the morning to sit in the cold and watch the sharp tail grouse dance on their lek within feet of their eyes, an experience they will remember for the rest of their lives. The surface lands on which we almost lost one of our boys, in a winter blizzard, as he ran out to an open prairie field disoriented from the hellacious winds and blinding snow not able to see his mom standing in the garage door waiting for him. And it's the same surface lands that I buried two of my best friends on. I don't -- I did not hear anything about giving up access or use of our surface lands in that legislative directive. And it's not just the surface lands. You're affecting real people with your

decisions from this hearing. Do you even know their names? Fay Beth Swenson, Joseph Oliver Swenson, Olivia Wazwek (phonetic), Warren Wayne Swenson, Courtney Geizer (phonetic), Donna May Smith, July Dawn Silvernagle (phonetic), Dean Silvernagle, Craig Bolinski (phonetic), Amanda Bolinski, Camden Bolinski, Mack Bolinski, Megan Summers-Butler, Jeff Butler, Lauren Summers-Gilmer, Chad Gilmer, Tammy Summers, Michael Boman (phonetic), Glen Gerving (phonetic), Lisa Gerving, Michael Hought, Bonnie Hought, Johnny Yocumb (phonetic), Kevin Craft, Kimberly Craft, Sharmaine Lee Belt, Charlotte Lee Belt, Kirk Mays, Linda Mays, Allen Mays, Paul Metz, Christy Metz, Gary Smith, Cassie Smith, and I can keep going all day if you'd like. But how many of them do you know, and do you know that your decisions will irreparably impact their land from your decisions from the sham of a hearing?

MR. BRAATEN: Can we take a break, Your Honor?

OFFICER GARNER: Yeah. We can take a five-minute break. We'll go off the record.

We are back on the record. Attorney Braaten, you can proceed.

MR. BRAATEN: Thank you, Your Honor.

Q. (By Mr. Braaten:) Mr. Swenson, can you talk about any -- you talked earlier about your experience with safety protocols and industrial settings. Can you talk about any safety concerns you have about the applicant's permit requests?

A. I can, and I'm not here to talk about the pipeline that's been given all the attention from a safety perspective. That's different, you know. They -- their -- everybody's worked -- worried about land shifting and the impact of the pipeline faulty construction, whatever. I just want to make sure that it's on the record that CO2 is an odorless and colorless oxygen displacing gas that can be deadly at certain levels, and just to re-enforce on the record that North Dakota Century Code 322808 states that before issuing a permit, the commission shall find that the storage facility shall not endanger human health. That's an absolute -- there's no variation that they provide you. That's an absolute requirement to not endanger human health. High burden of proof. Shouldn't be taken lightly. For the protection of human health. Unfortunately, the applicant has not submitted any evidence of a potential vapor release model, concentration gradients of the oxygen robbing CO2 that may be released, and its potential impact to

public receptors into the record. Whether it's from an unplanned release or one of these little pressure valves or whatever we talked about yesterday, without that, how can the state possibly say that they've met the statutory requirement and that burden, absolute burden, of finding these disposal facilities shall not endanger human health. Simply put. You can't. It's not possible.

Q. Do you feel comfortable just trusting that after the process the Industrial Commission is going to ensure that there are safety standards at some point?

A. I don't -- I don't know if I do. Probably not. I'm not sure that I have faith that, you know, even if the applicant were to have provided basic concentration gradients from a release with their application, even if it was under confidential seal that the state would even know what to do with it as evidenced by Mr. Helms' e-mail dated January 15th, 2023, addressed to the North Dakota Senate, Energy & Natural Resources Committee, as those members were considering numerous bills related to carbon dioxide pipelines disposal facilities and safety in general as -- of a CO2 release. In this e-mail, it appears to be an attempt to share his knowledge and expertise on

modelling and release from a CO2 pipeline.

Q. I'm going to hand you what we have marked as LO -- as Exhibit LO-89. Mr. Swenson, I've handed you what we've marked as Exhibit LO-89. Is this a copy of the e-mail you were just referencing?

A. It is.

Q. And how did you obtain a copy of that e-mail?

A. From one of the members noted on there, Mr. -- senator Jeffrey Magrum.

MR. BRAATEN: Move to admit LO-89.

OFFICER GARNER: Any objections?

MR. GLUDT: No objection.

OFFICER GARNER: Exhibit is admitted.

Q. (By Mr. Braaten:) Did you have a chance to review the information that was being conveyed to the legislators by Mr. Helms in this e-mail, Mr. Swenson?

A. I did.

Q. And did you do an assessment of whether you agreed with whether this was a -- an accurate or predictive or even relevant model to be using in this situation?

A. I did. So at this time which was during the 2023 legislative session, as I mentioned before, there were numerous bills going through the

legislator, and as you can see in the way Mr. Helms introduces this, that it was, you know, carbon dioxide pipeline information. There was discussion about the Satartia, Mississippi, pipeline break that occurred which caused a vapor cloud, and then there was -- and has been and continues to this day a significant amount of concern about the vapor concentrations that were released, and how they impacted the residents of Satartia, and I'm not here to discuss that, but what I am here to discuss is that Mr. Helms then under that pretense of, we're going to talk about vapor concentrations in an air dispersion model. Unfortunately, what Mr. Helms did is, he used a risk management program over pressure model. That's not a vapor concentration model. It's not an air dispersion model, as he promotes in his e-mail to our senators, that were making decisions on bills to protect public safety. That model is used for regulated substances and is used to determine offsite consequences to populations after an explosion, not a vapor release. But an explosion. So instead of predicting safe concentrations in the air of vapors, this model predicts what are called pressure rings from an explosion and determines a safe distance where the resulting blast ring is at 1 pound per square inch or

less. This can be a very useful tool. I've used this tool in the refinery explosion scenarios where we looked at where should we build our maintenance shop or how thick of concrete walls should we put on a building where our control room operators were where they could experience a 5 PSI blast, where a 1 PSI blast get them. How about the public that's driving by on the roadway? That's what this model is used from. And it's very useful in the right application, and unfortunately, this has zero, zilch, not a thing to do with carbon dioxide vapor concentrations in air which may affect human health.

