Lignite Reserves
Scranton NE Quadrangle, North Dakota

Edward C. Murphy
2008

UNIT DESCRIPTIONS

- Area Of Mined Lignite
- Geology Undifferentiated
- Economic Coal Deposits

Economic coal deposits are those that meet the minimum criteria established by coal companies operating surface mines in North Dakota. These economic criteria include a minimum cumulative coal thickness of ten feet, typically occurring in less than two beds, a minimum individual bed thickness of at least 2.5 feet, a ratio of overburden to coal thickness of not more than 10:1, a minimum of 25 feet of overburden, and a minimum depth to coal of approximately 150 feet.

Geologic Symbols

- Extent of Local Lignite Reserves
- Data Points
- Diametrical Hole Numbers
- Thickness (in feet) of Mineable Lignite
- Coal thicknesses were determined by interpretation of electric logs from individual drill holes. Gamma and density logs were typically available for coal exploration holes but, oil wells were often limited to a gamma log run through surface casing.

Other Features
- US Highway
- Paved Road
- Unpaved Road

This project supported, in part by the U.S. Geological Survey, Department of Interior, under contracts ACR#G001010 and ACR#G00103.
