AGE MILLIANS REMARKS PRESENT	ERATHIEM	SYSTEM	SEQUENCE	ROCK UNIT			RESOURCE Potential	ROCK COLUMN	MAXIMUM THICKNESS FEET (METERS)	LITHOLOGY, DEPOSITIONAL ENVIRONMENTS, AND OTHER ATTRIBUTES
				GROUP	FORMATION	MEMBER				
0-0.01	QUATERNARY	Holocene	TETIAS	OAHE	RIVERDALE PICK CITY AGGIE BROWN MALLARD ISLAND		Salt Water Gravel	100 (30)	Clay, silt, sand, and gravel; tan to gray to black; organic-rich or organic-rich lenses; pebbles of locally derived materials such as intraformational concretions and nodules as well as clinker and lignite fragments in western North Dakota; crystalline sodium sulfate in some playa lake deposits; paleosols. Two prominent paleosols have been identified in the Oahe Formation, the Thompson paleosol (Riverdale Member) and the Leonard paleosol (Aggie Brown Member). River, lake, silt, and gravel.	
0-2.6		Pleistocene		COLEHARBOR	WEST CENTRAL EASTERS RED RIVER VALLEY SHERACK POPULAR RIVER BRENSA FALGONER BRUT ARGONVILLE WELLS RED LAKE FALLS ST. JEROME MARCOUR	Gravel Water Sand Clay	1,000 (300)	Clay, silt, sand, and gravel; primarily glacial till, olive-gray to tan, pebbly, silty clay that may contain fragments or pebbles of lignite and clinker, iron stained, often jointed, contains cobbles and large boulders that when left at the surface by erosion are called erratics. Pebbles and boulders consist primarily of granite, gneiss, banded iron, basalt, limestone, and dolomite. Numerous glacial advanced created tills that can be differentiated based on lithologic and mineral content. Till generally forms rounded, well vegetated slopes, and steep, barren slopes along river and lake cuts. Glaciolacustrine clays, gray to black, laminated, varved, organic-rich. Glacial deposits cover all but southwestern North Dakota; windblown silts and sands scattered across North Dakota; glacial outwash is an important source of sand, gravel, and water. Remains of Ice Age plants and animals have been found in the glaciolacustrine and glaciolacustrine sediments. Sixteen stratigraphic units of the Coleharbor Group have been formally recognized in North Dakota. The Sherack, Brenna, and Wylie Formations are glaciolacustrine sediments, the Poplar River Formation is river sediment, and the remaining units consist primarily of till.		
2.6-5.3	NEOGENE	Pliocene	TETIAS	(Unnamed Unit)			Gravel Water	300 (91)	Gravel, sand, sandstone, siltstone, claystone; locally derived river sediment; mainly pebbles and cobbles; terrace, fan, and pediment deposits. Clay, silt, sand, and gravel; western-derived pebbles and cobbles; volcanic porphyries, quartzites, and chert. Includes both upland gravels and valley fills.	
5.3-23.0		Miocene		ARIKAREE			Rock	330 (101)	Limestone, sandstone, and siltstone; tuffaceous; light gray, green, to white; green chert nodules in marlstone; contains the burrowed marker unit; found as caprock on several of the major buttes in southwestern North Dakota. Lake and river deposits.	
23.0-33.9	TERTIARY	Oligocene	TETIAS	BRULE				200 (61)	Siltstone, sandstone, and claystone; brown to pink; nodular, siltstones may contain claystone inclusions; weathers to steep slopes with rounded, pitted surfaces; mammal fossils are common. River and lake deposits.	
33.9-55.8		Eocene		WHITE RIVER	SOUTH HEART CHADRON CHALKY BUTTES	Clay Gravel	140 (43)	South Heart Member: 60 feet (18 m) thick, claystone; brown, pink, and green; contains siltified zones; bentonitic; popcorn weathering surface; lake deposit. Chalky Buttes Member: 80 feet (24 m) thick, sandstone and conglomerate; grayish green to white; cross-bedded, poorly-cemented sandstone. Pebbles include volcanic porphyries, quartz, and some petrified wood. River deposits.		
55.8-65.5	PALEOGENE	Paleocene	TETIAS	GOLDEN VALLEY	CAMELS BUTTE		Clay	400 (122)	Camels Butte Member: 350 feet (107 m) thick, sandstone, siltstone, mudstone, claystone, and thin lignite; shades of yellow and brown; sandstone is poorly-cemented to well-cemented; the lower part is very similar lithologically to the Sentinel Butte Formation except that it is generally micaceous; the upper part contains a massive fluvial sandstone that caps many of the major buttes in southwestern North Dakota. River, lake, and swamp deposits. Bear Den Member: 50 feet (15 m) thick, claystone, siltstone, and sandstone; kaolinitic; white, gold, to purple; small iron spheres; forms steep, nonvegetated slopes; capped in places by a siliceous bed; a weathering horizon or paleosol.	
65.5-99.6				CRETACEOUS	Upper	ZUNI	SENTINEL BUTTE		Clinker Uranium Coal Lignite Water	650 (198)
99.6-145.5	Lower	ZUNI	MONTANA				BULLION CREEK		Water Stone Coal Clinker	650 (198)
145.5-201.6				ZUNI	Upper	MONTANA	SLOPE		Clay Coal Clinker	270 (82)
201.6-251.0	ZUNI	Upper	MONTANA				CANNONBALL		Clay	255 (78)
251.0-299.0				ZUNI	Upper	MONTANA	LUDLOW		Water Clinker Coal	300 (91)
299.0-318	ZUNI	Upper	MONTANA				HELL CREEK		Clay	330 (101)