I don't know if there was a lack of critical thinking skills needed to realize that when the model didn't allow carbon dioxide which is a nonflammable, i.e., it won't explode chemical compound. In fact, it's used to put fires out as a choice. He intentionally chose a different chemical, carbonyl sulfide. That's not carbon dioxide, but he does say that in the model that's predicting a whole separate type of safety risk that CO2 doesn't pose. How can we possibly trust the state to find that these storage facilities shall not endanger human health if they don't even know what model to run? The state fails miserably on this point.

UNIDENTIFIED MALE: Mr. Braaten, I don't know if this is appropriate at this time, but could you possibly that -- you could add to LO-89 and include the e-mail that went to Mr. Helms so we know what he's responding to?

MR. BRAATEN: I don't know what e-mail you're referring to.

MR. GLUDT: It's because it's not on there.

UNIDENTIFIED MALE: I mean, that's the point. This is an e-mail from Mr. Helms to Jeffrey Magrum.

MR. BRAATEN: I don't see anything that indicates it's a response to anything, particularly an e-mail.

UNIDENTIFIED MALE: Okay. You're probably right. I thought it was a response to an e-mail. Maybe I'm wrong.

MR. BRAATEN: I don't know.

UNIDENTIFIED MALE: Okay. I'm sorry to interrupt you.

OFFICER GARNER: That's okay.

THE WITNESS: You know, the sad part is in addition to using the wrong type of model, they -- in this permit application process, they don't even ask for the data on a release scenario. In an open

records request to the state, they admit they do not receive information to evaluate this important topic on a prior permit application.

Q. (By Mr. Braaten:) Can I have you take a look at landowner or Exhibit LO-90? Mr. Swenson, we've handed out Exhibit LO-90. Can you tell us what this exhibit is?

A. I can. It is an open records request submitted January 20th -- or I'm sorry, February 25th of '24 to the oil and gas open records request e-mail. Specifically the e-mail asked on those open records request for all records relating to a carbon dioxide release to atmosphere from the storage facility and related equipment including flow lines, compression, and well bore. That supports the finding that the commission made that the storage facility will not endanger human health as required by statute on the Blue Flint permit that was issued on May 31st of '23. It asks for the means and method of analysis, the scenarios model such as releases from any pressure relief valves, the maximum release, downstream of compression facilities due to flow line pipe, flange or valve failure. The weather assumptions for the scenario such as temperature, humidity, wind speed, and direction, the name of the software utilized, the

name, the employer, the certifications of the North Dakota professional engineering license of the person that did the modelling, and the CO2 concentration level delineation at which the commission determined is safe for human health, if there is a relief -- release and the geographic topography assumed.

Q. And what was the response from the DMR to that request?

A. On February 29th of 2024, a response was provided. That dispersion models for specific release scenarios from the storage facility isn't information that is provided to our office, but it does include an emergency and remedial response plan which discusses the necessary actions that the storage operator will take during a potential emergency event including the release of carbon dioxide from the storage facility whether it be from well bore, integrity failure, flow line leak or other storage equipment.

MR. BRAATEN: Move to admit LO-90.

OFFICER GARNER: Any objections?

MR. GLUDT: Object on relevance, foundation, and Mr. Koept isn't here to ask -- answer any questions of ours.

OFFICER GARNER: The objections are noted. The exhibit is admitted.

Q. (By Mr. Braaten:) Do you have any concerns about this response to the record request and the positions taken by the state regarding human safety?

A. Well, obviously, it's important to have an emergency response and remediation or remedial response plan, sorry, but that just tells you how you're going to respond to where the dead bodies are from a vapor concentration that exceeds the IDLH standards that our federal government sets. It doesn't tell you, are you designing the facility properly. It doesn't tell you what my setback should be. It just says, here's where the ambulance should go, and here's who we're going to call to go gurney out the dead bodies. The applicant did not include in this hearing process any data with these applications under consideration for this matter, and the state presumably has not asked for it. We haven't received it, and we can't verify this as well as our deposition requests and discovery requests have been ignored by the applicant and unenforced by the State of North Dakota.

MR. GLUDT: Objection to that, Your Honor. The request had not been ignored. There's currently motions pending, and the applicant intends to respond.

OFFICER GARNER: Overruled.

THE WITNESS: The state will tell you they have a setback of 500 feet, and that's highly adequate as they have used it for oil and gas wells for many years; yet, what they won't tell you, this setback was determined from a study of idling diesel trucks that has nothing to do with a natural gas or crude oil release, let alone a deadly CO2 vapor hugging the ground looking for the children playing in our creek bottom while they're hunting for frogs. For these safety reasons, these permit applications should be denied.

