Field Screening for Shallow Gas in McKenzie County, North Dakota

Fred J. Anderson and Cassie B. Gudmunsen

2010

The identification of shallow natural gas occurrences within existing groundwater wells is the initial step in determining the potential for gas well development. This study was conducted to evaluate the potential for shallow gas occurrences in the McKenzie County, North Dakota region. The study involved the collection of data from existing wells and the use of geophysical methods to identify potential gas occurrences. The results of this investigation provide valuable information for further exploration and development.

Items of note include:
- Existing wells
- Potential gas occurrences
- Geophysical methods
- Groundwater levels
- Potential for gas well development

The map and accompanying text provide a comprehensive overview of the study area, including detailed information on the potential for gas occurrences and the methods used to identify them. The information is valuable for future exploration and development efforts in the region.
