Scale 1:250,000

The Bauer and Land Company collected groundwater samples for uranium analysis from almost 3,500 private domestic wells and stock wells in southwestern North Dakota between October 1975 and June 1978. The uranium detection limit was 2 ppb. The National Uranium Resource Evaluation program (NURE) collected 545 groundwater samples from southwestern North Dakota during the summer of 1979, sampling several of the same wells that Bauer and Land had sampled. The uranium detection limit for the NURE program was <1 ppb.