Q. (By Mr. Braaten:) And in general, Mr. Swenson, do you believe that the applicant's request should be approved?

A. I think they should be denied. We've been highly prejudiced due to the lack of adherence due to North Dakota Rules of Civil Procedure, and the state's failure to hold the applicant accountable to our request. And honestly, Mr. Braaten, they're simply setting themselves up to waste more taxpayer money on a due process lawsuit pending their decisions made by the people in this room. On these permits.

So as I discussed earlier, the applicant has refused our depositions and discovery requests. We have had no information provided from them for us

to properly prepare for this hearing. While in bed with Summit, the state has denied us, as intervenors, a fair hearing, and our rights of due process guaranteed in law. While they are asleep at the wheel, our game clock was run down to 20 percent of the time remaining, severely prejudicing us with lack of due process. We put our petition to intervene in two days after the notice came out, and you wasted 80 percent of our time to prepare by not granting us our petition to intervene. How is that a fair hearing process? How is that due process under the state's procedures?

The applicant has testified they intentionally adjusted model perimeters to reduce the size of the CO2 plume? Additionally, they intentionally set the boundaries of the storage facility smaller than where CO2 will be present. When they find that the storage facility is too small, the applicant has testified that they have no plan and they wouldn't commit yesterday by Mr. Boeshans to even compensate these new landowners.

MR. GLUDT: Objection. Mischaracterization of Mr. Boeshans' testimony.

THE WITNESS: Read the record.

OFFICER GARNER: Any response?

MR. BRAATEN: The record will speak for itself. We'll have a transcript.

OFFICER GARNER: Overruled.

THE WITNESS: For these reasons, the commission can't possibly find as statutorily required that pore space owners are compensated equitably because they don't even know who all the pore space owners are and that they should be -- who should be paid, and the applicant has no plans to pay for them. Let them -- let alone be paid just compensation guaranteed by our constitution. On this physical taking of private property, the commission can't possibly find that these disposal facilities shall not endanger human health when the applicant hasn't provided CO2 vapor dispersion modelling from a release at each of the disposal facilities. They have no idea how far a major leak will travel, potentially endangering human health at public receptors. Hopefully someone in the state can find someone to run a dispersion model with the correct chemical compounds and a model that predicts vapor concentrations and not blast ring pressures. The applicant has failed to fulfill its obligation of proving the requested permits are in the public interest.

And finally, I'm gravely concerned about

the sham of a due process that our state has allowed, not only has the applicant put forward tremendous effort to get here today, but North Dakota, the State of North Dakota has put in tremendous time, resources, effort, taxpayer monies into laying the framework out for this industry that could lead to great things for our North Dakota industries, the workforce economy, citizens, but unfortunately, due to the state's lack of action, denial of our due process, as an affected party, as an intervenor, you're jeopardizing a future lawsuit that's going to likely end in the EPA removing North Dakota's primacy for Class 6 injection well programs. Is this a legacy you want as you go into retirement? Is this your swan song? I fucking hope not.

UNIDENTIFIED MALE: Whoa.

OFFICER GARNER: Whoa.

MR. BRAATEN: I don't have any further questions for this witness at this time.

OFFICER GARNER: Okay. We're going to break here for lunch. Attorney Braaten, I would hope that on cross examination you can control the witness.

MR. BRAATEN: Yes, Your Honor.

OFFICER GARNER: We'll break here for lunch. Off the record.

Okay. We are back on the record, and we will begin with cross examination of the previous witness. However, there's been a request for a statement.

MR. BRAATEN: Yeah. Mr. Swenson would just like to say something briefly before the cross examination.

THE WITNESS: Thank you. I'd like to just apologize to the oil and gas folks that are here and to -- to you, Mr. Garner, for my choice of words at the end of my testimony. And any condescending tone that I had towards individuals. As you can imagine, this has been a very emotional experience for us, personally for me, the family that I love and will protect until the end, our land, and the landowners that have been affected. So thank you for allowing me to make this statement.

OFFICER GARNER: Thank you. Attorney Gludt. You may proceed.

MR. GLUDT: Thank you, Mr. Examiner. We have no questions.

OFFICER GARNER: Any questions from the staff?

CROSS EXAMINATION

BY UNIDENTIFIED MALE:

Q. Kurt, in your experience working for different industrial companies, do you believe in a company like Summit can operate this facility safely?

A. You know, I've been a part of start-up companies a couple of times. Like, they have built businesses in, like, they're trying to build, not pipeline, I -- I don't know enough about the people in the company that they're hiring to operate. Thank you. But I do -- it is possible we did -- we have done it ourselves, and I think they have every chance to do it if they put the right people in place, the right procedures, and design and all that.

Q. Okay. Thank you.

CROSS EXAMINATION

BY MR. HELMS:

Q. Kurt, I'm looking at your Exhibit LO-89. Did you have a conversation with Senator Magrum about this e-mail?

A. As you'll see, Mr. Helms, on the exhibit, it's dated Monday, June 10th, 2024. So he -- I had talked with him on Monday. And he had forwarded it to me on Monday. It wasn't actually -- I had asked him for some other information, and he sent me this one that was related, yes. So I did talk with him.

Q. And what did he tell you about the context

or the -- what initiated the e-mail?

A. What he generally -- and I'm not quoting him here, but generally, what I was left with was that it was in regards to the time when there was pipeline bills being introduced in the legislator and that it was in relationship to the safety of the pipeline being proposed in this case by the applicant, and the Public Service Commission, ultimately, and the rules that were -- or the senate bills at that time that were trying to be passed that affected setbacks and county ability to adopt ordinances or changes that they desired. So it was kind of in that context, Mr. Helms. And it was -- it was about, you know, how far does one have to be to be safe from the pipeline is the impression that I was left with from that conversation. But you may have to ask him specifically, but.

