# MADISON GROUP SUMMARY

## DRILL STEM TESTS AND PRODUCTION MAPPING

Prepared by  
Travis Stollendorf

In order to better facilitate petroleum exploration and development in the Williston Basin, the North Dakota Geological Survey (NDGS) has published a series of production-related maps and corresponding data sets. These maps sets include production and drill stem test (DST) results with an accompanying spreadsheet for easy data extraction. The primary goal of this project is to create a database showing the distribution of hydrocarbons within each productive unit.

Prior to this project, over 55% of the DST results in the state did not have an associated geologic interval. The NDGS utilized a series of filters in Petra and Excel to unite formation tops with DST results. Now over 95% of DST results are associated with a geologic interval. After removing failed (misrun) DSTs, the remaining DST results were then separated into three groups. The first group (Positive DSTa) contains wells that have recovered oil or gas (in either the drill pipe or the sampler), or those that list oil or gas as the primary component of the fluid/gas mixture (e.g. 10' mud cut oil) in the description. Secondly, Positive DSTb wells display results for oil or gas as the secondary component of the fluid/gas mixture (e.g. 50' gas cut mud). Although Positive DSTb wells do show signs of hydrocarbons, the hydrocarbon signal is considered weaker than those in the Positive DSTa group. Lastly, the Negative DST results have no indication of hydrocarbons. Detailed information for each DST (time-pressure data, interval depths, fluid and gas recovery information) can be accessed through the well file database maintained by the North Dakota Industrial Commission (NDIC) Oil and Gas Division.

Production for each well was determined using the NDIC's Production Pools and associated monthly production totals. The production pools utilized are shown on the Production Map for each interval. Cumulative production for each well was calculated through September 2019.

This project is a summary of the Madison Group's production and drill stem test results. Map sets include a production map, cumulative production map and DST results in North Dakota's portion of the Williston Basin. The Madison Group is highlighted by the red box on the North Dakota Stratigraphic Column on the left. A representative log of the Madison Group is shown below along with a map showing the well's approximate location.

AGE YEARS BEFORE PRESENT	ERA/THEM	SYSTEM		SEQUENCE	ROCK UNIT					
		SERIES	GROUP		FORMATION	MEMBER				
0-0.01	CENOZOIC	QUATERNARY	Holocene	TEJAS	OAHE	RIVERDALE				
					COLEHARBOR	WEST CENTRAL	EASTERN	RED RIVER VALLEY		
		Pleistocene								
		NEOGENE	Pliocene			(Unnamed Unit)				
					Miocene		ARIKAREE			
		Oligocene	Eocene			WHITE RIVER	BRULE	SOUTH BEARY		
						CHADRON		CHALKY BUTTE		
						GOLDEN VALLEY		CAMELS BUTTE		
	MESOZOIC	CRETACEOUS	Upper	ZUNI						
					PALEOCENE	Paleocene	FORT UNION	SENTINEL BUTTE		
									BULLION CREEK	
									SLOPE	
						CANNONBALL				
						LUDLOW				
					MONTANA			HELL CREEK		
									FOX HILLS	
	COLORADO									
	DAROTA	Lower								
	JURASSIC			ABSAROKA						
	TRIASSIC			KANSASKIA						
	PERMIAN			KANSASKIA						
	CARBONIFEROUS			KANSASKIA						
	MISSISSIPPIAN			KANSASKIA						
	PENNSYLVANIAN			KANSASKIA						
	DEVIANIAN			KANSASKIA						
	SILURIAN			KANSASKIA						
	ORDOVICIAN			KANSASKIA						
	CAMBRIAN			KANSASKIA						
	PRECAMBRIAN			STRUCTURAL PROVINCES						

The Madison Group is separated into several formations and intervals. Based on available data, this project will look at the Ratcliffe Interval (Charles/Mission Canyon Formation), Frobisher-Alida Interval (Mission Canyon Formation) and Lodgepole Formation, the primary hydrocarbon producing intervals within the Madison Group.