Q. Were you present at the January 15th, 2023 Senate and House Ag & Energy Resources Committee meeting?

A. I was not at the joint -- the joint one that we played.

Q. Yes.

A. Video from that one, I was not personally present. I had watched it in its entirety on the

legislative website that allows you to see those things. But I was not present.

Q. Your exhibit LO-63, you indicated that we could see some white areas, but my copy doesn't show any white areas. But --

A. Is that the -- I'm sorry, is that the map?

Q. It's a map.

A. Yeah.

Q. LO intervenor properties.

MR. BRAATEN: It might be a cream color.

THE WITNESS: Oh, okay. My vision color might be slightly off, but we'll take a look here.

MR. BRAATEN: I think it's how it printed.

THE WITNESS: Oh, that looks different than the electronic one, slightly, color wise.

MR. BRAATEN: Yeah. Let's look at the difference here. Oh, okay. Yeah.

THE WITNESS: So the white areas that I was referring to, Mr. Helms, if you were to look on the legend down where it says Swenson --

MR. HELMS: Yep.

THE WITNESS: -- towards the bottom, that, in particular, looks white.

MR. HELMS: Uh-huh.

THE WITNESS: And that's what I was

referring to. What -- when the over -- I'm guessing what happened is, when the overlays went on, it slightly changed because of the multiple layers. And, so the areas, if you'd like me to point them out, that I was referring to, I can.

Q. (By Mr. Helms:) Well, either that or submit a supplement that brings those to the -- to the front --

A. So.

Q. Like, the way it is, it isn't useful for your testimony.

MR. BRAATEN: You don't need to say anything.

MR. HELMS: Can you submit it electronically?

MR. BRAATEN: We're not going to submit any supplements.

MR. HELMS: All right.

MR. BRAATEN: The legal descriptions for each intervenor landowner are itemized in declarations with the deeds attached. Every incumbrance on the property and the legal description.

THE WITNESS: Yeah.

MR. HELMS: That's all I got.

THE WITNESS: Okay.

OFFICER GARNER: Okay. Mr. Braaten, call your next witness.

MR. BRAATEN: I'm not going to call any more witnesses. I'm not going to rest my case. I renew my objection to the time table on which this hearing was held. The lack of notice, the inability to get information from both the agency and the applicant, so. I move once again to continue this hearing until a later date after we have had time to obtain the data and to prepare for a hearing. And given that the applicant, apparently, doesn't have a complete application yet, I think that's going to be required anyway. So I'm not trying to be difficult, and I know everybody wants to go home, and I do, too, so I'm not trying to make people stay here, but I'm not going to rest. I'm going to put my objection on record and move to continue.

OFFICER GARNER: Your objection is noted, and your motion is denied. At this time, then, I think we can move with public comment.

UNIDENTIFIED MALE 2: (Inaudible).

OFFICER GARNER: Okay. Let's try to keep this as orderly as possible. Do we have a sign-in sheet?

UNIDENTIFIED MALE 2: (Inaudible) there was

one at the table.

OFFICER GARNER: Because I can call people individually. Nothing? Okay. At this point I will open the floor to anyone that would like to come up and make a public comment. Okay. I'll note for the record that no one --

UNIDENTIFIED MALE 2: He's coming.

OFFICER GARNER: Oh, I'm sorry.

KENNETH HENSE: I'm kind of slow.

OFFICER GARNER: No. That's fine. Please state your name for the record.

KENNETH HENSE: Kenneth Hemel (phonetic) Hense.

OFFICER GARNER: Okay. You may proceed.

KENNETH HENSE: Kenneth Hemel Hense. I'm a landowner in Oliver County. Would you like the legal description on my property in Oliver County? Is that necessary?

OFFICER GARNER: Sure.

KENNETH HENSE: Okay. So the legal description on my property is the northeast quarter of Section 9, 142, 86, in the northeast quarter of Section 17, 142, 86. As a landowner in Oliver County, I support the Summit Carbon Solutions project. The project will provide new industry for North Dakota,

supplement income for farmers and ranchers and tax dollars for the county. I have dealt with them since 2021, and the overall experience has always been very good and open. Thank you.

OFFICER GARNER: Thank you. Anybody else? Okay. Then before we go off the record, we have a number of supplementals that we're going to need to keep the record open for. Attorney Bender and Braaten, how long do you think you need to keep the record open?

MR. BENDER: I think we can have all the supplementals into the commission by June 24th.

OFFICER GARNER: And one of those includes an amended storage agreement which is probably going to require you to work in conjunction. How long -- can you have that in the same time frame?

MR. BENDER: Yes. We can have everything to you by June 24th.

OFFICER GARNER: Attorney Braaten.

MR. BRAATEN: I presume so.

OFFICER GARNER: June 24th. All right. We'll leave the record open until June 20th -- oh, go ahead.

UNIDENTIFIED MALE: I just want to make sure you're going to address the written comments --

OFFICER GARNER: Oh.

UNIDENTIFIED MALE: -- and --

OFFICER GARNER: Yes. I did receive two e-mails, one in support of the application, one in opposition. I note that the e-mails came in after 5:00 o'clock on Monday, on June 10th. Any objection to admitting those into the record?

MR. BENDER: I don't have any objection, Your Honor.

MR. BRAATEN: No objection, Your Honor.

OFFICER GARNER: Then we will admit those e-mails into the record as well.

UNIDENTIFIED MALE: Okay.

OFFICER GARNER: Anything further?

MR. BENDER: Go ahead.

UNIDENTIFIED MALE: There was also the number of written comments received prior to. I guess, is there a response from either party to any of the written comments received prior to the hearing?

MR. BENDER: I'm not sure that I understood what you're saying, I'm sorry.

UNIDENTIFIED MALE: Any objection to them in the record or response to any of the content within those?

MR. BENDER: Well, I don't know. I haven't

had an opportunity to review them carefully. Perhaps, you could leave the record open additionally for responding to the letters that are coming into the record until June 24th as well. That's not inappropriate, Mr. Examiner. That's what we would propose.

OFFICER GARNER: Any problem with that? Okay. Then we will leave the record open until June 24th for that purpose as well.

MR. BENDER: I don't think you're going to get a lot of response from us, but it does give us that opportunity, obviously.

OFFICER GARNER: Okay.

MR. BENDER: I do have one matter, Mr. Examiner. This is probably because of my poor recordkeeping, but I did put together a list of the exhibits that we discussed. I could give Mr. Braaten a copy and you a copy as well, and you know, maybe it's something we can all look over in the next day or so. And I don't know if Mr. Braaten plans on providing us with one, and then we can decide if all the exhibits are in. I don't want a situation where, you know, we talked about an exhibit, it's clear that it could be entered, but we forgot to offer it, and it wasn't admitted. So if Mr. Braaten doesn't have any

problem with that, I can provide my list now, and I don't have any problem with, if Mr. Braaten wants to provide -- supply his with a copy to me in the next couple of days so I have an opportunity to respond.

MR. BRAATEN: I think that's a great idea. I agree.

OFFICER GARNER: Okay. That's fine.

UNIDENTIFIED MALE: I guess to the effect that there were supplementals requested by commission staff, are you confident you have a -- a list of the items that were requested and -- and/or indicated would be submitted as supplementals?

MR. BENDER: I am. But I am prepared to provide you with a list of what we believe needs to be supplied. I can submit that to you and copy Mr. Braaten, and obviously, if you think we missed something, perhaps, you can just respond in an e-mail, certainly copy Mr. Braaten.

MR. BRAATEN: Yeah. That works for me. I appreciate that.

UNIDENTIFIED MALE: Okay. Thank you.

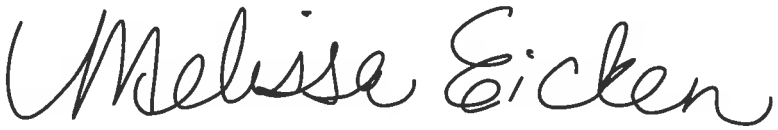
OFFICER GARNER: Anything further? Okay. That concludes our hearings for case numbers 30869 through 30880. It concludes our hearings for the day.

(Audio ended.)

CERTIFICATE OF REPORTER

I, Melissa J. Eicken, Certified Court Reporter of Missouri, Certified Shorthand Reporter of Illinois and Registered Professional Reporter, do hereby certify that I was asked to prepare a transcript of proceedings had in the above-mentioned case, which proceedings were held with no court reporter present utilizing an open microphone system of preserving the record.

I further certify that the foregoing pages constitute a true and accurate reproduction of the proceedings as transcribed by me to the best of my ability and may include inaudible sections or misidentified speakers of said open microphone recording.



Melissa J. Eicken, CCR, CSR, RPR

NOTICE OF HEARING N.D. INDUSTRIAL COMMISSION OIL AND GAS DIVISION

The North Dakota Industrial Commission will hold a public hearing at 9:00 AM CDT Tuesday, June 11, 2024 – Wednesday, June 12, 2024 at N.D. Oil & Gas Division 1000 East Calgary Avenue Bismarck, North Dakota. At the hearing the Commission will receive testimony and exhibits. Persons with any interest in the cases listed below, take notice. PERSONS WITH DISABILITIES: If at the hearing you need special facilities or assistance, contact the Oil and Gas Division at 701-328-8038 by Tuesday, May 28, 2024.

STATE OF NORTH DAKOTA TO:

Case No. 30869 In the matter of a hearing called on a motion of the Commission to consider the application of Summit Carbon Storage #1, LLC requesting consideration for the geologic storage of carbon dioxide in the Broom Creek Formation from the Midwest Carbon Express Pipeline in the storage facility located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND pursuant to North Dakota Administrative Code Chapter 43-05-01. View the draft storage facility permit, fact sheet, and storage facility permit application at www.dmr.nd.gov/dmr/oilgas/. Summit Carbon Storage #1, LLC intends to receive carbon dioxide from the Midwest Carbon Express Pipeline and sequester it in the Broom Creek Formation. The Commission will accept and consider written comments on the merits of the application and draft permit if received no later than 5:00 pm CDT June 10, 2024. Submit written comments to the Oil and Gas Division, 1016 East Calgary Ave, Bismarck, ND 58503-5512 or slforsberg@nd.gov. Further draft permit information may be obtained from Tammy Madche, and further hearing information may be obtained from Sara Forsberg, both at the ND Oil and Gas Division, 1016 East Calgary Ave, Bismarck, ND 58503-5512, 701-328-8020. Summit Carbon Storage #1, LLC, 2321 North Loop Dr Suite #221, Ames, IA 50010.

Case No. 30870 In the matter of a hearing called on a motion of the Commission to consider the application of Summit Carbon Storage #1, LLC to consider the amalgamation of the storage reservoir pore space, in which the Commission may require that the pore space owned by nonconsenting owners be included in the geologic storage, as required to operate the Summit Carbon Storage #1, LLC storage facility located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, in the Broom Creek Formation, pursuant to North Dakota Century Code Section 38-22-10.

Case No. 30871 In the matter of a hearing called on a motion of the Commission to consider the application of Summit Carbon Storage #1, LLC for an order of the Commission determining the amount of financial responsibility for the geologic storage of carbon dioxide from the Midwest Carbon Express Pipeline in the storage facility located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31; 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, in the Broom Creek Formation, pursuant to North Dakota Administrative Code Section 43-05-01-09.1.

Case No. 30872 In the matter of a hearing called on a motion of the Commission to consider establishing the field and pool limits for lands located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, subject to the application of Summit Carbon Storage #1, LLC for the geologic storage of carbon dioxide in the Broom Creek Formation, and enact such special field rules as may be necessary.

Case No. 30873 In the matter of a hearing called on a motion of the Commission to consider the application of Summit Carbon Storage #2, LLC requesting consideration for the geologic storage of carbon dioxide in the Broom Creek Formation from the Midwest Carbon Express Pipeline in the storage facility located in Sections 27, 28, 29, 32, 33, 34, and 35, Township 143 North, Range 88 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, 35, and 36, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, and 31, Township 142 North, Range 87 West, and Sections 1, 2, and 3, Township 141 North, Range 88 West, Mercer and Oliver Counties, ND pursuant to North Dakota Administrative Code Chapter 43-05-01. View the draft storage facility permit, fact sheet, and storage facility permit application at www.dmr.nd.gov/dmr/oilgas/. Summit Carbon Storage #2, LLC intends to receive carbon dioxide from the Midwest Carbon Express Pipeline and sequester it in the Broom Creek Formation. The Commission will accept and consider written comments on the merits of the application and draft permit if received no later than 5:00 pm CDT June 10, 2024. Submit written comments to the Oil and Gas Division, 1016 East Calgary Ave, Bismarck, ND 58503-5512 or slforsberg@nd.gov. NOTICE OF HEARING N.D. INDUSTRIAL COMMISSION OIL AND GAS DIVISION

The North Dakota Industrial Commission will hold a public hearing at 9:00 AM CDT Tuesday, June 11, 2024 – Wednesday, June 12, 2024 at N.D. Oil & Gas Division 1000 East Calgary Avenue Bismarck, North Dakota. At the hearing the Commission will receive testimony and exhibits. Persons with any interest in the cases listed below, take notice.

PERSONS WITH DISABILITIES: If at the hearing you need special facilities or assistance, contact the Oil and Gas Division at 701-328-8036 by Tuesday, May 28, 2024.

STATE OF NORTH DAKOTA TO:

Case No. 30869 In the matter of a hearing called on a motion of the Commission to consider the application of Summit Carbon Storage #1, LLC requesting consideration for the geologic storage of carbon dioxide in the Broom Creek Formation from the Midwest Carbon Express Pipeline in the storage facility located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND pursuant to North Dakota Administrative Code Chapter 43-05-01. View the draft storage facility permit, fact sheet, and storage facility permit application at www.dmr.nd.gov/dmr/oilgas/. Summit Carbon Storage #1, LLC intends to receive carbon dioxide from the Midwest Carbon Express Pipeline and sequester it in the Broom Creek Formation. The Commission will accept and consider written comments on the merits of the application and draft permit if received no later than 5:00 pm CDT June 10, 2024. Submit written comments to the Oil and Gas Division, 1016 East Calgary Ave, Bismarck, ND 58503-5512 or sflorsberg@nd.gov. Further draft permit information may be obtained from Tammy Madche, and further hearing information may be obtained from Sara Forsberg, both at the ND Oil and Gas Division, 1016 East Calgary Ave, Bismarck, ND 58503-5512, 701-328-8020. Summit Carbon Storage #1, LLC, 2321 North Loop Dr Suite #221, Ames, IA 50010.

Case No. 30870 In the matter of a hearing called on a motion of the Commission to consider the application of Summit Carbon Storage #1, LLC to consider the amalgamation of the storage reservoir pore space, in which the Commission may require that the pore space owned by nonconsenting owners be included in the geologic storage, as required to operate the Summit Carbon Storage #1, LLC storage facility located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, in the Broom Creek Formation, pursuant to North Dakota Century Code Section 38-22-10.

Case No. 30871 In the matter of a hearing called on a motion of the Commission to consider the application of Summit Carbon Storage #1, LLC for an order of the Commission determining the amount of financial responsibility for the geologic storage of carbon dioxide from the Midwest Carbon Express Pipeline in the storage facility located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, in the Broom Creek Formation, pursuant to North Dakota Century Code Section 43-05-01-09.1.

Case No. 30872 In the matter of a hearing called on a motion of the Commission to consider establishing the field and pool limits for lands located in Sections 31, 32, 33, and 34, Township 142 North, Range 87 West, Sections 1, 11, 12, 13, 14, 15, 22, 23, 24, 25, 26, 35, and 36, Township 141 North, Range 88 West, Sections 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, and 35, Township 141 North, Range 87 West, Sections 1, 2, 3, and 12, Township 140 North, Range 88 West and Sections 4, 5, 6, and 7, Township 140 North, Range 87 West, Mercer, Morton, and Oliver Counties, ND, subject to the application of Summit Carbon Storage #1, LLC for the geologic storage of carbon dioxide in the Broom Creek Formation, and enact such special field rules as may be necessary.

Case No. 30873 In the matter of a hearing called on a motion of the Commission to consider the application of Summit Carbon Storage #2, LLC requesting consideration for the geologic storage of carbon dioxide in the Broom Creek Formation from the Midwest Carbon Express Pipeline in the storage facility located in Sections 27, 28, 29, 32, 33, 34, and 35, Township 143 North, Range 88 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, 35, and 36, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, and 31, Township 142 North, Range 87 West, and Sections 1, 2, and 3, Township 141 North, Range 88 West, Mercer and Oliver Counties, ND pursuant to North Dakota Administrative Code Section 43-05-01-09.1. View the draft storage facility permit, fact sheet, and storage facility permit application at www.dmr.nd.gov/dmr/oilgas/. Summit Carbon Storage #2, LLC intends to receive carbon dioxide from the Midwest Carbon Express Pipeline and sequester it in the Broom Creek Formation. The Commission will accept and consider written comments on the merits of the application and draft permit if received no later than 5:00 pm CDT June 10, 2024. Submit written comments to the Oil and Gas Division, 1016 East Calgary Ave, Bismarck, ND 58503-5512 or sflorsberg@nd.gov. Further draft permit information may be obtained from Tammy Madche, and further hearing information may be obtained from Sara Forsberg, both at the ND Oil and Gas Division, 1016 East Calgary Ave, Bismarck, ND 58503-5512, 701-328-8020. Summit Carbon Storage #2, LLC, 2321 North Loop Dr Suite #221, Ames, IA 50010.

Case No. 30874 In the matter of a hearing called on a motion of the Commission to consider the application of Summit Carbon Storage #2, LLC to consider the amalgamation of the storage reservoir pore space, in which the Commission may require that the pore space owned by nonconsenting owners be included in the geologic storage, as required to operate the Summit Carbon Storage #2, LLC storage facility located in Sections 27, 28, 29, 32, 33, 34, and 35, Township 143 North, Range 88 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, 35, and 36, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, and 31, Township 142 North, Range 87 West, and Sections 1, 2, and 3, Township 141 North, Range 88 West, Mercer and Oliver Counties, ND, in the Broom Creek Formation, pursuant to North Dakota Century Code Section 38-22-10.

Case No. 30875 In the matter of a hearing called on a motion of the Commission to consider the application of Summit Carbon Storage #2, LLC for an order of the Commission determining the amount of financial responsibility for the geologic storage of carbon dioxide from the Midwest Carbon Express Pipeline in the storage facility located in Sections 27, 28, 29, 32, 33, 34, and 35, Township 143 North, Range 88 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, 35, and 36, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, and 31, Township 142 North, Range 87 West, and Sections 1, 2, and 3, Township 141 North, Range 88 West, Mercer and Oliver Counties, ND, in the Broom Creek Formation, pursuant to North Dakota Administrative Code Section 43-05-01-09.1.

Case No. 30876 In the matter of a hearing called on a motion of the Commission to consider establishing the field and pool limits for lands located in Sections 27, 28, 29, 32, 33, 34, and 35, Township 143 North, Range 88 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, and 35, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, and 31, Township 142 North, Range 87 West, and Sections 1, 2, and 3, Township 141 North, Range 88 West, Mercer and Oliver Counties, ND, subject to the application of Summit Carbon Storage #2, LLC for the geologic storage of carbon dioxide in the Broom Creek Formation, and enact such special field rules as may be necessary.

Case No. 30877 In the matter of a hearing called on a motion of the Commission to consider the application of Summit Carbon Storage #3, LLC requesting consideration for the geologic storage of carbon dioxide in the Broom Creek Formation from the Midwest Carbon Express Pipeline in the storage facility located in Section 36, Township 143 North, Range 87 West, Sections 19, 20, 21, 28, 29, 30, 31, 32, 33, 34, 35, and 36, Township 143 North, Range 88 West, Sections 1, 2, 11, 12, 13, 14, and 24, Township 142 North, Range 87 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, and 35, Township 142 North, Range 88 West, and Sections 5, 6, 7, 8, 17, 18, 19, and 20, Township 142 North, Range 87 West, Oliver County, ND pursuant to North Dakota Administrative Code Chapter 43-05-01. View the draft storage facility permit, fact sheet, and storage facility permit application at www.dmr.nd.gov/dmr/oilgas/. Summit Carbon Storage #3, LLC intends to receive carbon dioxide from the Midwest Carbon Express Pipeline and sequester it in the Broom Creek Formation. The Commission will accept and consider written comments on the merits of the application and draft permit if received no later than 5:00 pm CDT June 10, 2024. Submit written comments to the Oil and Gas Division, 1016 East Calgary Ave, Bismarck, ND 58503-5512 or sflorsberg@nd.gov. Case No. **30874** In the matter of a hearing called on a motion of the Commission to consider the application of Summit Carbon Storage #2, LLC to consider the amalgamation of the storage reservoir pore space, in which the Commission may require that the pore space owned by nonconsenting owners be included in the geologic storage, as required to operate the Summit Carbon Storage #2, LLC storage facility located in Sections 27, 28, 29, 32, 33, 34, and 35, Township 143 North, Range 88 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, 35, and 36, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, and 31, Township 142 North, Range 87 West, and Sections 1, 2, and 3, Township 141 North, Range 88 West, Mercer and Oliver Counties, ND, in the Broom Creek Formation, pursuant to North Dakota Century Code Section 38-22-10

Case No **30875** In the matter of a hearing called on a motion of the Commission to consider the application of Summit Carbon Storage #2, LLC for an order of the Commission determining the amount of financial responsibility for the geologic storage of carbon dioxide from the Midwest Carbon Express Pipeline in the storage facility located in Sections 27, 28, 29, 32, 33, 34, and 35, Township 143 North, Range 88 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, 35, and 36, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, and 31, Township 142 North, Range 87 West, and Sections 1, 2, and 3, Township 141 North, Range 88 West, Mercer and Oliver Counties, ND, in the Broom Creek Formation, pursuant to North Dakota Administrative Code Section 43-05-01-09.1

Case No **30876** In the matter of a hearing called on a motion of the Commission to consider establishing the field and pool limits for lands located in Sections 27, 28, 29, 32, 33, 34, and 35, Township 143 North, Range 88 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, 35, and 36, Township 142 North, Range 88 West, Sections 5, 6, 7, 8, 17, 18, 19, 20, 29, 30, and 31, Township 142 North, Range 87 West, and Sections 1, 2, and 3, Township 141 North, Range 88 West, Mercer and Oliver Counties, ND, subject to the application of Summit Carbon Storage #2, LLC for the geologic storage of carbon dioxide in the Broom Creek Formation, and enact such special field rules as may be necessary.

Case No. **30877** In the matter of a hearing called on a motion of the Commission to consider the application of Summit Carbon Storage #3, LLC requesting consideration for the geologic storage of carbon dioxide in the Broom Creek Formation from the Midwest Carbon Express Pipeline in the storage facility located in Section 36, Township 143 North, Range 87 West, Sections 19, 20, 21, 28, 29, 30, 31, 32, 33, 34, 35, and 36, Township 143 North, Range 86 West, Sections 1, 2, 11, 12, 13, 14, and 24, Township 142 North, Range 87 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, and 35, Township 142 North, Range 86 West, and Sections 6, 7, 17, 18, 19, and 20, Township 142 North, Range 85 West, Oliver County, ND pursuant to North Dakota Administrative Code Chapter 43-05-01. View the draft storage facility permit, fact sheet, and storage facility permit application at www.dmr.nd.gov/dmr/oilgas/. Summit Carbon Storage #3, LLC intends to receive carbon dioxide from the Midwest Carbon Express Pipeline and sequester it in the Broom Creek Formation. The Commission will accept and consider written comments on the merits of the application and draft permit if received no later than 5:00 pm CDT June 10, 2024. Submit written comments to the Oil and Gas Division, 1016 East Calgary Ave, Bismarck, ND 58503-5512 or sforsberg@nd.gov. Further draft permit information may be obtained from Tammy Madche, and further hearing information may be obtained from Sara Forsberg, both at the ND Oil and Gas Division, 1016 East Calgary Ave, Bismarck, ND 58503-5512, 701-328-8020. Summit Carbon Storage #3, LLC 2321 North Loop Dr Suite #221, Ames, IA 50010

Case No **30878** In the matter of a hearing called on a motion of the Commission to consider the application of Summit Carbon Storage #3, LLC to consider the amalgamation of the storage reservoir pore space, in which the Commission may require that the pore space owned by nonconsenting owners be included in the geologic storage, as required to operate the Summit Carbon Storage #3, LLC storage facility located in Section 36, Township 143 North, Range 87 West, Sections 19, 20, 21, 28, 29, 30, 31, 32, 33, 34, 35, and 36, Township 143 North, Range 86 West, Sections 1, 2, 11, 12, 13, 14, and 24, Township 142 North, Range 87 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, and 35, Township 142 North, Range 86 West, and Sections 6, 7, 17, 18, 19, and 20, Township 142 North, Range 85 West, Oliver County, ND, in the Broom Creek Formation, pursuant to North Dakota Century Code Section 38-22-10

Case No **30879** In the matter of a hearing called on a motion of the Commission to consider the application of Summit Carbon Storage #3, LLC for an order of the Commission determining the amount of financial responsibility for the geologic storage of carbon dioxide from the Midwest Carbon Express Pipeline in the storage facility located in Section 36, Township 143 North, Range 87 West, Sections 19, 20, 21, 28, 29, 30, 31, 32, 33, 34, 35, and 36, Township 143 North, Range 86 West, Sections 1, 2, 11, 12, 13, 14, and 24, Township 142 North, Range 87 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, and 35, Township 142 North, Range 86 West, and Sections 6, 7, 17, 18, 19, and 20, Township 142 North, Range 85 West, Oliver County, ND, in the Broom Creek Formation, pursuant to North Dakota Administrative Code Section 43-05-01-09.1

Case No **30880** In the matter of a hearing called on a motion of the Commission to consider establishing the field and pool limits for lands located in Section 36, Township 143 North, Range 87 West, Sections 19, 20, 21, 28, 29, 30, 31, 32, 33, 34, 35, and 36, Township 143 North, Range 86 West, Sections 1, 2, 11, 12, 13, 14, and 24, Township 142 North, Range 87 West, Sections 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, and 35, Township 142 North, Range 86 West, and Sections 6, 7, 17, 18, 19, and 20, Township 142 North, Range 85 West, Oliver county, ND, subject to the application of Summit Carbon Storage #3, LLC for the geologic storage of carbon dioxide in the Broom Creek Formation, and enact such special field rules as may be necessary

Signed by,
Doug Burgum, Governor
Chairman, NDIC
